1. Introduction

Oxygen XML Author Eclipse plugin is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful Integrated Development Environment and the intuitive Graphical User Interface of Oxygen XML Author Eclipse plugin is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with XSLT and FOP transformation technologies, Oxygen XML Author Eclipse plugin offers support for generating output to multiple target formats, including: PDF, PS, TXT, HTML, JavaHelp, WebHelp, and XML.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Author Eclipse plugin to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.
2. Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Author Eclipse plugin would be to install the software. For detailed information about that process, see the Installation chapter (on page 38).

After installation, when you launch Oxygen XML Author Eclipse plugin for the first time, you are greeted with a Welcome dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

What is Oxygen XML Author Eclipse plugin

Oxygen XML Author Eclipse plugin is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Author Eclipse plugin to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, macOS, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Author Eclipse plugin, see the Oxygen Website.

Getting Familiar with the Interface

Oxygen XML Author Eclipse plugin includes several perspectives (on page 2082) and editing modes (on page 219) to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

Regardless of the perspective (on page 2082) or editing mode (on page 219) that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Author Eclipse plugin. Most of the menus are common for all types of documents, but Oxygen XML Author Eclipse plugin also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing
modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited.

Helper Views

Oxygen XML Author Eclipse plugin includes a large variety of dockable views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane.

Perspectives

Oxygen XML Author Eclipse plugin includes several different perspectives that you can use to work with your documents. The Oxygen XML perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Author Eclipse plugin for the first time. Oxygen XML Author Eclipse plugin also includes a Database perspective that allows you to manage databases.

Supported Document Types

You can use the main editing pane in Oxygen XML Author Eclipse plugin to edit a large variety of document types. You can see the type of document association by the special icons displayed in the tabs of the editor title bar.

The supported document types include the following:

- XML documents
- JavaScript documents
- CSS documents
- Markdown documents
Resources to Help You Get Started Using Oxygen XML Author Eclipse plugin

Configuring Oxygen XML Author Eclipse plugin

There are numerous ways that you can configure Oxygen XML Author Eclipse plugin to accommodate your specific needs.

See the Configuring Oxygen section (on page 61) for details on the various ways that you can configure the application and its features.

Video Tutorials and Webinars

The Oxygen XML Author Eclipse plugin website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Author Eclipse plugin and show you how to complete specific tasks or how to use the various features.

Go to the Oxygen Videos page to see the list of video tutorials.

Go to the Oxygen Events page to see all the upcoming and past webinars, conferences, and other events.

Oxygen XML Author Eclipse plugin Documentation

The Oxygen XML Author Eclipse plugin documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the F1 key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this Getting Started section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section (on page 219)** - Provides information about the Text editor.
- **Author Editing Mode Section (on page 220)** - Provides information about the visual WYSIWYG-like Author editing mode.
- **Editing Specific Document Types Chapter (on page 279)** - Includes information about editing numerous different types of documents.
- **DITA Authoring Chapter (on page 1752)** - Provides information about using DITA to edit and structure your content.
- **Publishing Chapter (on page 785)** - Provides information about the various ways that you can publish content.
- **Importing Data Chapter (on page 1418)** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
- **Tools Chapter (on page 1709)** - Details about the various built-in tools that are available in Oxygen XML Author Eclipse plugin.
Sample Documents

Your installation of Oxygen XML Author Eclipse plugin includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the samples folder that is located in the installation directory of Oxygen XML Author Eclipse plugin. You will find files and folders for various types of documents, including the following:

- **Sample project file (sample.xpr)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the Project Explorer view (on page 244).
- **Sample files (personal.xml, etc.)** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Author Eclipse plugin:

- See the Oxygen XML Author Eclipse plugin Blog Site for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.
- Take advantage of the Oxygen XML Author Eclipse plugin Forum to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful DITA Style Guide Best Practices for Authors.
- To learn about the WebHelp features in Oxygen XML Author Eclipse plugin, see the Publishing DITA and DocBook to WebHelp section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Author Eclipse plugin, see the Tools section (on page 1709).
- See the External Resource Page for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the Oxygen SDK section for details about the SDK that allows you to extend and develop Oxygen XML Author Eclipse plugin frameworks (on page 2080) and plugins (on page 2082), and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Author Eclipse plugin, see the What's New Section of the Website

Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

To create your first XML document, select File > New > Other > Oxygen or click the New button on the toolbar. The New document wizard (on page 221) is displayed:
You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting File > New > New from Templates and choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

**Writing Your First Document**

Depending on the type of document you choose, the Oxygen XML Author Eclipse plugin interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Author Eclipse plugin may open your document in Text (on page 219) or Author (on page 220) mode. Text mode shows the raw XML source file, while Author mode shows a graphical view of the document.

The availability of Author mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the Author mode. Oxygen XML Author Eclipse plugin includes default Author mode views for most of the document types it supports. If your company has created its own document types, Author mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Author Eclipse plugin built-in support, you need to edit it in Text mode or create your own Author mode CSS (on page 1602) for it.

You can switch back and forth between Author mode and Text mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from Author to Text mode. Text and Author modes are just different views for the same XML document.

There is also a Grid mode (on page 219) available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to extract XML content to a spreadsheet (on page 338)).

If you use Author mode, you might find that it is similar to word processors that you are used to. Likewise, the Text mode is similar to many other typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Author Eclipse plugin assists you with a continuous validation of the XML markup.

**Structuring Your First Document**

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you
need to make sure that your document follows the particular structure for the document type you are creating.

This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Author Eclipse plugin helps you determine which elements are allowed. In Author mode, when you press Enter, Oxygen XML Author Eclipse plugin assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press Enter to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the Model view (on page 304) (Window > Show View > Model).

- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Author Eclipse plugin helps you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Author Eclipse plugin creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Author Eclipse plugin presents XML Quick Fixes (on page 554) that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

### Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Author Eclipse plugin provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Author Eclipse plugin provides many tools to help you edit your structure and to keep your structure valid while editing text.

#### The Document Breadcrumbs

Across the top of the editor window (in Text mode), there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

#### Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the Author view. There are several levels of tag visibility that you can choose using the Tags Display Mode drop-down menu (on page 344) on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

#### Outline View
The **Outline view (on page 299)** shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

![Outline View](image)

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

![Outline View Filtered to only Show Element Names](image)

**Cut and Paste, Drag and Drop**

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.
A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or Outline view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Author Eclipse plugin warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using Author mode, you can also switch to Text mode to see exactly which bits of XML you are selecting and moving.

**Refactoring actions**

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the Refactoring menu of the contextual menu. More advanced refactoring operations are also available using the XML Refactoring tool (on page 581) that is available in the XML Tools menu.

**Validating Your First Document**

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Author Eclipse plugin knows how to find the schema, it validates the document for you as you type. Oxygen XML Author Eclipse plugin finds the schema automatically for most of the document types created from templates. However, in some cases, you may have to tell it how to find the schema (on page 519).

When Oxygen XML Author Eclipse plugin validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Author Eclipse plugin also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Author Eclipse plugin cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the Validate action from the Validation toolbar drop-down menu or the XML menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.
Proofing Your First Document

Oxygen XML Author Eclipse plugin includes an automatic (as-you-type) spell checking feature (on page 266), as well as a manual spell checking action. To check the spelling of your document manually, use the Check Spelling action on the toolbar.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such a DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Author Eclipse plugin uses transformation scenarios (on page 785) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Author Eclipse plugin or ones created by your organization.

To see the list of transformations available for your document, select the Apply Transformation Scenario(s) action from the toolbar or the XML menu. A list of available transformation scenarios is displayed. Choose one or more scenarios to apply, and click Apply associated. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Author Eclipse plugin. Oxygen XML Author Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Author Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Author Eclipse plugin works to support you as you write.
Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Author Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Author Eclipse plugin, along with the features of DITA, in a variety of ways.

**Creating a DITA Topic in Oxygen XML Author Eclipse plugin**

To create a DITA topic (on page 1826):

1. Select **File > New > Other > Oxygen XML Author Eclipse plugin**, or click the **New** button on the toolbar, and select **New from Templates**.

   **Step Result:** The **New from Templates Wizard (on page 221)** is displayed:

   ![New from Templates Wizard](image)

   **Figure 3. New DITA Document from Templates Wizard**

   - Go to **Framework templates > DITA > topic** and select the type of topic that you want to create, then click **Next**.
Note:
If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click Finish.

Result: Your document is opened in the editor. Eventually, you will need to add a reference to it in your DITA map (on page 28).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Author Eclipse plugin provides for editing XML documents (on page 20) also apply to DITA topics. Oxygen XML Author Eclipse plugin also provides additional specific DITA-related support for working with DITA topics (on page 1824), their associated DITA maps (on page 1760), and for creating DITA output (on page 1943).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2079). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Author Eclipse plugin

To create a map (on page 1777):

1. Select File > New > Other > Oxygen XML Author Eclipse plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 1762). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

![Figure 4. DITA Maps Manager View](image)

Adding Existing Topics to a Map in Oxygen XML Author Eclipse plugin

There are several ways to add a topic reference to a map (on page 1781). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.

2. Right-click the DITA map in the DITA Maps Manager view (on page 1762) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

   **Step Result:** This opens the Insert Reference dialog box (on page 1786) with all of the required fields already filled in for you.
3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the **DITA map**.

### Adding New Topics to a Map in Oxygen XML Author Eclipse plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map** *(on page 1781)*, follow these steps:

1. In the **DITA Maps Manager** *(on page 1762)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(on page 1827)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(on page 1827)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

Duplicate - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

Note: The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 77) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a <topicref>) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the Alt key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Adding Submaps in Oxygen XML Author Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 1778). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 1778):
1. Right-click the parent DITA map in the DITA Maps Manager view (on page 1762) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (on page 1786) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select Insert and close to add a reference to your submap in the main map.
4. Save the main DITA map.

**Validating a Map in Oxygen XML Author Eclipse plugin**

Just as it is with your individual topics, it is important to validate your maps (on page 1806). Oxygen XML Author Eclipse plugin provides a validation function for DITA maps that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 1762).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 1807).

2. Select any of the various options you want to check.
3. Click Check to run the validation process.

**Publishing Your Topics in Oxygen XML Author Eclipse plugin**

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 1943) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Author Eclipse plugin uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Author Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:
1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 1762).

**Step Result:** This opens the Configure Transformation Scenario(s) dialog box (on page 898).

![Figure 6. Configure Transformation Scenarios Dialog Box](image)

2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click Edit.

4. Click Apply associated.

**Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

**Resources**

For more information about getting started with DITA and how to work with DITA in Oxygen XML Author Eclipse plugin, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.
Creating a New Project

Oxygen XML Author Eclipse plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the Project Explorer view (on page 244) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New > XML Project or New > Sample XML Project from the contextual menu or File menu.

This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the Project Explorer view.

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting File > New > New from Templates and choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the New menu of the contextual menu, when invoked from the Project Explorer view (or from the File menu). You can also create a document from a template by selecting New > New from Templates from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the project contextual menu and the Project Explorer view (on page 244) will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by using the contextual menu from the location in the project tree.
where you want it added and selecting **New > Folder > Advanced**. The linked folders presented in the **Project Explorer view (on page 244)** are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select **New > File** (you can use the **Advanced** button to link to a file in the local file system).

**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see **Project Explorer View (on page 244)**.

### Getting Help

If you run into specific problems while using Oxygen XML Author Eclipse plugin you can take advantage of a variety of support related resources. Those resources include the following:

- The **Oxygen XML Author Eclipse plugin Support Section of the Website**
- The **Oxygen XML Author Eclipse plugin Forum**
- The **Oxygen XML Author Eclipse plugin Video Tutorials**
- The **Common Problems and Solutions Section of the User Manual (on page 1733)**
- The **Online Technical Support Form**

The application also includes various specific help-related resources in the **Help menu**.

### Help Menu

The Oxygen XML Author Eclipse plugin **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

- **Welcome**
  
  This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Author Eclipse plugin.

- **Help Contents**
  
  Use this action to open a dialog box that presents Eclipse help topics and it includes a section that is specific to Oxygen XML Author Eclipse plugin. Also, you can use the **F1** key to open a **Help** view that presents a section in the User Manual that is appropriate for the context of the current cursor position.

- **Report Oxygen problem**
You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

**Tip:**
You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed *plugins* (on page 2082) with your report.
- **Frameworks** - You can choose whether or not to include details about your installed *frameworks* (on page 2080) with your report.

**Support Tools > Randomize XML text content**

Use this action when you need to send samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data. For more information, see [Randomize XML Text Content](on page 36).

**Warning:**
Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

**About Eclipse**

Use this option and then click the Oxygen XML Author Eclipse plugin icon to open a dialog box that contains information about Oxygen XML Author Eclipse plugin and the installed version.

**Related information**

[Details to Submit in a Request for Technical Support Using the Online Form](on page 1736)
Randomize XML Text Content

Oxygen XML Author Eclipse plugin includes an action that randomizes the text content of an XML document. This action is available in the Help > Support Tools menu. It is helpful if you need to send XML samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data.

Warning:
Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Figure 7. Randomize XML Text Content Dialog Box

The Randomize XML Text Content dialog box includes the following options:

Scope
Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2079) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 2085).

Filters
This section includes the following options:
• **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.

• **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
3. Installation

Oxygen XML Author Eclipse plugin is available on Windows, Linux, and macOS and there are a variety of methods and options for installing and running Oxygen XML Author Eclipse plugin on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing add-ons, and uninstalling.

Choosing How Oxygen XML Author Eclipse plugin Runs

You can install Oxygen XML Author Eclipse plugin to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or macOS.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or macOS).
- On Windows and Linux, the native installer can also run in unattended mode.
- The Update Site installer (on page 39).
- The Zip archive installer (on page 40).

Choosing a License Option

You must obtain and register a license key (on page 41) to run Oxygen XML Author Eclipse plugin.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, transferring, and uninstalling.

You can also upgrade (on page 58) Oxygen XML Author Eclipse plugin, transfer a license (on page 46), or uninstall (on page 60) Oxygen XML Author Eclipse plugin.

Getting help with installation

If you need help, email support at: support@oxygenxml.com.
Installing Oxygen as an Eclipse Plugin

System Requirements

Operating Systems

- macOS version 10.11 64-bit or later
- Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.8 from Oracle

CPU

- Minimum - 1 GHz processor
- Recommended - Dual-core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 1.8 from Oracle.

On Eclipse, Oxygen XML Author Eclipse plugin uses the same Java Virtual Machine as the copy of Eclipse it is running in.

Eclipse

The following Eclipse versions are officially supported: 4.4-4.22.

Update Site Method

To install the Eclipse plugin using the Update Site method, follow this procedure:

1. Start Eclipse.
2. Go to Help > Install New Software > Available Software.
3. Click Add in the Available Software dialog box.
4. Enter https://www.oxygenxml.com/InstData/Author/Eclipse/site.xml into the Location field of the Add Site dialog box.
5. Click OK.
6. Select the Oxygen XML Author Eclipse plugin checkbox.
7. Click **Next** and continue with the rest of the installation wizard.

8. Restart Eclipse when prompted.

9. Verify that Oxygen XML Author Eclipse plugin is installed correctly by creating a new XML Project. Go to **File > New > Other** and choose **Oxygen XML Author Eclipse plugin > XML Project**.

10. When prompted for a license key, enter the license information received in the registration email.

**Note:**
If you already have a native version of Oxygen XML Author Eclipse plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

**Zip Archive Method**

To install the Eclipse plugin using the *Zip Archive* method, follow this procedure:

1. **Download** the zip archive with the Eclipse plugin.
2. Unzip the downloaded zip archive in the *dropins* subdirectory of the Eclipse installation directory.
3. Restart Eclipse.
4. Verify that Oxygen XML Author Eclipse plugin is installed correctly by creating a new XML Project. Go to **File > New > Other** and choose **Oxygen XML Author Eclipse plugin > XML Project**.
5. When prompted for a license key, enter the license information received in the registration email.

**Note:**
If you already have a native version of Oxygen XML Author Eclipse plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

**Eclipse Marketplace**

It is also possible to install Oxygen XML Author Eclipse plugin from the Eclipse Marketplace. Simply search for **Oxygen** and use the **Install** button that has instructions when you hover over the button.

**Site-Wide Deployment**

If you are deploying Oxygen XML Author Eclipse plugin for a group, there are various things you can do to customize Oxygen XML Author Eclipse plugin for your users and to make the deployment more efficient.

**Creating custom default options**

You can create a custom set of default options (on page 196) for Oxygen XML Author Eclipse plugin. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Author Eclipse plugin, but if they choose to reset their options to defaults, the custom defaults that you set will be used.
Creating default project files

Oxygen XML Author Eclipse plugin project files (on page 242) are used to configure a project. You can create and deploy default project files (on page 243) for your projects so that your users will have a preconfigured project file to begin work with.

Using floating licenses

If you have a number of people using Oxygen XML Author Eclipse plugin on a part-time basis or in different time zones, you can use a floating license (on page 43) so that multiple people can share a license.

Licensing

Oxygen XML Author Eclipse plugin is not free software. To activate and use Oxygen XML Author Eclipse plugin, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at https://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

Choosing a License Type

You can use one of the following license types with Oxygen XML Author Eclipse plugin:

1. A **Named-User License** (on page 42) may be used by a single *Named User* (on page 2081) on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.

2. A **Floating License** (on page 43) may be used by any user on any machine. However, the total number of copies of Oxygen XML Author Eclipse plugin in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Author Eclipse plugin (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

3. A **Subscription license** (on page 42) that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

For definitions and legal details of the license types, consult the End-User License Agreement available at https://www.oxygenxml.com/eula_author.html.

Obtaining a License Key

You can obtain a license key for Oxygen XML Author Eclipse plugin in one of the following ways:
You can purchase one or more licenses from the Oxygen XML Author Eclipse plugin website at https://www.oxygenxml.com/buy.html or through one of the authorized resellers. A license key will be sent to you by email.

- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key or configuration details to connect to a license server.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from https://www.oxygenxml.com/registerCode.html. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Author Eclipse plugin website at https://www.oxygenxml.com/register.html.

**Register a Named-User or Subscription License**

To register a *Named-User License* or *Subscription License* on a machine owned by the *Named User* (on page 2081), follow these steps:

1. Purchase a license from the Oxygen XML Author Eclipse plugin website. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
   - If this is a new installation of Oxygen XML Author Eclipse plugin, the registration dialog box is displayed. If the registration dialog box is not displayed, go to Window (Eclipse on macOSX) and choose Preferences > Oxygen XML Author Eclipse plugin and click the Register button.

   ![Figure 8. License Registration Dialog Box](image)

   - Select **Use a license key** as the licensing method.
Note:
If your license key has 20 or more licenses, you must use a license server (on page 46) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.

6. Click OK.

Related information
Oxygen XML Author Eclipse plugin End-User License Agreement

Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not need to use Oxygen XML Author Eclipse plugin all at the same time. Instead of each user having their own individual license key to use at their discretion, there are a pool of licenses that are used one at a time by various users upon request.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for setting up the license server (on page 46). Then you will need to request a floating license from the server (on page 43). This process is designed to help you comply with the Oxygen End-User License Agreement (EULA). This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see Releasing a Floating License (on page 44).

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see Reserving a Floating License (on page 45).

Requesting a Floating License from an HTTP License Server

How to Request a Floating License

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start the Eclipse platform.
3. Open the Preferences dialog box (on page 61) and click the Register button.

Step Result: The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.
6. In the **URL** field, enter the address of the license server. The URL address has the following format: `http://hostName:port/oXygenLicenseServlet/license-servlet`.
7. Complete the **User** and **Password** fields.
8. Click the **OK** button.

**Result:** If a floating license is available, it is registered in Oxygen XML Author Eclipse plugin. To display the license details, open the **Preferences** dialog box (on page 61). If a floating license is not available, you will get a message listing the users currently using floating licenses.

**How to Register Floating Licenses for Additional Users**

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Author Eclipse plugin on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Author Eclipse plugin:
   a. Open the **Preferences** dialog box (on page 61) and click the **Register** button.
   b. Click **OK** without entering any information in this dialog box.
   c. Click **Reset** and restart the application.
2. Register the license using one of the floating license registration procedures (on page 43).

**Step Result:** A license.xml file is created.

3. Copy the license.xml file from the preferences directory (on page 62) and place it in the **lib** subfolder of the installation directory (e.g. \ECLIPSE-INSTALL-DIR\plugins \com.oxygenxml.author_22.1.0.v*\lib).

**Related information**

*Setting up an HTTP License Server (Floating or Named-User Licenses) (on page 47)*

**Releasing a Floating License**

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- The Oxygen XML Author Eclipse plugin will consume one license from the server’s pool of licenses if at least one Oxygen editor window is opened (not necessarily focused). In other words, if a user wants to release a license, all Oxygen editor windows must be closed.
- You exit the application running on your machine, and no other copies of Oxygen XML Author Eclipse plugin running on your machine are using your floating license.
• You register a *Named User (on page 2081)* license with your copy of Oxygen XML Author Eclipse plugin, and no other copies of Oxygen XML Author Eclipse plugin running on your machine are using your floating license.
• Your computer idles for more than 2 hours.
• Your system administrator manually revokes the license (*on page 52*).

**Tip:**
To prevent your floating license from being released, you can use the **Lock floating license** action available in the *Preferences* dialog box (go to *Window (Eclipse on macOS)* and choose *Preferences > Oxygen XML Author Eclipse plugin*). You can use the same action to unlock the license. Note that your system administrator can also unlock your license (*on page 52*).

To release a floating license on demand, follow these steps:

1. Open the *Preferences* dialog box (*on page 61*) and click *Register*.
   The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the *Use a license key* option is selected.
4. Click *OK*.
   A dialog box is displayed asking if you want to reset your license key.
5. Select between:
   - *Use the last one* - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User (on page 2081)* license.
   - *Reset* - Removes your license key from your user account on the current computer.
   The *Reset* button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Author Eclipse plugin.

**Reserving a Floating License**

There are instances where you might want to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. Select *Lock floating license* from the *Preferences* dialog box (go to *Window (Eclipse on macOS)*) and choose *Preferences > Oxygen XML Author Eclipse plugin*.
2. Click *OK*.
   Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.
Transferring a License Key

If you want to transfer your Oxygen XML Author Eclipse plugin license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. Open the Preferences dialog box and click Register.
   The license registration dialog box is displayed.
2. Make sure the Use a license key option is selected.
3. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
4. Click the Remove button at the bottom-right corner of the dialog box.
   A confirmation message is displayed asking if you want to remove your license key.
5. Select between:
   - Yes - Removes your license key from your user account on the current computer.
   - No - Falls back to your previous license key, if applicable.

License Servers

Installing a License Server to Manage Licenses

If you are using floating licenses or a large number of user-based licenses (20 or more) for Oxygen XML Author Eclipse plugin, you must set up an Oxygen XML Author Eclipse plugin HTTP server.

Note:
Oxygen XML Author Eclipse plugin version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

Activating License Keys

To help you comply with the Oxygen XML Author Eclipse plugin EULA (terms of licensing), all floating or named-user licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Author Eclipse plugin servers, which in turn will sign the license key.

Splitting or Combining License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same Oxygen XML Author Eclipse plugin version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.
Setting up an HTTP License Server (Floating or Named-User Licenses)

**Restriction:**
The floating license server does not work with Docker containers.

The HTTP License Server is available in several distributions, tailored for covering various deployment configurations:

- **Windows installer (on page 47)** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution (on page 48)** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, macOS, and Linux.
- **Web Archive (WAR) distribution (on page 49)** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

### HTTP License Server System Requirements

**Table 1. Requirements**

<table>
<thead>
<tr>
<th>Hardware</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1 core</td>
</tr>
<tr>
<td>RAM</td>
<td>512 MB/Linux OS, 1 GB/Windows OS (256 MB available memory)</td>
</tr>
<tr>
<td>Hard Disk Space</td>
<td>500 MB</td>
</tr>
<tr>
<td>Network Requirements</td>
<td>Network interfaces stay unchanged (static MAC addresses) after activation</td>
</tr>
<tr>
<td>Server OS Requirements</td>
<td>Linux or Windows</td>
</tr>
<tr>
<td>Antivirus and Firewall Requirements</td>
<td>Allow access to the configured TCP port (default 8080)</td>
</tr>
</tbody>
</table>

### Installing the HTTP License Server Installer Distribution for Windows

1. Download the HTTP license server installer from the HTTP License Server website.
2. Run the installer and follow the on-screen instructions.
3. You must configure two sets of credentials:
   a. **Administrator credentials** - Used for accessing the Oxygen XML Author Eclipse plugin license server administrative interface.
   b. **Standard user credentials** - Used by an Oxygen XML Author Eclipse plugin application to connect to the license server.
4. You can choose to change the default 8080 port the server runs on. If you need to change the port after the installation, you can do it by editing the following `vmoptions` file: `oXygen HTTP License Server \Windows Service\oXygenHTTPLicenseServer.vmoptions`.

5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

Tip:

In case you run into issues, the license server log file is located in:

```
[Installation_Directory]\work\logs\oXygenLicenseServlet.log
```

## Installing the HTTP License Server All-Platform Distribution

1. **Prerequisite** Java 8 or later must be installed.

2. Download the HTTP license server all-platform archive from the [HTTP License Server website](http).

3. Unpack the archive.

4. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and macOS).

   **Note:**

   To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.

5. On the first run, you are prompted to set two sets of credentials:

   a. **Administrator credentials** - Used for accessing the Oxygen XML Author Eclipse plugin license server administrative interface.
   
   b. **Standard user credentials** - Used by an Oxygen XML Author Eclipse plugin application to connect to the license server.

   **Tip:**

   If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

   - `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
   - `startWindowsService.bat [serviceName]` - Starts the Windows service.
   - `stopWindowsService.bat [serviceName]` - Stops the Windows service.
   - `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.
If you do not provide the `serviceName` argument, the default name `oXygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

Installing the HTTP License Server WAR Distribution

1. Make sure that you have Java Servlet Container installed on the server you have selected to be the license server. Apache Tomcat 5.5 or higher is recommended (available at [http://tomcat.apache.org](http://tomcat.apache.org)).

   **Important:**
   By default, the license server stores the statistics database and other data in the Java Servlet Container's temporary directory. If you are not using Apache Tomcat, this directory may be deleted when the server is stopped or restarted. However, you can set the `oxygen.license.server.work.dir` system property to specify a different path for the directory where the database is stored.

2. Download the HTTP license server **Web Archive (.war)** from the [HTTP License Server website](http://www.license-server.org).

3. Configure three user roles in your installation of the Java Servlet Container (such as Apache Tomcat):
   a. One user with the role `user`, used by an Oxygen XML Author Eclipse plugin application to connect to the license server. In the subsequent example, this user name is **John**.
   b. Another user with the role `admin`, used for accessing the HTTP License Server administrative interface and the management interface. In the subsequent example, this user name is **Mary**.

   For example, in Apache Tomcat, a typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat `zip/tar.gz` distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the three users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
    version="1.0">

  <!-- ... other user and role definitions ... -->

  <role rolename="user"/>
  <role rolename="admin"/>
  <user username="John" password="user_pass" rolenames="user"/>
  <user username="Mary" password="admin_pass" rolenames="admin"/>

</tomcat-users>
```
4. Deploy the WAR file.

For example, in Apache Tomcat, go to the Web Application Manager page and log in with the user you configured with the admin role (Mary in the example above). In the WAR file to deploy section, choose the WAR file and click the Deploy button. The oXygenLicenseServlet application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page. By default, the address of this page is http://<server-address>/oXygenLicenseServlet. In Apache Tomcat, you can also open this page by clicking the oXygenLicenseServlet link in the manager page.

You need to authenticate with the user configured with the admin role (Mary in the example above).

6. **Activate the license key.** This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access.

   ![Note:]
   
   If you cannot access the internet during the deployment, you can manually activate the license key (on page 51).

   Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:

   a. Paste your license key into the form and click **Register/Activate**.

   **Step Result:** You will be redirected to an online form hosted on the Oxygen XML Author Eclipse plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

   b. Click **Register/Activate**.

   If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Author Eclipse plugin client applications.

7. The application's log file location is specified by the log4j.appender.R2.File property from the WEB-INF/lib/log4j.properties configuration file.

   For example, in Apache Tomcat, the configuration file is located at: TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties and the default log file location is TomcatInstallDir/logs/oxygenLicenseServlet.log.

### Installing Multiple Instances of the Oxygen License Servlet on a Tomcat Web Server

For cases where your organization has multiple sets of licenses (for example, an integrator with multiple clients might host a different license server for each client), follow this procedure to install multiple instances of the Oxygen License Servlet on a Tomcat web server:
1. Rename the license server WAR file according to your needs. For example, you could use the customer name and a number (e.g. client23415).
2. Go to your Tomcat license server manager (e.g. http://my.tomcatserver.com:port/manager/) and enter your credentials.
3. Scroll to WAR file to deploy and press Browse button.
4. Locate the WAR file from step 1 and press the Open button.
5. Press the Deploy button.
6. Check that the newly deployed license server is running (it must be in the Applications table).

Manual License Activation Procedure (For Users Whose License Server is Offline)

If your license server is not connected to the internet (therefore, the license cannot be activated automatically during the installation), you can manually activate the license by following these steps:

1. Access the HTTP license server management page in a web browser.
2. Copy the machine signature code.

   Note:
The machine signature is displayed on the page as long as the license key was never activated. If you are trying to update/replace an already activated license key, the machine signature can be found by clicking on Remove/Replace License, then Replace on the next page.

4. Enter or paste the machine signature code and the license key, then click Activate.

   Step Result: The activated license key is displayed on-screen.
5. Copy the activated license key and paste it in the license registration page of the HTTP server.

Backup License Server Information

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it requires its own separate license key. Contact the Oxygen support team to find out more details about the backup license pricing and availability.

Related information

Troubleshooting: Server Signature Mismatch Errors (on page 57)

License Server Management and Statistics Pages

A system administrator can manage and access information about the license server at: http://hostName:port/oXygenLicenseServlet.
This page provides access to several statistics reports and management tasks. It also shows the current status of the server and provides additional instructions for using the license server with Oxygen XML Author Eclipse plugin.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the Allocated License Report page (on page 52).
- **Usage Statistics** (Available only for floating licenses) - Opens the License Usage Statistics page (on page 53).
- **View License Key** - Use this link to open a page where you can see details about the license key.
- **Replace/Remove License Key** - Use this link if you need to replace or remove the current license key (on page 55).
- **Configuration** - Opens a page where you can configure notification settings and specify whether or not users are allowed to lock licenses. This page can be used for setting up the mail server used for sending emails whenever license requests from users are rejected.
- **Users management** (Available only for named-user licenses) - Opens a page where you can manage the list of users who are entitled to use the license key.
- **Allowed users list** (Available only for named-user licenses) - Opens a page where you can see the allowed users list (if one has already been configured), along with instructions for configuring one.

**Allocated License Report Page**

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where Oxygen XML Author Eclipse plugin runs, and lock status.
  - **Revoke** - A system administrator can click on the **Revoke** icon next to a user name to release that particular license and return it to the pool.
  - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

**Note:**

This report is also available in XML format at: [http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml](http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml).
License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.

- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

**Tip:**
You can click on any bar to see the license consumption per hour for that particular day.

![Figure 9. Concurrent License Consumption per Day Chart](image-url)
• **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

![Figure 10. Concurrent License Consumption per Hour Chart](image)

**Users Management Page (Named-User License Only)**

When using a named-user license key, the license server allocates available licenses on a *first come first served* basis until the maximum number is reached. Further users attempting to get a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

- Revoke a user's right to use a license.
- Reactivate a previously deactivated user.
Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your Oxygen XML Author Eclipse plugin HTTP license server contains a previously activated license key (on page 50) and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (on page 46).

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your admin credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Replace** button.
4. Paste the new license key in the displayed form.
5. Click **Register/Activate**. The browser used in the process needs to have Internet access.
Step Result: You will be redirected to an online form hosted on the Oxygen XML Author Eclipse plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

Note:
If you cannot access the online activation form, you can manually activate the license key (on page 51).

Result: If the activation process is completed successfully, your license server is now running using the new license key. You can click View license key to inspect the key currently used by the license server.

Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your admin credentials.
2. Click the Replace/Remove license key link. This will open a page that contains details about the license currently in use.
3. Click the Remove button to begin the license deletion procedure.
4. Click the Remove button in the confirmation page.

Important:
The removal process is irreversible. Once the process is complete, you cannot restore the license key.

Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the admin credentials.
2. Click the View license key link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the admin role, and Undeploy the license server.
4. Download the Web Archive (WAR) distribution of HTTP license server.
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the admin user.
7. Paste your license key into the form and register it.
Configuring a License Server to Only Allow Certain Users

A system administrator can configure the license server to only allow specific users to request a license. This is available only for named-user licenses (not floating licenses) and is managed using an Allowed Users List.

To configure an Allowed Users List:

1. Create a text file named allowed-users.txt.
2. Enter the user name for each allowed user on a separate line.
3. Save the file in the license server work directory. You can go to the license server management page, and under Management Tasks, click the Allowed users list link to open a page where you can see the exact directory where it needs to be stored.

Note: If the allowed-users.txt file is present but it is empty, all users are allowed to request a license.

In the license server management page, there is a link to the Allowed users list under Management Tasks. Also, in the Current Allocated Licenses page, there is a Show allowed users button. Both of them direct you to a page where you can see the Allowed Users List (if one has already been configured), along with instructions for configuring one. The list updates automatically between license requests every 30 seconds if the file is changed.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a floating license server.

Server Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server’s Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Server Signature) is sent to the Oxygen XML Author Eclipse plugin servers, which in turn will sign the license key. The Server Signature is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your Server Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.
Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:
A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

Upgrading

From time to time, upgrades and patch versions of Oxygen XML Author Eclipse plugin are released to provide enhancements that fix problems and add new features.

Upgrading Oxygen XML Author Eclipse plugin on Windows/Linux

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Author Eclipse plugin, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Author Eclipse plugin already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in framework (on page 2080) files, XSLT stylesheets, XML Catalogs (on page 2085), and templates.
- All global user preferences are preserved in the new version.
• All project preferences will be preserved in their project files.
• Any custom frameworks (on page 2080) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 80)) will be preserved and will be found by the new installation.

If you install in a new directory:

• All the files from the old install directory will be preserved, including any modification in framework (on page 2080) files, XSLT stylesheets, XML Catalogs (on page 2085), and templates. However, these modifications will not be automatically imported into the new installation.
• All global user preferences are preserved in the new version.
• All project preferences will be preserved in their project files.
• Any custom frameworks (on page 2080) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 80)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Author Eclipse plugin on Windows or Linux

1. Uninstall the current version of Oxygen XML Author Eclipse plugin (on page 60).
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Author Eclipse plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.

Upgrading Oxygen XML Author Eclipse plugin on macOS

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Author Eclipse plugin, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

• All the files from the old install directory will be preserved, including any modification in framework (on page 2080) files, XSLT stylesheets, XML Catalogs (on page 2085), and templates. However, these modifications will not be automatically imported into the new installation.
• All global user preferences are preserved in the new version.
• All project preferences will be preserved in their project files.
• Any custom frameworks (on page 2080) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 80)) will be preserved and will be found by the new installation.
How to Upgrade Oxygen XML Author Eclipse plugin on macOS

1. **Uninstall the current version of Oxygen XML Author Eclipse plugin (on page 60)** or rename the installation directory (for example, Oxygen XML Editor.old).
2. Download and install the new version in an empty folder according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Author Eclipse plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.

Uninstalling

How to Uninstall Oxygen XML Author Eclipse plugin

⚠️ **CAUTION:**

The following procedure will remove Oxygen XML Author Eclipse plugin from your system. It will not remove the Eclipse platform. If you want to uninstall Eclipse, refer to its uninstall instructions.

1. Choose the menu option **Help > About > Installation Details**.
2. Select Oxygen XML Author Eclipse plugin from the list of plugins.
3. Choose **Uninstall**.
4. Accept the Eclipse restart.
5. If you want to remove the user preferences:
   - **Windows** - Remove the directory: `%APPDATA%\com.oxygenxml.author` (usually `%APPDATA%` has the value: `[user-home-dir]\Application Data`). Note that this directory is hidden.
   - **macOS** - Remove the directory: `Library/Preferences/com.oxygenxml.author` of the user home folder.
   - **On Linux**, remove the directory: `.com.oxygenxml.author` from the user home directory.
4.

Configuring Oxygen XML Author Eclipse plugin

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables (on page 199) that are available for customizing user-defined commands.

Preferences

You can configure Oxygen XML Author Eclipse plugin options using the Preferences dialog box.

To open the preferences dialog box, go to go to Window (Eclipse on macOSX) and choose Preferences > Oxygen XML Author Eclipse plugin.

Figure 12. Eclipse Preferences Dialog Box
Click the ? icon or press F1 for help on any preferences page.

You can restore options to their default values by pressing the Restore Defaults button, available in each preferences page.

A filtered version of the Preferences dialog box is available by selecting Options from the contextual menu in the editor. It displays an appropriate preferences page according to the context where the action was invoked and filters the tree on the left according to where the preference page is located in the hierarchy.

Figure 13. Eclipse Preferences Dialog Box - Filtered Version

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (com.oxygenxml) that is in the following locations:

- **Windows (7, 8, 10)** - \[user_home_directory\]\AppData\Roaming\com.oxygenxml.author
- **macOS** - \[user_home_directory\]/Library/Preferences/com.oxygenxml.author
- **Linux/Unix** - \[user_home_directory\]/.com.oxygenxml.author

Oxygen XML Author Eclipse plugin License

To configure the license options, open the Preferences dialog box (on page 61). This preferences page presents the details of the license key that enables the Oxygen XML Author Eclipse plugin plugin, such as registration name, category and number of purchased licenses, encrypted signature of the license key. Clicking the Register button opens the Oxygen XML Author Eclipse plugin License dialog box that allows you to insert a new license key.

Archive Preferences

To configure Archive options, open the Preferences dialog box (on page 61) and go to Archive.

The following options are available in the Archive preferences page:

- **Archive backup options**
  Controls if the application makes backup copies of the modified archives. The following options are available:
• **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.

• **Never create backup copies of modified archives** - No backup copy is created.

• **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

**Note:**
Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

**Show archive backup dialog box**

Select this option if you want to be notified for backup when modifying in archives. The last backup option you chose will always be used as the default one.

**Archive types**

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Author Eclipse plugin. You can use the Edit button at the bottom of the table to edit an existing mapping or the + New button to create a new one and associate your own list of extensions to an archive format.

**Figure 14. Edit Archive Extension Mappings**

![Edit Archive Extension Mappings](image)

**Important:**
You have to restart Oxygen XML Author Eclipse plugin after removing an extension from the table for that extension to not be recognized as an archive extension.

**Store Unicode file names in Zip archives**

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.
CSS Validator Preferences

To configure the CSS Validator preferences, open the Preferences dialog box (on page 61) and go to CSS Validator.

You can configure the following options for the built-in CSS Validator of Oxygen XML Author Eclipse plugin:

- **Profile** - Selects one of the available validation profiles: CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 + SVG, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile.
  
  The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen (on page 1628) that can be used in Author mode (on page 220). That means all Oxygen-specific extensions are accepted in a CSS stylesheet by the built-in CSS validator (on page 604) when this profile is selected.

- **Media type** - Selects one of the available mediums: all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen.

- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: All, Normal, Most Important, No Warnings.

- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: -ro-* (PDFreactor), -ah-* (Antenna House), prince-* (Prince). As wildcards you can use:
  
  - * to match any string.
  - ? to match any character.

- **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Author Eclipse plugin recognizes browser-specific CSS properties (no validation is performed). The Content Completion Assistant (on page 2078) lists these properties at the end of its list, prefixed with the following particles:
  
  - -moz- for Mozilla.
  - -ms- for Edge.
  - -o- for Opera.
  - -webkit- for Safari/WebKit.

Custom Editor Variables Preferences

An editor variable (on page 199) is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in editor variables (on page 199).

Custom editor variables are created and configured in the Custom Editor Variables preferences page. To access this page, open the Preferences dialog box (on page 61) and go to Custom Editor Variables.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable Name, its Value, and its Description. The create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent
dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

**Figure 15. Custom Editor Variables Table**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${startDir}</td>
<td>./../bin</td>
<td>Start directory of command line validator</td>
</tr>
<tr>

<td>-c config.xml -v -level 5 -list</td>
<td>List of command line standard parameters</td>
</tr>
</tbody>
</table>

**Data Sources Preferences**

To configure the **Data Sources** preferences, open the **Preferences** dialog box (on page 61) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see Download Links for Database Drivers (on page 70).

**Connection Wizards Section**

**Create eXist-db XML connection**

Click this link to open the dedicated **Create eXist-db XML connection** dialog box (on page 1390) that provides a quick way to create an eXist connection.

**Data Sources Section**

This section allows you to add and configure data sources.
The following buttons are available at the bottom of the **Data Sources** panel:

**New**

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

The following options are available in the **Data Source Drivers** dialog box:
• **Name** - The name of the new data source driver that will be used for creating connections to the database.
• **Type** - Selects the data source type from the supported driver types.
• **Help button** - Opens the User Manual at the list of the sections (on page 70) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
• **Driver files (JAR, ZIP)** - Lists download links for database drivers (on page 70) that are necessary for accessing databases in Oxygen XML Author Eclipse plugin.
• **Add Files** - Adds the driver class library.
• **Add Recursively** - Adds driver files recursively.
• **Remove** - Removes the selected driver class library from the list.
• **Detect** - Detects driver file candidates.
• **Stop** - Stops the detection of the driver candidates.
• **Driver class** - Specifies the driver class for the data source driver.

**Edit**

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

**Duplicate**

Creates a copy of the selected data source.

**Delete**

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

**Connections Section**

This section allows you to add and configure data source connections.
The following buttons and options are available at the bottom of the Connections panel:

+ New

Opens the Connection dialog box that allows you to configure a new database connection.
• **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.

• **Data Source** - Allows selecting a data source defined in the Data Source Drivers dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

• **URL** - The URL for connecting to the database server.

• **User** - The user name for connecting to the database server.

• **Password** - The password of the specified user name.

• **Host** - The host address of the server.

• **Port** - The port where the server accepts the connection.

• **XML DB URI** - The database URI.

• **Database** - The initial database name.

• **Collection** - One of the available collections for the specified data source.

• **Environment home directory** - Specifies the home directory (only for a Berkeley database).

• **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).

• **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

**Edit**

Opens the Connection dialog box, allowing you to edit the selected connection. See above the specifications for the Connection dialog box.

**Duplicate**

Creates a copy of the selected connection.

**Delete**

Deletes the selected connection.

**Move Up**

Moves the selected connection up one row in the list.

**Move Down**

Moves the selected connection down one row in the list.

**Limit the number of cells**

For performance issues, you can set the maximum number of cells that will be displayed in the Table Explorer view (on page 1361) for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the Table Explorer view (on page 1361), a warning dialog box will inform you that the table is only partially shown.
Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the Data Source Explorer view (on page 1359) would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the Up and Down buttons in the Data Source Explorer view (on page 1359). This limited number is set in the field. The default value is 200 nodes.

Show warning when expanding other database schema

Controls if a warning message will be displayed when expanding another database schema and there are tables selected in the current, expanded one. This applies to the Select database table dialog box in the Import Database Data to XML wizard (on page 1423).

Table Filters Preferences

The Table Filters preferences page allows you to choose the types of tables to be shown in the Data Source Explorer view (on page 1359). To open this preferences page, open the Preferences dialog box (on page 61) and go to Data Sources > Table Filters.

You can choose to display the following types of tables:

- Alias
- Global Temporary
- Local Temporary
- Synonym
- System Table
- Table
- View

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Author Eclipse plugin:

- **IBM DB2 Pure XML database** - Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Author Eclipse plugin for configuring a DB2 data source (on page 1366).
- **eXist database** - Copy the jar files from the eXist database install directory to the Oxygen XML Author Eclipse plugin install directory as described in the procedure for configuring an eXist data source (on page 1391).
- **MarkLogic database** - Download the MarkLogic driver from MarkLogic Community site.
- **PostgreSQL database** - Go to [http://jdbc.postgresql.org/download.html](http://jdbc.postgresql.org/download.html) and download the PostgreSQL JDBC driver specific for your server version.
- **Berkeley DB XML database (Deprecated)** - Copy the jar files from the Berkeley database install directory into the Oxygen XML Author Eclipse plugin install directory as described in the [procedure for configuring a Berkeley DB data source](on%20page%201384).<br>• **Microsoft SQL Server 2005/2008 database (Deprecated)** - Download the appropriate MS SQL JDBC driver from the Microsoft website.

**DIFF Preferences**

To access the DIFF preferences page, go to Window (Eclipse on macOSX) and choose Preferences > Oxygen XML Author Eclipse plugin > DIFF. This preferences page includes the following sections and options:

**Enable file comparison in Text mode**

When selected, the text-based comparison mode is available when comparing XML files.

**Enable file comparison in Author mode**

When selected, the visual comparison mode is available when comparing XML files.

**Two-Way Diff section**

**Default algorithm**

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Algorithm strength**

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

**Three-Way Diff section**

**Default algorithm**
The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Algorithm strength**

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

**Show pseudo conflicts**

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

**XML Diff section**

In this section, you can choose to ignore **Namespaces**, **Prefixes**, **Namespace declarations**, and the **Attribute order**.

**Appearance Preferences**

To configure the appearance options for the visual file comparison tool, go to **Window (Eclipse on macOS)** and choose **Preferences > Oxygen XML Author Eclipse plugin > DIFF > Appearance**. This preferences page includes the following sections and options:

- **Incoming color**
  Specifies the color used on the vertical bar for incoming changes.

- **Outgoing color**
  Specifies the color used on the vertical bar for outgoing changes.

- **Conflict color**
  Specifies the color used on the vertical bar for conflicts between the compared files.
DITA Preferences

To access the DITA Preferences page, open the Preferences dialog box (on page 61) and go to DITA. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Author Eclipse plugin installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in Oxygen Publishing Engine (based on DITA-OT 3.x)

Oxygen XML Author Eclipse plugin comes bundled with the Oxygen Publishing Engine (based on DITA-OT 3.7.0). By default, all defined DITA transformation/validation scenarios will run with this version. The default publishing engine directory is: 

\[OXYGEN\_INSTALL\_DIR]/frameworks/dita/DITA-OT3.x

Custom

Allows you to specify a custom directory for your DITA-OT distribution.

Location

You can either provide a new file path for the specific DITA-OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

Important:

Using a custom DITA Open Toolkit may disable certain features in the application. Examples of features that may not work properly:

- If the custom DITA-OT is missing certain publishing plugins, default transformation scenarios such as DITA Map WebHelp Responsive (on page 1945) or DITA Map PDF - based on HTML5 & CSS (on page 1958) may no longer work properly.
- Validation of Markdown documents using Schematron may not work because it is based on a certain DITA Open Toolkit plugin.
- The DITA framework (defined in the Preferences > Document Type Associations page) will use the XML catalogs specified in the DITA-OT configured in the Preferences > DITA page to perform the validation of all DITA topic types. If this DITA-OT is different from the one that comes bundled with the Oxygen XML Author Eclipse plugin default distribution, you might encounter validation-related issues.
Enable DITA 2.0 editing support (Experimental)

If selected, you will have access to a DITA 2.0 folder in the New Document Wizard (on page 221) where you can find new document templates for creating DITA 2.0 maps or topics based on the DITA 2.0 standard DTDs. For example, in a DITA topic based on the DITA 2.0 DTDs, you can insert an `<include>` element that is not found in the DITA 1.3 DTDs.

DITA Logging Preferences

To access the DITA Logging preferences page, open the Preferences dialog box (on page 61) and go to DITA > Logging. This preferences page includes the following sections and options:

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- When build fails - Displays the console output log only if the build fails.
- Always - Displays the console output log, regardless of whether or not the build fails.

Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

DITA Maps Preferences

To access the DITA Maps preferences page, open the Preferences dialog box (on page 61) and go to DITA > Maps. This preferences page includes the following options:

Expand references to other maps when opening a map in Author mode
Enabling this option will improve performance (decrease the loading time) when opening maps in **Author** mode (particularly maps that contain a large amount of submaps). This option is disabled by default.

**Note:**
You must close and reopen the map to see the effects of enabling/disabling this option.

**DITA Maps Manager section**

**Prefer using the navigation title for rendering topic references**
If selected and there is a `@navtitle` attribute set on a `<topicref>`, then the `@navtitle` is used to render the title of the topic in the **DITA Maps Manager** *(on page 1762).*

**Allow referenced submaps to be edited**
If selected, all DITA maps referenced directly or indirectly in a DITA map that is open in the **DITA Maps Manager** view will be fully editable. You will be able to add new topic references, modify properties, and move topic references from one submap to another. Saving the main DITA map will also save the contents of the modified submaps.

**Attention:**
The documents must be reopened to apply a change to this option.

**Local files only**
If selected, only submaps that are located on local disk drives will be editable. As for maps located in remote locations (e.g. content management systems), the save operation might not work on all submaps. This checkbox is selected by default.

**Inserting Topic References section**

**Always set values for the following attributes**
Allows you to specify that when inserting a topic reference (using the **Insert Reference** dialog box *(on page 1786)* and **Edit Properties** dialog box *(on page 1797)*), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.
• **Type** - If selected, the @type attribute will always be automatically populated with a detected value.

• **Navigation title** - If selected, the @navtitle attribute will always be automatically populated with a detected value.

**Use the file name as the value of the "keys" attribute**

If selected, when inserting a topic reference into a map, the file name will be used as the value of the @keys attribute for the new <topicref>. This option has a slightly different effect depending on the method used for inserting the topic reference:

• **Drag/Drop or Copy/Paste in the DITA Maps Manager** - If you drag or copy a resource from another view (or outside Oxygen XML Author Eclipse plugin) and drop or paste it into the DITA Maps Manager and a key is already defined for that resource, a @keyref attribute will be inserted instead. This even works for two consecutive drag/drop or copy/paste operations without saving the file and it works for multiple selections of topic references.

• **Drag/Drop or Copy/Paste in a Map opened in Author Mode** - If you drag or copy a resource from another view (or outside Oxygen XML Author Eclipse plugin) and drop or paste it into a map that is open in Author mode, and a key is already defined for that resource, a @keyref attribute will be inserted instead.

**Restriction:**

In this particular scenario, if you perform two identical, consecutive drag/drop or copy/paste operations without saving the file between operations, the value of the @keys attribute will be the same for both inserted topic references. The workaround for this limitation is to simply save the map after each drag/drop or copy/paste operation.

• **Using the Fast Create Topics or Duplicate Actions** - If you use the Fast Create Topics feature (on page 1829) or Duplicate action (on page 1826) to insert topic references, the newly created <topicref> elements will contain the @keys attribute with its value set depending on the file name.

• **Using the Insert Topic Reference Dialog Box from the DITA Maps Manager** - If you use an action in the DITA Maps Manager to insert topic references (e.g. Append Child > Reference), a @keys attribute will be set for each inserted topic reference and the value depends on the file name. You can see the value in the Define keys field from the Keys tab of the Insert Reference dialog box (on page 1786) and you can change it.

**Note:**

This option also has an effect on image references. When inserting a reference to an image in a DITA map and this option is selected, a <keydef> element is created if it is allowed by the schema. If it is not allowed (or this option is deselected), a specific
A topic reference element is created with the value of the `@processing-role` attribute set to `resource-only`.

## DITA Publishing Preferences

To access the DITA Publishing preferences page, open the Preferences dialog box (on page 61) and go to DITA > Publishing. You can also open this page by clicking the Configure Publishing Templates Gallery link in the Templates tab of the transformation scenario dialog box for WebHelp Responsive transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the Templates tab of the transformation scenario dialog box, along with all the built-in templates.

## DITA New Topics Preferences

To access the DITA New Topics preferences page, open the Preferences dialog box (on page 61) and go to DITA > New Topics. This preferences page includes the following options:

### New Topics section

**Use the title to generate the file name**

This option (and its sub-options) pertain to the rules that will be used to generate file names in the New DITA File dialog box (on page 1826). Select this option to use the text entered in the Title field to automatically generate a file name (the generated name can be seen in the Save as field). By default, the generated name will replace spaces with underscores (_), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

**Replace non-alphanumeric characters with**

If selected, the file name generation mechanism will replace all non-alphanumeric characters in the title with the character entered in this option.

**Lower case only**

If selected, the file name generation mechanism will only use lower case letters.

**Use camel case**

If selected, the file name generation mechanism will convert the title to a file name using the camel case convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, `myFileName`).

**Upper case first letter**
Select this option if you want the file name generation mechanism to convert the title to a file name using the camel case convention but with an upper case letter for the first word (for example, MyFileName).

**Use the file name as the value of the root ID attribute**

If selected, when creating a new topic, the file name (as seen in the Save as field but without the file extension) will be used as the value of the root \@id attribute for the new topic.

**Inserting Links section**

**Always set values for the following attributes**

Allows you to specify that when a link reference is inserted (using actions in the Link drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the @format attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the @scope attribute will always be automatically populated with a detected value.
- **Type** - If selected, the @type attribute will always be automatically populated with a detected value.

**Use "." instead of the ID of the parent topic (DITA 1.3)**

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with "." (#./elementId). For more information, see https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html.

**Document Templates Preferences**

Oxygen XML Author Eclipse plugin provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the New Document wizard (on page 221) when you create a new document (New toolbar button or File > New > New from Templates).

You can also create your own templates (on page 228) and share them with others. You can store your custom document templates in the existing templates folder in the Oxygen XML Author Eclipse plugin installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this Document Templates preferences page to add that directory to the list of template directories that Oxygen XML Author Eclipse plugin makes available in the New Document wizard.

To add a template directory, follow these steps:
1. open the **Preferences** dialog box *(on page 61)* and go to **Document Templates**.
2. Use the ❌ New button to select a location of the new document template folder.
3. You can also use the Edit or Delete buttons to manage folders in the list, and you can alter the order that Oxygen XML Author Eclipse plugin looks in these directories by using the Up and Down buttons.

**Result:** This will add the folder to the list in this preferences page and it will now appear in the **New from templates wizard (on page 228)** in a category based upon the folder path you specified.

**Note:**
For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template *(on page 230)*, you need to set the type property to dita in the corresponding properties file.

---

### Document Type Association Preferences

Oxygen XML Author Eclipse plugin uses document type associations *(on page 2079)* to associate a document type *(on page 646)* with a set of functionality provided by a framework *(on page 2080)*. To configure the Document Type Association options, open the **Preferences** dialog box *(on page 61)* and go to Document Type Association.

The following actions are available in this preferences page:

- **Discover more frameworks by using add-ons update sites**
  Click on this link to specify URLs for framework add-on update sites.

- **Document Type Table**
  This table presents the currently defined frameworks *(on page 2080)* (document type associations *(on page 2079)*), sorted by priority and alphabetically. Each edited document type has a set of association rules *(on page 83)* (used by the application to detect the proper document type association to use for an open XML document).

- **New**
  Opens a **Document type configuration dialog box (on page 81)** that allows you to add a new framework.

- **Edit**
  Opens a **Document type configuration dialog box (on page 81)** that allows you to edit an existing framework.

**Note:**
If you try to edit an existing framework when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

- **Duplicate**
Opens a Document type configuration dialog box (on page 81) that allows you to duplicate the configuration of an existing framework. This will create a snapshot of the framework in its current form. It is merely a copy of the document type and will not evolve along with the base document type as the Extend action does.

**Extend**

Opens a Document type configuration dialog box (on page 81) that allows you to extend an existing framework. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

**Delete**

Deletes the selected framework (document type).

**Enable DTD/XML Schema processing in document type detection**

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the @DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Author Eclipse plugin to correctly match the DITA customization.

**Only for local DTDs/XML Schemas**

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

**Enable DTD/XML Schema caching**

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

**Related information**

Sharing a Framework (on page 1584)

**Locations Preferences**

Oxygen XML Author Eclipse plugin allows you to change the location where frameworks (on page 2080) (document types) are stored, and to specify additional framework directories. The Locations preferences page allows you to specify the main frameworks folder location. You can choose between the Default directory ({OXYGEN_INSTALL_DIR}/frameworks) or a Custom specified directory. You can also change the current frameworks folder location value using the com.oxygenxml.editor.frameworks.url system property.
A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the Add, Edit and Delete buttons to manage the list of folders.

A document type configuration (framework) can be loaded from the following locations:

- **Internal preferences** - The document type configuration is stored in the application [Internal preferences](on page 82).
- **Additional framework directories** - The document type configuration is loaded from one of the specified Additional frameworks directories list.
- **The frameworks folder** - The main folder containing framework configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

**Document Type Configuration Dialog Box**

The Document Type Configuration dialog box allows you to create or edit a framework (on page 2080) (document type). It is displayed when you use the New, Edit, Duplicate, or Extend buttons in the Document Type Association preferences page (on page 79) (open the Preferences dialog box (on page 61) and go to Document Type Association).

![Figure 20. Document Type Configuration Dialog Box](image)

The configuration dialog box includes the following fields and sections:

- **Name**
The name of the framework. This will be displayed as its name in the Document Type column in the Document Type Association preferences page (on page 79).

Priority

Depending on the priority level, Oxygen XML Author Eclipse plugin establishes the order that the existing frameworks are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for frameworks you want to be evaluated first.

Note:
The built-in document types are set to Low priority by default. Frameworks that have the same priority are sorted alphabetically.

Description

The document type description displayed as a tooltip in the Document Type Association preferences page (on page 79).

Storage

The location where the framework is saved. If you select the External storage option, the framework is saved in a specified file with a mandatory extension (located in a subdirectory of your current framework directory. If you select the Internal storage option, the framework configuration data is saved in the Oxygen XML Author Eclipse plugin internal options file.

Initial edit mode

Sets the default edit mode when you open a document for the first time: Editor specific, Text, Author, Grid and Design (available only for the W3C XML Schema editor). If the Editor specific option is selected, the initial editing mode is determined based upon the document type. You can find the mapping between editors and edit modes in the Edit modes preferences page. You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the Author mode, you can set it in the Initial edit mode combo box.

Note:
You can also customize the initial mode for a document type in the Edit modes preferences page. Open the Preferences dialog box (on page 61) and go to Editor > Edit modes.

Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the framework.
Related information
Creating and Configuring Custom Frameworks (on page 1430)
Sharing a Framework (on page 1584)
Localizing Frameworks (on page 1526)

Association Rules Tab

To open the Association Rules tab of the Document type configuration dialog box, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), and click on the Association Rules tab.

In the Association rules tab, you can perform the following actions:

- **New**
  - Opens the Document type rule dialog box allowing you to create association rules.

- **Edit**
  - Opens the Document type rule dialog box allowing you to edit the properties of the currently selected association rule.

- **Delete**
  - Deletes the currently selected association rules from the list.

- **Move Up**
  - Moves the selected association rule up one spot in the list.

- **Move Down**
  - Moves the selected association rule down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Author Eclipse plugin to identify the type of a document. Oxygen XML Author Eclipse plugin identifies the type of a document when the document matches at least one of the association rules. This tab gives you access to a Document type rule dialog box that you can use to create association rules that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the + New button at the bottom of the Association Rules tab, or to edit an existing rule, click the Edit button.
Figure 21. Document Type Rule Dialog Box

The Document type rule dialog box includes the following fields and options:

**Namespace**

Specifies the namespace of the root element from the association rules set (* (any) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the ANY_VALUE string).

**Root local name**

Specifies the local name of the root element (* (any) by default).

**File name**

Specifies the name of the file (* (any) by default).

**Public ID**

Represents the Public ID of the matched document.

**Attribute Local name**

Specifies the local name of the attributes for the root element (* (any) by default).

**Attribute Namespace**

Specifies the namespace of the attributes for the root element (* (any) by default).

**Attribute Value**

Specifies the value of the attributes for the root element (* (any) by default).

**Java class**

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.
Tip:
You can use wildcards ( ? and * ) or editor variables ( on page 199 ) in the Document Type Rule dialog box, and you can enter multiple values by separating them with a comma.

Schema Tab

In the Schema tab, you can specify a default schema for Oxygen XML Author Eclipse plugin to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the Schema tab of the Document type configuration dialog box, open the Preferences dialog box ( on page 61 ), go to Document Type Association, use the New, Edit, Duplicate, or Extend button ( on page 79 ), and click on the Schema tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

- **Schema type**
  Use this drop-down list to select the type of schema.

- **Schema URI**
  You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables ( on page 199 ) button, or the browsing actions in the Browse drop-down list.

Tip:
It is a good practice to store all resources in the framework directory and use the ${framework} editor variable ( on page 205 ) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The Classpath tab displays a list of folders and JAR ( on page 2080 ) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework ( on page 2080 ) translation files. Oxygen XML Author Eclipse plugin loads the resources looking in the folders in the order they appear in the list.

To open the Classpath tab of the Document type configuration dialog box, open the Preferences dialog box ( on page 61 ), go to Document Type Association, use the New, Edit, Duplicate, or Extend button ( on page 79 ), and click on the Classpath tab.

The Classpath tab includes the following actions:

- New
Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.

**Tip:**
The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

**Edit**

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.

**Tip:**
The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

**Delete**

Deletes the currently selected resource from the list.

**Move Up**

Moves the selected resource up one spot in the list.

**Move Down**

Moves the selected resource down one spot in the list.

**Related information**

- Extensions Tab *(on page 108)*
- Author Tab *(on page 86)*
- Localizing Frameworks *(on page 1526)*

**Author Tab**

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding **framework** *(on page 2080)*-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, open the Preferences dialog box *(on page 61)*, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button *(on page 79)*, and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.
CSS Subtab

The CSS subtab contains the CSS files that Oxygen XML Author Eclipse plugin uses to render a document in the Author mode. In this subtab, you can set main and alternate CSS files. When you are editing a document in the Author mode, you can switch between these CSS files from the Styles drop-down menu on the Author Styles toolbar.

To open the CSS subtab, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the CSS subtab.

The following actions are available in the CSS subtab:

- **New**
  
  Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

- **Edit**
  
  Opens a dialog box that allows you to edit the current selection.

- **Delete**
  
  Deletes the currently selected CSS file.

- **Move Up**
  
  Moves the selected CSS file up in the list.

- **Move Down**
  
  Moves the selected CSS file down in the list.

**Enable multiple selection of alternate CSSs**

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

**If there are CSSs specified in the document then**

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.

- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.
Actions Subtab

The Actions subtab of the Document Type Configuration dialog box contains a sortable table with all the Author mode actions that are configured for the specific framework (on page 2080). Each action has a unique ID, a name, a description, and a shortcut key.

To open the Actions subtab, open the Preferences dialog box (on page 61), go to Document Type Association, select your framework, use the Duplicate or Extend button to create an extension of the framework (or the Edit button for an already extended framework), click on the Author tab, and then the Actions subtab.

The following features are available in this subtab:

Export existing actions ( tồ )

It is possible to export existing actions to use them in other frameworks. Each exported action is extracted from the framework configuration file and exported as an individual XML file.

To export actions, the Storage option (on page 82) in the top part of the Document Type Configuration dialog box must be set to External and the external location must be a subdirectory of your current framework directory.

The Export action is found by right-clicking an action or a selection of multiple actions (the Export button is also located below the table of actions). If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have _externalAuthorActions at the end of the folder name) inside your current framework directory.

Result: Exported actions will display the icon in the first column in the table.

Important:
The newly created files for the exported actions will not appear on disk until you click OK several times to confirm your changes and exit the Preferences dialog box.

Tip:
If you want to create a new XML file for an action, there is a document template called Author Actions in the New from templates wizard (on page 228) to help you get started.
Note:
You can add or edit the action files outside of Oxygen XML Author Eclipse plugin, but you will need to restart the application each time to reload the changes.

For more information, see Creating or Editing Actions Using an Individual XML File for Each Action (on page 1446).

Open in editor (↵)

For exported actions, there is a Open in editor action in the contextual menu that will open the XML file for that action in the main editor.

Create a new action (➕)

Use the New button (located underneath the table of actions) to open the Action dialog box (on page 89) where you can configure a new action.

Duplicate an existing action (↵)

Use the Duplicate action (found in the contextual menu and underneath the table of actions) to duplicate the selected action.

Edit an existing action (↵)

Use the Edit button (found in the contextual menu and underneath the table of actions) to open the Action dialog box (on page 89) where you can edit the selected action.

Delete an existing action (✖)

Use the Delete button (found in the contextual menu and underneath the table of actions) to delete the selected action.

Author Action Dialog Box

To edit an existing document type action or create a new one, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the Actions subtab. At the bottom of this subtab, click New to create a new action, or Edit to modify an existing one.
Figure 22. Action Dialog Box

The following options are available in the Action dialog box:

**ID**

Specifies a unique action identifier.

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

**Tip:**

You can use the $\{i18n('key')\} editor variable (on page 206) to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the letter in the name of the action that can be used to access the action.

**Description**

A description of the action. This description is displayed as a tooltip when hovering over the action.
Tip:
You can use the ${i18n('key')} editor variable (on page 206) to allow for multiple translations of the description.

How to translate frameworks link
Use this link to see more information about Localizing Frameworks (on page 1526).

Large icon
Allows you to select an image for the icon that Oxygen XML Author Eclipse plugin uses for the toolbar action.

Tip:
A good practice is to store the image files inside the framework directory and use the ${frameworks} editor variable (on page 206) to make the image relative to the framework location. If the images are bundled in a jar archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the class-path.

Small icon
Allows you to select an image for the icon that Oxygen XML Author Eclipse plugin uses for the contextual menu action.

Note:
If you are using a Retina or HiDPI display, Oxygen XML Author Eclipse plugin automatically searches for higher resolution icons in the path specified in both the Large icon and Small icon options. For more information, see Using Retina/HiDPI Icons for the Actions from a Framework (on page 1478).

Shortcut key
This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

Enable platform-independent shortcut keys
If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- M1 represents the Command key on macOS, and the Ctrl key on other platforms.
- M2 represents the Shift key.
- M3 represents the Option key on macOS, and the Alt key on other platforms.
- M4 represents the Ctrl key on macOS, and is undefined on other platforms.
Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: Controlling Which Author Operations Gets Executed Through XPath Expressions *(on page 93).*

The following options are available in this section:

**Activation XPath**

An XPath 2.0 expression that applies to elements and attributes. For more details see: Controlling Which Author Operations Gets Executed Through XPath Expressions *(on page 93).*

**Operation**

Specifies the invoked operation that can be a default operation *(on page 1449)* or a custom operation *(on page 1475).*

**Arguments**

Specifies the arguments of the invoked operation. The **Edit** at the bottom of the table allows you to edit the arguments of the operation.

**Operation priority**

 Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

- **Add** - Adds an operation.
- **Remove** - Removes an operation.
- **Duplicate** - Duplicates an operation.

**Evaluate activation XPath expressions even in read-only contexts**

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

**Related information**

Localizing Frameworks *(on page 1526)*
Controlling Which Author Operations Gets Executed Through XPath Expressions

An Author mode action can have multiple operation modes, each one invoking an Author operation (on page 1449) with certain configured parameters. Each operation mode has an XPath 2.0 expression for activating it.

For each operation mode of an action, the application will check if the XPath expression is fulfilled (when it returns a non-empty node set or a true result). Only the first operation whose XPath operation is fulfilled will be executed.

The following special XPath extension functions are provided:

- **oxy:allows-child-element()** (on page 93) - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- **oxy:allows-global-element()** (on page 95) - Use this function to check whether or not an element is a valid global element for the current framework (on page 2080), according to the associated schema.
- **oxy:current-selected-element()** (on page 96) - Use this function to get the currently selected element.
- **oxy:selected-elements()** (on page 97) - Use this function to get the selected elements.
- **oxy:is-required-element()** (on page 97) - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).
- **oxy:platform()** (on page 97) - Use this function to get the current platform in cases where you want to enable or disable an action depending on the platform. Possible values include: eclipse, standalone and webapp.

**oxy:allows-child-element() Function**

The oxy:allows-child-element() function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```
oxyl:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?)?)
```

The following parameters are supported:

- **$childName**
  
The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:
  
  - The child element with the specified local name that belongs to the default namespace.
    ```
oxyl:allows-child-element("para")
```
    The above example verifies if the `<para>` element (of the default namespace) is allowed in the current context.
  
  - The child element with the local name specified by any namespace.
The above example verifies if the `<para>` element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

  `oxy:allows-child-element("prefix:para")`

  The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

  `oxy:allows-child-element("{namespaceURI}para")`

  The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current context.

- Any element.

  `oxy:allows-child-element(*)`

  The above function verifies if any element is allowed in the current context.

**Note:**
A common use case of `oxy:allows-child-element(*)` is in combination with the `attributeName` parameter.

**attributeName**

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

  `oxy:allows-child-element("", "class", " topic/topic ")`

  The above example verifies if an element with the `@class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

  `oxy:allows-child-element("", "*:localname", " topic/topic ")`

- A qualified name of an attribute.
oxy:allows-child-element("*", "prefix:localname", "topic/topic")

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of false.

**defaultAttributeValue**

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

**contains**

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

**oxy:allows-global-element() Function**

The oxy:allows-global-element() function allows you to check whether or not an element that matches the arguments of the function is valid for the current framework (on page 2080), according to the associated schema. It has the following signature:

oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains)?)

The following parameters are supported:

**elementName**

The name of the element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.
  
  oxy:allows-global-element("para")

  The above example verifies if the <para> element (of the default namespace) is allowed in the current framework.

- The element with the local name specified by any namespace.
  
  oxy:allows-global-element("*:para")

  The above example verifies if the <para> element (of any namespace) is allowed in the current framework.

- A prefix-qualified name of an element.
  
  oxy:allows-global-element("prefix:para")

  The prefix is resolved in the context of the framework. The function matches on the element with the para local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.
• A specified namespace-URI-qualified name of an element.

\[
\text{oxy:allows-global-element}("\textit{\{namespaceURI\}para}"
\]

The namespaceURI is the namespace of the element. The above example verifies if the <para> element (of the specified namespace) is allowed in the current framework.

• Any element.

\[
\text{oxy:allows-global-element}(\ast)
\]

The above function verifies if any element is allowed in the current framework.

attributeName

The attribute of an element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

• The attribute with the specified name from no namespace.

\[
\text{oxy:allows-global-element}(\ast, \textit{class}, \ast\textit{topic/topic})
\]

The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current framework.

• The attribute with the local name specified by any namespace.

\[
\text{oxy:allows-global-element}(\ast, \textit{*:localname}, \ast\textit{topic/topic})
\]

• A qualified name of an attribute.

\[
\text{oxy:allows-global-element}(\ast, \textit{prefix:localname}, \ast\textit{topic/topic})
\]

The prefix is resolved in the context of the framework. If the prefix is not resolved to a namespace, the function returns a value of false.

defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

Example: oxy:current-selected-element Function
This example returns the `<b>` elements that are children of the currently selected `<p>` element.

**oxy:current-selected-element()**

This example returns the currently selected element.

**oxy:selected-elements()** Function

This function returns the selected elements from **Author** mode.

**Example: oxy:selected-elements Function**

    oxy:selected-elements()[self::para][@audience="novice"]

This example would activate an action when at least one of the selected elements is a `<para>` element with the `@novice` attribute defined.

**oxy:is-required-element()** Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

**Example: oxy:is-required-element Function**

    oxy:is-required-element(.)

This example would check to see if the current element is required by the schema.

**oxy:is-editable-element()** Function

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an `xi:include` section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

**Example: oxy:is-editable-element Function**

    oxy:is-editable-element(ancestor-or-self::table)

This example would return `true` if the cursor is placed inside a table and it is editable or `false` if it is not editable.

**oxy:platform()** Function

This function returns the current platform. You can use this if you want to enable or disable an action depending on the platform. The possible values are: **standalone**, **eclipse**, or **webapp**.

**Example: oxy:platform Function**

    oxy:platform()="standalone"
This example would keep the action activated for the standalone distribution of Oxygen XML Author Eclipse plugin, but disable it for the Eclipse and Web Author distributions.

**Menu Subtab**

In the Menu subtab, you can configure which actions will appear in the framework-specific menu. The subtab is divided into two sections: Available actions and Current actions.

To open the Menu subtab, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the Menu subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Author Eclipse plugin menu. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an image in this section as a child of the currently selected action, use the Add as child button.

The following actions are available in the Current actions section:

- **Edit**
  - Edits an item.

- **Remove**
  - Removes an item.

- **Move Up**
  - Moves an item up.

- **Move Down**
  - Moves an item down.

**Contextual Menu Subtab**

In the Contextual menu subtab you configure what framework-specific action the Content Completion Assistant (on page 2078) proposes. The subtab is divided into two sections: Available actions and Current actions.

To open the Contextual Menu subtab, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the Contextual Menu subtab.
The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

- **Add as sibling**
  
  Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

- **Add as child**
  
  Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

- **Edit**
  
  This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

The following options are available in this dialog box:

**Name**
Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

**Tip:**
You can use the `$(i18n('key'))` editor variable (on page 206) to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the letter in the name of the action that can be used to access the action.

**Menu icon**

Allows you to select an image for the icon that Oxygen XML Author Eclipse plugin uses for the container (submenu).

**Promote items when in a table context**

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the Other actions submenu when invoking the contextual menu within a table.

**Remove**

Removes the selected action or submenu from the Current actions section.

**Move Up**

Moves the selected item up in the list.

**Move Down**

Moves the selected item down in the list.

**Toolbar Subtab**

In the Toolbar subtab you configure what framework (on page 2080)-specific action the Oxygen XML Author Eclipse plugin toolbar holds. The subtab is divided into two sections: Available actions and Current actions.

To open the Toolbar subtab, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the Toolbar subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Author Eclipse plugin toolbar when you work with a document belonging to the edited framework. To add
an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an action in this section as a child of the currently selected action, use the Add as child button.

The following actions are available in the Current actions section:

- **Edit**
  Edits an item.

- **Remove**
  Removes an item.

- **Move Up**
  Moves an item up.

- **Move Down**
  Moves an item down.

**Content Completion Subtab**

In the Content Completion subtab you configure what framework (on page 2080)-specific the Content Completion Assistant (on page 2078) proposes. The subtab is divided into two sections: Available actions and Current actions.

To open the Content Completion subtab, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), click on the Author tab, and then the Content Completion subtab.

**Available and Current Actions**

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that the Content Completion Assistant proposes when you work with a document that belongs to the edited framework.

To add the selected available action as a sibling of the currently selected action in the Current actions section, use the Add as sibling button. To add it as a child of the currently selected action, use the Add as child button. To edit an existing action, select it and use the Edit button. To remove an existing action, use the Remove button. You can also move items up and down the list using the Move Up or Move Down buttons.

Adding an action (or editing an existing one) opens the Content Completion Item dialog box.
Use this dialog box to configure the action:

**Action**
Displays the name of the selected action.

**Display name**
You can use the drop-down menu to choose between displaying the action name or the replaced element name, or you can enter another name to be displayed.

**Replacement for**
Use this section to replace an existing element with the configured action:

- **Element name** and **Namespace** - The name (and namespace, if needed) of the replaced element. The original element no longer needs to be excluded using the Filter - Remove content completion items table (on page 103).
- **Display item only when element is allowed at cursor** - The configured action is contributed in the UI components selected in the Contribute to section only if the associated schema allows the original element at the current location in the document. This is equivalent to defining activation XPaths in the Author Action dialog box (on page 89) using the oxy:allows-child-element() XPath extension function. Activation XPaths for the action are still checked when the action is invoked.

**Contribute to**
Use this section to specify where to display the configured item in the interface:
• **Content Completion Window** - The configured item will appear in the *Content Completion Assistant* (on page 2078).

• **Elements View** - The configured item will appear in the *Elements view* (on page 306).

• **Element Insert Menus** - The configured item will appear in the *Append Child*, *Insert Before*, or *Insert After* menus that are available in certain contextual menus (for example, the contextual menu of the *Outline view* (on page 299)).

**Filter Table**

The *Filter* section presents a table that allows you to add elements to be filtered from the *Content Completion Assistant* or from some specific helper views or menus. Use the ✦ Add button to add more filters to the table, the ✂ Edit button to modify an existing item in the table, or the ✗ Remove button to remove a filtered item.

The ✦ Add and ✂ Edit buttons open a *Remove item* dialog box.

**Figure 26. Remove Item Dialog Box**

![Remove Item Dialog Box](image)

Use this dialog box to add or configure the elements that will be filtered:

**Item name**

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered:

- **<SPLIT> [elementName]** - Filters split entries for elements that have the form *Split elementName* or *New elementName*.
- **<SPLIT>** - Filters split entries for all elements.
- **<ENTER>** - Filters *Insert New Line* entries that appear in elements where whitespace is significant.

The filter list can be used to remove only content completion items contributed by the schema associated to the document and it does not remove actions added to the content completion list via the framework configuration. The element name specified in the filter is not namespace aware, it matches the name of the element defined in the associated schema exactly as it would appear rendered in the content completion window.
Note:
If you try to insert an element in an invalid position (for example, using the content completion assistant), the editor will attempt to make the insertion valid. This may mean finding an alternate position for the insertion or splitting the element at the current position. If a `<SPLIT>` entry is added in the filter list for an element, the editor will never split that element.

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the Content Completion Assistant (on page 2078).
- **Element Insert Menus** - The element will not appear in the Append Child, Insert Before, or Insert After menus that are available in certain contextual menus (for example, the contextual menu of the Outline view (on page 299)).
- **Entities View** - The element will not appear in the Entities view (on page 307).

Related information

Customizing the Content Completion Assistant Using a Configuration File (on page 1488)

Templates Tab

The Templates tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the New from templates wizard (on page 228) inside the Framework templates category according to your framework and the directory path you specify in this tab.

To open the Templates tab of the Document type configuration dialog box, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), and click on the Templates tab.

The Templates tab includes the following actions:

+ **New**

  Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.
Tip:
The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the templates directory.

Edit
Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Tip:
The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the templates directory.

Delete
Deletes the currently selected template directory from the list.

Move Up
Moves the selected template directory up one spot in the list.

Move Down
Moves the selected template directory down one spot in the list.

Related information
Creating New Document Templates (on page 228)
Customizing Document Templates (on page 230)
Sharing Custom Document Templates (on page 234)

Catalogs Tab
The Catalogs tab specifies a list of XML Catalogs (on page 567), specifically for the edited framework (on page 2080), that are added to list of catalogs that Oxygen XML Author Eclipse plugin uses to resolve resources.

To open the Catalogs tab of the Document type configuration dialog box, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), and click on the Catalogs tab.

You can perform the following actions:

Add
Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

- **Edit**
  
  Opens a dialog box that allows you to edit the path of an existing catalog.

- **Delete**
  
  Deletes the currently selected catalog from the list.

- **Move Up**
  
  Moves the selected catalog up one spot in the list.

- **Move Down**
  
  Moves the selected catalog down one spot in the list.

## Transformation Tab

In the Transformation tab, you can configure the transformation scenarios associated with the particular framework (on page 2080) you are editing. These transformation scenarios are presented in the Configure Transformation Scenarios dialog box (on page 898) when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the Transformation tab of the Document type configuration dialog box, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), and click on the Transformation tab.

The Transformation tab offers the following options:

- **Default checkbox**
  
  You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the Configure Transformation Scenarios dialog box (on page 898).

- **New**
  
  Opens the New scenario dialog box allowing you to create a new transformation scenario for the particular document type (on page 816).

- **Duplicate**
  
  Allows you to duplicate the configuration of an existing transformation scenario. It opens the Edit scenario dialog box where you can configure the properties of the duplicated scenario (on page 896).

- **Edit**
Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected transformation scenario (on page 894).

Delete
Delete the currently selected transformation scenario.

Import scenarios
Imports transformation scenarios.

Export selected scenarios
Export transformation scenarios.

Move Up
Moves the selection to the previous scenario.

Move Down
Moves the selection to the next scenario.

Validation Tab

In the Validation tab, you can configure the validation scenarios associated with the particular framework (on page 2080) you are editing. These validation scenarios are presented in the Configure Validation Scenarios dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

Note:
If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using 'Main Files' Support (on page 252) or Modular Contextual XML Editing Using 'Main Files' Support (on page 570).

To open the Validation tab of the Document type configuration dialog box, open the Preferences dialog box (on page 61), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 79), and click on the Validation tab.

The Validation tab offers the following options:

Default checkbox
You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the Configure Validation Scenarios dialog box.

New
Opens the **New scenario** dialog box allowing you to create a new validation scenario *(on page 531).*

**Duplicate**

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario *(on page 541).*

**Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected validation scenario *(on page 541).*

**Delete**

Deletes the currently selected validation scenario.

**Import scenarios**

Imports validation scenarios.

**Export selected scenarios**

Exports validation scenarios.

**Move Up**

Moves the selected scenario up one spot in the list.

**Move Down**

Moves the selected scenario down one spot in the list.

### Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box *(on page 61)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 79)*, and click on the **Extensions** tab.

Libraries containing the implementations must be present in the *classpath*(on page 85) of your document type. The Javadoc available at [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/) contains details about how each API implementation functions.

### Editor Preferences

Oxygen XML Author Eclipse plugin offers the possibility to configure the appearance of various components and features of the main editor. To access these options, open the **Preferences** dialog box *(on page 61)* and go to **Editor** (or right-click in the editor window and choose **Preferences**).

The following options are available:
Editor background

Allows you to set the background color for text editors.

Completion proposal background

Allows you to set the background color of the Content Completion Assistant (on page 2078).

Completion proposal foreground

Allows you to set the color of the text in the Content Completion Assistant (on page 2078).

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the Content Completion Assistant (on page 2078).

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the Content Completion Assistant (on page 2078).

Line wrap

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use new-line characters to break long lines.

Enable folding when opening a new editor

If selected (default value), the vertical stripe that holds the folding markers (on page 289) is displayed in Text mode.

Beep on operation finished

Oxygen XML Author Eclipse plugin emits a short beep when a validation, check well-formedness, or transformation action has ended.

Note:

When the validation or the transformation process of a document is successful, the beep signal has a higher audio frequency, as opposed to when the validation fails, and the beep signal has a lower audio frequency. On the Windows platform, for other operations, the default system sound (Asterisk) is used. You can configure it by changing the sound theme.

Display quick-assist and quick-fix side hints

Displays the Quick Assist (on page 2083) icon (qrst) and Quick Fix (on page 2083) icon (qrst) in the line number stripe on the left side of the editor.

Highlight matching tag

If you place the cursor on a start or end tag, Oxygen XML Author Eclipse plugin highlights the corresponding member of the pair.
Tip:
You can configure the colors and how various types of highlights are shown from the Eclipse Annotations preferences page (Window (Eclipse on macOSX) > Preferences > General > Editors > Text Editors > Annotations).

Minimum fold range
You can specify the minimum number of lines in a block that will have the folding (on page 2080) support become active. If you modify this value, the change takes effect next time you open the editor.

Content Completion Preferences
Oxygen XML Author Eclipse plugin provides a Content Completion Assistant (on page 2078) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the Content Completion preferences, open the Preferences dialog box (on page 61) and go to Editor > Content Completion. These options control how the Content Completion Assistant works.

The following options are available:

Auto close the last opened tag
When selected, Oxygen XML Author Eclipse plugin automatically closes the last open tag when you type </.

Automatically rename/delete/comment matching tags
If you rename, delete, or comment out a start tag, Oxygen XML Author Eclipse plugin automatically renames, deletes, or comments out the matching end tag.

Note:
If you select Toggle comment for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion
Toggles the content completion feature on or off.

Consider subsequent sibling elements
When this option is selected (default), the subsequent sibling elements of the current element are taken into account when using the Content Completion Assistant. For example, in DITA, if you invoke the content completion before an already inserted required element (e.g. a title element), the content completion mechanism will not offer a proposal to insert a title (since it was already inserted).

Close the inserted element
When you choose an entry from the Content Completion Assistant list of proposals, Oxygen XML Author Eclipse plugin inserts both start and end tags. The following additional options are available with regard to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Author Eclipse plugin inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document (on page 557).
  - **Add optional content** - If selected, Oxygen XML Author Eclipse plugin inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
  - **Add first Choice particle** - If selected, Oxygen XML Author Eclipse plugin inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.

**Case sensitive search**

When selected, the search in the Content Completion Assistant is case-sensitive when you type a character (‘a’ and ‘A’ are different characters).

![Note:]

This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

**Position cursor between tags**

When selected, Oxygen XML Author Eclipse plugin automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the Insert the required attributes option (on page 111) is not selected.

**Show all entities**

Oxygen XML Author Eclipse plugin displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

**Insert the required attributes**

Oxygen XML Author Eclipse plugin inserts automatically the required attributes taken from the DTD or XML Schema.

**Insert the fixed attributes**

If selected, Oxygen XML Author Eclipse plugin automatically inserts any `FIXED` attributes from the DTD or XML Schema for an element inserted with the help of the Content Completion Assistant.
Show recently used items

When selected, Oxygen XML Author Eclipse plugin remembers the last inserted items from the Content Completion Assistant window. The number of items to be remembered is limited by the Maximum number of recent items shown list box. These most frequently used items are displayed on the top of the content completion window and their icons are decorated with a small red square.

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the Content Completion Assistant window.

Learn attributes values

When selected, Oxygen XML Author Eclipse plugin learns the attribute values used in a document.

Learn on open document

Oxygen XML Author Eclipse plugin automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on Ctrl+Space (Command+Space on macOS))

When selected, Oxygen XML Author Eclipse plugin learns the typed words and makes them available in a content completion fashion by pressing Ctrl + Space (Command + Space on macOS) on your keyboard;

Note:
For the words to be learned, they need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from the last key press until the Content Completion Assistant is displayed.

Related information

Configuring the Proposals for Attribute and Element Values (on page 1497)

Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Author Eclipse plugin can display these annotations when offering content completion suggestions. To configure the Annotations preferences, open the Preferences dialog box (on page 61) and go to Editor > Content Completion > Annotations.

The following options are available:

Show annotations in Content Completion Assistant
If selected, Oxygen XML Author Eclipse plugin displays the schema annotations of an element, attribute, or attribute value currently selected in the Content Completion Assistant (on page 2078) proposals list.

**Show annotations in tooltip**

If selected, Oxygen XML Author Eclipse plugin displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the Elements view (on page 306). If not selected, tooltips are disabled in all modes.

**Show annotation in HTML format, if possible**

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

**Prefer DTD comments that start with "doc:" as annotations**

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Author Eclipse plugin recommends prefixing with the doc: particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Author Eclipse plugin uses the following mechanism to collect annotations:

- If at least one doc: comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc: comment is found in the entire DTD, all comments are considered annotations and displayed as such.

If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

**Use all Relax NG annotations as documentation**

If selected, any element outside the Relax NG namespace, that is http://relaxng.org/ns/structure/1.0, is considered annotation and is displayed in the annotation window next to the Content Completion Assistant (on page 2078) window and in the Model view (on page 304). When this option is not selected, only elements from the Relax NG annotations namespace, that is http://relaxng.org/ns/compatibility/annotations/1.0 are considered annotations.

Related information

Schema Annotations in Text Mode (on page 295)
Code Templates Preferences

Code templates (on page 296) are code fragments that can be inserted at the current editing position. Oxygen XML Author Eclipse plugin includes a set of built-in templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates (on page 297) for any type of file and share them with your colleagues (on page 298) using the template export and import functions.

To configure Code Templates, open the Preferences dialog box (on page 61) and go to Editor > Templates > Code Templates.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the Code template dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 2078). HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the Command key on macOS, and the Ctrl key on other platforms.
  - M2 represents the Shift key.
  - M3 represents the Option key on macOS, and the Alt key on other platforms.
  - M4 represents the Ctrl key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 199) can be used in the text box using the Insert Editor Variables button.

Edit

Opens the Code template dialog box and allows you to edit an existing code template. You can edit the following fields:
• **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 2078). HTML markup can be used for better rendering.

• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
  - M2 represents the **Shift** key.
  - M3 represents the **Option** key on macOS, and the **Alt** key on other platforms.
  - M4 represents the **Ctrl** key on macOS, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 199) can be inserted in the text box using the Insert Editor Variables button.

**Duplicate**

Creates a duplicate of the currently selected code template.

**Delete**

Deletes the currently selected code template. This action is not available for the built-in code templates.

**Export**

Exports a file with code templates.

**Import**

Imports a file with code templates that was created by the Export action.

You can use the following editor variables (on page 199) when you define a code template in the Content text box:

• **${caret}** - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

**Note:**

The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.
Note:
The \${caret} editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use \texttt{AuthorDocumentFilter} and inside the \texttt{insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)} method, use the \texttt{AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)} API on the given fragment.

- \${selection} - The currently selected text content in the currently edited document. This variable can be used in a code template, in \texttt{Author} mode operations, or in a \texttt{selection} plugin.
- \${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value', @id)} - To prompt for values at runtime, use the \texttt{ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')} editor variable. You can set the following parameters:
  - \texttt{message} - The displayed message. Note the quotes that enclose the message.
  - \texttt{default-value} - Optional parameter. Provides a default value.
  - \texttt{@id} - Optional parameter. Used for identifying the variable to reuse the answer using the \$\{answer(@id)\} editor variable.
  - \texttt{type} - Optional parameter (defaults to \texttt{generic}), with one of the following values:

Note:
The title of the dialog box will be determined by the type of parameter and as follows:
- For \texttt{url} and \texttt{relative_url} parameters, the title will be the name of the parameter and the value of the \texttt{message}.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', type, 'default')}</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{generic} (default)</td>
<td>\texttt{Description:} The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td>Example:</td>
<td>${ask('Hello world!')} - The dialog box has a \textit{Hello world!} message displayed.</td>
</tr>
<tr>
<td></td>
<td>${ask('Hello world!', \texttt{generic}, 'Hello again!')} - The dialog box has a \textit{Hello world!} message displayed and the value displayed in the input box is \textit{Hello again!}.</td>
</tr>
<tr>
<td>\texttt{url}</td>
<td>\texttt{Example:}</td>
</tr>
<tr>
<td></td>
<td>${ask('message', url, 'default_value')}</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description:</td>
</tr>
<tr>
<td>-----------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| **relative_url** | Input is considered a URL. Oxygen XML Author Eclipse plugin checks that the provided URL is valid. | ▪ `${ask('Input URL', url)}` - The displayed dialog box has the name *Input URL*. The expected input type is URL.  
▪ `${ask('Input URL', url, 'http://www.example.com')}` - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.  
**Note:**  
If the `$ask` editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Author Eclipse plugin will transform it into an absolute URL.  
▪ `${ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name *File location*. The URL inserted in the input box is made relative to the currently edited document location. |
| **password** | The input is hidden with bullet characters. | ▪ `${ask('Input password', password)}` - The displayed dialog box has the name *Input password* and the input is hidden with bullet symbols.  
▪ `${ask('Input password', password, 'abcd')}` - The displayed dialog box has the name *Input password* and the input hidden with bullet symbols. The input field already contains the default *abcd* value. |
| **combobox** | Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated value (*real_value*). | ▪ `${ask('message', combobox, ('real_value1':'rendered_value1';..;'real_valueN':'rendered_valueN'), 'default')}` |
### Parameter

| Note: | The list of ‘real_value’:’rendered_value’ pairs can be computed using $\{xpath\_eval()\}. |
| Note: | The ‘default’ parameter specifies the default-selected value and can match either a key or a value. |

### Example:

- \$\{ask(‘Operating System’, combobox, (‘win’:’Microsoft Windows’,’macos’:’macOS’,’lnx’:’Linux/UNIX’),’macos’)} - The dialog box has the name ‘Operating System’. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

- \$\{ask(‘Mobile OS’, combobox, (‘ios’:’iOS’,’and’:’Android’) ,’Android’)\}
- \$\{ask(‘Mobile OS’, combobox, $\{xpath\_eval(form $pair in ([‘ios’,’iOS’],[‘and’,’Android’]) return “’” || $pair?1 || “’:” || $pair?2 || “’”; $pair?2 || “’”;\}),’ios’\})

### editable_combobox

| Format: | $\{ask(‘message’, editable_combobox, (‘real\_value1’:’rendered\_value1’;...;’real\_valueN’:’rendered\_valueN’),’default’)\} |
| Description: | Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry. |
| Note: | The list of ‘real_value’:’rendered_value’ pairs can be computed using $\{xpath\_eval()\}. |
Parameter

| Note: | The 'default' parameter specifies the default-selected value and can match either a key or a value. |

Example:

- `${ask('Operating System', editable_combobox, ('win': 'Microsoft Windows'; 'macos': 'macOS'; 'lnx': 'Linux/UNIX'), 'macos')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

- `${ask('Operating System', editable_combobox, (${xpath_eval(for $pair in (["win", 'Microsoft Windows'], ["macos", 'macOS'], ["lnx", 'Linux/UNIX']) return "" || $pair?1 || ":" || $pair?2 || "\"\", "ios")}, 'ios')}`

| radio |
| Format: | `${ask('message', radio, ('real_value1': 'rendered_value1'; ..., 'real_valueN': 'rendered_valueN'), 'default')}` |

| Description: | Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value. |

| Note: | The list of 'real_value': 'rendered_value' pairs can be computed using `${xpath_eval()}`. |

| Note: | The 'default' parameter specifies the default-selected value and can match either a key or a value. |

Example:

- `${ask('Operating System', radio, ('win': 'Microsoft Windows'; 'macos': 'macOS'; 'lnx': 'Linux/UNIX'), 'macos')}` - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.
Parameter

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="note_icon" alt="Note:" /></td>
<td>In this example, macOS is the default-selected value and if selected, it would return macos for the output.</td>
</tr>
</tbody>
</table>

-`${ask('Operating System', radio, (${xpath_eval(for $pair in (["win", 'Microsoft Windows"], ["macos", 'macOS"], ["lnx", 'Linux/UNIX"]) return "" || $pair?1 || "":"" || $pair?2 || ":")))}, 'ios')}`

- **$(timeStamp)** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **$(uuid)** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- **$(id)** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **$(cfn)** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **$(cfne)** - Current file name with extension. The current file is the one currently open and selected.
- **$(cf)** - Current file as file path, that is the absolute file path of the currently edited document.
- **$(cfd)** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **$(frameworksDir)** - The path (as file path) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the Document Type Association > Locations preferences page.
- **$(pd)** - The file path to the folder that contains the current project file (.xpr).
- **$(oxygenInstallDir)** - Oxygen XML Author Eclipse plugin installation folder as file path.
- **$(homeDir)** - The path (as file path) of the user home folder.
- **$(pn)** - Current project name.
- **$(env(VAR_NAME))** - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the $(system(var.name)) editor variable.
- **$(system(var.name))** - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the $(env(VAR_NAME)) editor variable instead.
• $\{date(pattern)\} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note:
This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

Code Templates (on page 296)

XPath Preferences

Oxygen XML Author Eclipse plugin provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the Preferences dialog box (on page 61) and go to Editor > Content Completion > XPath.

The following options are available:

• Enable content completion for XPath expressions - Enables the Content Completion Assistant (on page 2078) in XPath expressions that you enter in the @match, @select, and @test XSL attributes.
  ◦ Include XPath functions - When this option is selected, XPath functions are included in the content completion suggestions.
  ◦ Include XSLT functions - When this option is selected, XSLT functions are included in the content completion suggestions.
  ◦ Include axes - When this option is selected, XSLT axes are included in the content completion suggestions.

• Show signatures of XSLT / XPath functions - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip.

Document Validation Preferences

To configure document validation options, open the Preferences dialog box (on page 61) and go to Editor > Document Validation. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both automatic validation (on page 519) and manual validation (on page 520).
Include problem ID in description

If this option is selected, validation issues listed in the Results view or Problems view will include the problem ID (as provided by the validation engine) in the Description column.

Clear validation markers on close

If this option is selected, all the error markers added in the Problems view for that document are removed when the Oxygen XML Author Eclipse plugin plugin is closed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Author Eclipse plugin.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

Custom Validation Engines Preferences

As the name implies, the Custom Validation Engines preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, open the Preferences dialog box (on page 61) and go to Editor > Document Validation > Custom Validation Engines.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the Custom Validator dialog box displayed by pressing the + New or Edit button.
The **Custom Validator** dialog box allows you to configure the following parameters:

**Name**
Name of the custom validation engine that will be displayed in the *Validation* toolbar dropdown menu.

**Executable path**
Path to the executable file of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.

**Working directory**
The working directory of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.

**Associated editors**
The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

**Command-line arguments for detected schemas**
Command-line arguments used in the commands that validate the currently edited file against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables (on page 199):

- \$\{cf\} - Current file as file path, that is the absolute file path of the currently edited document.
- \$\{currentFileURL\} - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- \$\{ds\} - The path of the detected schema as a local file path for the current validated XML document.
- \$\{dsu\} - The path of the detected schema as a URL for the current validated XML document.

Related information
Editor Variables (on page 199)

Increasing the Stack Size for Validation Engines
To prevent the appearance of a StackOverflowException error, use one of the following methods:

- Use the com.oxygenxml.stack.size.validation.threads property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576.

  Note:
  Increasing the value of the -Xss parameter affects all the threads of the application.

Edit Modes Preferences
Oxygen XML Author Eclipse plugin lets you configure which edit mode (on page 219) a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the Preferences dialog box (on page 61) and go to Editor > Edit Modes.

Allow Document Type specific edit mode setting to override the general mode setting
If selected, the initial edit mode setting set in the Document Type configuration dialog box (on page 81) overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor
This table specifies the default editing mode that will be opened for each type of document when the Allow Document Type specific edit mode setting to override the general mode setting
option is not selected. Use the Edit button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- **Text** (on page 219)
- **Author** (on page 220)
- **Grid** (on page 219)
- **Design** (available only for the XSD editor).

Figure 28. Edit Modes Preferences Page

Author Preferences

Oxygen XML Author Eclipse plugin provides an **Author editing mode** (on page 220) that provides a configurable graphical interface for editing XML documents. To configure the options for the Author mode, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author.

The following options are available:

**Author default background color**

Sets the default background color of the Author editing mode. The background-color property set in the CSS file associated with the currently edited document overwrites this option.

**Author default foreground color**

Sets the default foreground color of the Author editing mode. The color property set in the CSS file associated with the currently edited document overwrites this option.

**Show XML comments**

When this option is selected, XML comments are displayed in Author mode. Otherwise, they are hidden.
Show placeholders for empty elements

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

Show processing instructions

When this option is selected, XML processing instructions are displayed in Author mode. Otherwise, they are hidden.

Show Author layout messages

When this option is selected, all errors reported while rendering the document in Author mode are presented in the Results view (on page 308) at the bottom of the editor.

Show doctype

When this option is selected, the doctype declaration is displayed in Author mode. Otherwise, it is hidden.

Fast text layout

In certain cases, the widths computed in the Author visual editing mode for lines of text may be larger than expected, leading to an incorrect visual layout. Deactivating this option will improve the computation quality for character widths in the visual editing mode, but it may hinder overall performance for very large documents.

Tip:

For macOS users, some specific examples of this type of situation can be found here: Text Rendering Issues on macOS (on page 1751). Because of such problems, when an installation kit with Java 9 or newer is used on macOS, the checkbox is not selected by default.

Show floating contextual toolbar

When this option is selected (default), the floating contextual toolbar is displayed in the Author mode in certain situations. When not selected, the floating contextual toolbar is never displayed.

Images Section

The following options regarding images in Author mode are available in this section:

Auto-scale images wider than (pixels)

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images

When this option is selected, images larger than 6 megapixels are displayed in Author mode. Otherwise, they are not displayed.
Important:
If you select this option and your document contains many such images, Oxygen XML Author Eclipse plugin may consume all available memory, throwing an OutOfMemory error. To resolve this, increase the available memory limit and restart the application.

Tags Section

In this section, you can configure the following options regarding tags that are displayed in Author mode:

**Tags display mode**

Sets the default display mode for element tags presented in Author mode. You can choose between the following:

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block (on page 2077) and inline elements (on page 2080). Oxygen XML Author Eclipse plugin

- **Full Tags**
  Displays full tag names without attributes for both block elements and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Block Tags without Element Names**
  Displays tags for block elements but without element names for a more compact version of Block Tags mode. You can still see the element names by hovering over the tags.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.
Sort attributes alphabetically for "Full Tags with Attributes"

When selected, if you choose Full Tags with Attributes for the Tags Display Mode (on page 344), the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

Tags background color

Sets the Author mode tags background color.

Tags foreground color

Sets the Author mode tags foreground color.

Tags font

Allows you to change the font used to display tags text in the Author visual editing mode. The default font is computed based on the setting of the Author option in the Fonts preferences page (on page 162).

Compact tag layout

If this option is not selected, the Author mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

References Section

Display referenced content (entities, XInclude, DITA conref, etc.)

When selected, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Allow referenced content to be edited

When selected, for a specific XML vocabulary that supports this feature, the content referenced from other files and presented in the Author visual editing mode can be edited in-place and saved. For now, if the feature is enabled and you use the Open Map in Editor with Resolved Topics toolbar action in the DITA Maps Manager view, the referenced content in the opened document becomes editable in-place. Saving the document will save all other modified topics.

Local files only

When selected (default), the Allow referenced content to be edited (Experimental) option only works for local files. For files located in remote locations such as a CMS, additional steps might be necessary to save all modified content because this feature might not function properly with remote resources.

Whitespaces Section

The following option is available in this section:
**Foreground color**

Sets the foreground color of the white spaces in the **Author** mode. To enable this option, open the **Preferences** dialog box (on page 61), go to **General > Editors > Text Editors** and select **Show whitespaces characters**.

**Enable mouse-wheel zooming**

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on macOS)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on macOS)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on macOS, due to the way inertia affects the mouse wheel on this operating system.

**Configure annotation tooltip**

Click this link to open the **Annotations Preferences (on page 112)** page.

**For advanced Author configuration see the Document Type Association settings**

Click this link to open the **Document Type Association preferences page (on page 79)**.

---

**AutoCorrect Preferences**

Oxygen XML Author Eclipse plugin includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this **AutoCorrect feature (on page 269)**, open the **Preferences** dialog box (on page 61) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

**Enable AutoCorrect**

When selected (default state), while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Author Eclipse plugin will automatically replace it with the value listed in the **With** column.

**Use additional suggestions from the spell checker**

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Author Eclipse plugin will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

**Note:**

The **AutoCorrect** feature shares the same options configured in the **Language options (on page 158)** and **Ignore elements (on page 159)** sections in the **Spell Check** preferences page.

**Include text-to-markup corrections based on the current document type**
If selected, in addition to anything listed in the Replacements table displayed in this preferences page, the *AutoCorrect* mechanism will also include XML markup insertion rules specified in a configuration file for each document type. For example, for default DITA, DocBook, and TEI documents, entering a hyphen (-) followed by a space in an empty paragraph will automatically insert a list element with an empty list item element inside. The configuration file is located at: `[/OXYGEN_INSTALL_DIR]/frameworks/[DOC_TYPE]/resources/structureAutocorrect.xml`.

**Tip:**
By default, the `structureAutocorrect.xml` file only exists for DITA, DocBook, and TEI frameworks, but it is possible to customize your own markup correction rules for your particular document type. For details, see Customizing Text-to-Markup Shortcut Patterns (on page 1484).

**Spell Check options link**

Use this link to navigate to the Spell Check Preferences page (on page 157).

**Replacements Table section**

The *AutoCorrect* feature uses the Replacements table to automatically replace anything that is listed in the Replace column with the value listed in the With column for each language.

**Replacements for language drop-down menu**

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the *AutoCorrect* feature. It is simply the language for the Replacements table.

**Replacements Table**

You can double-click on cells in either column to edit the listed items. Use the Add button to insert new items and the Remove button to delete rows from the table.

**Note:**
Any changes, additions, or deletions you make to this table are saved to a path that is specified in the *AutoCorrect Dictionaries* preferences page (on page 132).

**Smart quotes section**

You can also choose to automatically convert double and single quotes to a quotation character of your choice by using the following options in the Smart quotes section:
• **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

• **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

![Note:]

These **Smart quotes** options are ignored for content inside any element listed in the **Ignore elements** section of the **Spell Check preferences page** *(on page 159).*

**Restore Defaults**

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the Replacements table** *(on page 130).*

**AutoCorrect Dictionaries Preferences**

To set the Dictionaries preferences for the **AutoCorrect feature** *(on page 269)*, open the **Preferences dialog box** *(on page 61)* and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Author Eclipse plugin uses for the **AutoCorrect** feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

**Dictionaries default folder**

Displays the default location where the dictionaries that Oxygen XML Author Eclipse plugin uses for the **AutoCorrect** feature are stored.

**Include dictionaries from**

Selecting this option allows you to specify a location where you have stored **AutoCorrect** dictionaries that you want to include, along with the default ones.

### Important:

Consider the following notes regarding this option:

• The **AutoCorrect** mechanism takes into account **AutoCorrect** dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, `en_UK.dat` from the default location is merged with `en_US.dat` from a custom location).

• If you have a generic **AutoCorrect** dictionary file (one that just has a two-letter language code for its file name, such as `en.dat`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dat` and `en_US.dat`) will not be merged and the existing generic dictionary will simply be used instead.
• You can use a custom suffix in the dictionary file name after the language code. For example, `en_US_synopsys.dat` or `en_synopsys.dat`.
• If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to add dictionaries for the AutoCorrect feature (on page 271).

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Related information
Add Dictionaries for the AutoCorrect Feature (on page 271)

Cursor Navigation Preferences

Oxygen XML Author Eclipse plugin allows you to configure the appearance and behavior of the cursor in the Author mode editor (on page 220). To set cursor navigation preferences, open the Preferences dialog box (on page 61) and go to Author > Cursor Navigation.

The following options are available:

Highlight elements near cursor

When this option is selected, the element that contains the cursor is highlighted. If the cursor is between two elements, both of them are highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Author Eclipse plugin uses tooltips in Author mode to indicate the position of the cursor in the element structure (on page 346) of the underlying document. Depending on context, the tooltips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is selected, Oxygen XML Author Eclipse plugin displays Location Tooltips (on page 347) when you are editing the document in certain tags display modes (Inline Tags, Partial Tags, No Tags) or when the mouse pointer is moved between block elements (on page 2077).

Quick up/down navigation
This option is deselected by default and this means that when you navigate using the up and down arrow keys in Author mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Avoid positioning the cursor between blocks after a deletion

If selected (default), the cursor will not stay between block element sentinels after a deletion is performed.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in Author mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

MathML Preferences

Oxygen XML Author Eclipse plugin allows you to edit MathML (on page 494) equations and displays the results in a preview window. For a more specialized MathML editor, you can either install Wiris MathFlow (on page 495), which is a commercial product that requires a separate license, or use an external MathML editor (e.g. the LibreOffice equation editor).

Using MathFlow for Editing and Rendering MathML Equations

To configure the MathML editor or to enter your MathFlow license information, open the Preferences dialog box (on page 61) and go to Editor > Edit Modes/Pages > Author > MathML.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the Author mode.

MathFlow installation directory

The installation folder for the MathFlow components product (MathFlow SDK).

MathFlow license file

The license file for the MathFlow components product (MathFlow SDK).
MathFlow preferred editor

A MathML formula can be edited in one of three editors of MathFlow components product (MathFlow SDK).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in &name; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek Omega character is saved as Ω.
- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the &#xNNN; format. For example, the Greek Omega character is saved as Ω.
- **As character values** - Saves the characters as the actual symbol. For example, the Greek Omega character is saved as Ω.

More documentation is available on the Wiris MathFlow website.

Using an External Tool for Editing MathML Equations

External application > Command line

You can use this option to specify an external MathML application for editing MathML equations. For example, the following commands could be used to edit MathML equations with a LibreOffice application (depending on the O.S.):

- **Windows** - "C:\Program Files\LibreOffice\program\smath.exe" --nologo "$\{cf\}"
- **macOS** - /Applications/LibreOffice.app/Contents/MacOS/soffice --math --nologo "$\{cf\}"
- **Linux** - /usr/lib/libreoffice/program/smath --nologo "$\{cf\}"

Profiling/Conditional Text Preferences

Oxygen XML Author Eclipse plugin lets you configure how profiling and conditional text (on page 414) is displayed in Author mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure **Profiling/Conditional Text** options, open the **Preferences** dialog box (on page 61) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**. There are several sub-pages in this section. This first parent page includes options for determining which types of profiled content is displayed:
Show profiling attributes

Toggles whether or not the Show Profiling Attributes option (on page 424) in the Profiling / Conditional Text drop-down menu is enabled by default.

Show profiling attribute name

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Show profiling colors and styles

Toggles whether or not the Show Profiling Colors and Styles option (on page 424) in the Profiling / Conditional Text drop-down menu is enabled by default.

Show excluded content

Toggles whether or not the Show Excluded Content option (on page 425) in the Profiling / Conditional Text drop-down menu is enabled by default.

Attributes and Condition Sets Preferences

To configure profiling attributes and condition sets, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

Note:

Note the following when configuring these settings:

• This preferences page is used to define how profiled elements are treated in Author mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.

• This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.

• If you are using the DITA XML vocabulary and a DITA subject scheme map (on page 2084) is defined in the root map (on page 2083) of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from DITAVAL files (on page 2018). You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Author Eclipse plugin displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.
Note:
When importing profiling attributes from DITAVAL files, Oxygen XML Author Eclipse plugin automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the + New button at the bottom of the table to add profiling attributes (on page 415), the Edit button to edit existing ones, or the ✗ Delete button to delete entries from the table. Use the Up and Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author Eclipse plugin uses the one that is positioned highest in the table.

Report invalid profiling attribute values (DITA only)

If selected, it means the following:

• In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
• In the DITA Validate and Check for Completeness dialog box, the Report attributes and values that conflict with profiling preferences (on page 1811) option is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the Edit Profiling Attributes action from the contextual menu in Author mode (or for DITA topics, the Edit Properties action in the DITA Maps Manager (on page 1762)), the Profiling Values Conflict dialog box (on page 417) will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Author Eclipse plugin behaves as if the Preserve the configuration option has been chosen in the Profiling Values Conflict dialog box (on page 417) and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the profiling Colors and Styles preference page (on page 137).

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the + New button at the bottom of the table to add
condition sets (on page 420), the Edit button to edit existing ones, or the Delete button to delete entries from the table. Use the Up and Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author Eclipse plugin uses the one that is positioned highest in the table.

Related information

- Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2020)

Colors and Styles Preferences

Oxygen XML Author Eclipse plugin lets you set the colors and styles used to display profiling / conditional text (on page 134) in the Author mode editor (on page 220). To set Colors and Styles preferences, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

The preference page includes the following options and sections:

Import from DITAVAL

Allows you to import profiling styles from a .ditaval file. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Author Eclipse plugin displays a dialog box containing two tables. The first one previews the imported styles, while the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones. This feature works even if you use profiling attribute groups to organize the attributes into subcategories (on page 2011).

Profiling Colors and Styles Table

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- Defined attributes values - Contains the styles for profiling attribute values defined in the Profiling / Conditional Text (on page 134) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the Defined attributes values category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name, and value). This is the reason why a style from this category can only be reset (on page 138), not deleted.

- Other - This category contains styles for attribute values that are not marked as profiling values, in the Profiling / Conditional Text (on page 134) preferences page. In this category are listed:
• All the styles that were defined in other projects (with other profiling attribute value sets).
• All the styles set for the profiling attributes defined in a subject scheme map (on page 2013).

Automatic styling button
If you click this button, Oxygen XML Author Eclipse plugin will apply automatic styling to the profiling attribute values that do not have a style defined.

New button
Opens the Add Profiling Style dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

Note:
You can define a default style for a specific attribute by setting the Attribute value field to <ANY>. This style is applied for attribute values that do not have a specific style associated with it.

Edit button
Open the Edit Profiling Style dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

Clear style button
Resets the style for the selected value to its default setting (no color or decoration).

Delete button
Delete the selected style from the Other category.

Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2020)

Attributes Preferences
When the Show Profiling Attributes option (on page 424) is selected, the Author mode displays conditional text markers at the end of conditional text blocks. To configure the rendering of these text markers, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles > Attributes.

The following options are available:

Background color
Sets the background color used to display the profiling attributes.

Attribute name foreground color
Sets the foreground color used to display the names of the profiling attributes.

**Attribute values foreground color**

Sets the foreground color used to display values of the profiling attributes.

**Border color**

Sets the color of the border of the block that displays the profiling attributes.

---

### Review Preferences

Oxygen XML Author Eclipse plugin allows you to add review comments and track changes *(on page 388)* in your documents. The **Review** preferences page allows you to control how the Oxygen XML Author Eclipse plugin review features work. To configure these options, open the **Preferences** dialog box *(on page 61)* and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

**Author**

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Author Eclipse plugin uses the system user name.

**Track Changes section (applies for all authors)**

**Initial state**

Specifies whether or not the **Track Changes feature** *(on page 2084)* is enabled when you open a document. You may have the **Track Changes** feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the **Track Changes** feature is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.
- **Always On** - The **Track Changes** feature is always on when you open a document. You can turn it off for an open document, but it will be turned on for the next document you open.
- **Always Off** - The **Track Changes** feature is always off when you open a document. You can turn it on for an open document, but it will be turned off for the next document you open.

**Initial display mode**
Specifies whether or not all tracked changes and comments are visible when you open a document in the Author visual editing mode. You can choose between the following options:

- **View All Changes/Comments** - All tracked changes and comments are visible in the Author visual editing mode.
- **View Final** - Comments are hidden, while insertion and deletion track changes are presented as if they would be accepted.

**Display changed lines marker**

A changed line marker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

**Inserted content color**

When the Track Changes feature (on page 2084) is on, the newly inserted content is highlighted with an insertion marker that uses a color to adjust the following display properties of the inserted content: foreground, background, and underline. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Author Eclipse plugin automatically assigns a color to each user who inserted content in the current document. The colors are picked from the Colors for automatic assignment list (on page 141), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author Eclipse plugin uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Author Eclipse plugin uses the color defined above (Automatic or Fixed) to render the foreground of the inserted content.
- **Use same color for background** - If selected, Oxygen XML Author Eclipse plugin uses the color defined above (Automatic or Fixed) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

**Deleted content color**

When the Track Changes feature (on page 2084) is on, the deleted content is highlighted with a deletion marker that uses a color to adjust the following display properties of the deleted content: foreground, background, and strikethrough. This section allows you to customize the following color options:
• **Automatic** - If this option is selected, Oxygen XML Author Eclipse plugin automatically assigns a color to each user who deleted content in the current document. The colors are picked from the [Colors for automatic assignment list](on page 141), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Author Eclipse plugin uses the specified color for all deletion markers, regardless of who the author is.

• **Use same color for text foreground** - If selected, Oxygen XML Author Eclipse plugin uses the color defined above (Automatic or Fixed) to render the foreground of the deleted content.

• **Use same color for background** - If selected, Oxygen XML Author Eclipse plugin uses the color defined above (Automatic or Fixed) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

**Comments color section (applies for all authors)**

Sets the background color of the text that is commented on. The options are:

• **Automatic** - If this option is selected, Oxygen XML Author Eclipse plugin automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the [Colors for automatic assignment list](on page 141), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Author Eclipse plugin uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

**Colors for automatic assignment list**

These are the colors that will be automatically assigned for tracked insertions, tracked deletions, and comments if the **Automatic** option is selected in any of the sections in this preferences page. The colors are assigned in the order that you see in this list. You can use the **Add**, **Edit**, or **Remove** buttons to modify the list of colors.

**Related information**

[Reviewing Documents](on page 388)

**Callouts Preferences**

Oxygen XML Author Eclipse plugin can display callouts (**callouts** (on page 2078)) for review items such as comments and tracked changes (**tracked changes** (on page 388)). To customize options for review callouts, [open the Preferences dialog box](on page 61) and go to **Editor > Edit modes > Author > Review > Callouts**.
The available options are as follows:

**Show Review Callouts section**

**Comments**

If selected, callouts are displayed for comments, including comments that are added to *tracked changes* *(on page 2084)*. This option is selected by default.

**Track Changes deletions**

If selected, callouts are displayed for *tracked change* *(on page 2084)* deletions and the following additional option becomes available:

**Show deleted content in callout**

If selected, the deleted content is also displayed in the callout.

**Track Changes insertions**

If selected, callouts are displayed for *tracked change* *(on page 2084)* insertions and the following additional option becomes available:

**Show inserted content in callout**

If selected, the inserted content is also displayed in the callout.

**Rendering section**

**Show review time**

When selected, timestamp information is displayed in callouts.

**Show all connecting lines**

When selected, lines are shown that connect the callout to the location of the change.

**Initial width (px)**

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

**Text lines count limit**

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select **Edit Comment** or **Show Comment**.
Schema-Aware Preferences

Oxygen XML Author Eclipse plugin can use the schema of your XML language to improve the way the Author mode editor handles your content. To configure the Schema-Aware options, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Schema-Aware.

The following options are available:

**Schema-aware normalization, format, and indent**

When you open or save a document in Author mode, white space is normalized using the display property of the current CSS stylesheet and the values of the settings (on page 152) for Preserve space elements, Default space elements, and Mixed content elements. When this option is selected, the schema will also be used to normalize white space, based on the content model (element-only, simple-content, or mixed). Note that the schema information takes precedence.

**Indent blocks-only content**

To avoid accidentally introducing inappropriate white space around inline elements (on page 2080), Oxygen XML Author Eclipse plugin does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Author Eclipse plugin will apply indenting to the source of mixed content elements that only contain block elements (on page 2077).

Schema-Aware Editing

The options in this section determine how Oxygen XML Author Eclipse plugin will use the schema of a document to control the behavior of the Author mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema-Aware Actions section

**Delete element tags with backspace and delete**

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Author Eclipse plugin will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of
the list container. However, the content could be appended to a preceding list item.

- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

**Paste and Drag and Drop**

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Author Eclipse plugin tries to find an appropriate insert position. The possibilities include:
  ◦ Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  ◦ Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below and existing list).
  ◦ Inserting the content into an ancestor element where it would be valid.

- **Reject action when its result is invalid** - If selected, Oxygen XML Author Eclipse plugin will not let you paste content into a position where it would be invalid.

**Typing**

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.

- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

**Content Completion**

Controls the behavior that takes place when inserting elements using the **Content Completion Assistant in Author mode** (on page 365). Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing Enter will open the Content Completion Assistant. If deselected, there are three possibilities:
  ◦ The current element will be split (if possible).
  ◦ A new element with the same name will be inserted (if possible).
  ◦ Otherwise, a new paragraph will be inserted.
• **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Author Eclipse plugin will attempt to find a valid location to insert it and may present you with several options.

• **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.

• **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the Attributes view (on page 377) or In-place Attributes Editor (on page 358). If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

**Warn on invalid content when performing action**

A warning message will be displayed when performing an action that will result in invalid content. Available options are:

• **Delete Element Tags** - If selected, a warning message will be displayed if the Delete Element Tags (on page 504) action will result in an invalid document. You will be asked to confirm the deletion.

• **Join Elements** - If selected, a warning message will be displayed if the Join Elements (on page 504) action will result in an invalid document. You will be asked to confirm the join.

**Automatically apply the best schema-aware insertion operation**

If selected, Oxygen XML Author Eclipse plugin automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Author Eclipse plugin will ask the user to choose from a list of proposed solutions.

**Convert external content on paste**

If selected, the Smart Paste feature (on page 362) is enabled when external content is pasted in Author mode.

**Convert even when pasting inside space-preserve elements**

If selected, the Smart Paste feature (on page 362) will be used even when external content is pasted inside a space-preserve element (such as a `<codeblock>`).

**Convert pasted URLs to links**
If selected, when a URL is pasted into Author mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `<xref>` is inserted.

**Related information**

- Smart Paste in Author Mode *(on page 362)*
- Customizing Smart Paste Support *(on page 1485)*

## Serialization Preferences

To configure the serialization options for the Author mode, open the Preferences dialog box *(on page 61)* and go to Editor > Edit modes > Author > Serialization.

The following options are available:

### Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from Author to Text mode). You can choose between the following two options:

- **Only the modified content**
  
  The Save operation only formats the nodes that were modified in the Author mode. The rest of the document preserves its original formatting.

  **Note:**
  
  This option also applies to the DITA maps opened in the DITA Maps Manager *(on page 1762)*.

- **The entire document**
  
  The Save operation applies the formatting to the entire document regardless of the nodes that were modified in Author mode.

**Also apply the format and indent options that are set for Text mode**

If this option is selected, the result of the Format and indent operation will be the same as when it is applied in Text editing mode. Thus, the content of the document is formatted by applying the Format and Indent rules from the Editor/Format *(on page 149)* and Editor/Format/XML *(on page 152)* preference pages. You can use the Format and indent options link to navigate to those options.

### Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:
• **None** - Choose this option if compatibility with other tools can be ignored.

• **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

**Note:**
New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the Also apply the format and indent options that are set for Text mode option (on page 146), since the formatting from Text mode does not take the CSS styles into account.

• **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Author Eclipse plugin to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

**Note:**
New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the Also apply the format and indent options that are set for Text mode option (on page 146), since the formatting from Text mode does not take the CSS styles into account.

## Grid Preferences

Oxygen XML Author Eclipse plugin provides a Grid view (on page 219) of an XML document. To configure the Grid options, open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Grid.

The following options are available:

**Compact representation**

If selected, the compact representation of the grid is used: a child element is displayed beside the parent element. In the non-compact representation, a child element is nested below the parent.

**Format and indent when passing from grid to text or on save**

If selected, the content of the document is formatted and indented (on page 311) each time you switch from the Grid view to the Text view.

**Default column width (characters)**

Sets the default width (in characters) of a table column of the grid. A column may contain the following:
• Element names
• Element text content
• Attribute names
• Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

**Active cell color**

Allows you to set the background color for the active cell (on page 2077) of the grid. The keyboard input always goes to the active cell and the selection always contains it.

**Selection color**

Allows you to set the background color for the selected cells of the grid, except the active cell (on page 2077).

**Border color**

Allows you to set the color used for the lines that separate the grid cells.

**Background color**

Allows you to set the background color of grid cells that are not selected.

**Foreground color**

Allows you to set the text color of the information displayed in the grid cells.

**Row header colors**

- **Background color**
  
  Allows you to set the background color of row headers that are not selected.

- **Active cell color**
  
  Allows you to set the background color of the row header cell that is currently active.

- **Selection color**
  
  Allows you to set the background color of the header cells corresponding to the currently selected rows.

**Column header colors**

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

- **Background color**
  
  Allows you to set the background color of column headers that are not selected.
Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the Text (on page 219) and Author (on page 220) editing modes. To control additional options specifically for the Author mode editor, see Whitespace Handling in Author Mode (on page 348).

Note:

These settings apply to the formatting of source documents. The formatting of output documents is determined by the transformation scenarios that create them (on page 785).

To configure the Format options, open the Preferences dialog box (on page 61) and go to Editor > Format.

The following options are available:

Detect indent on open

If selected, Oxygen XML Author Eclipse plugin detects how a document is indented when it is opened. Oxygen XML Author Eclipse plugin uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Author Eclipse plugin detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip:

If you want to minimize the formatting differences created by the Format and Indent operation in a document edited in the Text edited mode, make sure that both the Detect indent on open and Detect line width on open (on page 150) options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all of your documents have no indentation and you want to keep them that way.
Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the Detect indent on open (on page 149) option.

Indent size

The meaning of this setting depends on the following:

- If the Detect indent on open option (on page 149) is selected and TAB characters are detected at the beginning of the line, the indent size is the width of a TAB character. Otherwise, the indent size value is ignored and Oxygen XML Author Eclipse plugin uses the number of detected SPACE characters.
- If the Indent with tabs option (on page 150) is selected, the indent size is the width of a TAB character.
- If neither of these options are selected, the indent size is the number of SPACE characters used for indenting the text lines.

For additional information about changing the indent size, see Setting an Indent Size to Zero (on page 316).

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Author Eclipse plugin (on page 151).

Indent on enter

If selected, when you press Enter to insert a line break in the Text editing mode, an indentation will be added to the new line.

Enable smart enter

If selected, when you press the Enter key between a start and an end XML tag in the Text editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Author Eclipse plugin.

Note:

Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open
If selected, Oxygen XML Author Eclipse plugin automatically detects the line width when the
document is opened.

**Hard line wrap (Limit to "Line width - Format and Indent")**

If selected, when typing content in the **Text** editing mode and the maximum line width is reached,
a line break is automatically inserted.

**Line width - Format and Indent**

Defines the number of characters after which the **Format and Indent** (pretty-print) action
performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the
longest line will have a maximum of 100 characters. This setting is also used when saving XML
content edited in the **Author** editing mode.

**Note:**
To avoid having an indent that is longer than the line width setting and without having
sufficient space available for the text content, the indent limit is actually set at half the
value of the **Line width - Format and Indent** setting. The remaining space is reserved for
text.

For information about when this setting is used, see [Where Indent Size and Line Width Settings
are Used in Oxygen XML Editor](on page 151).

**Clear undo buffer before Format and Indent**

The **Format and Indent** operation can be **undone**, but if used intensively, a considerable amount
of the memory allocated for Oxygen XML Author Eclipse plugin will be used for storing the
undo states. If this option is selected, Oxygen XML Author Eclipse plugin empties the undo
buffer before doing a **Format and Indent** operation. This means you will not be able to undo
any changes you made before the format and indent operation. Select this option if you
encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and
Indent** operation.

**Where Indent Size and Line Width Settings are Used in Oxygen XML Author Eclipse plugin**

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the
application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **Enter** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the
  maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

For more information about the formatting options offered by Oxygen XML Author Eclipse plugin, watch our
video demonstration:
CSS Preferences

Oxygen XML Author Eclipse plugin can format and indent your CSS files. To configure the CSS formatting options, open the Preferences dialog box (on page 61) and go to Editor > Format > CSS.

The following options control how your CSS files are formatted and indented:

- **Class body on new line**
  - If selected, the class body (including the curly brackets) is placed on a new line. This option is not selected by default.

- **Indent class content**
  - When selected (default state), the class content is indented.

- **Add space before the value of a CSS property**
  - When selected (default state), whitespaces are added between the : (colon) and the value of a style property.

- **Add new line between classes**
  - If selected, an empty line is added between two classes. This option is not selected by default.

- **Preserve empty lines**
  - When selected (default state), the empty lines from the CSS content are preserved.

- **Allow formatting embedded CSS**
  - When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

JavaScript Preferences

To configure the JavaScript format options, open the Preferences dialog box (on page 61) and go to Editor > Format > JavaScript.

The following options control the behavior of the Format and Indent action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Author Eclipse plugin to format embedded JavaScript code, taking precedence over the Schema-aware format and indent (on page 155) option. This option is selected by default.

XML Preferences

To configure the XML Formatting options, open the Preferences dialog box (on page 61) and go to Editor > Format > XML.
The following options are available:

**Format and Indent Section**

This section includes the following drop-down boxes:

- **Preserve empty lines**
  The Format and Indent operation preserves all empty lines found in the document.

- **Preserve text as it is**
  The Format and Indent operation preserves text content as it is, without removing or adding any white space.

- **Preserve line breaks in attributes**
  Line breaks found in attribute values are preserved.

**Note:**
When this option is selected, the **Break long attributes option (on page 153)** is automatically disabled.

- **Break long attributes**
  The Format and Indent operation breaks long attribute values.

- **Indent inline elements**
  The inline elements are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

  Original XML:
  ```xml
  <root>
    text <parent> <child></child> </parent> 
  </root>
  ```

  **Indent inline elements** selected:
  ```xml
  <root> text <parent>
    <child/>
  </parent>
  </root>
  ```

  **Indent inline elements** not selected:
  ```xml
  <root> text <parent> <child/> </parent> </root>
  ```

- **Expand empty elements**
  If not selected (default), the Format and Indent operation results in an empty XML element being serialized in a compact form (`<a atr1="v1"/>`). If selected, the same
operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1"></a>`).

**Notes:**

- When using the **Format and Indent** operation in **Text** mode, if the **Schema-aware format and indent** option *(on page 155)* is enabled, Oxygen XML Author Eclipse plugin will use information from the associated schema and avoid expanding tags for elements that are defined as empty in the schema.
- When saving a document in **Author** mode, if the **Schema-aware normalization, format, and indent** option in the **Schema-Aware** preferences page *(on page 143)* is enabled, Oxygen XML Author Eclipse plugin will use information from the associated schema and avoid expanding tags for elements that are defined as empty in the schema (therefore, text or other elements are not allowed inside them).

**Sort attributes**

The **Format and Indent** operation sorts the attributes of an element lexicographically.

**Add space before slash in empty elements**

Inserts a space character before the trailing / and > of empty elements.

**Break line before an attribute name**

When selected, the **Format and Indent** operation always breaks the line before any attribute name in an XML element. By default, the setting is not selected, which means that new lines might still be added before the attribute names but only if the line of content would overflow the maximum line width specified in the **Format preferences page** *(on page 149)*.

**Element Spacing Section**

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND/OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):
• `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
• `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
• `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
• `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

```
* elementName
* //elementName
* /elementName1/elementName2/elementName3
* //xs:localName
```

Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.

```
* //xs:documentation[@lang="en"]
```

The tabs are as follows:

**Preserve space**

List of elements that will have the **Format and Indent** operation preserve the whitespaces (such as blanks, tabs, and newlines).

**Default space**

List of elements that will have the content normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

**Mixed content**

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

**Line break**

List of elements that will have line breaks inserted, regardless of their content. You can choose to break the line before the element, after, or both.

**Schema-aware format and indent**

The **Format and Indent** operation takes the schema information into account with regard to the `space preserve`, `mixed`, or `element only` properties of an element.
Indent Section

Includes the following options:

**Indent (when typing) in preserve space elements**

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the *Preserve space* tab of the *Element Spacing* list *(on page 154)*) are ignored by the *Format and Indent* operation. When this option is selected and you edit one of these elements, its content is formatted.

**Indent on paste - sections with number of lines less than 300**

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

Whitespaces Preferences

When Oxygen XML Author Eclipse plugin formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Author Eclipse plugin allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the *Whitespace* preferences, open the *Preferences* dialog box *(on page 61)* and go to *Editor > Format > XML > Whitespaces*.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The *Format and Indent* action is applied on an XML document.
- You switch from *Text* mode to *Author* mode.
- You switch from *Author* mode to *Text* mode.

**Note:**

The whitespace normalization process replaces any sequence of characters declared as whitespaces in the *Whitespaces* table with a single space character (`U+0020`). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the *Whitespaces* table.

**Important:**

The characters with the codes `U+0009` (TAB), `U+000A` (LF), `U+000D` (CR) and `U+0020` (SPACE) are always considered to be whitespace characters and cannot be deselected.
Open/Save Preferences

Oxygen XML Author Eclipse plugin lets you control how files are opened and saved. To configure the options for opening and saving documents, open the Preferences dialog box (on page 61) and go to Editor > Open/Save.

The following options are available:

Open section

Format document when longest line exceeds
Oxygen XML Author Eclipse plugin will create line breaks if the characters in a line exceed the specified value. You can choose one of the following:

- Always format
- Never format
- Always ask

Save section

Check errors on save
If selected, Oxygen XML Author Eclipse plugin runs a validation that checks your document for errors before saving it.

Save all files before transformation or validation
Saves all open files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Performance section

Clear undo buffer on save
If selected, Oxygen XML Author Eclipse plugin clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter out of memory errors when editing large documents.

Spell Check Preferences

Oxygen XML Author Eclipse plugin provides support for spell checking in the Text (on page 219) and Author (on page 220) editing modes. To configure the Spell Check options, open the Preferences dialog box (on page 61) and go to Editor > Spell Check.

The following options are available:

Automatic spell check
This option is not selected by default. When selected, Oxygen XML Author Eclipse plugin automatically checks the spelling as you type and highlights misspelled words in the document.

**Select editors**

You can select which editors (and therefore which file types) will automatically be spell checked. File types such as CSS and DTD are excluded by default since automatic spell checking is not usually helpful in these types of files.

**Language options section**

This section includes the following language options:

**Default language**

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can add additional dictionaries to the spell check engines *(on page 257).*

**Use "lang" and "xml:lang" attributes**

When this option is selected, the contents of an element with one of the @lang or @xml:lang attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the @lang and @xml:lang attributes are missing, the selection in the Default language list *(on page 158)* is used.
- **Do not check** - If the @lang and @xml:lang attributes are missing, the element is not checked.

**XML spell checking in section**

You can choose to check the spelling inside the following XML items:

- Comments
- Processing instructions
- Attribute values
- Text
- CDATA

**Options section**

This section includes the following other options:

**Check capitalization**

When selected, the spell checker reports detected capitalization errors.
Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, SpellChecker).

Ignore acronyms

Available only for the Hunspell Spell Checker. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, b2b).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, www.oxygenxml.com or c:\boot.ini).

Allow compounds words

When selected, all words formed by concatenating multiple legal words with hyphens or underscores are accepted.

Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, myfile.txt or index.html).

Ignore elements section

You can use the Add and Remove buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard
An example of an allowed XPath expression is: `/a/*/b`.

**AutoCorrect options link**

Use this link to navigate to the AutoCorrect preferences page *(on page 129)*.

To change the color used by the spell check engine to highlight spelling errors, go to Window (Eclipse on macOSX) and choose Preferences. Then go to General > Editors > Text Editors > Annotations and change the color in the Spell Check Annotation option.

**Spell Check Dictionaries Preferences**

To set the Dictionaries preferences, open the Preferences dialog box *(on page 61)* and go to Editor > Spell Check > Dictionaries. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Author Eclipse plugin uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Author Eclipse plugin uses the Hunspell spell checking engine:

**Dictionaries and term lists default folder**

Displays the default location where the dictionaries and term lists that Oxygen XML Author Eclipse plugin uses are stored.

**Include dictionaries and term list from**

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

**Important:**

Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two-letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

**How to add more dictionaries and term lists link**

Use this link to open a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to add more dictionaries and term lists *(on page 261)*.
Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

Note:
Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

Adding Custom Spell Check Dictionaries (on page 261)
Adding Custom Spell Check Term Lists (on page 263)

Syntax Highlight Preferences

Oxygen XML Author Eclipse plugin supports syntax highlighting in the Text mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, , and more.

To configure syntax highlighting, open the Preferences dialog box (on page 61) and go to Editor > Syntax Highlight.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the Preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the Preview area to select it.

Note:
All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in Editor > Syntax Highlight preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the Preview area has a separate tab for each of them when XML is selected in the top pane.

The Enable nested syntax highlight option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.
Elements/Attributes by Prefix Preferences

Oxygen XML Author Eclipse plugin allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the Elements/Attributes by Prefix preferences, open the Preferences dialog box (on page 61) and go to Editor > Syntax Highlight > Elements/Attributes by Prefix.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the New button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note:
Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the Draw only the prefix with a separate color option.

Fonts Preferences

Oxygen XML Author Eclipse plugin allows you to choose the fonts to be used in the Text and Grid editor modes, and fonts for the Author mode that are not specified in the associated CSS stylesheet. To configure the font options, open the Preferences dialog box (on page 61) and go to Fonts.

The following options are available:

Text

This option allows you to choose the font used in Text mode. There are two options available:

• Map to text font - Uses the same font for the basic text editor as the one set in General > Appearance > Colors and Fonts.
• Customize - Allows you to configure various font-related options.

Author

Allows you to configure various font-related options that will be used in Author mode. However, these font-related options will be overridden by rules specified in any CSS file associated with the open document.

Note:
You must restart the application for your changes to be applied.
Markdown Preferences

The Markdown preferences page makes it possible to validate Markdown documents with Schematron. To access the page, open the Preferences dialog box (on page 61) and go to Markdown. This preferences page includes the following options:

- **Validate converted HTML content**
  
  If selected, converted HTML content will be validated using the Schematron file specified in this option.

- **Validate converted DITA content**
  
  If selected, converted DITA content will be validated using the Schematron file specified in this option.

**Note:**

It is also possible to create a Schematron association for Markdown documents by adding a catalog mapping (on page 567) for one of the following URIs:

- http://www.oxygenxml.com/schematron/validation/markdown-as-dita

The catalog mapping is a fallback in case the validation is disabled in this preferences page or the path to the Schematron is empty. The associations configured in this preferences page take precedence.

Network Connection Settings Preferences

This section presents the options available in the Network Connection Settings preferences pages.

(S)FTP Preferences

To configure the (S)FTP options, open the Preferences dialog box (on page 61) and go to Network Connection Settings > (S)FTP. You can customize the following options:

- **Encoding for FTP control connection**
  
  The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding, Oxygen XML Author Eclipse plugin will use it for communication. Otherwise, it will use ISO-8859-1. This section also includes a Show hidden files toggle option.

- **Public known hosts file**
  
  Specifies the file that contains the list of all SSH server host keys that you have determined are accurate. The default value is ${homeDir}/.ssh/known_hosts.

- **Private key file**
The path to the file that contains the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. Only RSA private keys in PEM (Base64) and PPK (PuTTY) formats are supported. Other keys (such as OpenSSH) are not supported.

**Passphrase**

The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol.

**Show SFTP certificate warning dialog**

If selected, a warning dialog box will be displayed each time when the authenticity of the host cannot be established.

### HTTP(S)/WebDAV Preferences

To set the HTTP(S)/WebDAV preferences, open the Preferences dialog box (on page 61) and go to Network Connection Settings > HTTP(S)/WebDAV. The following options are available:

**Enable the HTTP(S)/WebDAV Protocols**

Activates the HTTP(S)/WebDAV protocols bundled with Oxygen XML Author Eclipse plugin. Any adjustment to this option requires a restart of the application.

**Read Timeout (seconds)**

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

**Automatically accept a security certificate, even if invalid**

When selected, the HTTPS connections that Oxygen XML Author Eclipse plugin attempts to establish with will accept all security certificates, even if they are invalid.

> Important:
> By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate’s issuer.

**Lock WebDAV files on open**

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

### Scenarios Management Preferences

To configure Scenarios Management options, open the Preferences dialog box (on page 61) and go to Scenarios Management. This allows you to share the global transformation scenarios with other users by exporting them to an external file that can also be imported in this preferences panel.
The actions available in this panel are as follows:

- **Import Global Transformation Scenarios** - Allows you to import all transformation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the Configure Transformation Scenario dialog box followed by *(import)*. This way there are no scenario name conflicts.

- **Export Global Transformation Scenarios** - Allows you to export all global transformation scenarios available in the Configure Transformation Scenario dialog box.

- **Import Global Validation Scenarios** - Allows you to import all validation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the Configure Validation Scenario dialog box followed by *(import)*. This way there are no scenario name conflicts.

- **Export Global Validation Scenarios** - Allows you to export all global validation scenarios available in the Configure Validation Scenario dialog box.

**View Preferences**

The View preferences page allows you to configure some options regarding certain views. To edit these options, open the Preferences dialog box *(on page 61)* and go to View.

The following options are available:

- **Console section**
  - **Enable Oxygen consoles**
    - If selected, various messages will be contributed to the Console view *(on page 277)* when certain events are triggered (such as schema detection, validation, or transformation events).
  
  - **Fixed width console**
    - If selected, a line in the Console view *(on page 277)* will be hard wrapped after the specified maximum numbers of characters allowed on a line is reached.

  - **Limit console output**
    - If selected, the content of the Console view *(on page 277)* will be limited to a configurable number of characters.
**Console buffer**

If the Limit console output option is selected, this specifies the maximum number of characters that can be written in the Console view (on page 277).

**Tab width**

Specifies the number of spaces used for depicting a tab character.

**Elements view section**

**Show only allowed items**

If selected, when editing in Author mode, only the elements that are allowed at the current cursor position will be listed in the Elements view (on page 382). If not selected, all elements allowed by the schema will be listed, even if they are already used.

**XML Preferences**

This section describes the panels that contain the user preferences related with XML.

**Import Preferences**

To configure importing options, open the Preferences dialog box (on page 61) and go to XML > Import. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

**Create empty elements for empty values**

If selected, an empty value from a database column or from a text file is imported as an empty element.

**Create empty elements for null values**

If selected, null values from a database column are imported as empty elements.

**Escape XML content**

Selected by default, this option instructs Oxygen XML Author Eclipse plugin to escape the imported content to an XML-safe form.

**Add annotations for generated XML Schema**

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

**Date / Time Format section**
Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (\( yyyy-MM-dd'T'HH:mm:ss \) for `datetime`, \( yyyy-MM-dd \) for `date` and \( HH:mm:ss \) for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Z</td>
<td>Time zone</td>
<td>RFC 822 time zone</td>
<td>-0800</td>
</tr>
</tbody>
</table>

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - **GMTOffsetTimeZone** - GMT Sign Hours: Minutes
    - **Sign** - one of + or -
    - **Hours** - one or two digits
    - **Minutes** - two digits
    - **Digit** - one of 0 1 2 3 4 5 6 7 8 9
  - Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.
- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
  - **RFC822TimeZone**
  - **TwoDigitHours** (must be between 00 and 23)

PDF Output Preferences

The **PDF Output** preferences page simply includes links to sub-pages for configuring PDF output options.

FO Processors Preferences

Oxygen XML Author Eclipse plugin includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Author Eclipse plugin provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add **RenderX XEP** as an external FO processor if you have the XEP installed. Also, if you have the **Antenna House Formatter**, Oxygen XML Author Eclipse plugin uses the environment variables set by the XSL formatter installation to detect and use.
it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for DITA-OT transformations scenarios (on page 843) and XML with XSLT transformation scenarios (on page 817).

To configure the options for the FO processors, open the Preferences dialog box (on page 61) and go to XML > PDF Output > FO Processors. This preferences page includes the following options:

**Apache FOP Section**

In this section, you can configure options for the built-in Apache processor. The following options are available:

**Use built-in Apache FOP**

Instructs Oxygen XML Author Eclipse plugin to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

**Use other Apache FOP**

Instructs Oxygen XML Author Eclipse plugin to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**Enable the output of the built-in FOP**

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Author Eclipse plugin window, including warning messages about FO instructions not supported by Apache FOP.

**Memory available to the Apache FOP**

If your Apache FOP transformations fail with an Out of Memory error (OutOfMemoryError), use this combo box to select a larger value for the amount of memory reserved for Apache FOP transformations.

**Configuration file for the built-in FOP**

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special true type font). You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**Generates PDF/A-1b output**

When selected, PDF/A-1b output is generated.
Notes:

- All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in Add a font to the built-in FOP (on page 878).
- You cannot use the <filterList> key in the configuration file since the FOP would generate the following error: The Filter key is prohibited when PDF/A-1 is active.

External FO Processors Section

In this section, you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the RenderX XEP or Antenna House Formatter commercial FO processors.

Add ‘XEP’ FO processor (executable file is needed)

If RenderX XEP is already installed on your computer, you can use this button to choose the XEP executable script (xep.bat for Windows, xep for Linux).

Add ‘Antenna House’ FO processor (executable file is needed)

If Antenna House Formatter is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd.exe or XSLCmd.exe for Windows, and run.sh for Linux/macOS).

Note:

The built-in Antenna House Formatter GUI transformation scenario requires that you configure an external FO processor that runs AHFormatter.exe (Windows only). In the external FO Processor configuration dialog box (on page 171), you could use "$\{env(AHF63_64_HOME)\}\AHFormatter.exe" -d $\{fo\} -- for the value in the Command line field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Click the ✤ New button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (✎ Edit, Duplicate, ✗ Delete) to configure existing external processors.
The external FO Processor configuration dialog box includes the following options:

**Name**

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

**Description**

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

**Working directory**

The directory where the intermediate and final results of the processing are stored. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button. You can use one of the following editor variables (on page 199):

- `{homeDir}` - The path to the user home directory.
- `{cfd}` - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- `{pd}` - The project directory.
- `{oxygenInstallDir}` - The Oxygen XML Author Eclipse plugin installation directory.

**Command line**

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button. You can use one of the following editor variables (on page 199):
- `${method}` - The FOP transformation method: `pdf`, `ps`, or `txt`.
- `${fo}` - The input FO file.
- `${out}` - The output file.
- `${pd}` - The project directory.
- `${frameworksDir}` - The path of the `frameworks` subdirectory of the Oxygen XML Author Eclipse plugin installation directory.
- `${oxygenInstallDir}` - The Oxygen XML Author Eclipse plugin installation directory.
- `${ps}` - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

**Output Encoding**

The encoding of the FO processor output stream that is displayed in a Results panel (on page 308) at the bottom of the Oxygen XML Author Eclipse plugin window.

**Error Encoding**

The encoding of the FO processor error stream that is displayed in a Results panel (on page 308) at the bottom of the Oxygen XML Author Eclipse plugin window.

**CSS-based Processors Preferences**

Oxygen XML Author Eclipse plugin includes a built-in XML to PDF transformation with CSS scenario type for generating PDF output using a CSS-based processor.

To configure the options for the CSS-based processors, open the Preferences dialog box (on page 61) and go to XML > PDF Output > CSS-based Processors. This preferences page includes the following options:

**Oxygen PDF Chemistry Section**

**Auto-detect**

If selected, the directory of the Chemistry processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

**Custom installation directory**

Use this option to select an external directory of a custom installation of the Chemistry processor.

**Memory available to the processor (MB)**

Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (`OutOfMemoryError`), you can use this option to select a bigger value for the amount of memory reserved for the process.

**Generates PDF/UA-1 output**

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.
Note:
This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see Oxygen PDF Chemistry User Guide: Fully Accessible PDF (PDF/UA1).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

XML Catalog Preferences

To configure options that pertain to XML Catalogs (on page 2085), open the Preferences dialog box (on page 61) and go to XML > XML Catalog.

The following options are available:

**Prefer**

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document that has both a public identifier and a system identifier specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used.

Generally, the purpose of catalogs is to override the system identifiers in XML documents, so public should usually be used for your catalogs.

Note:
If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

**Verbosity**

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the XML catalog resolver that will be displayed in the Catalogs table at the bottom of the window. You can choose between the following:
- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

**Resolve schema locations also through system mappings**

If selected, Oxygen XML Author Eclipse plugin analyzes both uri and system mappings to resolve the location of schema.

**Note:**
This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

**Process "schemaLocation" namespaces through URI mappings for XML Schema**

If selected, the target namespace of the imported XML Schema is resolved through the uri mappings. The namespace is taken into account only when the schema specified in the schemaLocation attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

**Use default catalog**

If this option is selected and Oxygen XML Author Eclipse plugin cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see How Oxygen XML Author Eclipse plugin Determines which Catalog to Use (on page 568).

**Catalogs table**

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

**Add**

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the `Insert Editor Variables` (on page 199) button, or the browsing actions in the `Browse` drop-down list.

**Edit**

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the `Insert Editor Variables` (on page 199) button, or the browsing actions in the `Browse` drop-down list.

**Delete**

Deletes the currently selected catalog from the list.
Up
Moves the selection to the previous resource.

Down
Moves the selection to the following resource.

**Note:**
When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual Validate action (on page 520) so that the changes take full effect.

You can also add or configure catalogs at framework level from the Catalogs tab (on page 105) in the Document Type configuration dialog box (on page 81).

**Related information**
- Controlling the Catalog Resolver
- Working with XML Catalogs (on page 567)

**XML Parser Preferences**

To configure the XML Parser options, open the Preferences dialog box (on page 61) and go to XML > XML Parser.

The configurable options of the built-in XML parser are as follows:

**Enable parser caching (validation and content completion)**

Enables re-use of internal models when validating and provides content completion in open XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

**Enable system parameter entity expansion in other entity definitions**

This security setting controls the expansion of the DTD system parameter entities (the ones that are loaded from disk or from remote sources). This option is off by default, to protect against XXE attacks. If you enable it, make sure the XML files you are opening or processing with the application come from a trusted source.

**Ignore the DTD for validation if a schema is specified**

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

**Note:**
Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both
the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

**Enable XInclude processing**

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Author Eclipse plugin is turned on for validation, rendering in **Author** mode and transformation of XML documents.

**Base URI fix-up**

According to the specification for XInclude, processors must add an `@xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `@xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `@xml:base` and / or `@xml:lang` is not desired by your application, you can deselect this option.

**Language fix-up**

The processor will preserve language information on a top-level included element by adding an `@xml:lang` attribute if its included parent has a different [language] property. If the addition of `@xml:lang` is not allowed by your application, you can deselect this option.

**DTD post-validation**

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

**Relax NG Preferences**

To configure options regarding Relax NG, open the Preferences dialog box (on page 61) and go to XML > XML Parser > Relax NG.

The following options are available in this page:

**Check feasibly valid**

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:**

Selecting this option disables the **Check ID/IDREF** option.
Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any data- attributes detected in the document will not be taken into account by the validation engine.

Schematron Preferences

To configure options regarding Schematron, open the Preferences dialog box (on page 61) and go to XML > XML Parser > Schematron.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for xslt2/xslt3 query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for Quick Fixes (on page 2083) in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: xslt1, xslt2, or xslt3.
Note:
To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `@queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in the application (on page 213) will be used and only the validation messages that match that language will be presented. You can use the Change application language link to navigate to the preferences page where you can specify the language to be used in the application.

- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `@xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.

- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.

- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note:
In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

Schematron 1.5 Section

**XPath Version**

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: 1.0, 2.0, or 3.0. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

**Security**

**Disable Schematron security checks**

For security reasons, several security checks are performed on Schematron files that are not located inside a framework (on page 2080) or plugin (on page 2082). Select this option if your Schematron files are failing because of these security
checks and you are unable to move them to a location recognized as safe (a framework or a plugin).

**XML Schema Preferences**

To configure options regarding XML Schema, open the Preferences dialog box (on page 61) and go to XML > XML Parser > XML Schema.

This preferences page allows you to configure the following options:

**Default XML Schema version**

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema 1.0 or XML Schema 1.1.

**Note:**
You are also able to set the XML Schema version using the Customize option in the New document wizard (on page 221).

**Default XML Schema validation engine**

Allows you to select the default validation engine to be used for XML Schema. You can choose Xerces or Saxon EE.

**Xerces validation features section**

- **Enable full schema constraint checking**
  
  Sets the schema-full-checking feature to true. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

- **Enable honour all schema location feature**
  
  Sets the honour-all-schema-location feature to true. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

- **Enable full XPath 2.0 for alternative types**
  
  When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

- **Assertions can see comments and processing instructions**
  
  Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

**Saxon EE validation features section**

- **Multiple schema imports**
Forces `<xs:import>` to fetch the referenced schema document. By default, the `<xs:import>` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

**Assertions can see comments and processing instructions**

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

### XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, open the Preferences dialog box (on page 61) and go to XML > XML Refactoring. The following option is available in this preferences page:

**Load additional refactoring operations from**

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button. Oxygen XML Author Eclipse plugin looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.

### XML Signing Certificates Preferences

Oxygen XML Author Eclipse plugin provides two types of keystores (on page 2081) for certificates that are used for digital signatures of XML documents: Java Keystore (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. To configure a certificate keystore, open the Preferences dialog box (on page 61) and go to XML > XML Signing Certificates. You can customize the following parameters of a keystore:

**Figure 31. Certificates Preferences Panel**

<table>
<thead>
<tr>
<th>Certificates for Signing XML Documents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keystore type: JKS</td>
</tr>
<tr>
<td>Keystore file:</td>
</tr>
<tr>
<td>Keystore password:</td>
</tr>
<tr>
<td>Certificate alias:</td>
</tr>
<tr>
<td>Private key password:</td>
</tr>
<tr>
<td>[Validate]</td>
</tr>
</tbody>
</table>

- **Keystore type** - The type of keystore (on page 2081) that Oxygen XML Author Eclipse plugin uses (JKS or PKCS-12).
- **Keystore file** - The location of the imported file.
• **Keystore password** - The password that is used for protecting the privacy of the stored keys.
• **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the keystore (on page 2081).
• **Private key password** - The private key password of the certificate (required only for JKS keystores (on page 2081)).
• **Validate** - Click this button to verify the configured keystore (on page 2081) and the validity of the certificate.

### XProc Preferences

Oxygen XML Author Eclipse plugin includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate the external XProc engine using a plugin extension procedure (on page 885).

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the XProc preferences page. Open the Preferences dialog box (on page 61) and go to XML > XProc.

To add an external engine, click the New button. To configure an existing engine, click the Edit button. This opens the Custom Engine dialog box that allows you to configure an external engine.

**Figure 32. Creating an XProc external engine**

![Custom Engine dialog box](image)
The following options can be configured in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:**
You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in `\OXYGEN_INSTALL_DIR\lib\xproc\calabash\lib`. If that file does not exist, you have to create it.

The Show XProc messages option at the bottom of the XProc preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc Results view (on page 308).

**XSLT/XQuery Preferences**

To configure options regarding XSLT and XQuery processors, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this Preferences page.

There is only one generic option available:

**Create transformation temporary files in system temporary directory**

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.
Custom Engines Preferences

Oxygen XML Author Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To configure the Custom Engines preferences, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > Custom Engines.

The table in this preferences page displays the custom engines that have been defined. Use the + New or Edit button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

Figure 33. Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

**Engine type**

Specifies the transformer type. You can choose between XSLT and XQuery engines.

**Name**

The name of the transformer displayed in the dialog box for editing transformation scenarios.

**Description**

A textual description of the transformer.

**Working directory**
The start directory of the executable program for the transformer. The following editor variables (on page 199) are available for making the path to the working directory independent of the location of the input files:

- `${homeDir}` - The user home directory in the operating system.
- `${cfd}` - The path to the directory of the current file.
- `${pd}` - The path to the directory of the current project.
- `${oxygenInstallDir}` - The Oxygen XML Author Eclipse plugin install directory.

**Command line**

The command line that must be executed by Oxygen XML Author Eclipse plugin to perform a transformation with the engine. The following editor variables (on page 199) are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- `${xml}` - The XML input document as a file path.
- `${xmu}` - The XML input document as a URL.
- `${xsl}` - The XSL / XQuery input document as a file path.
- `${xslu}` - The XSL / XQuery input document as a URL.
- `${out}` - The output document as a file path.
- `${outu}` - The output document as a URL.
- `${ps}` - The platform separator that is used between library file names specified in the class path.

**Output Encoding**

The encoding of the transformer output stream.

**Error Encoding**

The encoding of the transformer error stream.

**XPath Preferences**

To configure XPath options, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XPath.

Oxygen XML Author Eclipse plugin allows you to customize the following options:

**Unescape XPath expression**

If selected, the entities of an XPath expression that you type in the XPath/XQuery Builder (on page 1346) are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os,'#x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os,'z')]
```
XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Author Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Author Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Author Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

XQuery Preferences

To configure the **XQuery** options, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XQuery.

The following generic XQuery preferences are available:

**Validation engine**

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Author Eclipse plugin uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

**Size limit of Sequence view (MB)**

When the result of an XQuery transformation is set as a sequence (Present as a sequence option (on page 839)) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option.

**Format transformer output**

Specifies whether or not the output of the transformer is formatted and indented (pretty-print (on page 2082)).
Note:
This option is ignored if you choose Present as a sequence (on page 839) (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes
If selected, Oxygen XML Author Eclipse plugin takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

Note:
This option is ignored if you choose Present as a sequence (on page 839) (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences
To configure global options for XQuery transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE.

Oxygen XML Author Eclipse plugin allows you to configure the following XQuery options for the Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")
Sets a Saxon 10.6 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")
This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")
This option activates the linked tree model.

Strip whitespaces ("-strip")
Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- All ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- Ignore ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source
document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

- **None ("none")** - Strips no whitespace before further processing.

The following option is available for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 10.6 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update ("-update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery ("-backup:(on|off)")**

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.
Saxon HE/PE/EE Advanced Preferences

To configure Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced.

The advanced XQuery options that can be configured for the Saxon 10.6 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

• **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 10.6 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (on page 820) for the particular transformation scenario.

  Note:
  If your URIResolver implementation does not recognize the given resource, the resolve(String href, String base) method should return a null value. Otherwise, the given resource will not be resolved through the XML Catalog (on page 567).

• **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 10.6 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (on page 820) for the particular transformation scenario.

XSLT Preferences

To configure the XSLT options, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XSLT.

The XSLT preferences page allows you to customize options for the default XSLT validation engines. You can also specify the engine directly in a validation scenario (on page 541).

Note:
If no specific engine is specified in the validation scenario and the XSLT file has a transformation scenario associated, Oxygen XML Author Eclipse plugin will use the engine specified in the transformation scenario.

The following options are available in this page:

MSXML Preferences ( Deprecated)

To configure the MSXML options, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XSLT > MSXML (Legacy).
The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

**Validate documents during parse phase**

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and stylesheet documents. If this option is selected, the resolution is disabled.

**Strip non-significant whitespaces**

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Start transformation in this mode**

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

**MSXML.NET Preferences (Deprecated)**

To configure the MSXML.NET options, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XSLT > MSXML.NET (Legacy).

The options in this preferences page for the MSXML.NET processor are as follows:

**Enable XInclude processing**

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the XSLT transformation scenario (on page 785).

**Validate documents during parse phase**

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**
By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

**Strip non-significant whitespaces**

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Forces ASCII output encoding**

There is a known problem with the .NET 1.X XSLT processor (System.Xml.Xsl.XslTransform class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as `?`. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&nnnn;` form).

**Allow multiple output documents**

This option allows you to create multiple result documents using the `exsl:document` extension element.

**Use named URI resolver class**

This option allows you to specify a custom URI resolver class to resolve URI references in `<xsl:import>` and `<xsl:include>` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

**Assembly file name for URI resolver class**

This option specifies a file name of the assembly where the specified resolver class can be found. The *Use named URI resolver class option (on page 190)* specifies a partially or fully qualified URI resolver class name (for example, Acme.Resolvers.CacheResolver). Such a name requires additional assembly specification using this option or the *Assembly GAC name for URI resolver class option (on page 190)*, but fully qualified class name (which always includes an assembly specifier) is all-sufficient.

**Assembly GAC name for URI resolver class**

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found.
List of extension object class names

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a plugin EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the username:password@domain format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the username:password@domain format (all parts are optional).

Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE.

Saxon-HE/PE/EE Options

Oxygen XML Author Eclipse plugin allows you to configure the following XSLT options for the Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Select this option if you want to use a Saxon 10.6 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")
Line numbers where errors occur are included in the output messages.

**Expand attributes defaults (“-expand”)**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source (“-dtd”)**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Strip whitespaces (“-strip”)**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All** ("all") - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips *all* ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following options are available for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 10.6 processors.

**Allow calls on extension functions (“-ext”)**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`).
It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The options available specifically for Saxon 10.6 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Saxon-HE/PE/EE Advanced Preferences**

To configure the Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced.

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 10.6 transformer (the `-r` option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from the dialog box for configuring the XSLT extension (on page 820) for the particular transformation scenario.
• **Collection URI Resolver class name** ("-cr") - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 10.6 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding **jar** or **class** extension must be configured from the dialog box for configuring the XSLT extension *(on page 820)* for the particular transformation scenario.

### Saxon6 Preferences

To configure the **Saxon 6** options, open the **Preferences** dialog box *(on page 61)* and go to **XML > XSLT- XQuery > XSLT > Saxox > Saxon6**.

The built-in Saxon 6 XSLT processor can be configured with the following options:

• **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.

• **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.

• **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.

### XSLTProc Preferences

To configure **XSLTProc** options, open the **Preferences** dialog box *(on page 61)* and go to **XML > XSLT- XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

• **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in XSLT transformation scenarios *(on page 785)*.

• **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.

• **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.

• **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.

• **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.

• **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
• **Show version of libxml and libxslt used** - If selected, Oxygen XML Author Eclipse plugin will display in the Warnings view the version of the libxml and libxslt libraries invoked by XSLTProc.

• **Show time information** - If selected, the Warnings view will display the time necessary for running the transformation.

• **Show debug information** - If selected, the Warnings view will display debug information about what templates are matched, parameter values, and so on.

• **Show all documents loaded during processing** - If selected, Oxygen XML Author Eclipse plugin will display in the Warnings view the URL of all the files loaded during transformation.

• **Show profile information** - If selected, Oxygen XML Author Eclipse plugin will display in the Warnings view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.

• **Show the list of registered extensions** - If selected, Oxygen XML Author Eclipse plugin will display in the Warnings view a list with all the registered extension functions, extension elements and extension modules.

• **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

• **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

### XML Structure Outline Preferences

To configure options regarding the Outline view (on page 299), open the Preferences dialog box (on page 61) and go to XML Structure Outline. It contains the following options:

**Preferred attribute names for display**

The preferred attribute names when displaying the attributes of an element in the Outline view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

**Enable outline drag and drop**

Drag and drop is disabled for the tree displayed in the Outline view only if there is a possibility to accidentally change the structure of the document by such operations.

### Configuring Options

A set of options controls the behavior of Oxygen XML Author Eclipse plugin, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Author Eclipse plugin includes several distinct layers of option values.

The option layers are as follows (sorted from high priority to low):
• **Global Options** *(on page 61)*

Allows individual users to personalize Oxygen XML Author Eclipse plugin according to their specific needs.

• **Customized Default Options** *(on page 196)*

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

**Note:**

Once this layer is set, it represents the initial state of Oxygen XML Author Eclipse plugin when an end-user selects the **Restore defaults** *(on page 62)* or **Reset Global Options** *(on page 197)* actions.

• **Default Options**

The predefined default values, tuned so that Oxygen XML Author Eclipse plugin behaves optimally in most working environments.

**Important:**

If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

### Customizing Default Options

Oxygen XML Author Eclipse plugin has an extensive set of options that you can configure. When Oxygen XML Author Eclipse plugin is installed, these options are set to default values. You can provide a different set of default values for an installation using an XML options file.

#### Creating an XML Options File

To create an options file, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Author Eclipse plugin and open the Preferences dialog box *(on page 61)*.
3. Go through the options and set them to the desired defaults.
4. Go to back to the main preferences page and click **Export Global Options** to create an XML options file.

### Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Author Eclipse plugin installation to use the customized default options from the created XML options file.

The possible methods for using customized default options during an installation include:
• Copy the XML Options File to the Installation Directory

In the \[OXYGEN_INSTALL_DIR\], create a folder called preferences and copy the created XML options file into it (for example: \[ECLIPSE-INSTALL-DIR\]/plugins/com.oxygenxml.author/preferences/default.xml, or if the plugin was installed as a drop-in: \[ECLIPSE-INSTALL-DIR\]/dropins/com.oxygenxml.author/plugins/com.oxygenxml.author/preferences/default.xml).

• Specify a Path to the XML Options File in a Startup Parameter

Set the path to the XML options file as the value of the com.oxygenxml.default.options system property in the Eclipse configuration file (\[ECLIPSE-INSTALL-DIR\]/configuration/config.ini). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

  ```
  com.oxygenxml.default.options=file:\default.xml
  ```

  This will make Oxygen XML Author Eclipse plugin look for default.xml inside the installation folder (for example: \[ECLIPSE-INSTALL-DIR\]/plugins/com.oxygenxml.author/preferences/default.xml, or if the plugin was installed as a drop-in: \[ECLIPSE-INSTALL-DIR\]/dropins/com.oxygenxml.author/plugins/com.oxygenxml.author/preferences/default.xml).

- A system variable that specifies the file path. For example:

  ```
  com.oxygenxml.default.options=file:\${system(CONFIG)}/default.xml
  ```

- An environmental variable that specifies the file path. For example:

  ```
  com.oxygenxml.default.options=file:\${env(CONFIG)}/default.xml
  ```

Note:
In the Eclipse configuration file, the backslash (\) is considered a special character. Therefore, use forward slashes for separators inside the file path.

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the preferences page of the Oxygen XML Author Eclipse plugin. To open this page, open the Preferences dialog box (on page 61). The export operation allows you to save global preferences as an XML options file and the import operation allows you to load the options file. You can use this file to reload the options on your computer or to share with others.

The following buttons are available at the bottom of the preferences page:

  - Reset Global Options
Restores the preference to the factory defaults or to customized defaults (on page 196). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

**Import Global Options**

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a project file (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

**Export Global Options**

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

**Import/Export Transformation or Validation Scenarios**

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, framework (on page 2080) option files, or exported scenario files). To access these import and export actions, open the **Preferences** dialog box (on page 61) and go to **Scenarios Management**. The following actions are available:

**Import Global Transformation Scenarios**

Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

**Export Global Transformation Scenarios**

Stores a set of global transformation scenarios in a specialized *scenarios* file.

**Import Global Validation Scenarios**

 Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

**Export Global Validation Scenarios**

Stores a set of global validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Global Transformation Scenarios** and **Import
Global Validation Scenarios actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word import.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Author Eclipse plugin includes a variety of built-in editor variables. You can also create your own custom editor variables (on page 208) by using the Custom Editor Variables preferences page (on page 64).

Editor variables are evaluated and automatically expanded in many places in the application, when:

- Creating new documents from file templates (on page 228).
- Inserting code templates (on page 228) in the Text or Author editor modes.
- Executing predefined Built-in Author Mode Operations (on page 1449) that have editor variables given as parameter values.
- Running validation scenarios (on page 541) that use editor variables inside to reference various resources.
- Executing transformation scenarios (of type ANT, DITA-OT (on page 1975), XSLT (on page 817), etc.) that have editor variables set as parameter values or as values for references to various resources.
- Expanding CSS imports (on page 1603) for editing in the Author visual editing mode.
- Using specific Java API `UtilAccess.expandEditorVariables(String, URL)` from plugins and framework extensions.

You can use the following editor variables in Oxygen XML Author Eclipse plugin commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, and validation scenarios:

- `${activeConditionSet}` - Current active profiling condition set (on page 420) name. If there is no active condition set, the variable will be replaced with an empty string.
- `${af}` - The local file path of the ZIP archive that includes the currently edited document.
- `${afd}` - The local directory path of the ZIP archive that includes the currently edited document.
- `${afdu}` - The URL path of the directory of the ZIP archive that includes the currently edited document.
- `${afn}` - The file name (without parent directory and without file extension) of the zip archive that includes the currently edited file.
- `${afne}` - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the currently edited file.
- `${afu}` - The URL path of the ZIP archive that includes the currently edited document.
• `${answer(@id)}` - Used in conjunction with the `${ask}` editor variable. The `@id` parameter is required and identifies the answer from the `${ask}` editor variable with the same ID.

Example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="topic_lcf_lcf4_tdb">
  <title></title>
  <body>
    <data name="${ask('Set a data name', String, 'name', @name)}"></data>
    <p>The name is: ${answer(@name)}</p>
  </body>
</topic>
```

• `${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}` - To prompt for values at runtime, use the `ask(message, type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)` editor variable. You can set the following parameters:

  ◦ 'message' - The displayed message. Note the quotes that enclose the message.
  ◦ 'default-value' - Optional parameter. Provides a default value.
  ◦ '@id' - Optional parameter. Used for identifying the variable to reuse the answer using the `${answer(@id)}` editor variable.
  ◦ 'type' - Optional parameter (defaults to `generic`), with one of the following values:

**Note:**
The title of the dialog box will be determined by the type of parameter and as follows:

  - For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the 'message'.
  - For the other parameters listed below, the title will be the name of that respective parameter.
  - If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: <code>${ask('message', type, 'default')}</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>generic</code> (default)</td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', url, 'default_value')}</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Description: Input is considered a URL. Oxygen XML Author Eclipse plugin checks that the provided URL is valid.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>▪ ${ask('Input URL', url)} - The displayed dialog box has the name <em>Input URL</em>. The expected input type is URL.</td>
</tr>
<tr>
<td></td>
<td>▪ ${ask('Input URL', url, '<a href="http://www.example.com')%7D">http://www.example.com')}</a> - The displayed dialog box has the name <em>Input URL</em>. The expected input type is URL. The input field displays the default value <a href="http://www.example.com">http://www.example.com</a>.</td>
</tr>
<tr>
<td>relative_url</td>
<td>Format: ${ask('message', relative_url, 'default')}</td>
</tr>
<tr>
<td></td>
<td>Description: Input is considered a URL. Oxygen XML Author Eclipse plugin tries to make the URL relative to that of the document you are editing.</td>
</tr>
<tr>
<td></td>
<td>Note: If the $ask editor variable is expanded in content that is not yet saved (such as an <em>untitled</em> file, whose path cannot be determined), then Oxygen XML Author Eclipse plugin will transform it into an absolute URL.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>${ask('File location', relative_url, 'C:/example.txt')} - The dialog box has the name <em>File location</em>. The URL inserted in the input box is made relative to the currently edited document location.</td>
</tr>
<tr>
<td>password</td>
<td>Format: ${ask('message', password, 'default')}</td>
</tr>
<tr>
<td></td>
<td>Description: The input is hidden with bullet characters.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><img src="image.png" alt="Image" /></td>
<td>- The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.</td>
</tr>
<tr>
<td><img src="image2.png" alt="Image" /></td>
<td>- The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default <code>abcd</code> value.</td>
</tr>
<tr>
<td><strong>combobox</strong></td>
<td><strong>Format:</strong> <code>${ask('message', combobox, ('real_value1':'rendered_value1';..;''real_valueN':'rendered_valueN'), 'default')}</code></td>
</tr>
<tr>
<td><strong>Description:</strong></td>
<td>Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated value (<code>real_value</code>).</td>
</tr>
<tr>
<td><img src="note.png" alt="Note" /></td>
<td><strong>Note:</strong> The list of <code>real_value</code>:<code>rendered_value</code> pairs can be computed using `${xpath_eval()}$.</td>
</tr>
<tr>
<td><img src="note2.png" alt="Note" /></td>
<td><strong>Note:</strong> The 'default' parameter specifies the default-selected value and can match either a key or a value.</td>
</tr>
<tr>
<td><img src="example7.png" alt="Example" /></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td><img src="note3.png" alt="Note" /></td>
<td><strong>Note:</strong> In this example, the default value is indicated by the <code>osx</code> key. However, the same result could be obtained if the default value is indicated by <code>macOS</code>, as in the following example: <code>${ask('Operating System', combobox, (win':'Microsoft Windows';macos':'macOS';lnx':Linux/UNIX'), 'macOS')}</code></td>
</tr>
<tr>
<td><img src="example10.png" alt="Example" /></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td><img src="example12.png" alt="Example" /></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Parameter</td>
<td>Format: ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description:</td>
<td>Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td>Note:</td>
<td>The list of 'real_value':'rendered_value' pairs can be computed using ${xpath_eval()}.</td>
</tr>
<tr>
<td></td>
<td>The 'default' parameter specifies the default-selected value and can match either a key or a value.</td>
</tr>
<tr>
<td>Example:</td>
<td>▪ ${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':Linux/UNIX'), 'macos')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
<tr>
<td></td>
<td>▪ ${ask('Operating System', editable_combobox, ${xpath_eval(for $pair in (['win', 'Microsoft Windows'] , ['macos', 'macOS'] , ['lnx', 'Linux/UNIX']) return ‘’</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value.</td>
</tr>
<tr>
<td>Note:</td>
<td>The list of 'real_value':'rendered_value' pairs can be computed using ${xpath_eval()}.</td>
</tr>
</tbody>
</table>
**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The ‘<em>default</em>’ parameter specifies the default-selected value and can match either a key or a value.</td>
</tr>
</tbody>
</table>

**Example:**

- `$\{ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')\}` - The dialog box has the name ‘*Operating System*’. The radio button group allows you to choose between the three operating systems.

  **Note:**
  In this example, *macOS* is the default-selected value and if selected, it would return *macos* for the output.

- `$\{ask('Operating System', radio, ($xpath_eval(for $pair in (["win","Microsoft Windows"], ["macos","macOS"], ["lnx","Linux/UNIX"]) return "" || $pair?1 || ":" || $pair?2 || ":")}, 'ios')\}`

**Note:**

- `$\{author.name\}` - Expands to the current author name that is set in the **Review preferences page (on page 139)**.
- `$\{caret\}` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection** plugin.

  **Note:**
  The `$\{caret\}` editor variable is available only for parameters that take XML content as values. It is replaced with the `$\{UNIQUE_CARET_MARKER_FOR_AUTHOR\}` macro. The default Author operations process this macro and position the cursor at the designated offset.

  **Note:**
  The `$\{caret\}` editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the `insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)` method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.

- `$\{cf\}` - Current file as file path, that is the absolute file path of the currently edited document.
- `$\{cfd\}` - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
• \${cfdu} - Current file folder as URL, that is the path of the currently edited document up to the name of the parent folder, represented as a URL.

• \${cfn} - Current file name without the extension and parent folder. The current file is the one currently open and selected.

• \${cfne} - Current file name with extension. The current file is the one currently open and selected.

• \${comma} - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.

• \${configured.ditaot.dir} - The default directory of the DITA Open Toolkit distribution, as configured in the DITA preferences page (on page 73).

• \${cp} - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.

• \${currentFileURL} - Current file as URL, that is the absolute file path of the currently edited document represented as URL.

• \${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

• \${dbgXML} - The local file path to the XML document that is currently selected.

• \${dbgXSL} - The local file path to the XSL/XQuery document that is currently selected.

• \${dita.dir.url} - A special local contextual editor variable that gets expanded only in the Libraries dialog box that is accessible from the Advanced tab of DITA transformation scenarios. The Libraries dialog box allows you to specify additional libraries (JAR (on page 2080) files or additional class paths) to be used by the transformer. This \${dita.dir.url} editor variable gets expanded to the value of the dita.dir parameter from the Parameters tab of the DITA transformation scenario.

• \${ds} - The path of the detected schema as a local file path for the current validated XML document.

• \${dsu} - The path of the detected schema as a URL for the current validated XML document.

• \${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \${system(var.name)} editor variable.

• \${framework(fr_name)} - The path (as URL) of the fr_name framework.

• \${framework} - The path (as URL) of the current framework directory.

• \${frameworkDir(fr_name)} - The path (as file path) of the fr_name framework.

Note: Since multiple frameworks might have the same name (although it is not recommended), for both \${framework(fr_name)} and \${frameworkDir(fr_name)} editor variables Oxygen XML Author Eclipse plugin employs the following algorithm when searching for a given framework name:
All frameworks are sorted, from high to low, according to their **Priority** (on page 82) setting from the **Document Type** configuration dialog box (on page 81). Only frameworks that have the **Enabled** checkbox selected are taken into account.

Next, if the two or more frameworks have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:

* Frameworks stored in the internal Oxygen XML Author Eclipse plugin options.
* Additional frameworks added in the **Locations** preferences page (on page 80).
* Frameworks installed using the add-ons support.
* Frameworks found in the main framework location (on page 80) (Default or Custom).

- **${frameworkDir}** - The path (as file path) of the current framework directory.
- **${frameworks}** - The path (as URL) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the **Document Type Association > Locations** preferences page.
- **${frameworksDir}** - The path (as file path) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the **Document Type Association > Locations** preferences page.
- **${home}** - The path (as URL) of the user home folder.
- **${homeDir}** - The path (as file path) of the user home folder.
- **${i18n(key)}** - Editor variable used only at framework-level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see *Localizing Frameworks* (on page 1526).
- **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **${makeRelative(base,location)}** - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

**Example:**

```
${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu})
```

- **${oxygenHome}** - Oxygen XML Author Eclipse plugin installation folder as URL.
- **${oxygenInstallDir}** - Oxygen XML Author Eclipse plugin installation folder as file path.
- **${pd}** - The file path to the folder that contains the current project file (.xpr).
- **${pdu}** - The URL path to the folder that contains the current project file (.xpr).
- **${pluginDir(pluginID)}** - Each plugin has an ID specified in its **plugin.xml** file. This editor variable expands to the file path of the folder that contains the **plugin.xml** file where that specific plugin ID is located.
• \${pluginDirURL(pluginID)} - Each plugin has an ID specified in its plugin.xml file. This editor variable expands to the URL path of the folder that contains the plugin.xml file where that specific plugin ID is located.

• \${pn} - Current project name.

• \${ps} - Path separator, which is the separator that can be used on the current platform (Windows, macOS, Linux) between library files specified in the class path.

• \${rootMapDir} - Will be expanded to the current root map parent directory file path.

• \${rootMapDirURL} - Will be expanded to the current root map parent directory URL.

• \${rootMapFile} - Will be expanded to the current root map file path.

• \${rootMapURL} - Will be expanded to the current root map URL. For example, if in the main DITA Map you define a key with a certain value:

```
<keydef keys="test">
  <topicmeta>
    <keywords><keyword>ABC</keyword></keywords></topicmeta>
</keydef>
```

you can modify a DITA-OT publishing parameter to have the value: \${xpath_eval(doc('${rootMapURL}')/keydef[@keys='test']/keywords/keyword/text())}. It will be expanded to the value of that specified key name.

• \${selection} - The currently selected text content in the currently edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

• \${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \${env(VAR_NAME)} editor variable instead.

• \${timeStamp} - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

• \${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the Editor / Print Preferences page.

• \${tsf} - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.

• \${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.

• \${xmlCatalogFilesList} - A list of file paths that point to all known XML catalog files, separated by semicolons (;).

• \${xpath_eval(expression)} - Evaluates an XPath expression. Depending on the context, the expression can be:

  ◦ static - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's Output tab.

  Example:

  \${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

Example:

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)})
```

### Custom Editor Variables

An *editor variable* ([on page 199]) can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the **Custom Editor Variables** preferences page ([on page 64]). To create a custom editor variable, follow these steps:

1. Open the **Preferences** dialog box ([on page 61]) and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

**Related information**

*Editor Variables* ([on page 199])

### Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior.

*com.oxygenxml.disable.http.protocol.handlers*

- **Allowed Values**: true or false
- **Default Value**: false
- **Purpose**: By default, Oxygen XML Author Eclipse plugin uses the open source Apache HTTP Client software for HTTP(S) connections. If set to true, the default Java Sun HTTP(S) will be used instead. You will also lose WebDAV support and possibly other related features.

*com.oxygenxml.present.license.reminders*

- **Allowed Values**: true or false
- **Default Value**: true
- **Purpose**: When set to false, Oxygen XML Author Eclipse plugin will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.
**com.oxygenxml.enable.content.reference.caching**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** Enables content reference caching.

**com.oxygenxml.eclipse.remove.grid.editing.mode**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** When set to false, Oxygen XML Author Eclipse plugin does not show the Grid editing mode when opening an XML document.

**com.oxygenxml.default.java.accessibility**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** System property that can be set to true to force the default detection of Java accessibility. If com.sun.java.accessibility.AccessBridge cannot be loaded, Oxygen XML Author Eclipse plugin forces the Java accessibility to be disabled.

**com.oxygenxml.floating.license.timeout**

- **Allowed Values:** An integer (minutes)
- **Default Value:** 120
- **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.

**com.oxygenxml.language**

- **Allowed Values:** Language code (for example, en-us)
- **Default Value:** N/A
- **Purpose:** Property that holds the language code set during installation.

**com.oxygenxml.default.options**

- **Allowed Values:** A URL-type relative or absolute path.
- **Default Value:** N/A
- **Purpose:** Provides the path to an XML file containing default application options. For more details, see Customizing Default Options (on page 196).

**com.oxygenxml.customOptionsDir**
• **Allowed Values**: A file system absolute path pointing to a folder.
• **Default Value**: N/A
• **Purpose**: Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. For more details, see Importing/Exporting/Resetting Global Options (on page 197).

**com.oxygenxml.ApplicationDataFolder** *(Windows only)*

• **Allowed Values**: A file system absolute path pointing to a folder.
• **Default Value**: %APPDATA%
• **Purpose**: When the application runs on Windows, you can set this property to change the location where the application considers that the APPDATA folder is located.

**com.oxygenxml.editor.frameworks.url**

• **Allowed Values**: A URL-type absolute path.
• **Default Value**: OXYGEN_DIR /frameworks
• **Purpose**: Changes the folder where the application considers that the main frameworks are installed. It has the same effect as changing the custom frameworks directory value in the Location preferences page (on page 80).

**com.oxygenxml.editor.plugins.dir**

• **Allowed Values**: The path can be specified with any of the following:
  - A URL or file path that is relative to the application's installation folder (for example: 
    -Dcom.oxygenxml.editor.plugins.dir=my-plugins).
  - A system variable that specifies the file path (for example:
    -Dcom.oxygenxml.editor.plugins.dir=${system(CONFIG)}/plugins).
  - An environmental variable that specifies the file path (for example:
    -Dcom.oxygenxml.editor.plugins.dir=${env(CONFIG)}/plugins).
• **Default Value**: N/A
• **Purpose**: Specifies the directory where the application finds plugins to load.

**com.oxygenxml.MultipleInstances**

• **Allowed Values**: true or false
• **Default Value**: false
• **Purpose**: If set to true, multiple instances of the application are allowed to be started.

**com.oxygenxml.xep.location**

• **Allowed Values**: A file system absolute path pointing to a folder.
• **Default Value**: N/A
• **Purpose**: Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the FO Processors preferences page (on page 168).
com.oxygenxml.additionalclasspath

- **Allowed Values**: A list of JAR (on page 2080)-type resources separated by a classpath separator.
- **Default Value**: N/A
- **Purpose**: An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the `lib` folder.

com.oxygenxml.user.home (Windows only)

- **Allowed Values**: A file system absolute path pointing to a folder.
- **Default Value**: `USERPROFILE` folder
- **Purpose**: Overwrites the user home directory that was implicitly detected for the application.

com.oxygenxml.use.late.delegation.for.author.extensions

- **Allowed Values**: true or false
- **Default Value**: true
- **Purpose**: All Java extensions in a framework configuration are instantiated in a separate class loader. When true, the JAR libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When false, the parent class loader will take precedence.

com.oxygenxml.stack.size.validation.threads

- **Allowed Values**: The number of bytes used for validation threads.
- **Default Value**: $5 \times 1024 \times 1024$
- **Purpose**: Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger Thread stack size to parse complex schemas. The default value should be more than enough.

com.oxygenxml.jing.skip.validation.xhtml.data.attrs

- **Allowed Values**: true or false
- **Default Value**: true
- **Purpose**: By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

com.oxygenxml.report.problems.url
• **Allowed Values:** User-defined URL
• **Default Value:** N/A
• **Purpose:** The URL where a problem reported through the Report Problem dialog box is sent. The report is sent in XML format using the `report` parameter with the POST HTTP method.

**com.oxygenxml.parallel.title.computing.threads**

• **Allowed Values:** Integers
• **Default Value:** 4
• **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the DITA Maps Manager view.

**com.oxygenxml.hidpi.scaling**

• **Allowed Values:** Numerical values between 1 and 2 (1, 1.5, and 2 have been tested, and for example, 1.5 is for 150% scaling)
• **Default Value:** N/A
• **Purpose:** Used to override the HiDPI scaling detection to force a specific scaling setting. This is helpful if you encounter scaling detection issues in Windows or Linux.

**com.oxygenxml.prefer.plugin.classloader.context.loader**

• **Allowed Values:** `true` or `false`
• **Default Value:** `true`
• **Purpose:** Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from Oxygen's `lib` directory.

**com.oxygenxml.classic.file.output.stream.save**

• **Allowed Values:** `true` or `false`
• **Default Value:** `false`
• **Purpose:** When set to `true`, the files are saved using a Java classic file output stream, which destroys the NTFS alternate data streams set on the file. However, this might prevent data loss in the rare occasions when Oxygen XML Author Eclipse plugin saves empty file content over shared network drives.

**com.oxygenxml.disable.correct.over.ascii.chars**

• **Allowed Values:** `true` or `false`
• **Default Value:** `false`
**Purpose:** By default, Oxygen XML Author Eclipse plugin will escape non-ASCII characters (encode them with their hexadecimal equivalent) within URL paths. If set to `true`, non-ASCII characters in URL paths will not be escaped. This is helpful if you are using a non-Latin alphabet (such as Arab, Japanese, Chinese) since the URL paths will remain unchanged and will be more readable.

```java
com.oxygenxml.format.indent.files.parallel
```

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** By default, when using the Format and Indent Files action from the Project Explorer view, only one thread will be used for the formatter. If the system property is enabled, up to four parallel threads are used by the operation, speeding up the processing when formatting very large or a large amount of documents.

### Localizing of the User Interface

To localize the Oxygen XML Author Eclipse plugin, you can use one of the following methods:

- **Localization through the update site:**

  Start Eclipse, go to Help > Install New Software. Click Add Site in the Available Software tab of the Software Updates dialog box. Enter `https://www.oxygenxml.com/InstData/Author/Eclipse/site.xml` in the location field of the Add Site dialog box. Click OK. Select the language pack checkbox.

- **Localization through the zip archive:**

  Go to `https://www.oxygenxml.com/download.html` and download the zip archive with the plugin language pack. Unzip the downloaded zip archive in the `dropins` subdirectory of the Eclipse install directory. Restart Eclipse.

If your operating system is running in the language you want to start Eclipse in (for example, you are using Japanese version of Windows, and you want to start Eclipse in Japanese), Oxygen XML Author Eclipse plugin matches the appropriate language from the language pack. However, if your operating system is running in a language other than the one you want to start Eclipse in (for example, you are using the English version of Windows, and you want to start Eclipse in Japanese, if you have the required operating system language support including the keyboard layouts and input method editors installed), specify the `-nl <locale>` command-line argument when you launch Eclipse. Oxygen XML Author Eclipse plugin uses the translation file that matches the specified `<locale>`.

You can also localize the Eclipse plugin to a different language than the initial languages in the language pack. Duplicate the `plugin.properties` file from the Oxygen XML Author Eclipse plugin plugin installation directory, translate all the keys in the file and change its name to `plugin_<locale>.properties`.
5. Perspectives

An Oxygen XML Author Eclipse plugin perspective (on page 2082) is a layout geared towards a specific use. The Oxygen XML Author Eclipse plugin interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Author Eclipse plugin. You can change the perspective by selecting the respective icon in the top-right corner of Oxygen XML Author Eclipse plugin or by selecting the perspective from the Window > Perspective > Open Perspective menu.

Oxygen XML Perspective

The Oxygen XML perspective (on page 2082) is the most commonly used perspective and it is the default perspective when you start Oxygen XML Author Eclipse plugin for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select Oxygen XML from the Window > Open Perspective menu.

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Author Eclipse plugin. Most of the menus are common for all types of documents. However, Oxygen XML Author Eclipse plugin also includes some context-sensitive and framework (on page 2080)-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, Author mode also includes framework (on page 2080)-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a DITA Author Custom Actions toolbar is available that includes operations that are specific to DITA documents).

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Author Eclipse plugin includes a large variety of dockable (on page 2078) views to assist you with editing, viewing, searching, validating, transforming, and organizing your
documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view (≡).

Some of the most helpful views in the **Oxygen XML perspective** include the following:

- **Project Explorer view (on page 244)** - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view (on page 1762)** - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- **Outline view (on page 299)** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view (on page 308)** - Displays the messages generated as a result of user actions such as validations (on page 517), transformation scenarios (on page 785), spell checking in multiple files (on page 268), search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view (on page 302)** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an in-place attribute editor (on page 379).
- **Model view (on page 304)** - Presents the currently edited element structure model and additional documentation as defined in the schema.
- **Elements view (on page 306)** - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode this view (on page 382)** includes tabs that present additional information relative to the cursor location.
- **Entities view (on page 307)** - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view (on page 903)** - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view (on page 1346)** - Displays the results from running an XPath expression.
- **Text view (on page 828)** - Displays the text output that is produced in XSLT transformations.
- **Browser view (on page 828)** - Displays HTML output from XSLT transformations.
• **Problems view** - A general Eclipse view that displays system-generated errors, warnings, or information associated with a resource.

• **Console view (on page 277)** - Status information generated by the Schema detection, validation, and transformation threads.

---

### Oxygen DB Perspective

The **Database perspective (on page 2082)** allows you to manage databases. To switch the focus to this **perspective**, select **Oxygen DB** from the Window > Open perspective menu.

The **Database perspective** offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

### Supported Databases

Oxygen XML Author Eclipse plugin supports numerous types of databases, including:

- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL (Enterprise edition only)
- SharePoint (CMS)
- Oracle Berkeley DB XML Database *(Deprecated)*
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only) *(Deprecated)*
Note:
For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Author Eclipse plugin. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Author Eclipse plugin go to the Oxygen XML Author Eclipse plugin website.

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the Table Explorer view (on page 1361).
- Handling the values from XML Type columns as String values.

Note:
The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Author Eclipse plugin by registering the database driver as a Generic JDBC type driver when defining the data source for accessing the database. For more information, see Database Connection Support (on page 1363).

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Author Eclipse plugin editor panel.
- Handling the values from XML Type columns as XML instance documents that can be opened and edited in an Oxygen XML Author Eclipse plugin editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip:
Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the perspective.

Toolbars

Contains all actions needed to configure and control the debugging process.

Editor Pane
The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

**Data Source Explorer View (on page 1359)**

Provides browsing support for the configured connections.

**Table Explorer View (on page 1361)**

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

**Related information**

- Working with Databases (on page 1359)
- Data Source Explorer View (on page 1359)
- Table Explorer View (on page 1361)
6. Editing Modes

The main editing area in Oxygen XML Author Eclipse plugin includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Author Eclipse plugin offers the following editing modes:

- **Text (on page 219)** - This mode presents the source of an XML document.
- **Grid (on page 219)** - This mode displays an XML document as a structured grid of nested tables.
- **Author (on page 220)** - This mode enables you to edit in a WYSIWYG-like editor.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting** option (on page 124) is selected in the **Edit Modes** preferences page, then the edit mode specified in the **Document Type** configuration dialog box (on page 81) is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting** option (on page 124) is not selected, then the edit mode specified in the **table in the Edit Modes preferences page** (on page 124) is used when that particular type of document is initially opened.

**Text Editing Mode**

The **Text** mode editor in Oxygen XML Author Eclipse plugin is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Author Eclipse plugin also includes specialized editing actions, a powerful **Content Completion Assistant (on page 292)**, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

For more information about working with XML documents in **Text** mode and all of the details about its features, see the **Editing XML Documents in Text Mode** section (on page 280).

**Grid Editing Mode**

The Oxygen XML Author Eclipse plugin **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can
easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area.

**Figure 34. Grid Editing Mode**

For more information about working with XML documents in **Grid** mode and all of the details about its features, see the [Editing XML Documents in Grid Mode](#) section (on page 329).

**Related information**

[Editing XML Documents in Grid Mode](#) (on page 329)

**Author Editing Mode**

The **Author** editing mode in Oxygen XML Author Eclipse plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Author Eclipse plugin provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the **Author** button at the bottom of the editing area.

For more information about working with XML documents in **Author** mode and all of the details about its features, see the [Editing XML Documents in Author Mode](#) section (on page 339).

**Related information**

[Editing XML Documents in Author Mode](#) (on page 339)
7.

Working With Any Type of Document

Oxygen XML Author Eclipse plugin includes a variety of general features that can be used when working with any type of document. More specialized features are available when working with specific type of documents, such as the various types of XML documents, CSS, JavaScript, Markdown, and more. For details about those specialized features for specific types of documents, see Editing Documents (on page 279).

This chapter includes information about how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Author Eclipse plugin for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Author Eclipse plugin, such as the file and directory comparison tools.

Creating, Opening, Saving, and Closing Documents

Oxygen XML Author Eclipse plugin includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Author Eclipse plugin includes a helpful New Document wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also create your own templates (on page 228) and share them with others (on page 234).

To quickly create a new document:

1. Click the New button on the toolbar or select File > New > Other > Oxygen XML Author Eclipse plugin.
2. Select the type of document that you want to create.

   Tip:
   You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click the Next button, then Finish.

New Document Wizard

Oxygen XML Author Eclipse plugin supports a wide range of document types. The New Document wizard presents the default associations between a file extension and the type of editor that opens the file. The New Document wizard creates a skeleton document that may contain a root element, the document prolog, and
possibly other child elements depending on options that are specific for each schema type. The wizard also provides access to the New from Templates option (on page 228) that opens a wizard where you can create a document based upon built-in templates or custom templates.

New Document Wizard

To create a new document in Oxygen XML Author Eclipse plugin, follow these steps:

1. Click the New button on the toolbar or select File > New > Other > Oxygen XML Author Eclipse plugin.

   Result: The New Document wizard is displayed with all the supported document types.

2. Select the type of document that you want to create. Oxygen XML Author Eclipse plugin includes a series of Eclipse wizards that help you create the new document based upon the type you choose.

   Tip:
   You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click Next.

   Result: The next wizard page allows you to select a path where you want to store the new file and for some document types it includes some customization options. If you selected XML File or XML Schema (XSD) File for the type of document, you need to select the storage path and click Next again to reach customization options.

   Note:
   For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see Creating a New DITA Topic (on page 1826).

4. After configuring the options for the particular type of document, click Finish to create the file. If the Open file for editing when done option is selected, the new file will be opened in the appropriate editor.
New XML Document Wizard

Figure 35. New XML File Configuration Options

If you selected XML File for the type of document you want to create, the wizard will include the following options:

**URL**

Specifies the path to the schema file. When you select a file, Oxygen XML Author Eclipse plugin analyzes its content and tries to fill in the rest of the dialog box.

**Schema Type**

Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.

**Public ID**

Specifies the PUBLIC identifier declared in the document prolog.

**Namespace**

Specifies the document namespace.

**Prefix**
Specifies the prefix for the namespace of the document root.

Root Element

Populated with elements defined in the specified schema, enables selection of the element used as document root.

Description pane

A small description of the selected document root.

Add Optional Content

If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Author Eclipse plugin generates the first element of an `<xs:choice>` schema element in the skeleton XML document. Oxygen XML Author Eclipse plugin creates this document in a new editor panel when you click Finish.

XSL Document Wizard

Figure 36. New XSL Document Configuration Options

![New XSL Document Configuration Options](image-url)
If you selected Stylesheet (XSL) File for the type of file you want to create, the wizard will include the following options:

**Stylesheet version**

Allows you to select the **Stylesheet version** number. You can select from: 1.0, 2.0, and 3.0.

**Add documentation annotations**

Select this option to generate the stylesheet annotation documentation.

### XML Schema (XSD) Document Wizard

**Figure 37. New XML Schema Configuration Options**

If you selected XML Schema (XSD) File for the type of file you want to create, the wizard will include the following options:

**Default XML Schema version**

Select this option to use the XML Schema version defined in the XML Schema preferences page (on page 179).

**XML Schema 1.0**
Sets the `@minVersion` attribute to 1.0 and the `@maxVersion` attribute to 1.1.

**XML Schema 1.1**

Sets the `@minVersion` attribute to 1.1.

**Target namespace**

Allows you to specify the schema target namespace.

**Namespace prefix declaration table**

This table contains namespace prefix declarations. Table information can be managed using the + New and × Delete buttons.

**Schematron Document Wizard**

*Figure 38. New Schematron Configuration Options*

If you selected Schematron File for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following option:

**Schematron version**

Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.
JSON Document Configuration Page

If you select **JSON** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

**Schema URL**

Specifies the path to a JSON Schema file that will be used to generate key-value pairs.

**Associate Schema in the Document**

If you select this option, the JSON instance will be generated with the JSON Schema associated directly in the document.

**Generate Optional Properties**

If you select this option, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate Additional Content**

If you select this option, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).
Creating New Documents Based on Templates

The New from Templates wizard (on page 221) allows you to select built-in templates or custom templates that you or other users created in previous sessions. You can access this wizard by selecting the New from Templates option in the New Document wizard (on page 221).

The categories of templates presented in the wizard include:

- **User-defined template directory** - You can add your own custom templates by creating template files (on page 228) in a directory and then add that directory to the list of template directories that Oxygen XML Author Eclipse plugin uses in the Document Templates preferences page (on page 78). This user-defined directory will appear in the New from templates wizard.

- **Global templates** - Contains a list of built-in templates as well as any user-defined custom templates (on page 228) that are saved in the templates directory of the Oxygen XML Author Eclipse plugin installation folder ([OXYGEN_INSTALL_DIR]/templates).

- **Framework templates** - Contains the list of templates defined in the Document Type configuration dialog box (Templates tab) (on page 104) for each framework (on page 2080).

New from Templates Wizard

To create a new document using this wizard, follow these steps:

1. Click the New button on the toolbar and select New from Templates (or select File > New > Other > Oxygen XML Author Eclipse plugin > New From Templates).

   **Result:** The New from Templates wizard is displayed where you to select various types of document templates.

2. Select the type of document that you want to create and click Next.

3. Choose the storage path and a file name for the new document.

4. Click the Finish button.

   **Result:** The new file is created and if the Open file for editing when done option is selected, the new file will be opened in the appropriate type of editor.

Creating New Document Templates

Oxygen XML Author Eclipse plugin allows you to create your own custom document templates and they will appear in the New from templates wizard (on page 228).

Creating a New Document Template

To create your own custom document template and have it appear in the new document wizard, follow these steps:
1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

**Tip:**
You can use *editor variables (on page 199)* in the template file content and they will be expanded when the files are opened. Also, see *Customizing Document Templates (on page 230)* for other template customization tips (for example, you could *add placeholders or hints (on page 233)* to assist authors).

2. Save the new document template and reference that location in Oxygen XML Author Eclipse plugin. There are several options for doing this:

   ◦ **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called *templates*) within that specific framework directory (usually a *custom framework (on page 1430)*). Then open the *Document Type* configuration dialog box *(on page 81)* for that specific framework, go to the *Templates tab (on page 104)*, and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, *${frameworkDir}/templates*). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

   ◦ **Saving the new template in the Oxygen installation directory** - Save the new template in the *templates* directory of the Oxygen XML Author Eclipse plugin installation directory (*[OXYGEN_INSTALL_DIR]/templates*). Document templates saved in this directory will appear in the *Global templates* category in the *New from templates wizard (on page 228)*.

   ◦ **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the *Document Templates preferences page (on page 78)*. This user-defined directory will appear in the *New from templates wizard (on page 228)* along with all the new document templates that you save inside it. Click **OK** or **Apply** to save your changes.

**Tip:**
If you want to create a new template for a binary file (e.g. a zip archive), you need to add *.bin* to the end of the file name (for example, *.*.zip.bin* or *.*.epub.bin*). Otherwise, the files will be treated as XML/text documents and you will be prompted to choose the editor type.

**Attention:**
The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, *My Custom Template1.xml* will appear in the new file wizard as *My Custom Template1*). You can also configure the displayed name in a properties file by following the procedure found in the *Configure the Displayed Names for Document Templates (on page 232)* section.
3. Open the new document wizard (-toolbar button or File > New > New from Templates) and you should see your custom template in the appropriate folder.

Note:
For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template (on page 230), you need to set the type property to dita in the corresponding properties file.

Related information
Customizing Document Templates (on page 230)
Sharing Custom Document Templates (on page 234)

Customizing Document Templates
Oxygen XML Author Eclipse plugin allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the New from templates wizard (on page 228).

Customizing the Icons for a Document Template
If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one following these guidelines:
   a. If you want to create a new properties file, you can use the Properties template found in the New Document folder in the New from templates wizard (on page 228). If you want to edit an existing template, you can find them within the subfolders in the templates folder for each framework (for example, the DITA topic properties file is located in: OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties).
   b. Use the same name as your custom template file except with a .properties extension (for example, MyTemplate.properties).
   c. In this properties file, specify the paths to the icons that will be used in the new file wizard. The properties file should look like this:

   ```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

Tip:
For DITA files, the type property must be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the DITA Maps Manager (on page 1762). For all other types of files, set it to general. The icons specified in this
2. Save the properties file in the same directory as your custom template.
3. Open the new file wizard (File > New > New from Templates) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the New button on the toolbar (or File > New > Other > Oxygen XML Author Eclipse plugin). The prefix or suffix is added to the name of the file in the File field.
- The new document dialog box that appears when you select New > New from Templates > [Template Name] > Next from the contextual menu in the Project Explorer view (on page 244). The prefix or suffix is added to the name of the file in the File field.
- For DITA files, it also applies to the new document dialog box that appears when you select Append Child > New, Insert Before > New, or Insert After > New from the DITA Maps Manager (on page 1762). The prefix or suffix is added to the name of the file in the Save as field.
- For DITA files, it also applies to the Fast Create Topics dialog box (on page 1829) that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.
   - If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file specifies the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```xml
<properties>
    <general type="general">
        <filenamePrefix>prod_</filenamePrefix>
        <filenameSuffix>_test</filenameSuffix>
    </general>
</properties>
```
**Important:**
For DITA files, the type property must be set to dita. For all other types of files, set it to general.

- If you edit an existing template, simply define the prefix/suffix as specified above *(on page 231)*.

2. Save the properties file in the same directory as the document template.

3. Open the new document wizard *(using the methods described above *(on page 231))* and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

**Note:**
The filenamePrefix and filenameSuffix properties can also have editor variables *(on page 199)* that do not require user interaction (i.e. editor variables that have $\{\text{ask}\}$ and $\{\text{answer}\}$ as values cannot be used).

**Configure the Displayed Names for Document Templates**

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a .properties extension (for example, `MyTemplate.properties`).

2. Add a displayName property in the properties file:

   ```
   displayName=My Template Name
   ```

   **Tip:**
   The names for framework *(on page 2080)*-specific document templates (such as DITA Topic or DocBook Article, as you would see in the Framework templates folder in the New file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

   ```
   displayName=${i18n(tag)}
   ```

   where tag refers to an entry in the translation.xml file for that specific framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml` for DITA).

3. Save the properties file in the same directory as the document template.

4. Open the new file wizard *(File > New > New from Templates)* and you should see the new name for the template.
Adding Placeholders or Hints in a Document Template

If a document template contains empty elements, it may not be clear to the Author what should be inserted in them. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
   <topic id="pi">
     <title><?oxy-placeholder content="Enter a title"?></title>
     <shortdesc><?oxy-placeholder content="Writing short descriptions induces the writer to clarify the main thesis of the topic. We recommended a 50 word limit."?></shortdesc>
     <body>
       <p><?oxy-placeholder content="A paragraph element should be a self-contained unit dealing with one idea or point."?></p>
     </body>
   </topic>
   ``

   Important:
   The elements that contain the placeholder processing instructions cannot contain other content/text, not even whitespace used for indentation. Otherwise, the placeholder will not be rendered properly.

3. Save the template file.
4. Use the New from templates wizard (on page 228) to create a new document using your customized template and you should see the hints in the open document.

Resources

To see a visual demonstration of how to customize document templates and to get more ideas for other advanced customization possibilities, watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.
Related information
Creating New Document Templates (on page 228)
Sharing Custom Document Templates (on page 234)

Sharing Custom Document Templates

Your custom document templates (on page 228) can be shared with the other members of your team so that they all have access to the templates in the New from templates wizard (on page 228). The best way to share them is by integrating them in an extended framework (on page 2080) (document type) configuration and then sharing the whole framework with the other users.

Sharing Custom Document Templates

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one (on page 1430), if you have not already done so.
2. Create the new document template (on page 228), if you haven't already done so.
3. Save the new template in a directory (for example, called templates) within your custom framework directory. Then open the Document Type configuration dialog box (on page 81) for that specific framework, go to the Templates tab (on page 104), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.
4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.
5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates. There are several methods for sharing frameworks and you can find details here: Sharing a Framework (on page 1584).

Related information
Sharing a Framework (on page 1584)

Opening Documents

To open a document in Oxygen XML Author Eclipse plugin, do one of the following:

- Go to File > Open File to display the Open File dialog box.
- Go to File > Open URL to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.
- Select the Open or Open with action from the contextual menu of the Project Explorer view (on page 244).
Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the View in Browser/System Application action that is available in the XML menu. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

Saving Documents

You can save the document you are editing with one of the following actions:

- File > Save.
- File > Save As - Displays the Save As dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- File > Save All - Saves all open documents.

Closing Documents

To close open documents, you can simply click the close icon (X) for the particular editor tab or use one of the following actions that are available by right-clicking the current editor tab (or from the File menu):

Close (Ctrl + F4 (Command + F4 on macOS))

Closes the currently selected editor.

Close Others

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

Close All (Ctrl + Shift + F4 (Command + Shift + F4 on macOS))

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the File menu, it closes all opened editors in all groups/stacks of tabs.

Working with Remote Documents

Oxygen XML Author Eclipse plugin supports editing remote files, using the FTP, SFTP, and WebDAV protocols. You can edit remote files in the same way you edit local files.

You can open one or more remote files in the Open using FTP/SFTP dialog box (on page 236)

A WebDAV resource can be locked when it is opened in Oxygen XML Author Eclipse plugin by selecting the Lock WebDAV files on open option (on page 164) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Author Eclipse plugin displays an error message that contains the lock owner’s name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Author Eclipse plugin.
To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out**
the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Author Eclipse plugin and the
HTTP / WebDAV server is compressed using the GZIP algorithm.

The current **WebDAV Connection** *(on page 1408)* details can be saved by switching to the **Database**
**perspective** *(on page 2082)* and then you can browse and manage the connection in the **Data Source Explorer**
**view** *(on page 1359)*.

**Open URL**

To access the **Open using FTP/SFTP/WebDAV** dialog box, go to **File > Open URL** menu, then choose the
**Browse for remote file** option from the drop-down action list.

**Figure 40. Open URL Dialog Box**
The displayed dialog box is composed of several parts:

- The editable URL combo box where you specify the URL to be opened or saved.

  Tip:
  If the file is accessible through an anonymous FTP, you can type a URL like: ftp://anonymous@some.site/home/test.xml.

  This combo box also displays the current selection when you change selection by browsing the tree of folders and files on the server.

- The Identification section contains the access credentials. If you want to browse for a file on a server, you have to specify the user and password. This information is bound to the selected URL and is also used in opening or saving the file. If the Save checkbox is selected, the user and password are saved between editing sessions. The password is encrypted and kept in the options file.

  Note:
  Your password is well protected. If the options file is used on another machine by a user with a different user name the password, it will become unreadable since the encryption is user-name dependent. This is also true if you add URLs to your project that include a user and password.

- The Browse for remote file section contains the Server URL combo box and Autoconnect checkbox. In the Server URL combo box, you can specify the protocol, the server host name, or server IP.

  Tip:
  When accessing an FTP server, you only need to specify the protocol and the host (such as ftp://server.com or if using a non-standard port ftp://server.com:7800/).

  By pressing the Browse button, the directory listing will be shown in the component. When Autoconnect is selected, every time the dialog box is displayed, the browse action will be performed.

- The bottom part of the dialog box displays the tree view of the documents stored on the server. You can browse the directories and make multiple selections. Additionally, you can use the Rename, Delete, and New Folder actions to manage the file repository.

  The file names are sorted in a case-insensitive manner.

### Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP file browser dialog box by right-clicking a tree node and selecting the Change permissions menu item.
In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the checkboxes.

**WebDAV over HTTPS**

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Author Eclipse plugin allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Author Eclipse plugin will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Author Eclipse plugin. This means that Oxygen XML Author Eclipse plugin can find the certificate in the key store of the Java Runtime Environment where it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

**Troubleshooting HTTPS**

If Oxygen XML Author Eclipse plugin cannot connect to an HTTPS-capable server and an error message mentions that it is "unable to find a valid certification path to the requested target", the HTTPS server is most likely configured to use a self-signed certificate or uses a certificate issued by an unknown authority that the Java Runtime Environment (JRE) that is used by Oxygen XML Author Eclipse plugin does not trust.

**Tip:**

To make Oxygen XML Author Eclipse plugin accept a certificate even if it is invalid, open the Preferences dialog box (on page 61), go to Network Connection settings > HTTP(S)/WebDAV, and select the *Automatically accept a security certificate, even if invalid* option.

**Notice:**

This *Automatically accept a security certificate, even if invalid* option does not influence the entire Eclipse workspace. It is limited to URLs that are opened directly by Oxygen XML Author Eclipse plugin.

To trust a certificate, follow this procedure:

1. Export a certificate into a local file using any HTTPS-capable web browser:

   **Chrome or Edge**
   
   a. Navigate to the page that uses the certificate.
   
   b. Right-click the page and select *Inspect*.
   
   c. Select the *Security* tab.
d. Click View Certificate. Step Result: A Certificate dialog box is displayed.

e. Select the Details tab of the Certificate dialog box.

f. Click the Copy to File button. Step Result: The Certificate Export Wizard is started.

g. Follow the instructions in the wizard for the DER encoded binary X.509 certificate. Save the certificate to the local file server.cer.

**Safari**

a. Navigate to the page that uses the certificate.

b. If there is a “This connection is not private” message, click Show Details and in the expanded panel, click view the certificate.

c. Otherwise, in the address bar, click the padlock icon on the left side of the website name and in the displayed pop-up, click Show Certificate.

d. Another pop-up box is displayed showing information about the certificate. Drag the large certificate icon to a Finder window. A .cer file will be created in the indicated folder from Finder.

2. Import the local file into the JRE running Oxygen XML Author Eclipse plugin:

a. Open a text-mode console with administrative rights. If Oxygen XML Author Eclipse plugin has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases, administrative rights will be required.

b. Go to the lib/security directory of the JRE running Oxygen XML Author Eclipse plugin. You can find the home directory of the JRE in the java.home property that is displayed in the About dialog box (Installation Details > Configuration).

Tip:

If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the -alias Command-line argument, as in the following example:

```bash
..\..\bin\keytool -import -trustcacerts -alias myalias1 -file server1.cer -keystore cacerts
```
3. Restart Oxygen XML Author Eclipse plugin.

Related information
HTTP(S)/WebDAV Preferences (on page 164)

HTTP Authentication Schemes

Oxygen XML Author Eclipse plugin supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the RFC2617 specifications.
- **Digest** - The *digest* authentication scheme defined in the RFC2617 specifications.
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:**
For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

- domain\username

- **Kerberos (on page 240)** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on

Oxygen XML Author Eclipse plugin implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the Kerberos protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Author Eclipse plugin obtains from the operating system.

**Restriction:**
This *Single sign-on* support is not available for SharePoint integrations.

To turn on the Kerberos-based authentication, you need to add the following system property in the eclipse.ini configuration file (on a separate line after the -vmargs parameter):

```
-Djavax.security.auth.useSubjectCredsOnly=false
```
Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

- **Close (Ctrl + F4 (Command + F4 on macOS))**
  Closes the currently selected editor.

- **Close Others**
  If multiple files are opened, this action is available to close all open editors in the current group/stack of tabs except for the one you are currently viewing.

- **Close All (Ctrl + Shift + F4 (Command + Shift + F4 on macOS))**
  If multiple files are opened, this action is available to close all open editors.

Viewing File Properties

The **Editor Properties** view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Other > Editor Properties**.

To copy a value from the **Editor Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

Simple Text Editor

While Oxygen XML Author Eclipse plugin specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the
helpful features that are commonly used when editing XML files in the Oxygen XML Author Eclipse plugin Text editing mode (on page 280) are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of non-XML files that can be created and edited in the simple text editor include:

- Java
- C++
- C
- PHP
- Perl
- Properties
- SQL
- Shell executables
- Batch
- Python
- Text

Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique features that are designed to help you work with projects (on page 242) are available for all types of files.
- **Shortcut Actions** - Many of the shortcut actions that are available in Text mode (on page 283) are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The content selection shortcuts (on page 290) that are available in Text mode are also available in the simple text editor.
- **Convert Hexadecimal Characters** - You can convert a sequence of hexadecimal characters to the corresponding Unicode character (on page 321).
- **Encoding/Decoding Actions** - Contextual menu actions are available to encode or decode Base 64, Base 32, and Hex schemes (on page 322).
- **Code Templates** - You can define your own code templates (on page 296) for any type of file and use the Content Completion Assistant (on page 2078) to invoke them.
- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, open the Preferences dialog box (on page 61) and go to Editor > Syntax Highlight (on page 161). Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the Preview pane.

Using Projects to Group Documents

Oxygen XML Author Eclipse plugin includes a Project Explorer view (on page 244) that helps you organize your projects. Oxygen XML Author Eclipse plugin offers a variety of helpful features for working with projects.
and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

Creating a New Project

Oxygen XML Author Eclipse plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the Project Explorer view (on page 244) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New > XML Project or New > Sample XML Project from the contextual menu or File menu.

This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the Project Explorer view.

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting File > New > New from Templates and choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the New menu of the contextual menu, when invoked from the Project Explorer view (or from the File menu). You can also create a document from a template by selecting New > New from Templates from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the project contextual menu and the Project Explorer view (on page 244) will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting New > Folder > Advanced. The linked folders presented in the Project Explorer view (on page 244) are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select New > File (you can use the Advanced button to link to a file in the local file system).
**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project Explorer View *(on page 244)*.

**Related information**

Using Projects to Group Documents *(on page 242)*

---

**Project Explorer View**

The **Project Explorer** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

**Tip:**

You can also use the Project Explorer view for many of the same purposes as the Project Explorer view.

---

**Figure 41. Project Explorer View**

![Project Explorer View](image)

By default, the view is positioned on the left side of the Oxygen XML Author Eclipse plugin window, above the Outline view *(on page 299)*. If the view has been closed, it can be reopened at any time from the Window > Show View menu (the Project Explorer view is in the Other submenu).
Project View Toolbar

The following actions are grouped in the upper right corner:

- **Collapse All**
  
  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

- **Link with Editor**
  
  When selected, the project tree highlights the currently edited file, if it is found in the project files.

View Menu

Drop-down menu that contains various settings contributed by the Eclipse plugin.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (🔗). The linked folders/files are added using **New > Folder > Advanced** or **New > File > Advanced**, or by dragging and dropping files/folders from the view or the system file explorer. ✗ **Delete** can be used to remove them from the project.

- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on macOS). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, ✉ **Copy**, and ✉ **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action ✗ **Delete** can be used to remove them from the project and local file system.
Creating New Projects

The following actions are available from the New menu when right-clicking any item, or the File > New menu:

XML Project

Opens the New XML Project dialog box that allows you to create a new project and adds it to the project structure in the Project Explorer view.

Sample XML Project

Opens the New sample XML project dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the Project Explorer view.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

Right-click any item > New > File

Opens a New Document Wizard (on page 221) that helps you create a new file and adds it to the project structure.

Right-click any item > New > 📘 New from Templates

Opens a wizard where you can create a new document based on a template (on page 228) and adds it to the project structure.

Right-click any item > New > 🌟 Folder

Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Adding Resources
You can add resources by using drag and drop (or Copy and Paste) actions from within the Project Explorer view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use Delete from the contextual menu (or press delete on your keyboard) and confirm by clicking OK in the resulting dialog box.

To remove folders or files from both the project and the local file system, use Delete from the contextual menu (or press Delete on your keyboard) and confirm by clicking OK in the resulting dialog box.

Moving Folders and Files

You can move the resources by using drag and drop actions from within the Project Explorer view.

You can also use the usual Copy and Paste actions (or the Move action) from the contextual menu to move resources in the project.

You can also move certain types of files (such as XML) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 572) by using the button.

Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select Rename from the contextual menu.
- Press F2 on your keyboard.

You also can rename certain types of files (such as XML) by using the Refactoring > Rename resource action from the contextual menu. This action opens the Rename resource dialog box that includes the following options:
• **New name** - Presents the current name of the edited resource and allows you to modify it.

• **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can [select or configure the scope](on page 572) by using the ![scope button](image).

**Opening Files**

There are several ways to open a file:

• Double-click the file.
• Select it and press **Enter** on your keyboard.
• Right-click the file and select **Open**.
• Drag the file from the project tree and drop it in the editor area.
• If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

**Saving the Project**

The project file is automatically saved every time the content of the **Project Explorer** view is saved or modified by actions such as adding or removing files and drag and drop.

**Other Contextual Menu Actions**

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

**Refactoring submenu**

Oxygen XML Author Eclipse plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

- **Rename resource (Available for certain types of XML documents)**
  
  Opens the **Rename resource** dialog box ([on page 251](#)) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

- **Move resource (Available for certain types of XML documents)**
  
  Opens the **Move resource** dialog box ([on page 251](#)) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

- **XML Refactoring**
  
  Opens the **XML Refactoring** tool wizard ([on page 581](#)) that presents refactoring operations to assist you with managing the structure of your XML documents.

**Show Resource Hierarchy**
Opens the Resource Hierarchy/Dependencies view (on page 573) that allows you to see the resource hierarchy for an XML document.

**Show Resource Dependencies**

Opens the Resource Hierarchy/Dependencies view (on page 573) that allows you to see the resource dependencies for an XML document.

**Refresh**

Refreshes the content and the dependencies between the resources in the Main Files directory (on page 252).

**// XPath in Files**

Opens the XPath/XQuery Builder view (on page 1346) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

**ABC Check Spelling in Files**

Allows you to check the spelling of multiple files. (on page 268)

**Format and Indent Files**

Opens the Format and Indent Files dialog box (on page 317) that allows you to configure the format and indent (pretty-print (on page 2082)) action that will be applied on the selected documents.

**HTML to XML Well-formed (Available when selecting multiple resources)**

Batch converts the selected HTML documents to be XML well-formed. This means that missing end tags will be added to applicable elements, unclosed tags will be properly closed, and quotes will be added to attribute values that were missing the quotes.

**Notes:**

- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the Results pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

**Transform submenu**

The currently selected files associated with the Oxygen XML Author Eclipse plugin in the Package Explorer view or Project Explorer view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

**Apply Transformation Scenario(s)**

Obtains the output with one of the built-in scenarios (on page 786).
Configure Transformation Scenario(s)

Opens a dialog box (on page 898) that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files associated with the Oxygen XML Author Eclipse plugin in the Package Explorer view or Project Explorer view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- Check Well-Formedness
  Checks if the selected file or files are well-formed.

- Validate
  Validates the selected file or files against their associated schema. For EPUB files, this action triggers an EPUB Validate and Check for Completeness (on page 1355) operation.

Validate with Schema

Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)

Allows you to configure and run a validation scenario (on page 530).

Clear Validation Markers

Clears all the error markers from the main editor and Problems view.

Properties

Displays the properties of the current file in a Properties dialog box.

Enable Main Files Support (Available from the project container)

Allows you to enable the Main Files Support (on page 253) for each project you are working on.

Detect Main Files (Available from the project container when Main Files Support is enabled)

Opens the Detect Main Files wizard (on page 253) that enables the automatic detection of main files.

Add to Main Files (Available when Main Files Support is enabled)

Adds the selected files to the Main Files folder (on page 254).
Moving/Renaming Resources in the Project Explorer View

The Refactoring submenu in the contextual menu of the Project Explorer view (on page 244) provides actions for moving or renaming resources in the current project while offering the option to update the references to the resources.

Moving Resources

You can move certain types of files (such as XML) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 572) by using the button.

Renaming Resources

You can rename certain types of files (such as XML) by using the Refactoring > Rename resource action from the contextual menu. This action opens the Rename resource dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (on page 572) by using the button.

Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an XML Catalog (on page 2085) or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Author Eclipse plugin displays a warning dialog box.
Contextual Project Operations Using 'Main Files' Support

Oxygen XML Author Eclipse plugin allows you to define Main Files (on page 2081) at project level. These main files are automatically used by Oxygen XML Author Eclipse plugin to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML modules. Oxygen XML Author Eclipse plugin maintains the hierarchy of the main files, helping you to determine the editing context.

Oxygen XML Author Eclipse plugin also provides unique support for using the Main Files support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources in the scope of the Main Files (in this case the main DITA map (root map) (on page 2083)). For more information, see Main Files Support in DITA (on page 2043).

For more information about the Main Files support for XML documents, watch our video demonstrations:

https://www.youtube.com/embed/e2oo4RWNxW8

https://www.youtube.com/embed/UZwg385RKNw

Related information

Modular Contextual XML Editing Using 'Main Files' Support (on page 570)
Main Files Benefits

Using the Main Files support in Oxygen XML Author Eclipse plugin includes the following benefits:

- When the main file is validated, Oxygen XML Author Eclipse plugin automatically identifies the modules included in the main file and validates all of them.
- When the main file is transformed, Oxygen XML Author Eclipse plugin automatically identifies the modules included in the main file and transforms them accordingly.
- The Content Completion Assistant (on page 2078) presents all the components that are collected from the main files for the modules they include.
- The main files that are defined for the current module determines the scope of the search and refactoring actions (on page 572). Oxygen XML Author Eclipse plugin performs the search and refactoring actions in the context that the main files determine, thus improving the speed of execution.

Enabling the Main Files Support

Oxygen XML Author Eclipse plugin stores the main files in a folder located in the Project Explorer view (on page 244), as the first child of the project root. The Main Files Support is disabled by default and Oxygen XML Author Eclipse plugin allows you to enable or disable the Main Files Support for each project you are working on.

To enable Main Files support, select Enable Main Files Support from the contextual menu of the project root folder in the Project Explorer view (on page 244).

Related information

Detecting Main Files (on page 253)
Adding or Removing Files in the Main Files Directory (on page 254)

Detecting Main Files

Oxygen XML Author Eclipse plugin allows you to detect the main files using the Detect Main Files option. This action applies to the folders you select in the project.

To detect main files over the entire project, do one of the following:

- Right-click the root of the project and select Detect Main Files from Project.
- Use the Detect Main Files from Project option, available in the contextual menu of the Main Files folder.

Both of these options display the Detect Main Files wizard. The detected main files are presented in a tree-like fashion. The resources are grouped into three categories:
• **Possible main files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *main files*.

**Note:**
For DITA projects, only *DITA Maps (on page 2079)* are reported as possible *main files*.

• **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible *main file*.

• **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *main files*.

To set them as *main files*, simply select their checkboxes. Oxygen XML Author Eclipse plugin marks all the children of a *main file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *main files*. A module can be accessed from multiple *main files*.

The next panel displays a list with the selected *main files*. Click the **Finish** button to add the *main files* in the Main Files folder.

You can use the **Select Main Files** option to automatically mark all *main files*. This action sets all the resources from the **Possible Main Files** category and the first resource of each Cycle as *main files*. The **Deselect All** button simply removes all of your selections.

**Tip:**
It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the Main Files directory.

**Related information**
- Enabling the Main Files Support *(on page 253)*
- Adding or Removing Files in the Main Files Directory *(on page 254)*

**Adding or Removing Files in the Main Files Directory**

**Adding Files to the Main File Directory**

The **Main Files** directory only contains logical folders and linked files. To add files in the **Main Files** directory, use one of the following methods:

- Right-click a file from your project and select 📁 **Add to Main Files** from the contextual menu.
- Drag and drop files into the **Main Files** directory.
- From the contextual menu of the **Resource Hierarchy Dependencies view** *(on page 573)*, use the 📁 **Add to Main Files** action.

You can view the *main files* for the currently edited resource in the **Editor Properties view** *(on page 241)*.
Removing Files from the Main Files Directory

The main files that are already defined in the project are automatically marked in the tree. To disable a main file, remove it from the Main Files folder (for example, use the Ctrl+X or Delete keyboard shortcuts). Deleting files from the Main Files folder does NOT delete the files from disk. It just removes the logical files from that logical folder.

Search and Find/Replace Features

Oxygen XML Author Eclipse plugin includes advanced search capabilities to help you locate documents and resources. The search features are powered by Apache Lucene. Apache Lucene is a free open source information retrieval software library. You can perform simple text searches or more complex searches using the Apache Lucene - Query Parser Syntax.

Note:

When Oxygen XML Author Eclipse plugin performs the indexing of resources, referenced content is not taken into account. For example, when DITA documents are indexed, the content referenced in a @conref or @conkeyref attribute is not parsed. The files that make up the index are stored on disk in the folder.

Find All Elements Dialog Box

To open the Find All Elements dialog box, go to Edit > Find All Elements. It assists you in defining XML element / attribute search operations in the current document.

Find All Elements Dialog Box

The dialog box can perform the following actions:
• Find all the elements with a specified name.
• Find all the elements that contain, or does not contain, a specified string in their text content.
• Find all the elements that have a specified attribute.
• Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

• **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify any element name, leave the field empty.

  ![Note:](image)

  Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

• **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For any element text, select contains from the drop-down menu and leave the field empty. If you leave the field empty but select equals from the drop-down menu, only elements with no text will be found. Select not contains to find all elements that do not include the specified text.

• **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For any or no attribute name, leave the field empty.

  ![Note:](image)

  Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.

• **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For any or no attribute value, select contains from the drop-down menu and leave the field empty. If you leave the field empty but select equals from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select not contains to find all elements that have attributes without a specified value.

• **Case sensitive** - When this option is selected, operations are case-sensitive.

When you select Find All, Oxygen XML Author Eclipse plugin tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

**Regular Expressions Syntax**

Oxygen XML Author Eclipse plugin uses the Java regular expression syntax. It is similar to that used in Perl 5, with several exceptions. Thus, Oxygen XML Author Eclipse plugin does not support the following constructs:
• The conditional constructs \((?{X})\) and \((?{condition}X|Y)\).
• The embedded code constructs \((?{code})\) and \((??{code})\).
• The embedded comment syntax \((?#comment)\).
• The preprocessing operations \(\l\), \(\u\), \(\L\), and \(\U\).

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Author Eclipse plugin/Java in the text searches. The most common example is with the \(\w\) and \(\W\) set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs:

• \(/w\) - \([\#x0000-\#x10FFFF]-[\p{P}\p{Z}\p{C}]\) instead of \(\w\)
• \(/W\) - \([\p{P}\p{Z}\p{C}]\) instead of \(\W\)

There are some other notable differences that may cause unexpected results, including the following:

• In Perl, \(\l\) through \(\u\) are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, \(\l\) through \(\u\) are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
• Perl uses the \(g\) flag to request a match that resumes where the last match left off.
• In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
• Perl is forgiving about malformed matching constructs, as in the expression \(^a\), as well as dangling brackets, as in the expression \(abc]\), and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as \(\+, \?\) and \(*\).

Comparison between the Java and Perl 5 regular expression syntax

Spell Checking

Oxygen XML Author Eclipse plugin includes an automatic (as-you-type) spell checking feature (on page 266), as well as a manual spell checking action to open a Spelling dialog box that offers a variety of options.

To manually check spelling in the current document, use the Check Spelling action on the toolbar.
The **Spelling** dialog box contains the following:

**Unrecognized word**

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

**Replace with**

The character string that will replace the misspelled word.

**Guess**

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

**Default language**

Allows you to select the default language dictionary used by the spelling engine.

**Paragraph language**

In an XML document, you can mix content written in multiple languages. You can set the language code in the `@lang` or `@xml:lang` attribute for any particular section and Oxygen XML Author Eclipse plugin will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

**Begin at cursor position**
Instructs the spell checker to begin checking the document starting from the current cursor position.

**Action Buttons**

**Replace**

Use this button to replace the unrecognized word with the selected word from the *Replace with* field.

**Replace All**

Use this button to replace all occurrences of the unrecognized word with the selected word from the *Replace with* field, starting from the cursor's position to the end of the document.

**Note:**

This action is case-sensitive.

**Ignore**

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Author Eclipse plugin skips the content of the XML elements marked to be ignored *(on page 266).*

**Ignore All**

Ignores all instances of the unrecognized word in the current document.

**Learn**

Adds the unrecognized word to the list of valid words.

**Options**

Opens the Spell Check preferences page *(on page 157)* where you can configure various options regarding the feature.

**Related information**

AutoCorrect Misspelled Words *(on page 269)*

**Spell Check Dictionaries and Term Lists**

Oxygen XML Author Eclipse plugin uses the Hunspell engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Author Eclipse plugin includes the following built-in dictionaries for the spell checker:

- English (US) [en_us]
- English (UK) [en_gb]
• French [fr]
• German [de_DE]
• Spanish [es_ES]

Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Author Eclipse plugin spell checker. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow these instructions and then add the dictionary to the Oxygen XML Author Eclipse plugin spell checker by following this procedure (on page 261).

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Author Eclipse plugin provides a way of adding personalized term lists (on page 263) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Author Eclipse plugin uses for storing learned words (on page 266).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, legal, medical, automotive). They can also be used to control forbidden words.

Related information

Adding Custom Spell Check Dictionaries (on page 261)
Adding Custom Spell Check Term Lists (on page 263)
Building and Testing Hunspell Dictionaries

Adding Custom Dictionaries and Term Lists

The Oxygen XML Author Eclipse plugin spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The personalized term lists are custom files (with the .tdi file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Author Eclipse plugin spell checker.

You can add dictionaries (on page 261) and personalized term lists (on page 263) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the Spell Check Dictionaries preferences page (on page 160) and the Include dictionaries and term list from option (on page 160) allows you to choose a custom storage location. All the dictionaries and term lists for a
particular language that are found in either location are merged and used by the spell checker in Oxygen XML Author Eclipse plugin.

Related information
Replacing a Spell Check Dictionary (on page 264)
Editing the Spell Checking Dictionaries

Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Author Eclipse plugin spell checker:

• You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
• You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
• You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

Important:
The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (on page 61) and go to Editor > Spell Check > Dictionaries (on page 160).
3. Choose one of the following two options for adding the downloaded files.
   a. Copy both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option (on page 160).
   b. Copy both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (on page 160), and select that directory. If you choose this option, make sure you read this important note (on page 160).
4. Restart the application for the spell checker to start using the new dictionary.
Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a .dic file extension) and an *affix* file (with the .aff file extension). The affix file (.aff) can be left empty, but it is needed for the mechanism to work properly.

   **Important:**
   The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see [https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. In the dictionary file (.dic extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

   ```
   2
   parabola
   asimptotic
   ```

   **Tip:**
   Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

   **Note:**
   If you save the .dic file using UTF-8 encoding, then the corresponding .aff file should specify the encoding as a property inside it (if you do not specify the encoding, the default platform encoding will be used):

   ```
   SET UTF-8
   ```

3. Open the Preferences dialog box *(on page 61)* and go to Editor > Spell Check > Dictionaries *(on page 160)*.

4. Choose one of the following two options for saving the files.
   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option *(on page 160)*.
   b. Save both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option *(on page 160)*, and select that directory. If you choose this option, make sure you read this important note *(on page 160)*.

5. Restart the application for the spell checker to start using the new dictionary.
Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Create your Hunspell dictionary. For more information on how to do this, see: Editing the Spell Checking Dictionaries.

   **Step Result:** You should end up with a *dictionary* file (with a *.dic* file extension) and an *affix* file (with an *.aff* file extension). The affix file (*.aff*) can be empty, but it is needed for the mechanism to work properly.

   ! Important:
   The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see [https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. Open the Preferences dialog box (on page 61) and go to Editor > Spell Check > Dictionaries (on page 160).

3. Choose one of the following two options for saving the files.
   a. Save both files (.*dic* and *.*aff*) to the default directory displayed in the Dictionaries and term lists default folder option (on page 160).
   b. Save both files (.*dic* and *.*aff*) to any other directory, select the Include dictionaries and term list from option (on page 160), and select that directory. If you choose this option, make sure you read this important note (on page 160).

4. Restart the application for the spell checker to start using the new dictionary.

Adding Custom Spell Check Term Lists (on page 263)

Editing the Spell Checking Dictionaries

Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:
1. Create a term list file (with the .tdi file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en_US_myterms.tdi for term list in the US version of the English language or en_myterms.tdi for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the term list file (.tdi extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

   parabola
   asimptotic
   *hyperbola

   **Note:**
   Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

3. Open the Preferences dialog box (on page 61) and go to Editor > Spell Check > Dictionaries (on page 160).

4. Choose one of the following two options for saving the file.
   a. Save the file (.tdi) to the default directory displayed in the Dictionaries and term lists default folder option (on page 160).
   b. Save the file (.tdi) to any other directory, select the Include dictionaries and term list from option (on page 160), and select that directory. If you choose this option, make sure you read this important note (on page 160).

5. Restart the application for the spell checker to start using the new term list.

*Adding Custom Spell Check Dictionaries (on page 261)*

### Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Author Eclipse plugin spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

### Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:
1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: [http://extensions.services.openoffice.org/dictionary](http://extensions.services.openoffice.org/dictionary).

2. Open the [Preferences](on page 61) dialog box and go to [Editor > Spell Check > Dictionaries](on page 160).

3. Choose one of the following two options to replace existing files.
   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the [Dictionaries and term lists default folder option](on page 160). Leave the Include dictionaries and term list from option deselected.
   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option (on page 160). If you choose this option, make sure you read this important note (on page 160).

   **Important:**
   Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, en_US.dic for a US English dictionary or en.dic for a less specific English dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

4. Restart the application for the spell checker to start using the new dictionary.

**Build a Full Hunspell Dictionary and Replace an Existing One**

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: [Building and Testing Hunspell Dictionaries](#).

   **Step Result:** You should end up with a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

2. Open the [Preferences](on page 61) dialog box and go to [Editor > Spell Check > Dictionaries](on page 160).

3. Choose one of the following two options to replace existing files.
   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the [Dictionaries and term lists default folder option](on page 160). Leave the Include dictionaries and term list from option deselected.
   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option (on page 160). If you choose this option, make sure you read this important note (on page 160).

4. Restart the application for the spell checker to start using the new dictionary.
Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select Learn word.
- Click the Learn button from the Spelling dialog box (on page 257) that is invoked by using the Check Spelling action on the toolbar.

Note:
To delete items from the list of learned words, use the Delete learned words option in the Editor > Spell Check > Dictionaries preferences page (on page 160).

Related information
Adding Custom Spell Check Term Lists (on page 263)

Ignored Words (Elements)

You may want the content of certain XML elements to always be skipped during the spell check process (for example, `<programlisting>`, `<codeblock>`, `<codeph>`, `<filepath>`, or `<screen>`). This can be done in one of several ways:

- You can skip through them manually, word by word, using the Ignore button in the Spelling dialog box (on page 257) that is invoked by using the Check Spelling action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the Ignore elements section (on page 159) in the Spell Check preferences page.

Automatic Spell Check

Oxygen XML Author Eclipse plugin includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a comment (on page 399). This feature is disabled by default, but it can be enabled and configured in the Spell Check preferences page (on page 157). When the Automatic Spell Check option (on page 157) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.
Tip:
You can configure the color and how spelling errors are shown from the Eclipse Annotations preferences page (Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations).

Figure 46. Automatic Spell Checking in Author Mode

Figure 47. Automatic Spell Checking in Text Mode

The contextual menu includes the following actions:

**Delete Repeated Word**

Allows you to delete words that were repeated in consecutive order.

**List of Suggestions**

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

**Learn Word**

Allows you to add the current unknown word to the persistent dictionary of learned words (on page 266).
Spell check options (Available in Author mode only)

Opens the Spell Check preferences page (on page 157).

Other actions

This submenu gives you access to all the usual contextual menu actions.

Related information

Learned Words (on page 266)

Spell Check Multiple Files

The Check Spelling in Files action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The contextual menu of the Project Explorer view (on page 244).
- The contextual menu of the DITA Maps Manager view (on page 1762), when editing DITA documents.

This action opens the Check Spelling in Files dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the Check All button to check the spelling in all specified files. The spelling corrections are displayed in the Results view (on page 308) at the bottom of the editor and you can group the reported errors as a tree with two levels.

Tip:

If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the Learn Word(s) action from the contextual menu in the Results view.

The following scopes are possible, depending on where the action was invoked:

- All opened files - The spell check is performed in all open files.
- Current file directory - All the files in the folder of the currently edited file.
- Current DITA map hierarchy - Option available when the dialog is invoked from the DITA Maps Manager view. Checks the spelling in all references contained in the DITA map.
- Project - All files from the current project.
- Selected project resources - The selected files from the current project.
- Specified path - Checks the spelling in the files located at a path that you specify.

The Options section includes the following options:

- File filter - Allows you to filter the files from the selected scope.
- Recurse subdirectories - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
• Include hidden files - When selected, the spell check is also performed in the hidden files.

• Spell Check Options - The spell check processor uses the options available in the Spell Check preferences page (on page 157).

When working with DITA documents, if you invoke the Check Spelling in Files action in the DITA Maps Manager view (on page 1762), a slightly different version of the dialog box is displayed:

The following scopes are available when you check the spelling in files from the DITA Maps Manager (on page 1762):

• Current DITA Map hierarchy - All the files referenced in the currently selected DITA map (on page 2079) from in the DITA Maps Manager view.

• Selected references - Checks the spelling in the selected references.

• Specified path - Checks the spelling in the files located at a path that you specify.

AutoCorrect Misspelled Words

Oxygen XML Author Eclipse plugin includes an AutoCorrect feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in Author mode. Oxygen XML Author Eclipse plugin includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the AutoCorrect feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the Replacements Table (on page 130).

When enabled, the AutoCorrect feature can be used to do the following:

• Automatically correct misspelled words while you edit in Author mode. The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ¡ ´ " ) ] .

• Easily insert symbols. For example, if you want to insert a ® character, you would type (R).

• Quickly insert text fragments.

• Quickly insert XML fragments. For example, if you enter a hyphen (-) in an empty paragraph followed by a space, it will automatically be converted to a list with a list item.

AutoCorrect is enabled by default. To configure this feature, open the Preferences dialog box (on page 61) and go to Editor > Edit Modes > Author > AutoCorrect.

AutoCorrect Drop-down Actions

After the automatic operation of replacing a misspelled word (triggered by a space, dash, or certain punctuation characters), the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following actions:
• Change back to "[original word]" - Reverts the correction back to its original form.

• **Stop Automatically Correcting [original word]** - This option is presented if the correction is performed based on the *AutoCorrect Replacements Table (on page 130)* and selecting it will delete the corresponding entry from the Replacements Table.

• **Learn Word [original word]** - This option is presented if the *Use additional suggestions from the spell checker option (on page 129)* is selected in the *AutoCorrect preferences page (on page 129)* and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of learned words *(on page 266)*.

• **AutoCorrect options** - Opens the *AutoCorrect preferences page (on page 129)* that allows you to configure the feature.

Figure 48. AutoCorrect Drop-down Actions

<table>
<thead>
<tr>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change back to “abotu”</td>
</tr>
<tr>
<td>Stop Automatically Correcting “abotu”</td>
</tr>
<tr>
<td>AutoCorrect options...</td>
</tr>
</tbody>
</table>

**AutoCorrect Case-Sensitivity**

The *AutoCorrect* feature results in the following types of substitutions regarding case-sensitivity:

• Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").

• Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").

• Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").

• Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

**Note:**

The *AutoCorrect* feature also uses the list of ignored elements from the Spell Check preferences page *(on page 159)*. All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

**Related information**

Spell Checking *(on page 257)*
Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the *AutoCorrect mechanism (on page 269)*, or to replace an existing one, follow these steps:

1. Download an *AutoCorrect* dictionary file for the desired language. The file needs to have a `.dat` file extension. An example of a website that includes some *AutoCorrect* dictionary files is: [OpenOffice Extensions Search Page](#).
2. Open the **Preferences** dialog box (on page 61) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries (on page 131)**.
3. Choose one of the following two options for adding the downloaded files:
   a. Copy the downloaded `.dat` file to the default directory displayed in the **Dictionaries default folder** option (on page 131). Note that if you are replacing an existing dictionary file, this is the best option.
   b. Copy the downloaded `.dat` file to any other directory, select the **Include dictionaries from** option (on page 131), and select that directory. If you choose this option, make sure you read this important note (on page 131).
4. Restart the application for the *AutoCorrect* mechanism to start using the new dictionary.

Working with Special Characters and Encoding

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other *special characters* that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Author Eclipse plugin provides support for special characters in various ways:

**Opening and Saving Documents**

The **Unicode standard** provides support for all the character symbols in all known languages and Oxygen XML Author Eclipse plugin provides support for all Unicode characters (on page 272). There are various encoding options and features to help determine how to handle documents with unsupported characters (on page 273).

**Fonts**

Oxygen XML Author Eclipse plugin provides the ability to choose the fonts to be used in the various editing modes (on page 162). In some cases, changing the font may be a solution when special characters are not rendered as expected.

For special characters that are not included in any of the default fonts, Oxygen XML Author Eclipse plugin tries to find that symbol in a **fallback font** (on page 273). For the **Author** editing mode, you can specify a set of fallback fonts in the **font-family** CSS property (in the particular CSS file used for rendering your documents). For more information, see the **CSS Support in Author Mode (on page 1602)** section.
**Navigation and Layout**

Oxygen XML Author Eclipse plugin supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph.

**Editing**

Oxygen XML Author Eclipse plugin includes a contextual menu action that converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 321).

If you do not have a special way of inserting special characters using your keyboard, you can insert special characters using the **Character Map** feature (on page 274).

For more information about working with special characters in specific editing modes, see the following sections:

- Special Character Support in Author Mode (on page 496)
- Special Character Support in Grid Mode (on page 337)

**Unicode Support**

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Author Eclipse plugin provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Author Eclipse plugin uses 16-bit characters covering the Unicode Character set.

**Note:**

Oxygen XML Author Eclipse plugin may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:**

On windows, you can enable the support for **CJK** (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.
Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Author Eclipse plugin receives the encoding of the document from the Eclipse platform. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart.

Saving Documents with Unsupported Characters

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is UnicodeLittle) has a different BOM than one created on a macOS platform (where the byte order mark is UnicodeBig). The byte order and the BOM of an existing document are preserved when the document is edited and saved.

Unicode Fallback Font Support

Oxygen XML Author Eclipse plugin provides fonts for most common Unicode ranges. However, if you use special symbols or characters (on page 274) that are not included in the default fonts, they will be rendered as small rectangles. A fallback font is a reserve typeface that contains symbols for as many Unicode characters (on page 272) as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Author Eclipse plugin will try to find that symbol in a fallback font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (₿-U+267F) into your content in a Windows operating system. By default, Oxygen XML Author Eclipse plugin does not render this symbol correctly since it is not included in any of the default fonts. It is included in Segoe UI Symbol, but this font is not part of the default fonts that come with Oxygen XML Author Eclipse plugin. To allow Oxygen XML Author Eclipse plugin to recognize and render the symbol correctly, you can add Segoe UI Symbol as a fallback font.

Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Author Eclipse plugin installation, use the following procedure:

1. Start Windows Explorer and browse to the [OXYGEN_INSTALL_DIR]/jre/lib/fonts directory.
2. Create a directory called fallback (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.
4. Restart Oxygen XML Author Eclipse plugin for the changes to take full effect.

**Result:** Whenever Oxygen XML Author Eclipse plugin finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the *fallback* folder.

**Adding a Fallback Font in Other Platforms**

For macOS or other platforms, you could use the following approach:

1. Use a font editor (such as *FontForge*) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Author Eclipse plugin, open the *Preferences* dialog box (on page 61), go to *Fonts*.
4. Click the *Change* button for the particular editing mode and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Author Eclipse plugin for the font changes to take full effect.

**Related information**

- Unicode Support (on page 272)
- Inserting Special Characters with the Character Map (on page 274)

**Inserting Special Characters with the Character Map**

Oxygen XML Author Eclipse plugin includes a *Character Map* for inserting special characters. It can also be used to find the decimal, hexadecimal, or *character entity* equivalent for a particular character or symbol.

**Inserting Special Characters**

To insert a special character at the current location within a document, follow these steps:

1. Open the *Character Map* dialog box (on page 275) by Edit > ✎ Insert from Character Map.
2. Find the symbol you want to insert and double-click it (or select it and click *Insert*).

**Tip:**

The most recently used characters and some of the most common characters are listed when you click the ✎ Symbols drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.
Finding the Decimal, Hexadecimal, or Character Entity Equivalent

You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the character entity equivalent, following these steps:

1. Open the **Character Map** dialog box ([on page 275](#)) by **Edit > Insert from Character Map**.
2. Find the symbol and select it. You can use the filters and the **Search** field at the top of the dialog box to narrow the search.
3. Click the **Details** tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The character entity equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

**Character Map Dialog Box**

*Figure 49. Character Map Dialog Box*
The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

**Font**

Use this drop-down list to choose the font that will have characters displayed.

**Unicode Block**

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

**Search**

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal
- description

**Note:**

Selecting **description** opens the **Details tab** *(on page 276)*. If you enter a character description in the **Search** field, the **description** is selected automatically.

**Character Table Section**

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

**Recently Used Characters Section**

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

**Character Mode Section**

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**
You can see the character or code that will be inserted in Text mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in Author mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Click the Insert button to insert the selected character in the current editor at the cursor position. You will see the character in the editor if the editor font (on page 162) is able to render it. The Copy button copies it to the clipboard without inserting it in the editor.

Note: The Character Map dialog box is not available in the Grid editor (on page 219).

Related information
Working with Special Characters and Encoding (on page 271)

Handling Read-Only Files

The default workbench behavior applies when editing read-only files in the Text mode. For all other modes no modification is allowed provided that the file remains read-only.

You can check out the read-only state of the file by looking in the Properties view (on page 241). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

Viewing Status Information

Status information generated by operations such as schema detection, manual validation, automatic validation, and transformations are fed into the Console view, allowing you to monitor how the operation is being executed (the Enable Oxygen consoles option (on page 165) must be selected in the View preferences page (on page 165)).

Figure 50. Console View Messages
Messages contain a timestamp, the name of the thread that generated it, and the actual status information. The number of displayed messages can be controlled with the Limit console output option in the View (on page 165) preference page.

To make the view visible, select Window > Show View > Console.

**Editor Highlights**

An editor highlight is a text fragment emphasized by a colored background.

Highlights are generated in both Text and Author mode when the following actions generate results:

- Find All Elements (on page 255)
- XPath in Files (on page 249)

By default, Oxygen XML Author Eclipse plugin uses a different color for each type of highlight (XPath in Files, Find/Replace, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the Editor preferences page (on page 108). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the Next and Previous buttons (➡️) from the bottom of the range ruler, located at the right side of the editor pane.

**Note:**

When there are multiple types of highlights in the document, the Next and Previous buttons (➡️) navigate through highlights of the same type.

- Clicking the messages displayed in the Results view (on page 308) at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the ✗ Remove all button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the ✗ Remove all button on the right side of the Results panel (on page 308) at the bottom of the editor.
8. Editing Documents

Oxygen XML Author Eclipse plugin includes built-in frameworks for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (on page 646) with a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). In addition, Oxygen XML Author Eclipse plugin provides support for editing numerous other types of documents (all XML document types and even some non-XML formats).

Each type of document has unique features and options and this chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Author Eclipse plugin, including general information about editing XML documents in Text mode (on page 280), the visual Author mode (on page 339), and Grid mode (on page 329).

For extensive details about the DITA editing features included in Oxygen XML Author Eclipse plugin, see the DITA Authoring chapter (on page 1752).

Related information

- Built-in XML Frameworks (Document Types) (on page 646)

Editing XML Documents

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in the visual Author editing mode. For more information about schema association, see Associating a Schema to XML Documents (on page 557).

Oxygen XML Author Eclipse plugin includes fully supported built-in frameworks (on page 2080) for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (on page 646) with a full set of features. These built-in frameworks are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. For extensive details about the DITA editing features included in Oxygen XML Author Eclipse plugin, see the DITA Authoring chapter (on page 1752).

This section includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

Related information

- Text Editing Mode (on page 219)
- Author Editing Mode (on page 220)
Editing XML Documents in Text Mode

This section includes topics that describe how to work with XML documents in **Text** mode, including various features, actions that are available, and much more.

The Oxygen XML Author Eclipse plugin **Text** editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Author Eclipse plugin also includes numerous specialized editing actions, a powerful **Content Completion Assistant (on page 292)**, a helpful **Outline view (on page 299)**, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

Navigating the Document Content in Text Mode

Oxygen XML Author Eclipse plugin includes some useful features to help you navigate XML documents in **Text** mode.

**Navigation Keyboard Shortcuts**

- **Ctrl + CloseBracket (Command + CloseBracket on macOS)**
  - Navigate to the next XML node.

- **Ctrl + OpenBracket (Command + OpenBracket on macOS)**
  - Navigate to the previous XML node.

- **Ctrl + RightArrow (Command + RightArrow on macOS)**
  - Navigate one word forward.

- **Ctrl + LeftArrow (Command + LeftArrow on macOS)**
  - Navigate one word backward.

- **Ctrl + Home (Command + Home on macOS)**
  - Position the cursor at the beginning of the document.

- **Ctrl + End (Command + End on macOS)**
  - Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Author Eclipse plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the **Navigation** menu:

- **Last Edit Location (Ctrl+Q)**
Navigates to the last modification in any open tab.

**Back (Alt+LeftArrow (Command+OpenBracket on macOS))**

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links.

**Forward (Alt+RightArrow (Command+CloseBracket on macOS))**

Available after you use the Back button at least once, and it navigates in the opposite direction as the Back button.

**Navigating with the Outline View**

Oxygen XML Author Eclipse plugin includes an **Outline view (on page 299)** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

![Figure 51. Outline View Navigation in Text Mode](image)

**Using the Breadcrumb to Navigate**

A **breadcrumb** on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

![Figure 52. Breadcrumb in Text Mode](image)

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

**Navigating with the Go To Dialog Box**

In **Text** mode, you can navigate precisely to a location in the document you are editing by pressing (Ctrl+L (Command+L on macOS)) or selecting Go To Line from the Navigation menu.

**Navigating with Bookmarks**

By using **bookmarks**, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents.
To insert a *bookmark* in *Text* mode, right-click the desired location in the vertical stripe on the left side of the editor and select *Add Bookmark* (you can remove it by selecting *Remove Bookmark* from the same contextual menu).

To navigate to any of the *bookmarks*, click their corresponding markers in the vertical stripe on the right side of the editor.

**Tip:**
You can configure the color and how the *bookmarks* are shown from the Eclipse *Annotations* preferences page (Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations).

### Smart Editing in Text Mode

Oxygen XML Author Eclipse plugin includes *smart editing* features to help you edit XML documents in *Text* mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two `<tag></tag>`.
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Author Eclipse plugin will mirror-edit the name of the matching end tag. This feature can be controlled from the Content Completion option page (on page 110).
- **Auto-breaking the edited line** - The Hard line wrap option (on page 151) automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation (on page 151).
- **Indent on Enter** - The Indent on Enter option (on page 150) indents the new line inserted when you press *Enter*.
- **Smart Enter** - The Smart Enter option (on page 150) inserts an empty line between the start and end tags. If you press *Enter* between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value are selected.
If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.

- Otherwise, a double-click selects contiguous text.

- **Triple-click** - A triple-click selects the entire current line of text.

### Shortcut Actions in Text Mode

Oxygen XML Author Eclipse plugin includes numerous shortcut actions to help you edit content in the **Text** editing mode.

#### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

**Undo** (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions to return to the preceding state.

**Redo** (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

#### Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

- **Cut** (Ctrl + X (Command + X on macOS))
  
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy** (Ctrl + C (Command + C on macOS))

  Places a copy of the currently selected content in the clipboard.

- **Paste** (Ctrl + V (Command + V on macOS))

  Inserts the current clipboard content into the document at the cursor position.

- **Select All** (Ctrl + A (Command + A on macOS))

  Selects the entire content of the current document.

#### Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

**Ctrl + Alt + UpArrow** (Command + Alt + UpArrow on macOS)
Moves the node up one line.

**Ctrl + Alt + DownArrow (Command + Alt + DownArrow on macOS)**

Moves the node down one line.

---

**Note:**

The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

---

**Miscellaneous Shortcut Actions in Text Mode**

Oxygen XML Author Eclipse plugin also includes the following other miscellaneous shortcut actions in *Text* mode:

**Ctrl + Delete (Command + Delete on macOS)**

Deletes the next word.

**Ctrl + Backspace (Command + Backspace on macOS)**

Deletes the previous word.

**Ctrl + W (Command + W on macOS)**

Cuts the previous word.

**Ctrl + K (Command + K on macOS)**

Cuts to end of line.

**Ctrl + Single-Click (Command + Single-Click on macOS) or F3**

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more). [Only F3 works for these types of references]
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

**Ctrl + Shift + Y (Command + Shift + Y on macOS) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.
Editing XML Markup in Text Mode

Oxygen XML Author Eclipse plugin includes some useful actions that allow you to easily edit XML markup in Text mode. These actions are available in the Refactoring submenu of the contextual menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

![Figure 53. Breadcrumb in Text Mode](image)

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element in the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

- **Append Child**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

- **Insert Before**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

- **Insert After**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

- **Edit Attributes**
  - Opens an editing window that allows you to edit the attributes of the currently selected element.

- **Toggle Comment**
  - Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

- **Cut**
  - Removes the selected element and copies it to the clipboard.

- **Copy**
  - Copies the selected element to the clipboard.

- **Delete**
  - Deletes the currently selected element.
Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the Refactoring submenu of the contextual menu:

 Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

 Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

- If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Author Eclipse plugin will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the Rename current prefix in all document option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the Rename also attribute values that start with the same prefix checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu:

 Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the **Position cursor between tags** option *(on page 111)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option *(on page 111)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ’tag’** *(Alt + Shift + ForwardSlash)*

Surround the selected content with the last tag used.

**Surround with <![CDATA]>* *(Alt + Shift + C (Command + Alt + C on macOS))*

Surround the selected content with a `<CDATA>` tag so that the parser will interpret it as textual data rather than markup.

**Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu:

**Delete element tags** *(Alt + Shift + Comma)*

Deletes the start and end tag of the current element.

**Join or Split Elements**

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu:

**Join elements** *(Alt + Shift + F (Command + Alt + F on macOS))*

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

**Split element**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.
Convert attribute to element
  Allows you to change an attribute into an element.

Delete attribute
  Allows you to remove one or more attributes.

Rename attribute
  Allows you to rename an attribute.

Replace in attribute value
  Allows you to search for a text fragment inside an attribute value and change the
  fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the
information preconfigured based upon the current context.

Delete comments
  Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the
information preconfigured based upon the current context.

Delete element
  Allows you to delete elements.

Delete element content
  Allows you to delete the content of elements.

Insert element
  Allows you to insert new elements.

Rename element
  Allows you to rename elements.

Unwrap element
  Allows you to remove the surrounding tags of elements, while keeping the content
  unchanged.

Wrap element
  Allows you to surround elements with element tags.

Wrap element content
  Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

---

**Folding XML Elements in Text Mode**

When working with a large document, the *folding* *(on page 2080)* support in Oxygen XML Author Eclipse plugin can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

---

**Figure 54. Folding of XML Elements in Text Mode**

```

    <link manager="Big.Boss"/>
  </person>
  <person id="four.worker">
```

---

**Folding Actions in Text Mode**

Element folds are marked with a small icon (折叠) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available in the *Folding* sub-menu:
Toggle Fold
Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))
Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))
Folds the child elements that are indented one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))
Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))
Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Author Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode
To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode
Oxygen XML Author Eclipse plugin includes a variety of keyboard shortcuts that allow you to select content in Text mode. These include numerous standard continuous selection possibilities that are common to many text editors.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on macOS)
Selects all content in the document.

Shift + Left/Right Arrow Keys
Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys
Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)
Begins a continuous selection at the cursor position and extends it one word at a time in the
direction that you press the arrow keys.

**Shift + Home**
Begins a continuous selection at the cursor position and extends it to the beginning of the
current line (on macOS, it extends to the beginning of the document).

**Shift + End**
Begins a continuous selection at the cursor position and extends it to the end of the current line
(on macOS, it extends to the end of the document).

**Ctrl + Shift + Home**
Begins a continuous selection at the cursor position and extends it to the beginning of the
document.

**Ctrl + Shift + End**
Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**
Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**
Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**
Selects certain text, depending on the position of the click in the document. See Smart Editing:
Double-Click *(on page 282)* for the specifics.

**Triple-Click**
Selects entire regions of text, depending on the position of the click in the document. See the
Smart Editing: Triple-Click *(on page 283)* for the specifics.

**Right-Click > Select > Element**
Selects the entire element at the current cursor position.

**Right-Click > Select > Content**
Selects the entire content of the element at the current cursor position, excluding the start
and end tag. Performing this action repeatedly will result in the selection of the content of the
ancestor of the currently selected element content.

**Right-Click > Select > Attributes**
Selects all the attributes of the element at the current cursor position.

**Right-Click > Select > Parent**
Selects the entire parent element at the current cursor position.
Content Completion Assistant in Text Mode

Oxygen XML Author Eclipse plugin includes an intelligent Content Completion Assistant (on page 2078) that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (on page 61), go to Editor > Content Completion, and deselect the Enable content completion option (on page 110).

Content Completion and the Associated Schema

The Content Completion Assistant feature is schema-driven and the list of proposals in the Content Completion Assistant (on page 2078) depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the Associating a Schema to XML Documents (on page 557) section.

Using the Content Completion Assistant in Text Mode

The feature is activated in Text mode in the following situations:

- After you enter the < character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option (on page 112) from the Content Completion preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing Ctrl + Space (Command + Space on macOS) or Alt + ForwardSlash (Command + Alt + ForwardSlash on macOS).

If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.
To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:**

When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the Add Element Content option (on page 111) (in the **Content Completion** preferences page) is selected. The Content Completion Assistant can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the Add optional content (on page 111) and Add first Choice particle (on page 111) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

**Where the Content Completion Assistant is Displayed**

The **Content Completion Assistant** is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

**Types of Proposals Listed in the Content Completion Assistant**

The following things are considered for determining the proposals that are listed in the content completion window:

- **Element Structure Specified in DTD or Schema**
The proposals that populate the **Content Completion Assistant** depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:**
The **Content Completion Assistant** is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

**Current Cursor Position**
The number and type of elements displayed by the **Content Completion Assistant** is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

**Unique ID Attribute Values**
A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Author Eclipse plugin checks the uniqueness and correctness of the `@id` attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

**Values for xml:id Attributes**
Values of all the `@xml:id` attributes are handled as `@id` attributes. They are collected and displayed by the **Content Completion Assistant** as possible values for anyURI attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

**Links/References in DITA**
When entering values for the various types of links and references in DITA (for example, values for `@href` or `@conref` elements), the **Content Completion Assistant** will propose potential targets when you use the forward slash key (/).

**ID Values for DITA Key References**
In DITA, when inserting key references (`@keyref`) or content key references (`@conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The **Content Completion Assistant** will only propose targets that are valid in the current context.

**Element and Attribute Values**
For documents that use an XML Schema or Relax NG schema, the **Content Completion Assistant** offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the **Content Completion Assistant**.

**Related information**
*Customizing the Content Completion Assistant Using a Configuration File* (on page 1488)
Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant (on page 2078).*
- A small tooltip window shown when the mouse hovers over an element or attribute.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the *Show annotations in Content Completion Assistant (on page 112)* option in the *Annotations* preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `<br>`, `<table>`, `<ul>`, `<ol>`).

The HTML rendering is controlled by the *Show annotations using HTML format, if possible (on page 113)* option in the *Annotations* preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `<br>`, `<ul>`, `<li>`), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `<br>` breaks the current line, `<ul>` encloses a list of items, and `<li>` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author Eclipse plugin looks for an annotation in the type definition of that element or attribute.
Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace like this:

```xml
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** (on page 113) option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```text
## Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Author Eclipse plugin defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (on page 112) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Content Completion Helper Views (Text Mode)

Information about the current element being edited is also available in various **dockable** (on page 2078) views, such as the **Model view** (on page 304), **Attributes view** (on page 302), **Elements view** (on page 306), and **Entities view** (on page 307). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline view** (on page 299), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Author Eclipse plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON,
HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on macOS) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

### How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Editor > Content Completion > Code Templates.

2. Click New to open a code template configuration dialog box.

   Tip:
   You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 2078). HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
Shortcut key - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:

- M1 represents the Command key on macOS, and the Ctrl key on other platforms.
- M2 represents the Shift key.
- M3 represents the Option key on macOS, and the Alt key on other platforms.
- M4 represents the Ctrl key on macOS, and is undefined on other platforms.

Content - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 199) can be inserted in the text box using the Insert Editor Variables button.

4. Click OK to save your new code template.

Result: Your code template can now be selected using the Content Completion Assistant (on page 2078) (Enter in Author mode or Ctrl + Space (Command + Space on macOS) in Text mode). The code templates are displayed with a symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (on page 61) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (on page 61), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (on page 61) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Project Explorer view (on page 244), the code templates will be available in their content completion list.
Tip:
It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (on page 1488) for a particular framework. You could then share the whole framework (on page 1584) with other members of your team.

Text Mode Views

There is a variety of dockable (on page 2078) helper views that are displayed by default in Text mode. There are also a large selection of additional views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Text mode.

Outline View for XML Documents

The Outline view displays a general tag overview of the currently edited XML document. When you edit a document, the Outline view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The Outline view allows you to:

- Quickly navigate through the document by selecting nodes in the Outline tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the Outline view, and vice versa.
- View document errors, as they are highlighted in the Outline view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

It also includes a View menu in the top-right corner that presents a variety of options to help you filter the view even further.
Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the Ctrl (Command on macOS) key after dragging, a copy operation will be performed instead of a move.

Figure 57. Outline View

Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

The following actions are available in the View menu of the Outline view:

Filter returns exact matches

The text filter of the Outline view returns only exact matches.
Selection update on cursor move (Available in Text mode)

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 195).

Configure displayed attributes

Displays the XML Structured Outline preferences page (on page 195).

Outline View Contextual Menu Actions

The contextual menu of the Outline view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the profiling attributes (on page 414) defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand All

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip:
You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:
• The names of the attributes are rendered with a bold font, and their values with a plain font.
• Default values are rendered with a plain font, painted gray.
• Empty values display the text "[empty]", painted gray.
• Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

• By attribute name in ascending order.
• By attribute name in descending order.
• Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 58. Attributes View

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes (on page 143) schema-aware option is selected.

Set empty value

Specifies the current attribute value as empty.
Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the Delete or Backspace keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (<, >, &).  
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.  
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note:

If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note:
When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

The Results view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The Results view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is dockable (on page 2078), so it can be moved to another UI location alongside other side views.

The actions that contribute messages to this view include:

- Validation actions (on page 520)
- Transformation actions (on page 785)
- Check Spelling in Files action (on page 268)
- SQL results (on page 1412)
Figure 64. Results View

![Image of Results View]

Results View Toolbar Actions

The view includes a toolbar with the following actions:

- **Grouping Mode toggle options**
  
  You can choose to group the result messages in a **Hierarchical** or **Flat** arrangement.

- **Next**
  
  Navigates to the message below the current selection.

- **Previous**
  
  Navigates to the message above the current selection.

- **Remove selected**
  
  Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

- **Remove all**
  
  Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Learn Word(s) (Available when spelling errors are reported in the Results view)**
  
  Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

- **Remove**
  
  Removes selected messages from the view.

- **Remove all**
  
  Removes all messages from the view.

- **Copy**
Covers information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

Copy Description
Copies the description values for all selected items.

Show message
Opens a dialog box that displays the details of the message.

Save Results
Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the Copy action (on page 309).

Save Results as XML
Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the Copy action (on page 309).

Save Results as HTML
Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the Copy action (on page 309).

Expand All
Available when Hierarchical mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All
Available when Hierarchical mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Syntax Highlighting in XML Documents
Oxygen XML Author Eclipse plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the Preferences dialog box (on page 61).
2. Go to Editor > Syntax Highlight (on page 161).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.
Tip:
Oxygen XML Author Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (on page 162).

Related Information:
Customize Syntax Highlight colors (on page 161)

Syntax Highlight Depending on Namespace Prefix

The syntax highlight scheme of an XML file type (on page 161) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. Marking tags with different colors based on the namespace prefix (on page 162) allows easier identification of the tags.

Figure 65. Example of Coloring XML Tags by Prefix

```xml
<xsl:template match="name">
  <xsl:list-item>
    <xsl:apply-templates select="?"/>
  </xsl:list-item>
</xsl:template>
```

Related Information:
Changing the colors displayed in the Text Mode Editor (on page 161)

Formatting and Indenting XML Documents

In Text mode (on page 219), you can decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Author Eclipse plugin automatically formats and indents the XML.

You can trigger a format and indent operation for your XML document (in Text mode) using one of the following actions:

- Format and Indent toolbar button - Formats and indents the current document.
- Document > Source > Format and Indent - Formats and indents the whole document.
• **Document > Source > Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.

• **Document > Source > Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

Various settings affect how Oxygen XML Author Eclipse plugin formats and indents XML. Many of these settings have to do with how whitespace is handled.

**Significant and Insignificant Whitespace in XML**

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called **insignificant whitespace**. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called **significant whitespace**.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```xml
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called **normalizing space**.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
</codeblock>
Here every whitespace character between the `<codeblock>` tags should be treated as significant.

### How Oxygen XML Author Eclipse plugin Determines When Whitespace is Significant

When Oxygen XML Author Eclipse plugin formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Author Eclipse plugin needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Author Eclipse plugin assigns each element in the document to one of four categories:

- **Ignore space**
  
  In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

- **Normalize space**
  
  In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

- **Mixed content**
  
  In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant.

#### Notes:

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.
This is a <strong>big</strong>
```
<emphasis>deal</emphasis>.
</p>

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end <strong>tag and the beginning <emphasis>tag should be normalized to a single space, not zero spaces.

**Preserve space**

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Author Eclipse plugin evaluates several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Author Eclipse plugin consults. For instance, if the element is named on the Default elements list (as described below) but it has an @xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the @xml:space="default" attribute in the source, but is listed on the Mixed content elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Author Eclipse plugin consults information from the following sources:

**xml:space**

If the XML element contains the @xml:space attribute, the element is promoted to the appropriate category based on the value of the attribute.

**CSS whitespace property**

If the CSS stylesheet controlling the Author mode editor applies the whitespace: pre setting to an element, it is promoted to the preserve space category.

**CSS display property**

If a text node contains only white-spaces:

- If the node has a parent element with the CSS display property set to inline then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS display property set to inline then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS display property set to table then the node is assigned to the ignore space category.

**Schema-aware formatting**
If a schema is available for the XML document, Oxygen XML Author Eclipse plugin can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value `preserve`.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema-aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box (on page 61), go to Editor > Edit modes > Author > Schema-Aware, and select/deselect the Schema-aware normalization, format and indent option (on page 143).
- To turn it on or off for the Text editing mode, open the Preferences dialog box (on page 61), go to Editor > Format > XML, and select/deselect the Schema-aware format and indent option (on page 155).

Preserve space elements list

If an element is listed in the Preserve space tab of the Element Spacing list (on page 154) in the XML formatting preferences (on page 152), it is promoted to the preserve space category.

Default space elements list

If an element is listed in the Default space tab of the Element Spacing list (on page 154) in the XML formatting preferences (on page 152), it is promoted to the default space category.

Mixed content elements list

If an element is listed in the Mixed content tab of the Element Spacing list (on page 154) in the XML formatting preferences (on page 152), it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In Author mode, if an element is marked as mixed content in
the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of display: block). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements (on page 2077). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the Schema-Aware Editing option (on page 143) in the Schema-Aware preferences page.

How Oxygen XML Author Eclipse plugin formats and indents XML

You can control how Oxygen XML Author Eclipse plugin formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- Format preferences page (on page 149)
- XML Formatting preferences page (on page 152)
- Whitespaces preferences page (on page 156)

When Oxygen XML Author Eclipse plugin formats and indents XML

Oxygen XML Author Eclipse plugin formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving or switching to Text mode from Grid mode, if the Format and indent when passing from grid to text or on save option (on page 147) is selected in the Grid preferences page.

Setting an Indent Size to Zero

Oxygen XML Author Eclipse plugin will automatically format and indent (on page 311) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:**

Changing the indent size does not override the rules that Oxygen XML Author Eclipse plugin uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

**Maintaining zero indent in documents with zero indent**
If you have existing documents with zero indent and you want Oxygen XML Author Eclipse plugin to maintain a zero indent when editing or formatting those documents:

1. Open the Preferences dialog box (on page 61) and go to Editor > Format (on page 149).
2. Select Detect indent on open.
3. Select Use zero-indent if detected.

Oxygen XML Author Eclipse plugin will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Author Eclipse plugin will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the Preferences dialog box (on page 61) and go to Editor > Format (on page 149).
2. Deselect Detect indent on open.
3. Set Indent size to 0.

All documents will be formatted and indented with an indent of zero.

⚠️ Warning:

Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Author Eclipse plugin provides support for formatting and indenting (pretty-print (on page 2082)) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project Explorer view (on page 244). This opens the Format and Indent Files dialog box that allows you to configure options for the action.
Figure 66. Format and Indent Files Dialog Box

The Scope section allows you choose from the following scopes:

- **All opened files** - The *pretty-print (on page 2082)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print (on page 2082)* is performed in the files located at a specified path.

The Options section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 2082)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 2082)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Author Eclipse plugin makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

**Quick Assist Support for IDs and IDREFS**

The *Quick Assist support (on page 2083)* is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the
line number stripe of the editor. You can also invoke the Quick Assist menu from the contextual menu or by pressing Ctrl+1 (Command+1 on macOS) on your keyboard.

The following actions are available:

**Rename in**

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 572). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

**Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

**Change scope**

Opens the Select the scope for the Search and Refactor operations (on page 572) dialog box.

**Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

**Search Occurrences**

Searches for the declaration an references of the ID located at the cursor position in the current document.

---

**Highlight ID Occurrences in Text Mode**

To see the occurrences of an ID in an XML document in the Text mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

---

**Note:**

Highlighted ID declarations are rendered with a different color than highlighted ID references.
Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Author Eclipse plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):

- **Cut, Copy, Paste**
  
  Executes the typical editing actions on the currently selected content.

- **Copy XPath**
  
  Copies the XPath expression of the current element or attribute (or property for JSON documents) to the clipboard.

- **Toggle Line Wrap** *(Ctrl + Shift + Y (Command + Shift + Y on macOS))*
  
  Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

- **Toggle Comment** *(Ctrl + Shift + Comma (Command + Shift + Comma on macOS))*
  
  Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

**Go to submenu**

This submenu includes the following actions:

- **Go to Matching Tag** *(Ctrl + Shift + G (Command + Shift + G on macOS))*
  
  Moves the cursor to the end tag that matches the start tag, or vice versa.

- **Go after Next Tag** *(Ctrl + CloseBracket (Command + CloseBracket on macOS))*
  
  Moves the cursor to the end of the next tag.

- **Go after Previous Tag** *(Ctrl + OpenBracket (Command + OpenBracket on macOS))*
  
  Moves the cursor to the end of the previous tag.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  
  Selects the entire element at the current cursor position.

- **Content**
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Attributes**

Selects all the attributes of the element at the current cursor position.

**Parent**

Selects the parent element at the current cursor position.

**Source submenu**

This submenu includes the following actions:

- **Shift Right**
  Shifts the currently selected block to the right.

- **Shift Left**
  Shifts the currently selected block to the left.

- **Indent selection (Ctrl + I (Command + I on macOS))**
  Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences (on page 149).

- **Escape Selection**
  Escapes a range of characters by replacing them with the corresponding character entities.

- **Unescape Selection**
  Replaces the character entities with the corresponding characters.

- **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on macOS))**
  Pretty-prints (on page 2082) the element that surrounds the current cursor position.

- **Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**
  Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

  - \texttt{0x0045} will be converted to \texttt{E}
  - \texttt{0X0125} to \texttt{ĥ}
Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding base 64 schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding base32 schemes:

Import File to Encode and Insert
Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Hex Encode/Decode submenu**

This submenu include the following actions for encoding or decoding hex schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection.
Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

Note:

In the Author mode, this dialog box presents a preview of the inserted document as an author page in the Preview tab and as a text page in the Source tab. In the Text mode, the Source tab is presented.

Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```xml
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization (on page 2078) algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu
This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

**Modify All**

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Surround All**

Surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

**Remove All**

Removes all the highlighted content.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Go to Definition (Ctrl + Shift + Enter)**

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “http://www.w3.org/2001/XMLSchema-instance” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

**Refactoring submenu**

This submenu includes the following actions:

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.
• If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author Eclipse plugin will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.

• If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.

• To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the **Position cursor between tags** option *(on page 111)* is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option *(on page 111)* is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’ (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Surround with <![CDATA]> (Alt + Shift + C (Command + Alt + C on macOS))**

Surround the selected content with a `<CDATA>` tag so that the parser will interpret it as textual data rather than markup.

**Delete element tags (Alt + Shift + Comma)**

Deletes the start and end tag of the current element.

**Split element**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Join elements (Alt + Shift + F (Command + Alt + F on macOS))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.
Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.
Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

Manage IDs submenu
This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

 Rename in
Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 572). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

 Rename in File
Renames the ID you are editing and all its occurrences from the current file.

 Search References
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

 Search References in
Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

 Search Declarations
Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Search Declaratios in**

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

**Quick Assist (Ctrl + 1 (Command + 1 on macOS))**

Available when the cursor is inside an ID or IDREF, this action opens the **Quick Assist (on page 2083)** window that allows you to select some search and refactoring actions for the selected ID or IDREF.

**Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

**Show Resource Hierarchy**

Opens the **Resource Hierarchy/Dependencies view (on page 573)** that allows you to see the resource hierarchy for an XML document.

**Show Resource Dependencies**

Opens the **Resource Hierarchy/Dependencies view (on page 573)** that allows you to see the resource dependencies for an XML document.

**Editing XML Documents in Grid Mode**

This section includes topics that describe how to work with XML documents in **Grid** mode, including various features, actions that are available, and much more.

The **Grid** mode in Oxygen XML Author Eclipse plugin displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup.

To switch to this mode, select **Grid** at the bottom of the editing area.

You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified
simply by editing the value of cells that contain the text and a useful Content Completion Assistant (on page 2078) is also available to help you edit or insert XML elements.

For more information about some of the features available in the Grid editor, watch our video demonstration:

https://www.youtube.com/embed/PoYm2VqisWk

Layouts: Grid and Tree

The Grid editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 67. Grid Layout

```
<xml version="1.0" encoding="UTF-8">
  <tbody>
    <tr>
      <td id="10001" first="Jhon" last="Doe">
      </td>
    </tr>
    <tr>
      <td id="10002" first="Mark" last="Ewing">
      </td>
    </tr>
    <tr>
      <td id="10003" first="Dave" last="Flint">
      </td>
    </tr>
  </tbody>
</xml>
```

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 68. Tree Layout

```
<xml version="1.0" encoding="UTF-8">
  <tbody>
    <tr>
      <td id="10001" first="Jhon" last="Doe">
      </td>
    </tr>
    <tr>
      <td id="10002" first="Mark" last="Ewing">
      </td>
    </tr>
    <tr>
      <td id="10003" first="Dave" last="Flint">
      </td>
    </tr>
  </tbody>
</xml>
```

To switch between the two modes, select Grid mode/Tree mode from the contextual menu.

Grid Mode Navigation

When you first open a document in Grid mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign (➡️) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (⬅️).

The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.
Expand/Collapse Submenu

The following actions are available on the Expand/Collapse submenu:

- **Expand All**
  Expands the selection and all its children.

- **Collapse All**
  Collapses the selection and all its children.

**Expand Children**
Expands all the children of the selection but not the selection.

**Collapse Children**
Collapses all the children of the selection but not the selection.

**Collapse Others**
Collapses all the siblings of the current selection but not the selection.

Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in Grid mode:

### Table 3. Shortcuts in the Grid Mode

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Tab</strong></td>
<td>Moves the cursor to the next editable value in a table row.</td>
</tr>
<tr>
<td><strong>Shift + Tab</strong></td>
<td>Moves the cursor to the previous editable value in a table row.</td>
</tr>
<tr>
<td><strong>Enter</strong></td>
<td>Begins editing and lets you insert a new value. Also commits the changes after you finish editing.</td>
</tr>
<tr>
<td><strong>UpArrow/PageUp</strong></td>
<td>Navigates toward the beginning of the document.</td>
</tr>
<tr>
<td><strong>DownArrow/PageDown</strong></td>
<td>Navigates toward the end of the document.</td>
</tr>
<tr>
<td><strong>Shift</strong></td>
<td>Used in conjunction with the navigation keys to create a continuous selection area.</td>
</tr>
<tr>
<td><strong>Ctrl (Command on macOS) key</strong></td>
<td>Used in conjunction with the mouse cursor to create discontinuous selection areas.</td>
</tr>
</tbody>
</table>

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on macOS)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on macOS)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on macOS)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on macOS)** scrolls the grid to the right.
Editing Actions in Grid Mode

Since Grid mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the Content Completion Assistant (on page 337) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Author Eclipse plugin provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip:
There are two different types of layouts available in Grid mode. Most people prefer to leave it on the default Grid mode layout, but there is also a Tree mode layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the Document > Grid Layout menu.

Expanding/Collapsing Nodes

An arrow sign displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign. The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select Expand All from the Expand/Collapse submenu. To collapse all node, right-click any cell and select Collapse All from the Expand/Collapse submenu.

Editing Elements or Attributes

To edit elements or attributes in Grid mode, simply double-click the cell that contains the element or attribute (or select the cell and press Enter) to invoke the Content Completion Assistant (on page 337). This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press Enter (or double-click the cell), and start editing.

To stop editing a cell value, press Enter again.

To cancel the editing without saving the current changes in the document, press the Esc key.
Editing the Structure of the Nested Tables

To edit the structure of the nested tables in Grid mode, Oxygen XML Author Eclipse plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu, or the toolbar):

**Cut, Copy, Paste, Delete common editing actions**

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

**Paste as Child**

Pastes the copied content as the last child of the current selection.

**Duplicate**

Creates a new node by duplicating the currently selected one.

**Insert Before**

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

**Insert After**

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

**Append Child**

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

**Sort Ascending, Sort Descending**

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between numerical and alphabetical.

**Insert Row**

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press Enter.

**Insert Column**

Inserts a column after the current selection.

**Clear Content**

Removes all content from the current cell.

**Expand/Collapse > Expand All**
Expands the selection and all its children.

**Expand/Collapse > Collapse All**

Collapses the selection and all its children.

**Expand/Collapse > Expand Children**

Expands all the children of the selection but not the selection.

**Expand/Collapse > Collapse Children**

Collapses all the children of the selection but not the selection.

**Expand/Collapse > Collapse Others**

Collapses all the siblings of the current selection but not the selection.

**Refresh Selected**

Forces the layout to be recomputed.

**Related Information:**

- Grid Mode Navigation *(on page 330)*
- Copy and Paste in the Grid Editing Mode *(on page 335)*
- Drag and Drop in the Grid Editing Mode *(on page 334)*
- Content Completion Assistant in Grid Mode *(on page 337)*

**Drag and Drop in the Grid Editing Mode**

You can easily arrange sections in your XML document in the Grid mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid.

**Tip:**

When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the **Refresh Selected** action that is available in the contextual menu and in the Document > Grid Edit menu.
Copy and Paste in the Grid Editing Mode

Selecting content in the Grid mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on macOS).

Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- **Paste** (Ctrl + V (Command + V on macOS)) - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the Grid editor can also be pasted into Text mode or other external applications. When pasting copied content from Grid mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.
Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.
If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the Insert row or Insert column actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the Grid editor.

**Content Completion Assistant in Grid Mode**

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the Grid editing mode offers a Content Completion Assistant (on page 2078) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press Enter on your keyboard).

**Special Character Support in Grid Mode**

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the Change Text Orientation (Ctrl + Shift + O (Command + Shift + O on macOS)) action that is available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

*Note:* This change applies only to the text from the cells, and not to the layout of the grid editor.
Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:
1. Open the XML document in Oxygen XML Author Eclipse plugin and switch to Grid mode.
2. Expand the nodes (on page 332) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export (Copy from the contextual menu or Ctrl +C).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Author Eclipse plugin also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in Grid mode). For more information, see Import from MS Excel Files – Grid Mode Method (on page 1420).

For more information about exchanging data between Oxygen XML Author Eclipse plugin and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Editing XML Documents in Author Mode**

This section includes topics that describe how to work with XML documents in Author mode, including its various features, actions that are available, and much more.

The Author editing mode in Oxygen XML Author Eclipse plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Author Eclipse plugin provides support for visually editing the most commonly used XML vocabularies in Author mode, including DITA, Doc Book, TEI, and XHTML.

Adding text content in Author mode is as simple as doing so in a standard text editor but the content is rendered similar to how you see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in Author mode and it includes an intuitive Image Map Editor (on page 469). You can easily change the rendering by selecting one of the preset main styles (on page 2081) from the Styles drop-down menu (on page 341) (available on the toolbar) and combine multiple alternate styles (on page 2077) that behave like layers. You can also use the options in the Tags Display Mode drop-down menu (on page 344) to control how much XML markup is displayed in Author mode and there are various features and views that provide information about the XML structure based on your current location within the document.
Author mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, drag and drop support (on page 361), a Smart Paste mechanism (on page 362), and an intelligent Content Completion Assistant (on page 365). Author mode also allows you to visualize and manage profiled content (on page 414), you can collaborate with others with various review features (on page 388) (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the Author button at the bottom of the editing area.

For more information about some of the features available in the visual Author editing mode, watch our video demonstration:

https://www.youtube.com/embed/bnQwJZD58wY

Author Mode User Roles

There are two main types of users for the Author mode: framework developers and content authors.

Framework Developers

A framework developer is a technical person with advanced XML knowledge who defines the framework (on page 2080) for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The framework (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in Author mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of XML Catalogs (on page 2085).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Author Eclipse plugin includes some ready-to-use built-in document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A content author does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.
Changing the Look of Documents in Author Mode Using the Styles Menu

The **Author** mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

Oxygen XML Author Eclipse plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one **main (non-alternate) CSS style (on page 2081)** and multiple **alternate CSS styles (on page 2077)**. This makes it easy to change the look of the document as it appears in **Author** mode.

The list of CSS styles that are available in the **Styles** menu depend on the **framework (on page 2080)** (document type).

![Figure 75. Styles Drop-down Menu in a DITA Document](image)

You can use the **Styles** drop-down menu to select a **main css style (on page 2081)** that applies to the whole document and then select one or more **alternate css styles (on page 2077)** that behave like layers and are merged sequentially with the **main style**. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in **Author** mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Author Eclipse plugin remembers them when subsequent documents are opened.

**Main CSS Styles**

The **main styles** are listed in the top section and each of their corresponding CSS files are primarily used to render basic things such as the font and background of the document. You can only select one main style at a time.
Alternate CSS Styles

The alternate styles are listed in the bottom section and their corresponding CSS files are used to render numerous different types of things in the document as they are merged with the selected main styles. You can select as many alternate styles as you wish. If you are unsure about how each of the styles with change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

**Note:**

If you deselect the Enable multiple selection of alternate CSSs option (on page 87) in the CSS subtab of the Document Type configuration dialog box (on page 81), the alternate styles are treated like main CSS styles and you can only select one at a time.

Unique CSS Styles for DITA

Oxygen XML Author Eclipse plugin comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps (on page 2079)). For example, the main styles for DITA documents include Cursive, Century, Facet Design, Roboto, Trip Journal, Papyrus, and more.

Some of these unique alternate styles for DITA documents include:

- **Hints** - Displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure.
- **Inline actions** - Displays possible elements that are allowed to be inserted at various locations throughout DITA documents.
- **Inline insertion actions** - Displays a widget (/hooks) near each empty paragraph that makes it easy to insert DITA elements (for example, to insert lists, notes, or tables).

**Tip:**

For information about configuring the Styles drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Related information

- Associating a Schema to XML Documents (on page 557)
- Configuring and Managing Multiple CSS Styles for a Framework (on page 1442)

Navigating the Document Content in Author Mode

Oxygen XML Author Eclipse plugin includes some useful features to help you navigate XML documents.

**Navigation Keyboard Shortcuts**

- Tab
Navigate to the next XML node.

Tip:
If you encounter a space-preserved element (on page 2084) when you navigate through a document and you do not press another key, pressing the Tab key will continue the navigation. However, if the cursor is positioned in a space-preserved element and you press another key or you position the cursor inside such an element using the mouse, the Tab key can be used to arrange the text.

Shift + Tab

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Author Eclipse plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the Navigation menu:

Last Edit Location (Ctrl+Q)

Navigates to the last modification in any open tab.

Back (Alt+LeftArrow (Command+OpenBracket on macOS))

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links.

Forward (Alt+RightArrow (Command+CloseBracket on macOS))

Available after you use the Back button at least once, and it navigates in the opposite direction as the Back button.

Navigating with the Outline View

Oxygen XML Author Eclipse plugin includes an Outline view (on page 299) that displays a hierarchical tag overview of the currently edited XML Document.
You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

**Figure 76. Outline View Navigation in Author Mode**

Using the Breadcrumb to Navigate

A breadcrumb in the toolbar area at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

**Figure 77. Breadcrumb in Author Mode**

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the linking support is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Author Eclipse plugin, links are marked with the icon (or the icon for key-based references). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by pressing the F3 key when the cursor is inside a link element.

Note:

Depending on the referenced file type, the target link will either be opened in the Oxygen XML Author Eclipse plugin or in the default system application. If the target file does not exist, Oxygen XML Author Eclipse plugin prompts you to create it.

Displaying the Markup

You can control the amount of markup that is displayed in the Author mode with various levels of tag modes for both block and in-line elements.
Tags Display Mode

The following dedicated tag modes are available from the Tags Display Mode drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both *block* (on page 2077) and *inline elements* (on page 2080). Oxygen XML Author Eclipse plugin.

- **Full Tags**
  
  Displays full tag names without attributes for both *block elements* and *inline elements*.

- **Block Tags**
  
  Displays full tag names for *block elements* and simple tags without names for *inline elements*.

- **Block Tags without Element Names**
  
  Displays tags for *block elements* but without element names for a more compact version of Block Tags mode. You can still see the element names by hovering over the tags.

- **Inline Tags**
  
  Displays full tag names for *inline elements*, while *block elements* are not displayed.

- **Partial Tags**
  
  Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

- **No Tags**
  
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page (on page 125) where you can configure the Tags Display Mode options.

**Note:**

The associated CSS information is used to determine whether a tag should be considered *inline* or *block*. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.

Displaying Referenced Content

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content (on page 1538) are expanded by default in Author mode and the referenced content is displayed. You can control this behavior from the Author preferences page (on page 125). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in the document.
If the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the icon, or the icon for key-based references) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the **XML Catalog** (on page 2085) set in the **XML Catalog preferences page** (on page 173).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Author Eclipse plugin.
- On demand, by using the **Refresh references** action (on page 499). This is useful when the referenced content is modified outside the Oxygen XML Author Eclipse plugin scope.

**Related Information:**
- Configuring a Reference Resolver (on page 1538)

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first block (on page 2077) child of the current node.

![Section 2: CAL](image)

- **Between two block elements** - The cursor is positioned between two block elements (on page 2077).

![Configure transformation](image)

- **After last block** - The cursor is positioned after the last block element (on page 2077) child of the current node.
• **Inside a node** - The cursor is positioned inside a node.

• **Before an inline element** - The cursor is positioned inside an element, before a child inline element (on page 2080).

• **Between two inline elements** - The cursor is positioned between two inline elements (on page 2080).

• **After an inline element** - The cursor is positioned inside an element, after a child inline element (on page 2080).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the Preferences dialog box (on page 61), go to Author > Cursor Navigation, and deselect the Show cursor position tooltip option (on page 132). Even if this option is deselected, you can still display the position tooltip by pressing Shift+F2.

**Note:**
The position information tooltip is not displayed if Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu (on page 344).

**Location Tooltip**

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Author Eclipse plugin displays a transparent preview of the position information, called the Location Tooltip:
Oxygen XML Author Eclipse plugin displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following tags display modes *(on page 344)*: **Inline Tags**, **Partial Tags**, **No Tags**.
- The mouse pointer is moved between **block elements (on page 2077)**.

To activate or deactivate this feature, use the **Show location tooltip on mouse move** option *(on page 132)* in the **Cursor Navigation** preferences page *(on page 132)*.

### Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Author Eclipse plugin must serialize the resulting document as XML. Oxygen XML Author Eclipse plugin serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Author Eclipse plugin **formats and indents the XML document (on page 311)** according to the current format and indent settings *(on page 149)*.

### Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control system, as it avoids introducing insignificant whitespace differences between versions, which in turn makes diff output easier to read.

### Entering Whitespace in Author Mode

Oxygen XML Author Eclipse plugin controls the entry of whitespace characters in **Author** mode according the **XML whitespace rules (on page 311)**, which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Author Eclipse plugin is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Author Eclipse plugin will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its **built-in document types (on page 646)**, Oxygen XML Author Eclipse plugin is correctly configured to recognize preserve space elements *(on page 152)* and to allow you to enter additional spaces in them.
If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly (on page 1430) so that Oxygen XML Author Eclipse plugin recognizes that the current element is a preserve-space element.

**Serialization Options for Author Mode**

The Options > Preferences > Editor > Edit modes > Author > Serialization page contains some options that control how the formatting and indenting is applied when a document is saved in Author mode or when switching from Author to Text mode. It also includes a Compatibility with other tools option (on page 146) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

**Editing Content in Author Mode**

The Author mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

**Undo/Redo Actions**

The typical undo and redo actions are available with shortcuts or in the Edit menu:

- **Undo (Ctrl + Z (Command + Z on macOS))**
  
  Reverses a maximum of 200 editing actions to return to the preceding state.

  ![Note:](image)

  Complex operations such as Replace All or Indent selection count as single undo events.

- **Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))**
  
  Recreates a maximum of 100 editing actions that were undone by the Undo function.

**Copy and Paste Actions**

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

- **Cut (Ctrl + X (Command + X on macOS))**
  
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on macOS))**
  
  Places a copy of the currently selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on macOS))**
Inserts the current clipboard content into the document at the cursor position.

**Select All (Ctrl + A (Command + A on macOS))**

Selects the entire content of the current document.

**Entering Text in Elements**

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

*Figure 79. Editing in empty element warning*

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and deselect the **Reject action when its result is invalid** option in the **Typing** actions section (on page 144).

**Editing Text Content Without Modifying the XML Markup**

You can use the options in the **Tags Display Mode** drop-down menu (on page 344) (available on the toolbar) to control how tags are displayed in **Author** mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the **Grid editing mode** (on page 329) to modify text content without affecting the XML tags.

**Related Information:**

- Editing XML Markup in Author Mode (on page 350)
- Drag and Drop in Author Mode (on page 361)
- Smart Paste in Author Mode (on page 362)
- Content Completion Assistant in Author Mode (on page 365)
- Contextual Menu Actions in Author Mode (on page 504)

**Editing XML Markup in Author Mode**

Oxygen XML Author Eclipse plugin includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

**Selecting XML Markup in Author Mode**

Selecting XML tags in Oxygen XML Author Eclipse plugin is very simple with several methods for selecting entire elements:
• **Breadcrumb** - Click the element (XML tag) on the breadcrumb (on page 351) displayed at the top of the editing window.

• **Outline View** - Click the element name in the Outline view (on page 299).

• **Full Tags Mode** - While editing in Full Tags mode (on page 344), click the start or end tag of the element in the editor.

• **Mouse Selection** - While editing in Full Tags mode (on page 344), click before the start tag of the element, drag the selection, and release the mouse button after the end tag.

• **Shift + Arrow Keys** - While editing in Full Tags mode (on page 344), place the cursor before the start tag of the element, press and hold Shift, and use the arrow keys to make the selection (including the end tag).

**Note:**

If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Author Eclipse plugin will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML (on page 517).

### Using the Breadcrumb in Author Mode

A breadcrumb on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

#### Figure 80. Breadcrumb in Author Mode

| book | chapter | sect1 | sect2 | sect3 | para | figure | title |

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

- **Edit Attributes**

  Opens the in-place attributes editor (on page 379) that allows you to easily edit the attributes of an element.

- **Edit Profiling Attributes**

  Allows you to select the profiling attributes (on page 414) that apply to a certain element.

- **Append child**

  Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

- **Insert before**

  Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.
Insert after

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Copy

Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the Rename dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip:
The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu:

Move Up (Alt + UpArrow)
Moves the current node or selected nodes in front of the previous node.

**Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

Tip:
The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

### Promote/Demote Nodes

You can easily promote or demote selected nodes (for example, within ordered lists or unordered lists) by using the following keyboard shortcuts:

**Promote (Shift + Tab)**

Promotes an entirely selected node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

**Demote (Tab)**

Demotes an entirely selected node (the list item is moved to the right). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

### Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu:

**Join Elements**

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Tip:
Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:

- The cursor is located before the end position of the first element and Delete key is pressed.
- The cursor is located after the end position of the first element and Backspace key is pressed.
- The cursor is located before the start position of the second element and Delete key is pressed.
- The cursor is located after the start position of the second element and Backspace key is pressed.
If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

**Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Rename Elements**

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu:

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (**wrap** the content) by using the following action in the **Refactoring** submenu of the contextual menu:

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 111) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 111) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with [tag] (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu:

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.
Tip:
Specifically, the Delete or Backspace keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and Delete key is pressed.
- The cursor is located after the start position of the element and Backspace key is pressed.
- The cursor is located before the end position of the element and Delete key is pressed.
- The cursor is located after the end position of the element and Backspace key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu:

- **Remove All Markup**
  Removes all the XML markup inside the selected block of content and keeps only the text content.

Tip:
You can use the Delete or Backspace keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu:

- **Remove Text**
  Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

- **DITA-related Refactoring Actions**
  A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.
Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert @conref attributes to @conkeyref attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.
Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.
Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Copying XML Content in Author Mode to the Clipboard

It is possible to copy the XML structure of a document to the system clipboard. Simply select the XML content in Author mode (for example, by selecting an element in the breadcrumb), and select Document > Edit > Copy as XML. The system clipboard will now contain the corresponding XML structure.

Related Information:
- Editing Content in Author Mode (on page 349)
- Displaying the Markup (on page 344)
- Refactoring XML Documents (on page 581)
- Selecting Content in Author Mode (on page 363)
- Content Completion Assistant in Author Mode (on page 365)
- Contextual Menu Actions in Author Mode (on page 504)

Editing Attributes in Author Mode

You can easily edit attributes in Author mode by using the Attributes View (on page 377) and Oxygen XML Author Eclipse plugin also allows you to edit attribute and element values in-place, directly in the Author mode, using an in-place attribute editor.
In-place Attributes Editor

Oxygen XML Author Eclipse plugin includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the \texttt{Alt + Enter} keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes (on page \ref{display-modes}):\texttt{Full Tags with Attributes}, \texttt{Full Tags}, \texttt{Block Tags}, or \texttt{Inline Tags}.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

![In-place Attributes Editor](image)

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the \texttt{Browse} button to select a URL for the value of an attribute. You can also press \texttt{Ctrl + Space} to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:**

For built-in frameworks, if the selected attribute in the Name field is an \texttt{@id} attribute, the \texttt{Browse} button is replaced by a \texttt{Generate Unique ID Value} button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Note:**
If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

Related Information:
Attributes View in Author Mode (on page 377)

**Folding XML Elements in Author Mode**

When working with a large document, the folding (on page 2080) support in Oxygen XML Author Eclipse plugin can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.
Folding Actions in Author Mode

Foldable elements (on page 2080) are marked with a small triangle (\^/\ ) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu:

- **Toggle Fold** (or you can simply click on the \^/\ arrow)
  
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on macOS))
  
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad- (Command + NumPad- on macOS))
  
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on macOS))
  
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on macOS))
  
  Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Author Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Related Information:

Folding Elements: -oxy-foldable Property (on page 1643)

Drag and Drop in Author Mode

The Oxygen XML Author Eclipse plugin Author mode includes support for dragging and dropping content in XML documents.

When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:
• When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
• When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
• The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

**Smart Paste in Author Mode**

The **Author** editing mode includes a **Smart Paste** feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other documents in Oxygen XML Author Eclipse plugin, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Author Eclipse plugin preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Author Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

**Tip:**
When pasting text fragments formatted with the *Courier New* font, the **Smart Paste** mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `<codeph>` element).

**Smart Paste Options**

By default, the **Smart Paste** feature is enabled in Oxygen XML Author Eclipse plugin. There are several options in the **Schema Aware** preferences page (on page 143) that control the **Smart Paste** mechanism:

• **Smart paste and drag and drop** (on page 144) - This option determines whether or not Oxygen XML Author Eclipse plugin will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
• **Reject action when its result is invalid** (on page 144) - If you select this option, Oxygen XML Author Eclipse plugin will not let you paste content into a position where it would be invalid. This option is deselected by default.
• **Convert external content on paste** *(on page 145)* - This option determines whether or not Oxygen XML Author Eclipse plugin will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.

• **Convert even when pasting inside space-preserve elements** *(on page 145)* - If you select this option, the Smart Paste feature will also work when pasting external content into a space-preserve element (such as a `<codeblock>`). This option is deselected by default.

### Smart Paste Supported Document Types

The Smart Paste feature is supported for the following document types *(frameworks (on page 2080)):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the Smart Paste support, watch our video demonstration:

https://www.youtube.com/embed/bpiXZQwzBfA

**Related Information:**

- Customizing Smart Paste Support *(on page 1485)*
- Migrating MS Office Documents to DITA *(on page 2049)*
- Oxygen Batch Converter add-on (Convert Markdown/HTML to DITA or DocBook)

### Selecting Content in Author Mode

Oxygen XML Author Eclipse plugin includes a variety of features and keyboard shortcuts to help you select content in **Author** mode.

#### Selection Shortcuts in Author Mode

- **Ctrl + A** *(Meta + A on macOS)*
  
  Selects all content in the document.

- **Shift + Left/Right Arrow Keys**

  Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

- **Shift + Up/Down Arrow Keys**

  Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

- **Ctrl + Shift + Left/Right Arrow Keys** *(Meta + Shift + Left/Right Arrow Keys on macOS)*
Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects the word at the cursor position.

**Triple-Click**

Selects the node at the cursor position.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

**Intelligent Selection in Author Mode**

Oxygen XML Author Eclipse plugin supports all usual content selection methods using the mouse or keyboard shortcuts (for example **Shift + Arrow Keys**). When selecting content in Author mode, there may be instances where you want to select an element (along with its content) rather than just inline text content. There are several ways to select an element, including:
• You can select an element by clicking the element name in the breadcrumb (on page 344).
• You can select an element using the Outline view (on page 299).
• If you have the Tags Display Mode (on page 345) set to any of the modes other than Partial Tags or No Tags, you can select an element directly in the main editing pane by clicking on the element's tag.
• If you have the Tags Display Mode (on page 345) set to Partial Tags (and the Compact tag layout option is enabled in the Author preferences page (on page 128)), you can still select certain block elements directly in the main editing pane by spanning the selection to the right of the end of the content that is inside a block element so that the selection includes the element's invisible end tag. In this mode, the end tag is normally not visible, but when your selection includes the invisible end tag, a tooltip displays the selected element name and the selection includes the whole element (along with its content).

Content Completion Assistant in Author Mode

One of the most useful features in Author mode is the Content Completion Assistant (on page 2078). It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 84. Content Completion Assistant in Author Mode

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (on page 61), go to Editor > Content Completion, and deselect the Enable content completion option (on page 110).

Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- Enter
- Ctrl + Space (Command + Space on macOS)
- Alt + ForwardSlash (Command + Alt + ForwardSlash on macOS)

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use Tab and Shift + Tab to navigate to those links and Space to
trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Author mode, simply press Enter.

**Types of Proposals Listed in the Content Completion Assistant**

The *Content Completion Assistant* offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates (on page 296).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (on page 344)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the Show all possible elements in the content completion list option from the Schema-Aware preferences page (on page 145) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:**

By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page (on page 145).

**Examples of How the Content Completion Assistant Works**

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:
• If the cursor is positioned at the beginning or at the end of the element, the first item offered in the Content Completion Assistant is a **New `<Element>`** item. Selecting this item will insert an empty element.

![Figure 85. Example (New [Element Name])](image)

• If the cursor is positioned somewhere inside the element, the first entry in the Content Completion Assistant is a **Split `<Element>`** item. In most cases, you can only split the closest block element (on page 2077) to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split `<Element>`** splits the content of the specified element around the cursor position.

![Figure 86. Example (Split [Element Name])](image)

• If the cursor is positioned inside a space-preserved element (on page 2084) (for example, a codeblock), the first choice in the Content Completion Assistant is **Enter**, which will insert a new line in the content of the element, followed by **New `<Element>`**.

![Figure 87. Example ('ENTER' New Line)](image)

• If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (on page 344)), it will allow you to rename the element.
• If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Related Information:
Customizing the Content Completion Assistant Using a Configuration File (on page 1488)

Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant (on page 2078) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:

• The schema specified explicitly in the document (on page 564). In this case, Oxygen XML Author Eclipse plugin reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
• The default schema declared (on page 566) in the Schema tab of the Document Type configuration dialog box (on page 85) for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant (on page 2078).
The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** (on page 112) option in the **Annotations** preferences page.

**Styling Annotations with HTML**

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `<br>`, `<table>`, `<ul>`, or `<ol>`).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** (on page 113) option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `<br>`, `<ul>`, `<li>`), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `<br>` breaks the current line, `<ul>` encloses a list of items, and `<li>` encloses an item of the list.

**Collecting Annotations from XML Schemas**

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author Eclipse plugin looks for an annotation in the type definition of that element or attribute.
Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace like this:

```xml
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the Use all Relax NG annotations as documentation (on page 113) option in the Annotations preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Author Eclipse plugin defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (on page 112) option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Customizing the Rendering of Elements (on page 1504)

Customizing Annotations in the Content Completion Assistant (on page 1509)

Content Completion Helper Views (Author Mode)

Information about the current element being edited is also available in various dockable (on page 2078) views, such as the Model view (on page 304), Attributes view (on page 377), Elements view (on page 382), and Entities view (on page 307). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (on page 299), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.
Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Author Eclipse plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on macOS) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Editor > Content Completion > Code Templates.

2. Click New to open a code template configuration dialog box.

   Tip:
   You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

3. Configure your template using the fields in the code template configuration dialog box:

   ![Code Template Configuration Dialog Box](image)
• **Name** - The name of the code template.
• **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 2078). HTML markup can be used for better rendering.
• **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  • M1 represents the Command key on macOS, and the Ctrl key on other platforms.
  • M2 represents the Shift key.
  • M3 represents the Option key on macOS, and the Alt key on other platforms.
  • M4 represents the Ctrl key on macOS, and is undefined on other platforms.
• **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 199) can be inserted in the text box using the Insert Editor Variables button.

4. Click **OK** to save your new code template.

**Result:** Your code template can now be selected using the Content Completion Assistant (on page 2078) (Enter in Author mode or Ctrl + Space (Command + Space on macOS) in Text mode). The code templates are displayed with a symbol.

**How to Share Code Templates**

There are two ways to easily share all of your code templates with other members of your team:

**Method 1: Export/Import**

1. Open the Preferences dialog box (on page 61) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.

5. Instruct them to open the Preferences dialog box (on page 61), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

**Result:** The code templates will be now available in their content completion list.

**Method 2: Share Project**

1. Open the Preferences dialog box (on page 61) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

**Result:** When they open the updated project file in their *Project Explorer view (on page 244)*, the code templates will be available in their content completion list.

---

**Tip:**

It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (*on page 1488*) for a particular framework. You could then share the whole framework (*on page 1584*) with other members of your team.

---

**Author Mode Views**

The content author is supported by a variety of *dockable (on page 2078)* helper views that are displayed by default when editing in *Author* mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is also a large selection of additional useful views available in the *Window > Show View* menu. This section presents some of the most helpful views for editing in *Author* mode.

---

**Outline View for XML Documents**

The *Outline* view displays a general tag overview of the currently edited XML document. When you edit a document, the *Outline* view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The *Outline* view allows you to:

- Quickly navigate through the document by selecting nodes in the *Outline* tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the *Outline* view, and vice versa.
- View document errors, as they are highlighted in the *Outline* view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.
The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

It also includes a View menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drag and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the Ctrl (Command on macOS) key after dragging, a copy operation will be performed instead of a move.
Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

The following actions are available in the View menu of the Outline view:

- **Filter returns exact matches**
  
  The text filter of the Outline view returns only exact matches.

- **Selection update on cursor move (Available in Text mode)**
  
  Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

- **Flat presentation mode of the filtered results**
  
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  
  Show/hide element name.

- **Show text**
  
  Show additional text content for the displayed elements.

- **Show attributes**
  
  Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 195).

- **Configure displayed attributes**
  
  Displays the XML Structured Outline preferences page (on page 195).

Outline View Contextual Menu Actions

The contextual menu of the Outline view contains the following actions:

- **Edit Attributes**
  
  Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

  **Edit Profiling Attributes (Available in Author mode)**
  
  Allows you to change the profiling attributes (on page 414) defined on all selected elements.

- **Append Child**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

**Insert Before**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

**Insert After**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

 Cut, Copy, Paste, Delete common editing actions
Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

**Paste before (Available in Author mode)**
Inserts a well-formed copied element before the currently selected element.

**Paste after (Available in Author mode)**
Inserts a well-formed copied element after the currently selected element.

**Paste as XML (Available in Author mode)**
Pastes copied content that is considered to be valid XML, preserving its XML structure.

 Toggle Comment
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

 Rename Element (Available in Author mode)
Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

 Expand All
Expands the structure tree of the currently selected element.

 Collapse All
Collapses all of the structure tree of the currently selected node.

Tip:
You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.
Attributes View in Author Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a false value for the -oxy-editable (on page 1642) property associated with the element.
- The element is entirely included in a deleted Track Changes (on page 388) marker.
- The element is part of a content fragment that is referenced in Author mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

Note:
If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.
A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:

- **Set empty value**
  Specifies the current attribute value as empty.

- **Remove**
  Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the Delete or Backspace keys.

- **Copy**
  Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:
  
  - The value of the attribute.
  - The value of the default attribute, if the attribute does not appear in the edited document.
  - Empty, if the attribute does not appear in the edited document and has no default value set.

- **Paste**
  Depending on the content of the clipboard, the following cases are possible:
• If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.

• If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.

• If the clipboard only contains text, the value of the selected attribute is modified.

**In-place Attributes Editor**

Oxygen XML Author Eclipse plugin includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.

• Double-click any named start tag when the document is edited in one of the following display modes (on page 344): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 94. In-place Attributes Editor**

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.
Note:
For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 95. In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only allowed items option** (on page 166) is not selected in the **View preferences page** (on page 165), all elements allowed by the schema will be listed.

Double-clicking any of the listed elements inserts that element into the edited document at the current cursor position.
Pressing **F2** with an element selected will display information about that particular element.

**Figure 99. Elements View in Author Mode**

Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:**

If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The *Entities* view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:**
When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

### Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is **dockable** *(on page 2078)*, so it can be moved to another UI location alongside other side views.

The actions that contribute messages to this view include:

- **Validation** actions *(on page 520)*
- **Transformation** actions *(on page 785)*
- **Check Spelling in Files** action *(on page 268)*
- **SQL** results *(on page 1412)*
Figure 101. Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

- **Grouping Mode toggle options**
  
  You can choose to group the result messages in a Hierarchical or Flat arrangement.

- **Next**
  
  Navigates to the message below the current selection.

- **Previous**
  
  Navigates to the message above the current selection.

- **Remove selected**
  
  Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

- **Remove all**
  
  Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Learn Word(s) (Available when spelling errors are reported in the Results view)**
  
  Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

- **Remove**
  
  Removes selected messages from the view.

- **Remove all**
  
  Removes all messages from the view.
Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

**Copy Description**

Copies the description values for all selected items.

**Show message**

Opens a dialog box that displays the details of the message.

**Save Results**

Saves the complete list of messages in a file in text format. For each message, the included
details are the same as the ones for the Copy action (on page 385).

**Save Results as XML**

Saves the complete list of messages in a file in XML format. For each message, the included
details are the same as the ones for the Copy action (on page 385).

**Save Results as HTML**

Saves the complete list of messages in a file in HTML format. For each message, the included
details are the same as the ones for the Copy action (on page 385).

**Expand All**

Available when Hierarchical mode is selected. Expands all the nodes of the tree, which is useful
when the messages are presented in a hierarchical mode.

**Collapse All**

Available when Hierarchical mode is selected. Collapses all the nodes of the tree, which is useful
when the messages are presented in a hierarchical mode.

**CSS Inspector View**

The purpose of the CSS Inspector view is to display information about the styles applied to the currently
selected element. You can use this view to examine the structure and layout of the CSS rules that match the
element. The matching rules displayed in this view include a link to the line in the CSS file that defines the
styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link
to open the associated CSS for editing purposes.
Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

**Displaying Rules**

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Author Eclipse plugin opens the associated CSS file at the line number where the properties of the rule are defined.

The **CSS Inspector** view has six possible tabs (depending on the current context):
• **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
• **:marker** - Displays the rules matching the :marker pseudo-element.
• **:before** - Displays the rules matching the :before pseudo-element.
• **:after** - Displays the rules matching the :after pseudo-element.
• **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
• **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane

Also, a **Show empty rules** action is available from a drop-down menu in the toolbar of the view. This action forces the view to show all the matching rules, even if they do not declare any CSS properties. By default, the empty rules are not displayed.

**Reviewing Documents**

Oxygen XML Author Eclipse plugin includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

**Tracking Document Changes**

The **Track Changes feature (on page 2084)** is a way to keep track of the changes you make in a document. The **Track Changes** feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the **Track Changes feature is activated (on page 390)**, insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The **tracked changes** are also displayed in the **Review view (on page 410)** and you can also choose to present the changes in **callouts (on page 404)** by selecting the **Track Changes Deletions (on page 142)** and **Track Changes Insertions (on page 142)** options in the **Callouts preferences page (on page 141)**.
Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of read-only text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in callouts (on page 404) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the Review preferences page (on page 139).

Highlighting Content

Oxygen XML Author Eclipse plugin includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Author Eclipse plugin includes a Review view (on page 410) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The Review view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from Author mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the Comments option (on page 142) is selected in the Callouts preferences page (on page 141), comment callouts will also be included (same with tracked change callouts if their corresponding options are selected in the Callouts preferences page (on page 141).

Managing Tracked Changes

Oxygen XML Author Eclipse plugin includes a Track Changes feature (on page 2084) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (on page 410).
The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the [Review view](on page 410) and [Attributes view](on page 377).

### Types of Tracked Changes

The types of *tracked changes* include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a *Split* operation
- Performing a *Surround with* operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:**

If you copy content in *Author* mode that contains *tracked changes*, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

### Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

- Click the 📊 *Track Changes* button on the toolbar.
- Select 📊 *Track Changes* from the *Review* submenu of the contextual menu in the main editing area in *Author* mode.
- Select 📊 *Track Changes* from the *Edit > Review* menu.

To activate the *Track Changes* feature globally for all documents that you open in Oxygen XML Author Eclipse plugin, change the *Initial State* option to *Always On* *(on page 139)* in the *Review preferences page* *(on page 139)*.

### Rendering Tracked Changes in Author Mode

When *Track Changes* *(on page 2084)* is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the *Review preferences page* *(on page 139)*, along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.
Figure 104. Change Tracking in Author Mode

When hovering over a change a tooltip displays information about the author and modification time.

**Change Tracking Contextual Menu Actions**

You can right-click any change in **Author** mode to access the following contextual menu actions:

- **✓ Accept Change(s)**
  
  Accepts the *Tracked Change* (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **✗ Reject Change(s)**
  
  Rejects the *Tracked Change* (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **💬 Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change* (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.
Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (similar actions are also available in the Edit > Review menu and the Review submenu of the contextual menu):

- **Track Changes**
  Enables or disables the Track Changes support for the current document.

- **Accept Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **✓ Accept Change(s) and Move to Next** - Accepts the Tracked Change located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.
  - **✓ Accept Change(s)** - Accepts the Tracked Change located at the cursor position or all of the changes in a selection.
  - **✓✓ Accept All Changes** - Accepts all Tracked Changes in the current document.

- **Reject Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **✗ Reject Change(s) and Move to Next** - Rejects the Tracked Change located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.
  - **✗ Reject Change(s)** - Rejects the Tracked Change located at the cursor position or all of the changes in a selection.
  - **✗✓ Reject All Changes** - Rejects all Tracked Changes in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing Tracked Change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.
Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.
- **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
- **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
- **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to View All Changes/Comments.
- **Review Settings** - Opens the Review Preferences (on page 139) page where the Initial display mode setting can be configured.

**Note:**
If you use **View Final** mode and **View Original** mode, callouts (on page 2078) are not displayed for comments or changes. To display callouts, use the **View All Changes/Comments** mode.

**Highlight**
Enables or disables the Highlight tool (on page 402). Use the Highlight drop-down menu to select a new color.

**Add Comment**
Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**
Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**
Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**
Opens the Review view (on page 410).
Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts (on page 2078) in Author mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the Track Changes Deletions (on page 142) and Track Changes Insertions (on page 142) options in the Callouts preferences page (on page 141). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts (on page 404).

Tracked Changes in the Review View

The Review view (on page 410) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View (on page 410).

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

For more information about the Track Changes support, watch our video demonstration:

https://www.youtube.com/embed/L_ESxRMfnek

Review View (on page 410)
**Tracked Changes Behavior**

The behavior of the *Track Changes feature* (on page 2084) depends on the context, the type of change, and whether or not it is activated.

**Inserting Content**

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an **Insert** change.

**Surrounding Content**

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

**Deleting Characters**

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:
• Deleting content in an existing **Delete** change results in nothing happening.
• Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the **INSERT** change shrinks accordingly.
• Deleting in regular content results in a regular deletion.

If the **Track Changes** feature is enabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing **Delete** change results in the following:
  ◦ If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
  ◦ If another author created the **Delete** change, nothing happens.
• Deleting content in an existing **Insert** change results in the following:
  ◦ If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
  ◦ If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
• Deleting in regular content results in the content being marked as a **Delete** change by the current author.

**Deleting Selections of Content**

If the **Track Changes** feature is disabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
• If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
• If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
• If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the **Track Changes** feature is enabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
• If the selection contains an entire **Insert** change, the following is possible:
  ◦ If the **Insert** is made by the same author, the change disappears and the content is deleted.
  ◦ If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.
Deleting Tags

Assuming you are using any of the Tag Display Modes (on page 344) other than No Tags and the Track Changes feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the Tag Display Modes (on page 344) other than No Tags and the Track Changes feature is enabled, if you delete a start tag of an inline element (on page 2080), both the start and end tag are marked as a Delete change by the current author, while any content that was inside the element is preserved.

Copying Content

If the Track Changes feature is disabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are also copied to the clipboard.

If the Track Changes feature is enabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the Track Changes feature is disabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), they will be preserved on paste.

If the Track Changes feature is enabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Tracked Changes Limitations

There are some inherent limitations to the Change Tracking (on page 2084) feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.

- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.

- **Limitations to using certain actions** - Some actions cannot be implemented with the Track Changes feature (on page 2084) enabled. For example, some table-related actions (Delete Row(s), Delete Column(s), Join Cells, Split Cell) ignore the Track Changes feature. The Rename Element action also does not record tracked changes.
• **Possible Serialization Limitation** - If you have equivalent adjacent tracked changes, for example, you see two back-to-back changes in the Review pane that have identical properties (the same user, timestamp, content, etc.), when you save the document, it is sometimes possible for the document to only contain a single processing instruction.

## Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the *Track Changes* feature ([on page 2084](#)):

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Split</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>Common Attributes (<a href="#">on page 398</a>), type=&quot;split&quot;</td>
</tr>
<tr>
<td>Deletion</td>
<td>&lt;?oxy_delete?&gt;</td>
<td>-</td>
<td>Common Attributes (<a href="#">on page 398</a>), content</td>
</tr>
<tr>
<td>Comment</td>
<td>&lt;?oxy_comment_start?&gt;</td>
<td>&lt;?oxy_comment_end?&gt;</td>
<td>Common Attributes (<a href="#">on page 398</a>), mid, parentID</td>
</tr>
<tr>
<td>Attribute Change</td>
<td>&lt;?oxy_attributes?&gt;</td>
<td>-</td>
<td>Attributes of the Processing Instruction have the name as the attribute that was changed on the XML element. The value is an attribute change descriptor (<a href="#">on page 399</a>).</td>
</tr>
</tbody>
</table>

If a comment intersects another, the `@mid` attribute is used to correctly identify start and end processing instruction markers.

### Common Attributes

The following attributes can be added on both change tracking and comment processing instructions:

- **@id** - Used to link a reply to its parent comment or change.
- **@comment** - The comment message associated with a comment or change.
- **@timestamp** - The time when the change or comment was created.
- **@author** - The name of the author that created the change or comment.
- **@flag** - The value *done* means that the item is **Marked as Done**.
Attribute Change Descriptor

The value of the attributes for a *Processing Instruction* is an (escaped) XML element as in:

```
<change type="modified" oldValue="word" author="John" timestamp="20210520T091038+0000"/>
```

Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and *tracked changes* (on page 2084) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the *Author* mode as *callouts* (on page 2078) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the *Comments option* (on page 142) in the *Callouts preferences page* (on page 141). Comments are also displayed in the *Review view* (on page 410).

![Figure 105. Comments in Author Mode](image)

Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in *Author* mode.

**Add Comment**

To insert a comment at the cursor position or on a specific selection of content, select the *Add Comment* action from the toolbar (or in the *Review* submenu of the contextual menu).

**Tip:**

When adding or editing a comment, you can use *Enter* to insert line breaks and Oxygen XML Author Eclipse plugin will take the line breaks into account when presenting the callout. You can also use *Ctrl + Enter* to accept your changes and close the dialog box.

**Show/Edit Comments**
To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the Comments option (on page 142) is selected in the Callouts preferences page (on page 141), comments are also displayed in callouts (on page 404). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 2084). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 410).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 2084) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options
Select this option to open the Callouts preference page (on page 141) where you can configure various callout options.

**Tip:**
When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author Eclipse plugin will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

### Managing Comments in the Review View

The **Review view (on page 410)** is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review view**, the contextual menu includes the following actions.

**Reply**

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes (on page 2084)**. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view (on page 410)**.

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes (on page 2084)** that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Show only reviews by '<author name>'**

Filters the comments to only show comments for the particular author.

**Remove all Comments**
Removes all comments from the document.

**Comments XML Source Code**

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content"?>
   Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `@parentID` attribute and its value is the same as the `@id` value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!" parentID="vws_x4l_1v" mid="4"?>
```

**Related Information:**

- Author Callouts (on page 404)
- Review View (on page 410)

**Managing Highlights**

Use the Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that need additional editing or to draw the attention of others to particular content.

**Using the Highlight Tool**

You can find the Highlight action on the main toolbar, in the Edit > Review menu, or in the Review submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to Stop highlighting from the same menus.

To highlight content, follow these steps:

1. Click the Highlight icon on the toolbar.
   
   **Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the Highlight icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on macOS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on macOS) if you want to select all of the text.

2. Click the small arrow next to the Highlight icon and select No color (erase), or right-click the highlighted content and select Remove highlight(s).

3. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

Note:
Oxygen XML Author Eclipse plugin preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.

Review View

The Review view (on page 410) is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes (on page 2084) and comments. The following actions are available in the contextual menu of each highlight in the Review view:

Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

Remove Highlight

Removes the selected highlight.

Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

Remove All Highlights

Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
  The highlights are stored<?oxy_custom_end?>
```
For more information about using the **Highlight** tool, watch our video demonstration:

https://www.youtube.com/embed/RMFyuMfisZY

**Related Information:**
- Review View *(on page 410)*

## Author Callouts

Oxygen XML Author Eclipse plugin uses callouts *(on page 2078)* to present comments and tracked change *(on page 2084)* modifications that you or other members of your team have added to the document.

### Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the **Review preferences page** *(on page 139)*. This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Author Eclipse plugin automatically assigns a color based upon the **Colors for automatic assignment** list *(on page 141)*.

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the **Show all connecting lines** option *(on page 142)* in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.
Winter is the season of cold weather. The season occurs during December - February in Northern hemisphere. In the Southern hemisphere winter occurs during June - August.

Some of the flowers blooming in winter are: Acashia, Alstromeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann's Lace, Roses, Star of Bethlehem, Statice.

### Note:
Oxygen XML Author Eclipse plugin displays callouts only if [View All Changes/Comments](#) or [View Only Changes/Comments by](#) is selected in the [Track Changes Visualization Modes](#) drop-down menu. Oxygen XML Author Eclipse plugin does not display callouts in [View Final](#) and [View Original](#) modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserved elements (on page 2084) that contain long fragments (such as a DITA `<codeblock>` element or `<programlisting>` in DocBook). To help you view the text under the covered area, Oxygen XML Author Eclipse plugin applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

---

**Figure 106. Multiple Author Callouts**

**Figure 107. Transparent Callout**
Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the Initial Width option (on page 142) in the Callouts preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the Text Lines Count Limit option (on page 142). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Author Eclipse plugin

Oxygen XML Author Eclipse plugin uses callouts to display comments and Tracked Changes (on page 2084) that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the Callouts preferences page (on page 141). You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the Comments option (on page 142) is selected in the Callouts preferences page (on page 141), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the Show review time option (on page 142) to include timestamp information in the comment callouts.

  ![Figure 108. Comment Callouts](image)

  There are several types of comments that can be added in Author mode:

  - **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the Add Comment action that is available on the toolbar (or in the Review submenu of the contextual menu).

  - **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select Comment Change.

  - **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select Reply. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.
Tip:

When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Author Eclipse plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option (on page 142) is selected in the Callouts preferences page (on page 141), deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also select the Show deleted content in callout option (on page 142) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (on page 142) to include timestamp information in the deletion callouts.

- **Tracked Change Insertion Callouts** - As long as the Track Changes Insertions option (on page 142) is selected in the Callouts preferences page (on page 141), insertions that are done while the Track Changes feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also select the Show inserted content in callout option (on page 142) to display the actual deleted content in the callout. Additionally,
you can select the **Show review time** option (**on page 142**) to include timestamp information in the deletion callouts.

**Figure 111. Insertion Callouts**

<table>
<thead>
<tr>
<th>Inserted [Mary]: Capitalized action name words.</th>
</tr>
</thead>
</table>

**Callout Contextual Menu Actions**

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes (on page 2084)**. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view (on page 410)**.

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes (on page 2084)** that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Accept Change**

Accepts the tracked change, removes the callout, and moves to the next change. For an **insertion** change, it keeps the inserted text and for a **deletion** change, it removes the content from the document.

**Reject Change**

Rejects the tracked change, removes the callout, and moves to the next change. For an **insertion** change, it removes the inserted text and for a **deletion** change, it preserves the original content.
Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2084)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (on page 141) where you can configure various callout options.

**Comment Callout Actions**

The following options are available in the contextual menu of a comment callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 2084)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 410).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 2084)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Edit Reference**
If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (on page 141) where you can configure various callout options.

**Printing Callouts**

When you print a document from Author mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to File > Print Preview.

**Review View**

The Review view (on page 410) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View (on page 410).

To watch our video demonstration about the Callouts support, see our video demonstration:

https://www.youtube.com/embed/kCCWylFqBaUM

**Related Information:**
- Managing Tracked Changes (on page 389)
- Managing Comments (on page 399)
- Review View (on page 410)

**Review View**

The Review view is an independent panel, available both for built-in and custom XML document frameworks (on page 2080). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes (on page 2084) using a single view.

The Review view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the Review view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.
You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

**Figure 112. Review View**

Activating the Review View

To activate the Review view, do one of the following:

- Click the Manage reviews button on the toolbar.
- Right-click anywhere in a document and select Review > Manage reviews.
- Open it from the Window > Show View menu.

Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes a Settings menu button.

**Settings**

The Settings menu includes the following options:

**Show highlights**

Controls whether or not the Review view displays the highlighting in your document.

**Show comments**

Controls whether or not the Review view displays the comments in the document you are editing.

**Show track changes**

Controls whether or not the Review view displays the inserted and deleted content in your document.
Show reviews in read-only content

Controls whether or not the Review view displays review items from content referenced with a @conref or @conkeyref attribute.

Show review time

Displays the time when the edits from the Review view were made.

Sort by date

Expands to offer the following sorting options: Oldest to newest, Newest to oldest, and No sorting.

Configure review options

Opens the Review preferences page (on page 139) where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

Remove

Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

Accept

Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

Reject

Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.

Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

Reply

Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

Mark as Done

Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

Show Comment
Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

**Edit Comment**

Available for comments you have added and you can use this action to edit a comment.

**Remove Comment**

Use this action to remove the selected comment.

**Show only Reviews by `<author name>`**

Use this action to filter the edits to only show them for a certain author.

**Remove All Comments**

Use this action to remove all the comments that appear in the edited document.

**Change Color**

Available for highlights and it opens a palette where you can choose a new color for the highlighted content.

**Remove Highlight**

Available for highlights and you can use this action to remove the selected highlight.

**Remove Highlights with the Same Color**

Available for highlights and you can use this action to remove all the highlights with the same color from the entire document.

**Remove All Highlights**

Available for highlights and you can use this action to remove all the highlights in your document.

**Accept Change**

Accepts the selected change and moves to the next change.

**Reject change**

Rejects the selected change and moves to the next change.

**Comment change**

Available for insertions or deletions and you can use this option to add a comment for the particular change.

**Accept all changes**

Accepts all the changes in the current document.

**Reject all changes**

Rejects all the changes in the current document.

For more information about the **Review** view, watch our video demonstration:
Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for expert users and another section for novice users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

Oxygen XML Author Eclipse plugin allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 113. Example: Profiling Content
Oxygen XML Author Eclipse plugin includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the Attributes and Condition Sets preferences page (on page 135). You can also define your own profiling attributes and condition sets for each document type (framework (on page 2080)).

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes (on page 415).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets (on page 420).

Related Information:
Customizing Elements that Wrap Profiled Content (on page 1560)

Creating and Editing Profiling Attributes

Oxygen XML Author Eclipse plugin includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework (on page 2080)). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.

Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

   Information:
   The Profiling Attributes section (on page 136) is used to define the attributes and their values for each document type.

3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Document type**
Select the document type ([framework (on page 2080)]).

**Tip:**
You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**
The name of the profiling attribute.

**Display name**
This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).
The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (Edit Profiling Attributes dialog box (on page 418), Condition Set dialog box (on page 420), and other UI components where the profiling is shown (on page 424)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between **space**, **comma**, and **semicolon**, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.

5. Click **Apply** to save the changes.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 358) in **Author** mode, the Attributes view (on page 377), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in **Author** mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the Attributes and Condition Sets preferences page (on page 135) where you can edit the profiling configuration.

**Note:**

If the Allow contributing extra profiling attribute values option (on page 136) is not selected in the Attributes and Condition Sets preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the **breadcrumb** (on page 351) or **Outline** (on page 299) view).

   **Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (**framework**). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All** / **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.
The attributes and values that appear in the dialog box are determined as follows:

- If you have defined profiling attribute values (on page 415) for the DITA document type in the **Attributes and Condition Sets preferences page (on page 135)**, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

**Figure 116. Edit Profiling Attributes Dialog Box**

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the **document fragment (on page 2078)**.

3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the **Show Profiling Attributes** option (on page 424) (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the
attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

![Figure 117. Profiling Attribute Value Form Control Pop Up](image)

**Creating and Editing Profiling Condition Sets**

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

**Create Profiling Condition Sets**

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box *(on page 61)* and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

**Information:**

The *Profiling Condition Sets* section *(on page 136)* is used to define condition sets.
2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

**Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

![Condition Set Configuration Dialog Box](image)

The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (*framework (on page 2080)*) that has profiling attributes defined.

**Use DITAVAL file**

For DITA projects, select this option if you want the **Profiling Condition Set** to reference a **DITAVAL file (on page 2018)**. You can specify the path by using the text field, its history
Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.

4. Click **Apply** to save the condition set.

**Related Information:**
- Applying Profiling Condition Sets ([on page 422](#))
- Creating and Editing Profiling Attributes ([on page 415](#))
- Applying Profiling Attributes ([on page 418](#))
- Showing and Filtering Profiled Content in Author Mode ([on page 424](#))
- Customizing Colors and Styles for Rendering Profiling in Author Mode ([on page 2010](#))

**Applying Profiling Condition Sets**

All defined **Profiling Condition Sets** ([on page 420](#)) are available as shortcuts in the **Profiling / Conditional Text** toolbar menu ([on page 424](#)). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode and **Outline view** ([on page 299](#)). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the expert value for the @audience attribute and content that has the prop1 value for the @other attribute.
This is how the document looks in Author mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

Showing and Filtering Profiled Content in Author Mode (on page 424)
Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 426)

Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in Author mode by using the options in the Profiling/Conditional Text drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page (on page 137).

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 135).
Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode and the Outline (on page 299) view. When this option is selected and a condition set is selected in this drop-down menu (on page 425), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 425), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 135).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 condition sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 425) to access a dialog box that presents all of them.

Profiling Settings

Opens the Attributes and Condition Sets preferences page (on page 135) where you can add and edit profiling attributes and condition sets.

Figure 119. Example: Profiling Controls in Author Mode

```
Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;

- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using an electric grinder or a file, grind the length of the blade until it is sharp;

- Check the electric cable for any signs of wear. Replace it if worn;

- Clean the mower’s underside for debris;

- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;

- Lubricate the gears of the manual lawn mower;
```

If the Show Profiling Attributes option is selected, a green border is painted around profied text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and
in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 120. Profiling Attribute Value Form Control Pop Up**

![Form Control Pop Up](image)

**Related Information:**
- Creating and Editing Profiling Attributes *(on page 415)*
- Applying Profiling Attributes *(on page 418)*
- Creating and Editing Profiling Condition Sets *(on page 420)*
- Applying Profiling Condition Sets *(on page 422)*
- Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 426)*

### Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.
Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles option (on page 424)** from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings (on page 425)** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets** preferences page (on page 135).
3. Go to the **Colors and Styles preferences page (on page 137)** to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes preferences page (on page 138)** to configure how you want the profiling attributes to appear in Oxygen XML Author Eclipse plugin.

**Result:** The styling is now applied in the **Author editing mode** and the **Outline view (on page 299)**. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the

---

**Figure 121. Example: Profiling Colors and Styles in Author Mode**

```
Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;

Adding Tables in Author Mode

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in various frameworks (on page 2080) (DITA, DocBook, TEI, and XHTML). This opens the Insert Table dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Author Eclipse plugin includes some general editing actions for configuring tables in Author mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

Editing Tables in Author Mode

Oxygen XML Author Eclipse plugin provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in Author mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width
specifications from the source document, and some types of tables include a `colspeccs` section that appears above the table in Author mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML frameworks (on page 2080) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

![Figure 123. Resizing a Table Column in Author Mode](image)

**Selecting Columns and Rows**

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to `>` for row selection and to `<` for column selection and that specific row or column is highlighted.

You can use the **Ctrl** and **Shift** keys to select multiple rows.

**Selecting Cells**

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing an RTL document (on page 497)) to select it. The cursor changes to `>` when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

**Drag and Drop**

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Author Eclipse plugin decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.
Copy/Cut and Paste

In Oxygen XML Author Eclipse plugin, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Author Eclipse plugin introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Author Eclipse plugin preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

Deleting Content

To delete the content of a cell, select the cell and press the Delete or Backspace key on your keyboard. If you press Delete or Backspace again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the Quick navigation in tables option (on page 133) is not selected in the Cursor Navigation preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Related Information:
- Adding Tables in DocBook (on page 431)
- Adding Tables in DITA Topics (on page 1851)
- Adding Tables in XHTML Documents (on page 455)
Adding Tables in DocBook

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

Inserting a CALS Table Model in DocBook

To insert a **CALS** table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select **CALS** for the table Model. This model allows you to configure a few more properties than the **HTML** model.

Figure 124. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.
Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths \((\texttt{colwidth})\) attribute. You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a \(\texttt{colwidth}\) attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, \(\texttt{colwidth=1\ast 2\ast 3\ast}\) causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the \(\texttt{colwidth}\) attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the \(\texttt{colwidth}\) attribute is \(1\ast\).

- **dynamic** - If you choose this option, the columns are created without a specified width \((\texttt{colwidth})\) attribute. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \(\texttt{pt}\) unit is inserted, but you can change the units in the \texttt{colspecs} (column specifications) section above the table or in Text mode. The following units are allowed: \(\texttt{pt}\) (points), \(\texttt{cm}\) (centimeters), \(\texttt{mm}\) (millimeters), \(\texttt{pi}\) (picas), \(\texttt{in}\) (inches).

Frame

Allows you to specify a value for the \(\texttt{frame}\) attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

Row separator

Specifies whether or not to include row separators \((\texttt{rowsep})\) attribute. The allowed values are: \(0\) (no separator) and \(1\) (include separators).

Column separator

Specifies whether or not to include column separators \((\texttt{colsep})\) attribute. The allowed values are: \(0\) (no separator) and \(1\) (include separators).

Alignment

Specifies the alignment of the text within the table \((\texttt{align})\) attribute. The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in Author mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

**Note:**

The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 220), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Sample DocBook CALS Table](image)

**Inserting an HTML Table Model**

To insert an HTML table model in DocBook documents, select the [Insert Table] action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select HTML for the table Model.
The dialog box allows you to configure the following options when you select the HTML table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (@width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @width attribute (in a <col> element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @width attribute are automatically changed.
accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form “0*” (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Alignment**

Specifies the alignment of the text within the table (@align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.

**Note:**
The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode** (on page 220), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be
used to fine-tune the formatting of your tables by using the Attributes view (on page 377) (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on macOS)) (on page 1862) action from the toolbar or contextual menu to modify many of the properties of the table (on page 438).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 219).

**DocBook Table Layouts**

The DocBook framework (on page 2080) supports the following two table model layouts:

- **CALS table model** (on page 436)
- **HTML table model** (on page 436)

**CALS Table Model Layout**

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (@colwidth attribute) or the text alignment (@align attribute). Although they appear as part of the Author mode (on page 220), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 127. CALS Table in DocBook**

**HTML Table Model Layout**

Choosing an HTML table model from the Insert Table dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an HTML table includes a section above the table that allows you to
easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (@width attribute) or the text alignment (@align attribute). Although these properties appear as part of the Author mode (on page 220), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 128. HTML Table in DocBook

<table>
<thead>
<tr>
<th>Sample HTML Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column title</td>
</tr>
<tr>
<td>Column title</td>
</tr>
<tr>
<td>Column 1</td>
</tr>
<tr>
<td>Data A</td>
</tr>
<tr>
<td>Data C</td>
</tr>
</tbody>
</table>

Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the CALS model. If you want to overwrite this behavior and instruct Oxygen XML Author Eclipse plugin to convert them to HTML tables, set the docbook.html.table parameter to 1. You can find this parameter in the following stylesheet:

- [OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl for DocBook 5
- [OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db4Driver.xsl for DocBook 4

Table Validation in DocBook

Oxygen XML Author Eclipse plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table @cols attribute.
- A row has more cells than the number of columns detected from the table @cols attribute.
- A cell has a vertical span greater than the available rows count.
- The number of <colspecs> is different than the number of columns detected from the table @cols attribute.
- The number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
- The value of the @cols, @rowsep, or @colsep attributes are not numeric.
- The @namest, @nameend, or @colname attributes point to an incorrect column name.

**HTML Tables**
• A row has fewer cells than the number of table columns.
• The value of the @colspan, @rowspan, or @span attributes are not numeric.
• A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 377) (Window > Show View > Attributes).

You can use the Table Properties (Ctrl + T (Command + T on macOS)) action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:
Some properties allow the following special values, depending on the context and the current properties or values:

• <not set> - Use this value if you want to remove a property.
• <preserve> - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in Author mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**
Specifies whether or not to include column separators (borders/grid lines) in the form of the @colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the @rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a @thead, @tbody, or @tfoot attribute).

---

**Edit Table Properties for an HTML Table Model**

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

**Frame (Available only in the Table tab)**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a @thead, @tbody, or @tfoot attribute).

**Horizontal alignment (Available in the Row, Column, and Cell tabs)**

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (@align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in Author mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.

**Vertical alignment (Available in the Row, Column, and Cell tabs)**
Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (@valign attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the **bottom** value. However, if the fonts are different sizes, the **baseline** value often makes the table look better.

**Related Information:**

Editing Tables in Author Mode *(on page 428)*

---

**Adding Tables in DITA Topics**

You can use the [Insert Table](#) action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model *(on page 1852)*** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) *(on page 1853)*** - This is used for more advanced functionality.
- **DITA Choice table model *(on page 1856)*** - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model *(on page 1858)*** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a **Simple** DITA table, select the [Insert Table](#) action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select **Simple** for the table Model.
The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Note:**
The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.
The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**@colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **@colwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **@colwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **@colwidth** attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (**@colwidth** attribute). Entering content into a cell changes the rendered width dynamically.
If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspects` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

### Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef(attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

---

>Note:
The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

- **dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

---

**Note:**
The options in the [Insert Table](#) dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the [Author mode (on page 220)](#), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 132. CALS Table in DITA**

![Sample CALS Table with Fixed Width](image)

**Inserting a Choice Table Model**

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the [Insert Table](#) action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the DITA menu), or select **choicetable** from the [Content Completion Assistant (on page 2078)](#). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.
The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**
Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**
Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

**Inserting a Properties Table Model**

To insert a Properties table within a `<refbody>` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (on page 2078). The Insert Table dialog box appears. Select Properties for the table Model.

![Figure 134. Insert Table Dialog Box - Properties Model](image)

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

- Allows you to choose the number of Rows and Columns for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view (on page 377) (Window > Show View > Attributes). See the [DITA documentation](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/) for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on macOS))** (on page 1862) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 1862).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode (on page 219)**.

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Author Eclipse plugin includes a **Smart Paste feature (on page 362)** that preserves certain style and structure information when pasting content.

<table>
<thead>
<tr>
<th>Tip:</th>
</tr>
</thead>
<tbody>
<tr>
<td>When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.</td>
</tr>
</tbody>
</table>

Related Information:

- **Editing Tables in Author Mode (on page 428)**
DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model (on page 450)**
- **Simple table model (on page 450)**
- **Choice table model (on page 451)**
- **Properties table model (on page 451)**

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**@colwidth** attribute) or the text alignment (**@align** attribute). Although they appear as part of the **Author mode (on page 220)**, the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 135. CALS Table in DITA**

![Sample CALS Table with no specified width and proportional column widths](image)

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

**Figure 136. DITA Simple Table**

<table>
<thead>
<tr>
<th>Header 1</th>
<th>Header 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column 1</td>
<td>Column 2</td>
</tr>
</tbody>
</table>
Choice Table Model Layout

A Choice table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetables>` element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting `choicetable` from the Content Completion Assistant (on page 2078) (within a `<step>` element) or by using the Insert Table action on the toolbar or from the contextual menu. The options and layout of a Choice table is similar to the Simple table model.

Figure 137. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting `properties(wizard)` from the Content Completion Assistant (on page 2078) (within a `<refbody>` element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 138. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Author Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 2079) with the Validate and Check for Completeness action, if the Report table layout problems option (on page 1811) is selected in the DITA Map Completeness Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.

The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.

The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.

The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

**Editing Table Properties in DITA**

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Table Properties (Ctrl + T (Command + T on macOS))` action from the toolbar or the `Table` submenu of the contextual menu (or `DITA` menu). This opens the `Table properties` dialog box.

The `Table properties` dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

**Note:**

Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a CALS table model, the `Table properties` dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a `Preview` pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**

The `justify` value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**
Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Edit Table Properties for a Simple, Choice, or Properties Table Model**

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:
Adding Tables in DITA Topics (on page 1851)
Editing Tables in Author Mode (on page 428)

Adding Tables in XHTML Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the Insert Table dialog box.

Figure 140. Insert Table Dialog Box in XHTML

The dialog box allows you to configure the following options:

Caption
If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (\texttt{@width} attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a \texttt{@width} attribute (in a \texttt{<col>} element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, \texttt{width="1* 2* 3*"} causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the \texttt{@width} attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the \texttt{@width} attribute is \texttt{1*}.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \texttt{pt} unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the \texttt{@frame} attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

**Alignment**

Specifies the alignment of the text within the table (\texttt{@align} attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

**Note:**
The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode (on page 220)**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view (on page 377)** (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode (on page 219)**.

**XHTML Table Layout**

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an **XHTML** table includes a `colspecs` section that allows you to easily configure some properties. For example, you can change the value of column widths (`@width` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author mode (on page 220)**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Figure 141. Table Layout in XHTML Documents](image-url)
Table Validation in XHTML

Oxygen XML Author Eclipse plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `@colspan`, `@rowspan`, or `@span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the [Insert Table](#) action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

**Figure 142. Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

- **Head**
  If this checkbox is selected, you can specify a title for your table in the adjacent text box.

- **Table Size**
  Allows you to choose the number of **Rows** and **Columns** for the table.

- **Generate table header**
  If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:**

The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.
**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 377) (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 219).

**Adding Tables in JATS Documents**

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a JATS document. This action inserts a simple HTML-type table into your document at the current cursor position. Once inserted, you can edit the structure of the table using the table buttons on the toolbar (or in the contextual menu). For example you can add or remove cells, rows, and columns, or split or join cells. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 377) (Window > Show View > Attributes).

Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 219).

**Sorting Content in Tables and List Items**

Oxygen XML Author Eclipse plugin offers support for sorting the content of tables and list items of ordered and unordered lists.

**Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the Sort action from the main toolbar or the contextual menu. This opens the Sort dialog box.

![Sort Dialog Box](image-url)
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:**
When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

**Note:**
The sorting support takes the value of the **@xml:lang** attribute into account and sorts the content in a natural order.

**Sorting a Selection of Rows**

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as short, medium, long, full, xs:date, and xs:dateTime).
- The sorting direction (either ascending or descending).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press `Ctrl + Z (Command + Z on macOS)` on your keyboard.

**Note:**

The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.
Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the Criteria section of the Sort dialog box, configure the applicable items, and click OK to complete the sorting operation.

Figure 145. Sorting Based on Multiple Criteria

Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain rowspans.

Note:
For this type of table, the Sort dialog box keeps the All rows option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Author Eclipse plugin depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)
- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
• Spare parts list (DITA Machinery Task)
• Safety conditions (DITA Machinery Task)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the Sort action from the main toolbar or the contextual menu. This opens the Sort dialog box.

**Figure 146. Sorting List Items**

![Sort dialog box](image)

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:**
When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The Criteria section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as `short`, `medium`, `long`, `full`, `xs:date`, and `xs:dateTime`).
- The sorting direction (either **ascending** or **descending**).

After you finish configuring the options in the Sort dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

**Note:**
The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.
Inserting Images

To insert an image in a document while editing in Author mode, use one of the following methods:

- Click the Insert Image action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Author Eclipse plugin tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file:/C:/project/xml/dir/img1.jpg image into the file:/C:/project/xml/doc1.xml document, Oxygen XML Author Eclipse plugin inserts a reference to dir/img1.jpg. This is useful when multiple users work on a common project and they have it stored in multiple locations.

  **Note:**
  The Insert Image action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the Author editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the @href attribute in an <image> element:

  ```xml
  <image href="../images/image_file.png"/>
  ```

  **Tip:**
  To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author Eclipse plugin will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Author Eclipse plugin will insert it as a reference to the image file the same as the drag/drop method.

- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Author Eclipse plugin will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

Related Information:
- Image Map Editor (on page 469)
- Image Rendering in Author Mode (on page 464)
- Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 1842)

Image Rendering in Author Mode

The Author mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.
### Table 4. Supported Image Formats

<table>
<thead>
<tr>
<th>Image Type</th>
<th>Support</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIF</td>
<td>built-in</td>
<td>Animations not yet supported.</td>
</tr>
<tr>
<td>JPG, JPEG</td>
<td>built-in</td>
<td>JPEG images with CMYK color profiles <em>(on page 1746)</em> are properly rendered only if color profile is inside the image.</td>
</tr>
<tr>
<td>PNG</td>
<td>built-in</td>
<td></td>
</tr>
<tr>
<td>SVG, SVGZ, WMF</td>
<td>built-in</td>
<td>Rendered using the open-source Apache Batik library that supports SVG 1.1.</td>
</tr>
<tr>
<td>BMP</td>
<td>built-in</td>
<td></td>
</tr>
<tr>
<td>TIFF</td>
<td>built-in</td>
<td>Rendered using a part of the Java JAI Image library.</td>
</tr>
<tr>
<td>EPS</td>
<td>built-in</td>
<td>Renders the preview TIFF image inside the EPS.</td>
</tr>
<tr>
<td>AI</td>
<td>built-in</td>
<td>Renders the preview image inside the Adobe Illustrator file.</td>
</tr>
<tr>
<td>PDF</td>
<td>built-in</td>
<td>Rendered by using the bundled Apache PDF Box library.</td>
</tr>
<tr>
<td>JPEG 2000, WBMP</td>
<td>plugin</td>
<td>Renders by installing the <em>Java Advanced Imaging (JAI) Image I/O Tools plug-in</em> <em>(on page 467)</em>.</td>
</tr>
</tbody>
</table>

When an image cannot be rendered, Oxygen XML Author Eclipse plugin **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the **Show very large images** option *(on page 126)*.
- The image format is not supported by default. It is recommended to install the *Java Advanced Imaging (JAI) Image I/O Tools plug-in* *(on page 467)*.

**Tip:**

If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```xml
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```css
image[href]{
  content: attr(href, url);
}
```
Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

• If you specify only the width attribute of an image, the height of the image is proportionally applied.
• If you specify only the height attribute of an image, the width of the image is proportionally applied.
• If you specify width and height attributes of an image, both of them control the rendered image.
• If you want to scale both the width and height of an image proportionally, use the `@scale` attribute.

Note:

As a Java application, Oxygen XML Author Eclipse plugin uses the Java Advanced Imaging API that provides a pluggable support for new image types. If you have an ImageIO library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

Rendering CGM Images

Oxygen XML Author Eclipse plugin offers a few add-ons that provide support for CGM 1.0 images.

To allow the rendering of CGM images in Author mode, go to https://github.com/oxygenxml/oxygenxml.cgm.support.eclipse and follow the instructions.

Rendering PDF Images

Oxygen XML Author Eclipse plugin provides built-in support for rendering PDF images in Author mode and PDF output.

Rendering PSD Images

Oxygen XML Author Eclipse plugin provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in Author mode, follow this procedure:

1. Download the following JAR (on page 2080) files:
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar
2. Copy the downloaded JAR libraries to the \{OXYGEN_INSTALL_DIR\}\lib directory.
3. Open \{OXYGEN_PLUGIN_DIR\}/META-INF/MANIFEST.MF and add a reference to the JAR libraries in the Bundle-ClassPath entry.

4. Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Author Eclipse plugin tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Author Eclipse plugin cannot render the image.
- The EPS image includes a TIFF preview picture.

Note:
Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Author Eclipse plugin renders the image correctly.

Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Author Eclipse plugin by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plugin, follow this procedure:

1. Start Oxygen XML Author Eclipse plugin and open the Help > About dialog box. Click the Installation Details button, go to the Configuration tab, and look for the java.runtime.name and java.home properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the java.runtime.name property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

Note:
The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the java.home property. Continue with the installation procedure and follow the on-screen instructions.
macOS Workaround

There is no native implementation of the JAI Image I/O Tools plugin for macOS 10.5 and later. However, it has a Java implementation fallback that also works on macOS. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this macOS workaround:

2. In the [OXYGEN_INSTALL_DIR]/lib directory, create a directory named endorsed ([OXYGEN_INSTALL_DIR]/lib/endorsed).
3. Unpack the .tar.gz. Copy the clibwrapper_jiio.jar and jai_imageio.jar files from its lib directory and paste them in the [OXYGEN_INSTALL_DIR]/lib/endorsed directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Rendering EMF Images

By default, Oxygen XML Author Eclipse plugin does not render EMF images. However, a plugin is available that provides support for rendering EMF images in the Author visual editing mode. You make this work, you need to install the plugin and some additional libraries.

How to Install Support for Rendering EMF Images

To install support for rendering EMF images in Author mode, follow these steps:

1. Go to https://github.com/oxygenxml/oxygenxml.emf.support and download the project as a ZIP file.
2. Extract the contents of the ZIP file to the [OXYGEN_INSTALL_DIR]/plugins directory.
4. Unpack the ZIP file and move all the .jar libraries from its lib folder to the [OXYGEN_INSTALL_DIR]/plugins/lib directory.

Retina/HiDPI Images in Author Mode

Oxygen XML Author Eclipse plugin provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png). Oxygen XML Author Eclipse plugin displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the url function in the content property, as in the following example:
This would place the image that is loaded from the `myImage.png` file just before the `<listItem>` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Author Eclipse plugin interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Author Eclipse plugin will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Author Eclipse plugin would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Author Eclipse plugin also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

### Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Author Eclipse plugin:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td><code>../img/myImage.png</code></td>
<td><code>../img/myImage@2x.png</code></td>
<td><code>../img/myImage@3x.png</code></td>
</tr>
<tr>
<td>dark</td>
<td><code>../img/myImage_dark.png</code></td>
<td><code>../img/myImage_dark@2x.png</code></td>
<td><code>../img/myImage_dark@3x.png</code></td>
</tr>
</tbody>
</table>

**Related Information:**

*Using Retina/HiDPI Icons for the Actions from a Framework*(on page 1478)

### Image Map Editor

Oxygen XML Author Eclipse plugin includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an *image map* is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.
The support for image maps in Oxygen XML Author Eclipse plugin is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks (on page 2080)). To create an image map on an existing image and open the Image Map Editor, right-click the image and select Image Map Editor.

**Figure 147. Image Map Rendered in Author Mode**

![Image Map Rendered in Author Mode](image.png)

**Image Maps in DITA**

Oxygen XML Author Eclipse plugin includes support for image maps in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.
Figure 148. Image Map Editor in DITA

Image Map Editor Interface in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape.
Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**
Use this button to create a duplicate of the currently selected shape.

**Delete**
Use this button to delete the currently selected shape.

**Undo**
Use this button to undo the last action.

**Redo**
Use this button to redo the last action that was undone.

**Show/Hide Numbers**
Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**
Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**
Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**
Use this button to send the currently selected shape back one layer.

**Send Shape to Back**
Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**
Use this slider to zoom the image in or out in the main image pane.

**Image Pane**
This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:
Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**
  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (on page 1935) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an `<xref>` element will be inserted with either an `<href>` attribute or a `<keyref>` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Author Eclipse plugin (on page 1935).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 475) in Author mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:
1. Right-click the image and select **Image Map Editor**.

   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ **New Rectangle**, ☐ **New Circle**, or ☐ **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(on page 471)* to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 473)*. For example, the easiest way to remove a point is to right-click the point and select ☒ **Remove Point**.

4. With the shape selected, use one of the linking options *(on page 474)* in the ![Link](image) drop-down menu to select a target resource (or enter its path in the **Target** *(on page 474)* text field).

5. (Optional) Enter a **Description** *(on page 474)* for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

   - **Image Map Editor** - Click this button to open the **Image Map Editor**.
   - **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 149. Image Map Details**
How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 471)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 471) (↑, ↓).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Related Information:
- DITA `imagemap` Element Specifications
- Working with Images in DITA Topics (on page 1838)

Image Maps in DocBook

Oxygen XML Author Eclipse plugin includes support for image maps in DocBook documents through the use of the `<areaspec>` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.
Image Map Editor Interface in DocBook

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.

- **Show/Hide Numbers**
Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**
Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**
Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**
Use this button to send the currently selected shape back one layer.

**Send Shape to Back**
Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**
Use this slider to zoom the image in or out in the main image pane.

**Image Pane**
This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**
You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **ID**
  The identifier for the selected area. This will become the value of the `@xml:id` attribute for the particular `<area>` element.

- **Target**
  Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the ![Link](#) drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `@xlink:href` attribute.

- **Description**
  You can enter an optional description for the selected area that will be displayed in the *Image Map Details* section (on page 480) in *Author* mode and as a tooltip message when the end-user hovers over the hyperlink in the output.
How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  
   ![New Rectangle](button.png) button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the **other buttons on the toolbar** *(on page 477)* to adjust its layer and color, or to perform other editing actions.

   **Tip:**
   You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions *(on page 478)*.

4. With the shape selected, enter an **ID** *(on page 479)* and use one of the **linking options** *(on page 479)* in the ![Link](button.png) drop-down menu to select a target resource (or enter its path in the **Target** *(on page 479)* text field).
5. (Optional) Enter a **Description** *(on page 479)* for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  
   ![New Rectangle](button.png) button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

   - **Image Map Editor** - Click this button to open the **Image Map Editor**.
   - **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.
You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:**
If you want to link a set of related `<area>` elements, you can use `<areaset>` elements. To add `<areaset>` elements, and `<area>` elements to the *areaset*, switch to **Text** mode and insert them manually.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 477)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 477) (↑, ↓, →, ←).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

DocBook `areaspect` Element Specifications

**Image Maps in TEI**

Oxygen XML Author Eclipse plugin includes support for **image maps** in TEI documents through the use of the `<facsimile>` element. In TEI documents, this feature provides an easy way to create areas (using `<zone>` elements) in an image where the end-user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.
The interface of the **Image Map Editor** consists of the following sections and actions:

### Toolbar

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or
simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

**Image Pane**

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**
• Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
• You can also drag any of the points of a selected shape to adjust its size and shape.
• You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
• To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
• You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

+ Add Point
  Adds a point to Polygon or Free Form shapes.

✗ Remove Point
  Removes the current point from Polygon or Free Form shapes.

☐ Duplicate
  Create a duplicate of the currently selected shape.

✗ Delete
  Delete the currently selected shape.

☐ New Rectangle
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

☐ New Polygon
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

← Undo
Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the @xml:id attribute for the particular <zone> element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (<graphic>) must be inside a <facsimile> element to support the Image Map Editor feature.

2. Right-click the image and select Image Map Editor.

   **Step Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (New Rectangle or New Polygon).

4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 482) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 484). For example, the easiest way to remove a point is to right-click the point and select Remove Point.

5. With the shape selected, enter an ID (on page 485).
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished, click OK to process your changes.

Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

**How to Edit an Existing Image Map in TEI**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction:**
Currently, if `<zone>` elements contain additional content (such as text or comments) and you edit the image map, the Image Map Editor does not preserve the additional content. Therefore, if you do need to insert additional content inside the `<zone>` elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in Text mode.

**Overlapping Areas**

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 482)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 482) (↑, ↓, ↓, ↑).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.
**Warning:**

PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

---

**Image Maps in XHTML**

Oxygen XML Author Eclipse plugin includes support for image maps in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `<img>` element) may be associated with an image map (in the form of a `<map>` element) by specifying a `usemap` attribute on the `<img>` element. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

![Image Map Editor in XHTML](image)

**Figure 152. Image Map Editor in XHTML**

**Image Map Editor Interface in XHTML**

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**

  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.
New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

- **Color Chooser**

  Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

- **Zoom Slider**

  Use this slider to zoom the image in or out in the main image pane.

**Image Pane**

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the `Ctrl` key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down `Shift` while using the arrow keys to move the shape further or `Alt` to move it 1 pixel at a time.
- To zoom in or out, you can use the `NumPad +` or `NumPad -` keys respectively. Use `Ctrl + NumPad 0` to reset the zoom level to its default value.
- You can use `Ctrl + Z` to undo an action or `Ctrl + Y` to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**

  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**

  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**

  Create a duplicate of the currently selected shape.
Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the Alternative property). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Href

Specifies the hyperlink target for the selected area. This will become the value of the @href attribute for the particular <area> element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, http://www.example.com/index.htm).
- **A Relative URL** - A link to a file within your website (for example, index.htm).
- **An Element** - A link to the ID of an element within the page (for example, #top).
• **Other Protocols** - A specified path using other protocols (such as https://, ftp://, mailto:, file://).

• **A Script** - A link to a script (for example, javascript:alert('Hello');)

**Alternate**

The description for the selected area. The value is inserted in an `@alt` attribute in the particular `<area>` element. This is a required attribute to present a text alternative for browsers that do not display images.

**Target**

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

**How to Create an Image Map in XHTML**

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.
   
   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (□ New Rectangle, ○ New Circle, or ○ New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other *buttons on the toolbar* (on page 487) to adjust its layer and color, or to perform other editing actions.

   **Tip:**
   
   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions* (on page 489). For example, the easiest way to remove a point is to right-click the point and select **Remove Point**.

4. With the shape selected, specify the hyperlink target in the **Href** field (on page 490) and enter a description for the selected area in the **Alternate** field (on page 491).

5. (Optional) Specify where the hyperlink resource will be opened in the **Target** field (on page 491).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.
Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

**How to Edit an Existing Image Map in XHTML**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 487)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 487)* *(*,*,*,*,*) .

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

⚠️ **Warning:**

PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

**Related Information:**

- HTML Image Map Specifications

**Adding Video, Audio, and Embedded HTML Resources**

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all
HTML5-based outputs. There is a toolbar button ( ) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project Explorer view (on page 244) and drop them into your documents (or copy and paste them).

### Table 5. Supported Media Types

<table>
<thead>
<tr>
<th>Media</th>
<th>Description</th>
<th>Type</th>
<th>Supported Size Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>mp3</td>
<td>Moving Picture Experts Group Layer-3 Audio</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>wav</td>
<td>Windows Wave</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>pcm</td>
<td>Pulse Code Modulation</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>m4a</td>
<td>Moving Picture Experts Group Layer-4 Audio</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>aif</td>
<td>Audio Interchange Format</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>mp4</td>
<td>Moving Picture Experts Group Layer-4 Video</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>
<td>m4v</td>
<td>iTunes Video File</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>

<td>Audio Video Interleaved</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>
<td>embedded video</td>
<td>Embedded Iframe Code (such as YouTube or Vimeo)</td>
<td>iframe</td>
<td>Width &amp; Height</td>
</tr>
</tbody>
</table>

### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the Insert Media Resource action from the toolbar. A Chose Media dialog box appears.

   ![Note]
   
   You can also drag media files from your system explorer or the Project Explorer view (on page 244) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click Ok.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in Author mode so that it can be played directly from there.
Attention:

• On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

Result in Output: In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Author Eclipse plugin includes a pre-installed plugin (on page 2082) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```xml
....
<foreign outputclass="html-embed">
<![CDATA[
    <iframe width="420" height="315"
    src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
    </iframe>
]]>
</foreign>
....
```

The converted HTML output would look like this:

```html
...........
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
............
```

The plugin is also available on the oxygenxml GitHub projects page.

Related Information:
How to Add Video and Audio Objects in DITA WebHelp Output (on page 1021)

Editing MathML Notations

Oxygen XML Author Eclipse plugin includes a built-in editor for MathML notations. To start the MathML editor, double-click a MathML notation (for embedded notations, you can also select the Edit Equation action from its contextual menu).
Tip:

For editing MathML equations, you can also try free choices, such as Apache OpenOffice Math (on page 496) or LibreOffice Math (on page 496).

Configuring the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Wiris and configure it in Oxygen XML Author Eclipse plugin with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).
2. Set the path to the MathFlow install folder in the MathML preferences page (on page 133).
3. Set the path to the MathFlow license file in the MathML preferences page (on page 133).

Figure 154. Default MathFlow Editor

Configuring an External MathML Editor

You can configure Oxygen XML Author Eclipse plugin to use a third-party MathML editor (e.g. the free Libre Office equation editor) by following these steps:

1. Install the third-party application (for example, Libre Office).
2. Open the MathML preferences page (on page 133) and in the External application > Command line field, set the command line used to open the external application. For example, on Windows, for starting the Libre Office equation editor, the command line would need to look like this: 
   ```
   "C:\Program Files\LibreOffice 5\program\smath.exe" "${cf}"
   ```
   You can use the ${cf} editor variable in the command line to refer to a temporary file automatically created by Oxygen XML Author Eclipse plugin that will contain the edited MathML content.
3. Insert a new equation or double-click an existing equation. The external application starts and it should display the equation inside it. Once you save the equation and close the external application, the equation rendered in the Author visual editing mode will refresh its contents based on your changes. When editing and saving the equation in the started external application, do not alter the path to the saved file in any way as the file is specifically saved in a location from where the Oxygen XML Author Eclipse plugin application will load it automatically.

Special Character Support in Author Mode

Oxygen XML Author Eclipse plugin offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Author Eclipse plugin uses the Unicode Bidirectional Algorithm, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a
modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in Author mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the **Arrow keys move the cursor in the writing direction** option (on page 133) in the Cursor Navigation preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

**Tip:**
If you experience performance issues when editing documents that contain bidirectional text, you could try the following solution:

- You could try changing the font. For example, you could try using the *David* font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Author Eclipse plugin, open the Preferences dialog box (on page 61), go to Fonts, and change the font using the **Author** option in the Fonts preferences page (on page 162).

For more information about the bidirectional text support in the Author mode, watch our video demonstration:

https://www.youtube.com/embed/IC0ahH11S7s

**Related Information:**
- Special Character Support in Grid Mode (on page 337)
- Inserting Special Characters with the Character Map (on page 274)

### Controlling the Text Direction Using XML Markup

Oxygen XML Author Eclipse plugin supports the following CSS properties that control the direction of text:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>direction</strong></td>
<td>Specifies the writing direction of the text. The possible values are ltr (the text direction is left to right), rtl (the text direction is right to left), and inherit (the direction property is inherited from parent element).</td>
</tr>
<tr>
<td><strong>unicodeBidi</strong></td>
<td>Used along with the direction property to create levels of embedded text with different text directions in the same document. The possible values of this property are bidi-override (creates an additional level of embedding and forces all strong characters to the direction specified in the direction), embed (creates an additional level of embedding), normal (does not use an additional level of embedding), and inherit (the value of the unicodeBidi property is inherited from parent element).</td>
</tr>
</tbody>
</table>
For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

**XML File:**

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLPara>
</article>
```

**Associated CSS File:**

```css
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Author Eclipse plugin recognizes the `dir` attribute on any XML document. The supported values are:

<table>
<thead>
<tr>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltr</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rtl</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
<tr>
<td>lro</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rlo</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
</tbody>
</table>

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:**

When the inline element (on page 2080) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.

**Controlling the Text Direction Using the Unicode Direction Formatting Codes**

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.
To insert Unicode Direction Formatting Codes, use the Symbols toolbar action. To easily find such a code, you can either enter directly the hexadecimal value, or use the Details tab to enter the codes name.

Oxygen XML Author Eclipse plugin offers the support for bi-directional text in all the side views (Outline view (on page 299), Attributes view (on page 377) and so on) and text fields.

**Refreshing the Content**

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the Reload (F5) action available on the toolbar.

To refresh the content of the referenced resources you can use the Refresh references action that is available in the menu for the current framework (for example, the DITA or DocBook5 menu). However, this action will not refresh the expanded external entities. For that, you will need to use the Reload action.

**Generating IDs for Elements in Author Mode**

Oxygen XML Author Eclipse plugin allows you to manually assign or edit values of id attributes in Author mode by using the Attributes View (on page 377) or an in-place attribute editor (on page 358). Oxygen XML Author Eclipse plugin also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

**Generate IDs On-Request**

You can generate ID values for specific elements on-request. To do so, select the element that will have an ID generated (or place the cursor inside the element) and select the Generate IDs action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of

---

### Table 7. Directional Formatting Codes

<table>
<thead>

Treats the following text as embedded left-to-right.

Treats the following text as embedded right to left.

Forces the following characters to be treated as strong left-to-right characters.

Forces the following characters to be treated as strong right-to-left characters.

Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.

Left-to-right strong zero-width character.

Right-to-left strong zero-width character.
selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box (on page 500)**. To open this dialog box, open an XML document that belongs to that specific document type and then select **ID Options** from the **DITA, DocBook**, or **TEI** main menu (depending on your document type).

**Note:**
The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

### Automatically Generate IDs

Oxygen XML Author Eclipse plugin includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box (on page 500)** that is displayed when you select the **ID Options** action from the **framework (on page 2080)**-specific menu (**DITA**, **DocBook**, or **TEI**). If this **Auto generate IDs for elements** option is selected, Oxygen XML Author Eclipse plugin automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

### ID Options Dialog Box

To configure options for generating IDs, select **ID Options** from the **DITA, DocBook**, or **TEI** menu (depending on your document type).

![Figure 155. ID Options Dialog Box](image)
The **ID Options** dialog box allows you to configure the following options with regard to generating ID values:

### ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Eclipse plugin **Editor Variables (on page 199)**.

### Element name or class value to generate ID for

The elements that will have ID values generated, specified using class attribute values. To customize the list, use the **Add, Edit, or Remove** buttons.

### Auto generate IDs for elements

If selected, Oxygen XML Author Eclipse plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### Remove IDs when copying content in the same document (DITA or TEI)

When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:**

This option does not have an effect on content that is **cut** and **pasted**.

### Remove IDs when copying content (DocBook)

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

### Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option *(on page 501)* is selected and you duplicate elements with existing IDs, Oxygen XML Author Eclipse plugin assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option *(on page 501)* is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
• For DITA and TEI, if the **Remove IDs when copying content in the same document** option (on page 501) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.

• For DocBook, if the **Remove IDs when copying content** option (on page 501) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.

### Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the **frameworks** folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the **resources** folder within the particular **framework** (on page 2080). For example, the configuration file for the DITA **framework** is located in:

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/resources/idGenerationDefaultOptions.xml
```

### Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your **framework** according to your needs.
2. Bundle a modified version of the entire **framework** folder (for example, `{OXYGEN_INSTALL_DIR}/frameworks/dita/`). To do this:
   a. Open the **Preferences** dialog box (on page 61) and go to **Document Type Association**.
   b. Select your document type and click the **Extend** button.
   c. In the **Document type** configuration dialog box (on page 81) that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the **frameworks** folder (for example, `{OXYGEN_INSTALL_DIR}/frameworks/dita-extension (1)`), but you can also use the **Browse** button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called **resources** and add your modified `idGenerationDefaultOptions.xml` file to this new **resources** folder.
   e. Go back to the **Document Type Association** preferences page, select the extended **framework**, and click **Edit**.
   f. Go to the **Classpath** tab (on page 85), add a reference to your new **resources** folder, and move this reference up (using the **Move Up** button) so that it is the first one that appears in the list.
   g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in **Sharing a Framework** (on page 1584).
Using Form Controls in Author Mode

Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Author Eclipse plugin includes a variety of built-in form controls (on page 1668) that can be defined in CSS stylesheets that are used to render Author mode (on page 1668). You can also implement custom form controls (on page 1699) for more specific needs. The types of built-in form controls that are available include:

- **Audio (on page 1668)** - A media object that plays audio clips.
- **Browser (on page 1669)** - A media object that renders HTML frames or interact with SVG documents.
- **Button (on page 1674)** - A graphical user interface object that performs a specific action.
- **Button Group (on page 1676)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox (on page 1680)** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box (on page 1682)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker (on page 1684)** - A form control object that allows you to select a date in a specified format.
- **HTML Content (on page 1686)** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up (on page 1688)** - A contextual menu that provides quick access to various actions.
- **Text Area (on page 1691)** - A box that allows you to enter multiple lines of text.
- **Text Field (on page 1694)** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser (on page 1697)** - A dialog box that allows you to select the location of local or remote resources.
- **Video (on page 1698)** - A media object that plays videos.

The following image is an example of several form controls rendered in Author mode. The first (Direct manager) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (Homepage), and the [+ ] and [ - ] icons also represent button form controls that are assigned specific actions to add or delete records from the document.
You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Author Eclipse plugin installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file to experiment with an example of how form controls can be implemented in Author mode.

### Contextual Menu Actions in Author Mode

Oxygen XML Author Eclipse plugin includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and framework-specific actions that are configured for each document type.

#### General Contextual Menu Actions in Author Mode

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all built-in document types include the following:

- **Quick Fix (Alt + 1 (Command + Alt + 1 on macOS))**
  
  Available when the contextual menu is invoked on an error where Oxygen XML Author Eclipse plugin can provide a Quick Fix (on page 554).

- **Open Image**
  
  Available when the contextual menu is invoked on an image. This action allows you to open an image in a default system application associated with the current image type.

- **Show in Explorer (Show in Finder on macOS)**
Available when the contextual menu is invoked on an image. This action allows you to open the parent directory of an image in the system file explorer, and it selects the image file.

**Save image as**

Available when the contextual menu is invoked on a local, external, or embedded image. This action opens a dialog box where you can choose a location in the local file system where the image will be saved. It also includes an option (Update the reference to the image) that can be toggled to choose whether or not to update the path in existing references to the image.

**Track Changes Actions**

Available when the Track Changes feature (on page 2084) is enabled and the contextual menu is invoked on a change. The following options are available:

- ✔️ **Accept Change(s)**

  Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

- ✗ **Reject Change(s)**

  Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

- 📝 **Comment Change**

  Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Author Callout Actions**

Available when the contextual menu is invoked on a callout (on page 2078). If the corresponding options in the Show review callouts section (on page 142) are selected in the Callouts preferences page (on page 141), the callouts are displayed in Author mode for comments, tracked insertions, or tracked deletions.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an insertion or deletion callout box:

- ✉️ **Reply**
Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 2084). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 410).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 2084) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✓ Accept Change(s)

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ Reject Change(s)

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

💬 Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.
**Callouts Options**

Select this option to open the Callouts preference page (on page 141) where you can configure various callout options.

**Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a comment callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 2084). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 410).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 2084) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Callouts Options**

Select this option to open the Callouts preference page (on page 141) where you can configure various callout options.

**Edit Attributes**

Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.
Edit Profiling Attributes

Allows you to change the profiling attributes (on page 414) defined on all selected elements.

Insert submenu

This submenu includes insert actions that are specific to each framework (on page 2080), along with the following general action:

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- \texttt{\#<decimal value> - e. g. \#65}
- \texttt{\&\#<decimal value>; - e. g. \&\#65}
- \texttt{\#x<hexadecimal value> - e. g. \#x41}
- \texttt{\&\#x<hexadecimal value>; - e. g. \&\#x41}

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes special paste actions that are specific to each framework (on page 2080), as well as the following general paste actions:

Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

Paste As Text

Pastes clipboard content, ignoring any structure or styling markup.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \(0x0045\) will be converted to \(E\)
- \(0x125\) will be converted to \(h\)
- \(265\) will be converted to \(ɥ\)
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
 Surround with `[tag]` (Alt + Shift + Forward Slash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.
**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Generate IDs**

Use this operation to automatically generate unique IDs for elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.
**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.
Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

JATSKit Refactoring Actions

Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Processing Instructions Refactoring Actions

Contains built-in XML refactoring operations that pertain to processing instructions.

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights.

Delete processing instructions

Deletes the detected processing instructions.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.
Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).
Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

-ren \n
Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

- Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

-Toggle Fold

Toggles the state of the current fold.

-Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))

Folds all the elements except the current element.

-Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))

Folds the elements indented with one level inside the current element.

-Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

-Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))

Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options
Opens the Author mode preferences page (on page 125).

Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the following document types (click the links to see the default actions that are available for each specific document type):

- DocBook4 Author Actions (on page 648)
- DocBook5 Author Actions (on page 669)
- DITA Author Actions (on page 1866)
- DITA Map Author Actions (on page 1812)

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Author Eclipse plugin provides validation functions that allow you to easily identify errors and their location.

Related Information:

Checking XML Well-Formedness

A Well-formed XML document is a document that conforms to the XML syntax rules. A Namespace Well-Formed XML document is a document that is Well-formed XML and is also Namespace-wellformed and Namespace-valid.

Well-Formedness Rules

The XML Syntax rules for Well-formed XML include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
• Attribute values must always be quoted.
• With XML, whitespace is preserved.

The **Namespace-wellformed** rules include:

• All element and attribute names contain either zero or one colon.
• No entity names, processing instruction targets, or notation names contain any colons.

The **Namespace-valid** rules include:

• The *xml* prefix is by definition bound to the namespace name: `http://www.w3.org/XML/1998/namespace`. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
• The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: `http://www.w3.org/2000/xmlns/`. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
• All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
• The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

**Check for Well-Formedness**

To check if a document is **Namespace Well-Formed XML** and **Namespace-valid**:

• Select the **Check Well-Formedness (Alt + Shift + V, W (Command + Alt + V, W on macOS))** action from the **Validation** drop-down menu on the toolbar (or the **XML** menu).
• A selection of files can be checked for well-formedness by selecting the **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project Explorer** view (**on page 244**).

**Result:** If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

**Example: A non Well-formed XML Document**

```xml
<root><tag></root>
```

When **Check Well-Formedness** is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```
To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert </tag>.

**Example: A non Namespace-wellformed Document**

```xml
<prefix:elem></prefix:elem>
```

When **Check document form** is performed the following error is raised:

The prefix "prefix" for element "prefix:elem" is not bound.

**Example: A non Namespace-valid Document**

```xml
<x:y></x:y>
```

When **Check document form** is performed the following error is raised:

The prefix "x" for element "x:y" is not bound.

## Validating XML Documents Against a Schema

A **Valid** XML document is a **Well-Formed** XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Author Eclipse plugin, how validation errors are presented, and information about built-in and custom validation scenarios.

For information about how to associate a schema for the purposes of validation (and content completion), see the **Associating a Schema to XML Documents** (on page 557) section.

## Automatic Validation

By default, Oxygen XML Author Eclipse plugin automatically checks for validation errors as you are editing a document. The **Enable automatic validation** option (on page 122) in the **Document Checking** preferences page (on page 121) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a **configurable delay** (on page 122) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.
Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Author Eclipse plugin.

Tip:
Status information generated by certain operations (such as validation) are fed into the Console view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select Window > Show View > Console.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

☑ Validate (Alt + Shift + V, V)

Available from the *Validation* drop-down menu on the toolbar, the XML menu, or from the Validate submenu when invoking the contextual menu in the Project Explorer view (on page 244).

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML Catalogs (on page 2085) and resets the schema used for content completion.

☑ Validate (cached)

Available from the *Validation* drop-down menu on the toolbar or the XML menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note:
Automatic validation also caches the associated schema.

Validate with

Available from the *Validation* drop-down menu on the toolbar, (or XML menu).
This action opens a dialog box that allows you to specify a schema for validating the current document (on page 560).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

**Validate with Schema**

Available from the Validate submenu when invoking contextual menu in the Project Explorer view (on page 244).

This action opens a dialog box that allows you to specify a schema for validating all selected files (on page 561).

**Other Validation Options**

To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or XML menu).

To clear the error markers added to the Problems view in the last validation, select Clear Validation Markers from the Validate submenu when invoking the contextual menu in the Project Explorer view.

**Tip:**

If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the Document Checking preferences page (on page 121).

**Related information**

- Automatic Validation (on page 519)
- Presenting Validation Errors in Text Mode (on page 521)
- Presenting Validation Errors in Author Mode (on page 524)

**Presenting Validation Errors in Text Mode**

By default, Oxygen XML Author Eclipse plugin automatically validates documents (on page 519) while editing in the Text mode, and actions are also available to manually validate documents (on page 520) on-request.
Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes** view (on page 302), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse **Annotations** preferences page (Window (Eclipse on macOSX) > Preferences > General > Editors > Text Editors > Annotations).
Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (on page 61), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (on page 121).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

Bottom Part of the Stripe

Two navigation arrows ( ) can be used to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next Error/Highlight (Ctrl + Period (Command + Period on macOS)) and Document > Automatic validation > Previous Error/Highlight (Ctrl + Comma (Command + Comma on macOS)).

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 554) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

Details About Validation Issues

• Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 121) where you can configure some validation options. Some validation messages have an icon ( ) and clicking it opens a dialog box with additional information and a link to specifications.
• Status messages from every validation action are logged in the Console view (on page 277) (the Enable Oxygen consoles option (on page 165) must be selected in the View preferences page).
If you want to see all the validation messages grouped in the Results view (on page 308), use the Validate action from the toolbar or XML menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

Related Information:
Validating XML Documents Against a Schema (on page 519)

Presenting Validation Errors in Author Mode

By default, Oxygen XML Author Eclipse plugin automatically validates documents (on page 519) while editing in the Author mode, and actions are also available to manually validate documents (on page 520) on-request.

Validation Marker Locations

In Author mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (on page 377), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:
• **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.

• **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.

• **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in blue.

**Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (on page 61), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (on page 121).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

**Bottom Part of the Stripe**

Two navigation arrows (↪️) can be used to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next Error/Highlight (Ctrl + Period (Command + Period on macOS)) and Document > Automatic validation > Previous Error/Highlight (Ctrl + Comma (Command + Comma on macOS)).

**Hovering Over Validation Issues**

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 554) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.
Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 121) where you can configure some validation options. Some validation messages have an icon (ër) and clicking it opens a dialog box with additional information and a link to specifications.
- Status messages from every validation action are logged in the Console view (on page 277) (the Enable Oxygen consoles option (on page 165) must be selected in the View preferences page).
- If you want to see all the validation messages grouped in the Results view (on page 308), use the Validate action from the toolbar or XML menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

Related Information:
Validating XML Documents Against a Schema (on page 519)

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the <assert> and <assertion> elements, set the @message attribute on these elements.

- For Xerces, the @message attribute has to belong to the http://xerces.apache.org namespace.
- For Saxon, the @message attribute has to belong to the http://saxon.sourceforge.net/ namespace.

The value of the @message attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Custom Validation Engines preferences page (on page 122). After a custom validation engine is properly configured (on page 122), it can be applied on the current document by selecting it from the list of custom validation engines in the *Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the output message format (on page 528) of Oxygen XML Author Eclipse plugin for linked messages:

- **Saxon-EE** - Included in Oxygen XML Author Eclipse plugin. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 179).
- **MSXML 4.0 (Legacy)** - Included in Oxygen XML Author Eclipse plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
• **MSXML.NET (Legacy)** - Included in Oxygen XML Author Eclipse plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.

• **LIBXML** - Not included in Oxygen XML Author Eclipse plugin and, depending on your operating system, the libraries need to be downloaded and installed separately from [http://xmlsoft.org/downloads.html](http://xmlsoft.org/downloads.html). Afterwards, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmlint` executable. Alternatively, you can go to **Options > Preferences > Editor > Custom Validation Engines**, edit the LIBXML validation engine and set a custom path to the `xmlint` executable.

The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for *XML Catalogs (on page 2085)* (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID’s located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid ${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

⚠️ **CAUTION:**

File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (on page 2085)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Author Eclipse plugin is installed in the default location on Windows (`C:\Program Files`) because the built-in *XML catalog* files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

⚠️ **Attention:**

On macOS, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

• **XSV (Legacy)** - Not included in Oxygen XML Author Eclipse plugin. Windows and Linux distributions of XSV can be downloaded from [http://www.cogsci.ed.ac.uk/~ht/xsv-status.html](http://www.cogsci.ed.ac.uk/~ht/xsv-status.html). The executable path is already configured in Oxygen XML Author Eclipse plugin (on page 122) for the `{OXYGEN_INSTALL_DIR}/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be corrected in Preferences. (on page 122) It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
• SQC [Schema Quality Checker from IBM] (Legacy) - Not included in Oxygen XML Author Eclipse plugin. It can be downloaded from here (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory \[OXYGEN_INSTALL_DIR\]/sqc. If it is installed in a different folder, the predefined executable path and working directory must be corrected in the Preferences page. (on page 122) It is associated to XSD Editor.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Author Eclipse plugin window. If such an output message (warning, error, fatal error, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type**: [F|E|W] (the string Type: followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID**: A system ID of a file (the string SystemID: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line**: A line number (the string Line: followed by the number of the line that will be highlighted).
- **Column**: A column number (the string Column: followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine**: A line number (the string EndLine: followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn**: A column number (the string EndColumn: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.
- **AdditionalInfoURL**: The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description**: Message content (the string Description: followed by the content of the message that will be displayed in the output view).

**Example:**
Example of how a custom validation engine can report an error using the format specified above:

Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context) { return null; }
        };
    }
}
```
```java
throws XPathException {
    long v0 = ((IntegerValue)arguments[0].next()).longValue();
    long v1 = ((IntegerValue)arguments[1].next()).longValue();
    long result = v0<<v1;
    return Value.asIterator(Int64Value.makeIntegerValue(result));
}
};
}

2. Compile the class and add it to a JAR file.

3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of
   the Java class in the `META-INF/services/` folder of the JAR file.

   **Note:**
   To add more function definitions in the same JAR file, you need to add their fully qualified
   names on different lines.

To enable Oxygen XML Author Eclipse plugin to pick up your custom function definition, the JAR file should be
added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (on page 85).
- In a validation scenario (on page 531), you can use the **Extensions** button to open a dialog box where
  you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (on page 818) to
  open a dialog box where you can add libraries.

**Validation Scenarios**

A complex XML document is split in smaller interrelated modules. These modules do not make much sense
individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML
Author Eclipse plugin validates the main module of the document when an imported module is checked for
errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and
`param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines
XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-
code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without
being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors regarding
parameters and templates that are used but undefined. These errors are only caused by ignoring the context
in which this module is used in real XSLT transformations and validations. To validate such a module, define a
validation scenario to set the main module of the stylesheet and the validation engine used to find the errors.
Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Author Eclipse plugin (Saxon 9) or any connection to a database that supports validation (eXist XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document where the main file includes smaller fragment files using XML entity references.

**Note:**
If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using 'Main Files' Support (on page 252) or Modular Contextual XML Editing Using 'Main Files' Support (on page 570).

**Tip:**
Status information generated by certain operations (such as validation) are fed into the Console view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select Window > Show View > Console.

**Related information**
- Validating XML Documents Against a Schema (on page 519)
- Presenting Validation Errors in Author Mode (on page 524)
- Presenting Validation Errors in Text Mode (on page 521)

**Creating a New Validation Scenario**

To create a validation scenario, follow these steps:

1. Select the Configure Validation Scenario(s) from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the Project Explorer View (on page 244)).

   The Configure Validation Scenario(s) dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply...
to and you can identify them by a yellow key icon that marks them as read-only. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework (on page 2080) are rendered in bold.

**Note:**

If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using ’Main Files’ Support (on page 252) or Modular Contextual XML Editing Using ’Main Files’ Support (on page 570).

Figure 159. Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:

**Show all scenarios**

Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Author Eclipse plugin can apply for the current document type.
Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the New button.

A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

Figure 160. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.
**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable (on page 199) or a custom editor variable (on page 208).

**Figure 161. Insert an Editor Variable**

<td>Value of system variable var.name</td>
</tr>
</tbody>
</table>

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Author Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

**Validation engine**

You can select one of the engines available in Oxygen XML Author Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 188), XML Schema preferences page (on page 179)).
- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the **Validate and Check for Completeness** action (on page 1806) in the DITA Maps Manager, but for a local file rather than an entire DITA map (on page 2079)).
- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and
maps (it is similar to the process when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager).

- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option (on page 1811)).

**Automatic validation**

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 519). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 121), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

**Settings**

Depending on the selected validation engine, clicking the Settings button either opens the Specify Schema dialog box or the Configure validation engine dialog box.

- **Specify Schema Dialog Box**

This dialog box allows you to specify a custom schema to be used for the validation process.

![Figure 162. Specify Schema Dialog Box](image)

The Specify Schema dialog box contains the following options:

- **Use detected schema**
Uses the schema detected for the particular document *(on page 557)*.

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the ✉️ Insert Editor Variables *(on page 199)* button, or the browsing actions in the ✎ Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify *Java extension JARs (on page 2080)* to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

- **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the ✉️ Validate and Check for Completeness action *(on page 1806)* in the DITA Maps Manager).

**Note:**

The options presented in the Configure validation engine dialog box depends on type of validation engine. For example, when configuring the DITA-OT Project Validation and Completeness Check validation engine,
the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 163. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (on page 530).
Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 1762). Clicking the Details icon opens a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2083) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.
Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes key scopes (on page 1923) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 1923) on the second occurrence.

Report unreferenced key definitions
Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 134) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**
Allows you to select a Schematron file that Oxygen XML Author Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

**Move Up**

Moves the selected validation unit up one spot in the list.

**Move Down**

Moves the selected validation unit down one spot in the list.

**Add**

Adds a new validation unit to the list.

**Remove**

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. Click OK.

The newly created validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. You can select the scenario in this dialog box to associate it with the current document and click the Apply associated button to run the validation scenario.

**Editing a Validation Scenario**

To edit an existing validation scenario, follow these steps:

1. Select the Configure Validation Scenario(s) from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the Project Explorer View (on page 244)).

   The Configure Validation Scenario(s) dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as read-only. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework (on page 2080) are rendered in bold.

   **Note:**

   If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on
The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:

**Show all scenarios**
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**
Select this option to only display the scenarios that Oxygen XML Author Eclipse plugin can apply for the current document type.

**Show associated scenarios**
Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:
Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**
When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and click the **Edit** button. If you try to edit one of the read-only built-in scenarios, you will receive a warning message that Oxygen XML Author Eclipse plugin needs to creates customizable duplicate (you can also use the **Duplicate** button).

The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

![Edit Validation Scenario](image)

This scenario configuration dialog box allows you to configure the following information and options:

**Name**
The name of the validation scenario.

**URL of the file to validate**
The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:
- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
Use the **Insert Editor Variable** button to insert an **editor variable** *(on page 199)* or a **custom editor variable** *(on page 208)*.

**Figure 166. Insert an Editor Variable**

<table>

</tr>
</tbody>
</table>

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Author Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

**Validation engine**

You can select one of the engines available in Oxygen XML Author Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, **XSLT preferences page** *(on page 188)*, **XML Schema preferences page** *(on page 179)*).
- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 1806)* in the DITA Maps Manager, but for a local file rather than an entire **DITA map** *(on page 2079)*).
- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 1806)* in the DITA Maps Manager).
- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the **Validate and Check for Completeness** action *(on page 1806)* in the DITA Maps Manager).
- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the **Report table layout problems option** *(on page 1811)*).
Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 519). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 121), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

Settings

Depending on the selected validation engine, clicking the Settings button either opens the Specify Schema dialog box or the Configure validation engine dialog box.

- Specify Schema Dialog Box

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 167. Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document (on page 557).

Use custom schema

Allows you to specify the schema using the following options:

- URL - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down,
the **Insert Editor Variables** (on page 199) button, or the browsing actions in the **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify **Java extension JARs** (on page 2080) to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

- **Configure Validation Engine Dialog Box**

  This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the **Validate and Check for completeness** action (on page 1806) in the DITA Maps Manager).

---

**Note:**

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).
The **Configure Validation Engine** dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 530*).
Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 1762). Clicking the Details icon opens a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2083) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.
Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes key scopes (on page 1923) into account.

For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
    <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 1923) on the second occurrence.

Report unreferenced key definitions
Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 134) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**
Allows you to select a Schematron file that Oxygen XML Author Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Move Up
Moves the selected validation unit up one spot in the list.

Move Down
Moves the selected validation unit down one spot in the list.

Add
Adds a new validation unit to the list.

Remove
Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. When you are done configuring the scenario, click OK.

The modified validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word copy at the end of its name.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (on page 198) that can then be imported.

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an XML Catalog (on page 2085).

For example, if the XML document contains a reference to a remote schema docbook.rng like this:

```xml
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```xml
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
     url="rng/docbook.rng"/>
```
An XML Catalog can also be used to map an XML Schema specified with a URN in the @xsi:schemaLocation attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

the URN can be resolved to a local schema file with a catalog entry like this:

```xml
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
     url="topic.xsd"/>
```

Related Information:
Working with XML Catalogs (on page 567)

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `<listitem>` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
     "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The ✗ Validate Document action will return the following error:

Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist|

|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `<listitem>` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that “The content of element type must match”.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to read about the element. In this case, you should learn about the child elements of `<listitem>` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

**Embedding Schematron Rules in XML Schema or RELAX NG**

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Author Eclipse plugin supports Schematron validation schemas and it is able to extract and use the embedded rules.

**Validating XML Documents with XML Schema and Embedded Schematron**

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```xml
<?xml-model href="percent.xsd" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

**Validating XML Documents with Relax NG and Embedded Schematron**

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```xml
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

**Note:**

When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Author Eclipse plugin provides two built-in validation scenarios: Validate XML Schema with embedded Schematron for XML schema, and Validate Relax NG with embedded Schematron for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.
Example: Embedded Schematron in XML Schema

```xml
<xs:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xs:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```xml
<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</grammar>
```

XML Quick Fixes

The Oxygen XML Author Eclipse plugin *Quick Fix support (on page 2083)* helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

**Figure 169. Quick Fix Presented in a Tooltip in Text Mode**

```xml
<p>When caring for your flower garden you want to feed
```

Validation:
- [ISO Schematron] Semicolon is not allowed after list item.

2 quick fix(es) available:
  - [X] Remove semicolon
  - [ ] Replace semicolon with full stop

Press F2 for focus
• When hovering over the error or warning in Author mode, a small Quick Fix drop-down menu is presented. You can use the drop-down menu to display a list of available Quick Fixes to select from for the particular error or warning.

• If you place the cursor in the highlighted area where a validation error or warning occurs, a Quick Fix icon (¶) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Author Eclipse plugin displays the list of available fixes.

• With the cursor placed in the highlighted area of the error or warning, you can also invoke the Quick Fix menu by pressing Ctrl + 1 (Command + 1 on macOS) on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of Quick Fixes is recomputed to ensure that you always have valid proposals.

**Note:**
A Quick Fix that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the Content Completion preferences (on page 110) are configured.

**Quick Fixes for DTD, XSD, and Relax NG Errors**

Oxygen XML Author Eclipse plugin offers Quick Fixes (on page 2083) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.
For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

*Quick Fixes* are available in **Text** mode and **Author** mode.

Oxygen XML Author Eclipse plugin provides *Quick Fixes* for numerous types of problems, including the following:

<table>
<thead>
<tr>
<th>Problem Type</th>
<th>Available Quick Fixes</th>
</tr>
</thead>
<tbody>
<tr>
<td>A specific element is required in the current context</td>
<td>Insert the required element</td>
</tr>
<tr>
<td>An element is invalid in the current context</td>
<td>Remove the invalid element</td>
</tr>
<tr>
<td>The content of the element should be empty</td>
<td>Remove the element content</td>
</tr>
<tr>
<td>An element is not allowed to have child elements</td>
<td>Remove all child elements</td>
</tr>
<tr>
<td>Text is not allowed in the current element</td>
<td>Remove the text content</td>
</tr>
<tr>
<td>A required attribute is missing</td>
<td>Insert the required attribute</td>
</tr>
<tr>
<td>An attribute is not allowed to be set for the current element</td>
<td>Remove the attribute</td>
</tr>
<tr>
<td>The attribute value is invalid</td>
<td>Propose the correct attribute values</td>
</tr>
<tr>
<td>ID value is already defined</td>
<td>Generate a unique ID value</td>
</tr>
<tr>
<td>References to an invalid ID</td>
<td>Change the reference to an already defined ID</td>
</tr>
</tbody>
</table>

Related Information:
- Schematron Quick Fixes (SQF) *(on page 556)*

### Schematron Quick Fixes (SQF)

Oxygen XML Author Eclipse plugin provides support for Schematron *Quick Fixes* *(on page 2083)* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: [https://blog.oxygenxml.com/topics/SchematronBCs.html](https://blog.oxygenxml.com/topics/SchematronBCs.html).
Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in Text mode and Author mode.

Figure 173. Example of a Schematron Quick Fix

Schematron Quick Fix Specifications

Associating a Schema to XML Documents

To provide as-you-type validation and to compute valid proposals for the Content Completion Assistant (on page 2078), Oxygen XML Author Eclipse plugin requires a schema to be associated with the XML document. The schema specifies how the internal structure of the XML is defined.

Supported Types of Schema

The following schema types are supported:

- **W3C XML Schema 1.0 and 1.1** (with and without embedded Schematron rules) - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
  - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a doctype declaration.
- **Relax NG - XML Syntax** (with and without embedded Schematron rules) - The association is added as an xml-model processing instruction.
- **Relax NG - Compact Syntax** - The association is added as an xml-model processing instruction.
- **Schematron** (both ISO Schematron and Schematron 1.5) - The association is added as an xml-model processing instruction.

Detecting the Schema(s) for Validation

For validation, Oxygen XML Author Eclipse plugin tries to detect one or more schemas by searching multiple locations, in the following order:
1. The schema or multiple schemas referenced in validation stages from the validation scenario(s) (on page 558) associated with the current XML document.

2. If no validation scenario is selected to be used with the current XML document, then it falls back to the schema or multiple schemas defined in validation stages from the validation scenarios specified as default in the particular document type configuration (on page 562).

3. If a schema is still not detected, then it falls back to the schema or multiple schemas associated directly in the XML document (on page 564).

Tip:

To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or XML menu).

4. If a schema is still not detected, then it falls back to the schema defined in the Schema tab of a framework (document type) configuration (on page 566).

Detecting a Schema for Content Completion

For content completion, Oxygen XML Author Eclipse plugin uses just one schema and tries to detect that schema by searching multiple locations, in the following order:

1. If no schema is detected in the document, then it falls back to the highest ranking schema defined in validation stages from the validation scenario(s) associated with the current document (on page 558).

2. If a schema is still not detecting, then it falls back to the highest ranking schema defined in validation stages from validation scenarios specified as default in the particular document type configuration (on page 562).

3. Oxygen XML Author Eclipse plugin determines the most appropriate or highest ranking schema that is associated directly in the XML document (on page 564) and uses it for content completion.

4. If a schema is still not detecting, then it falls back to the schema defined in the Schema tab of a framework (document type) configuration (on page 566).

W3C: Associating Schemas with XML Documents

Associating a Schema Through a Validation Scenario

Oxygen XML Author Eclipse plugin uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in validation scenarios (on page 530) and there are several methods that can be used to do so.
Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the Configure Validation Scenario(s) from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the Project Explorer View (on page 244)).
2. Click the New button to create a new validation scenario or the Edit button to modify an existing one.
3. Add or configure validation units (on page 543) according to your needs and click the Specify Schema button.

**Step Result:** The Specify Schema dialog box is displayed:

![Specify Schema Dialog Box](image)

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (on page 557).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL.
field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify [Java extension JARs](on page 2080) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with that validation scenario whenever it is invoked.

**Use the Validate with Action to Specify a Schema for Validating the Current Document**

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **XML** menu).

**Step Result:** The **Validate with** dialog box is displayed:

![Figure 175. Validate with Dialog Box](image)

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify [Java extension JARs](on page 2080) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click OK.

**Result:** The current document is validated using the schema you specified.

**Tip:**
To quickly open the schema used for validating the current document, select the [Open Associated Schema](action) action from the toolbar (or XML menu).

### Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the Project Explorer view.
2. Invoke the contextual menu (right-click) and select the [Validate with Schema](action) action from the Validate submenu.

**Step Result:** The Validate with dialog box is displayed:

#### Figure 176. Validate with Dialog Box

This dialog box contains the following options:
- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Extensions** - Opens a dialog box that allows you to specify **Java extension JARs** to be used during the validation.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.

4. Click **OK**.

**Result:** The selected documents are validated using the schema you specified.

**Associating a Schema in Validation Scenarios Defined in the Document Type**

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Author Eclipse plugin uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the framework (document type) configuration, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Document Type Association.

2. Select your particular document type and click the Edit or Duplicate button to modify an existing framework (or use the New button to create a new one).

   **Step Result:** This opens a Document type configuration dialog box (on page 81).

3. Go to the Validation tab (on page 107).

4. Create or edit a validation scenario:
   
a. To create a new validation scenario (on page 531), click the **New** button.

   b. To edit the properties of an existing validation scenario (on page 541), select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).
5. Add or configure validation units (on page 543) according to your needs and click the Specify Schema button.

**Step Result:** The Specify Schema dialog box is displayed:

*Figure 177. Specify Schema Dialog Box*

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (on page 557).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
• **Extensions** - Opens a dialog box that allows you to specify *Java extension JARs (on page 2080)* to be used during the validation.

• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.

7. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with the validation scenario you just configured for that particular document type.

### Associating a Schema Directly in XML Documents

The schema used by the *Content Completion Assistant (on page 2078)* and document validation engine can be directly associated with the current document by using the **Associate Schema** action. For most of the schema types, it uses the *xml-model processing instruction*, with the exceptions of:

- **W3C XML Schema** - The `@xsi:schemaLocation` attribute or `@xsi:noNamespaceSchemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of *framework (on page 2080)* level.

To associate a schema to the current document, follow these steps:

1. Select the **Associate Schema** action from the toolbar (or **Document > Schema** menu).

**Step Result:** The *Associate Schema* dialog box is displayed:
This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).

- **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Add additional association for embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.

2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.

3. Click **OK**.

**Result:** The schema association is created based upon the specified type.
• **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  ◦ @xsi:schemaLocation attribute, if the root element of the document is in the namespace.
  ◦ @xsi:noNamespaceSchemaLocation attribute, if the root element is not in the namespace.

• **DTD** - The association with a DTD is added as a DOCTYPE declaration.

• **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as an xml-model processing instruction.

**Tip:**
To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or XML menu).

**Related Information:**
Validating XML Documents (on page 517)
Content Completion Assistant in Text Mode (on page 292)
Content Completion Assistant in Author Mode (on page 365)

**Associating a Schema in a Framework (Document Type) Configuration**

The schema used to compute valid proposals in the Content Completion Assistant (on page 2078) and by the document validation engine to report errors and warnings can be defined in each particular framework (on page 2080) (document type). This schema will be used only if one is not detected in the current XML file (on page 564).

To associate a schema in a particular framework (document type), follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Document Type Association.

2. Select your particular document type and click the Edit (on page 79), Extend (on page 80), or Duplicate (on page 79) button to modify an existing framework (or use the New button to create a new one).

   **Step Result:** This opens a Document type configuration dialog box (on page 81).

3. Go to the Schema tab (on page 85).
4. Select the schema type and its URI.
5. Click OK.

**Result:** The schema is now associated with the particular document type and will be used by the Content Completion Assistant and validation engine if a schema is not detected in the current XML document.

**Learn Document Structure when Schema is not Detected**

When working with documents that do not specify a schema, or the schema is not known or does not exist, Oxygen XML Author Eclipse plugin is able to learn and translate the document structure to a DTD.
can choose to save the learned structure to a file to provide a DTD as an initialization source for content completion (on page 292) and document validation (on page 517). This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Author Eclipse plugin automatically learns the document structure and uses it for content completion (on page 292). To disable this feature, deselect the Learn on open document option in the user preferences (on page 110).

**Related Information:**
Detecting a Schema (on page 557)

---

### Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Author Eclipse plugin can learn the document structure by parsing the document internally. This feature is enabled by the Learn on open document option (on page 110) that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document that will be used to create the DTD.
2. Go to **XML > Learn Structure** (Ctrl + Shift + L (Command + Shift + L on macOS)).
   The Learn Structure action reads the mark-up structure of the current document. The Learn completed message is displayed in the application status bar when the action is finished.
3. Go to **XML > Save Structure** (Ctrl + Shift + S (Command + Shift + S on macOS)) and enter the DTD file path.
4. Click the Save button.

---

### Working with XML Catalogs

Oxygen XML Author Eclipse plugin uses XML Catalogs (on page 2085) to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Author Eclipse plugin supports any XML Catalog file that conforms to one of the following:

1. OASIS XML Catalogs Committee Specification v1.1.
2. OASIS Technical Resolution 9401:1997, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements `systemSuffix` and `uriSuffix`.

Depending on the resource type, Oxygen XML Author Eclipse plugin uses different catalog mappings.
### Table 8. Catalog Mappings

<table>

</tbody>
</table>

### Creating an XML Catalog with a Template

An **XML Catalog (on page 2085)** file can be created quickly in Oxygen XML Author Eclipse plugin starting from the document template called **OASIS XML Catalog**. It is available when creating new document templates (on page 228).

### How Oxygen XML Author Eclipse plugin Determines which Catalog to Use

Oxygen XML Author Eclipse plugin uses **XML Catalogs (on page 2085)** to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various **frameworks (on page 2080)** (DocBook, DITA, TEI, XHTML, SVG, etc.)
Oxygen XML Author Eclipse plugin includes default global catalogs and default catalogs for each of the built-in frameworks, and you can also create your own.

Oxygen XML Author Eclipse plugin looks for catalogs in the following order:

- Global user-defined catalogs that are set in the XML Catalog preferences page (on page 173).
- User-defined catalogs that are set for each framework (on page 2080) in the Catalog tab (on page 105) of the Document Type configuration dialog box (on page 81).
- Default built-in catalogs.

**Example: Using an XML Catalog to map an Absolute XML Schema Reference to an XML Schema Located Relative to the XML Catalog**

An XML Catalog can be used to map an XML Schema specified with a URN in the @xsi:noNamespaceSchemaLocation attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

The URN can be resolved to a local schema file with an XML catalog entry like this:

```xml
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1" url="topic.xsd"/>
```

**Example: Using an XML Catalog to map an Imported XML Schema Reference to an XML Schema Located Relative to the XML Catalog**

An XML Catalog can be used to map an xs:import or xs:include XML Schema reference to a local copy of the schema.

Considering the following xs:include inside an XML Schema:

```xml
<xs:include schemaLocation="someFolder/common.xsd"/>
```

The reference can be resolved to a local schema file with an XML catalog entry like this:

```xml
<uriSuffix uriSuffix="someFolder/common.xsd" url="relative/path/to/common.xsd"/>
```

Related Information:

- XML Catalog Preferences (on page 173)

**Resolving Schema Locations Through XML Catalogs**

Schema locations can be mapped using an XML Catalog (on page 2085). Oxygen XML Author Eclipse plugin resolves the location of a schema in the following order:
First, it attempts to resolve the schema location as a URI (\texttt{uri, uriSuffix, rewriteUri, delegateUri}) mappings from the \textit{XML Catalog}). If this succeeds, the process end here.

If the \textbf{Resolve schema locations also through system mappings option (on page 174)} is selected in the \textit{XML Catalog} preferences page, it attempts to resolve the schema location as a system ID (\texttt{system, systemSuffix, rewriteSuffix, rewriteSystem}) from the \textit{XML Catalog}). If this succeeds, the process ends here.

If the \textbf{Process "schemaLocation" namespaces through URI mappings for XML Schema option (on page 174)} is selected in the \textit{XML Catalog} preferences page, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the \texttt{schemaLocation} attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.

If none of these succeeds, the actual \textbf{schema location (on page 557)} is used.

\section*{Modular Contextual XML Editing Using 'Main Files' Support}

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Author Eclipse plugin provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the \textbf{main files (on page 2081)}.

You can set a main XML document either using the \textbf{main files support from the Project Explorer view (on page 252)}, or using a validation scenario.

To set a \textit{main file} using a validation scenario, add validation units that point to the main modules. Oxygen XML Author Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a \textbf{main file (on page 2081)} include:

\begin{itemize}
\item Correct validation of a module in the context of a larger XML structure.
\item \textbf{Content Completion Assistant (on page 2078)} displays all collected entities and IDs starting from the \textit{main files}.
\item Oxygen XML Author Eclipse plugin uses the schema defined in the \textit{main file} when you edit a module that is included in the hierarchy through the \textit{External Entity} mechanism.
\item The \textit{main files} defined for the current module determines the \textbf{scope of the search and refactoring actions (on page 572)} for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Author Eclipse plugin performs the search and refactoring actions in the context that the \textit{main files} determine, improving the speed of execution.
\end{itemize}

For more information about editing modular XML files in the \textit{main files} context, watch our video demonstration:
Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Author Eclipse plugin allows you to search for ID declarations and references (IDREFS) and to define the scope of the search and refactor operations (on page 572). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In Text mode, these actions are also available in the Quick Assist (on page 318) menu.

The search and refactor actions from the contextual menu are grouped in the Manage IDs section:

- **Rename in**
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 572). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Rename in File**
  Renames the ID you are editing and all its occurrences from the current file.

  **Note:**
  Available in the Text mode only.

- **Search References**
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

- **Search References in**
  Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

- **Search Declarations**
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.
**Search Declarations in**

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

**Note:**
Available in the Text mode only.

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current document.

**Tip:**
A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the Ctrl + Single-Click (Command + Single-Click on macOS) navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Author Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

**Figure 179. Selecting an ID in the Author Mode**

![Selecting an ID in the Author Mode](image)

**Related Information:**

**Search and Refactor Operations Scope**

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the Change scope operation, available in the Quick Fix action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets (on page 2085). The Use only Main Files, if enabled checkbox allows you to restrict the scope of
the search and refactor operations to the resources from the Main Files directory. Click read more for details about the Main Files support (on page 252).

**Figure 180. Change Scope Dialog Box**

![Change Scope Dialog Box](image)

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set (on page 2085) structure.

**XML Resource Hierarchy/Dependencies View**

The Resource Hierarchy/Dependencies view displays the hierarchy or dependencies for resources included in an XML document. The tree structure presented in this view is built based on the Xinclude and External Entity mechanisms. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

If you want to see the hierarchy or dependencies of an XML document, select the document in the Project Explorer view (on page 244) and choose Show Resource Hierarchy or Show Resource Dependencies from the contextual menu.
The following actions are available on the toolbar of the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the Resource Hierarchy/Dependencies view contains the following actions:

- **Open**
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Go to reference**

Opens the source document where the resource is referenced.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

 Renames the selected resource.

**Show Resource Hierarchy**

 Shows the hierarchy for the selected resource.

**Show Resource Dependencies**

 Shows the dependencies for the selected resource.

**Add to Main Files**

 Adds the currently selected resource in the Main Files directory (on page 252).

**Expand More**

Expands more of the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:**

When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

**Note:**

The **Move resource** or **Rename resource** actions give you the option to update the references to the resource (on page 576). Only the references made through the XInclude and External Entity mechanisms are handled.

**Related Information:**

Search and Refactor Operations Scope (on page 572)
Moving/Renaming XML Resources

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A Preview option is available that allows you to see what will be updated before selecting Rename to process the operation.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to using a modular approach so that everyone involved in the project can work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use DTD Entities or XInclude to combine XML content in a main file (on page 2081). A main document can be created with references to various document parts, users can edit those documents individually, and then apply an XSLT stylesheet over the main document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The main document should declare the DTD to be used, while the external entities should declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the main document will not be valid. If you want to validate the parts separately you have to use XInclude (on page 578) for assembling the parts together with the main file.

The main document looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [ ]
```
The referenced document (testing.xml) looks like this:

```
<section> ... here is the section content ... </section>
```

Note:

The indicated DTD and the element names (section, chapter) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it is a <section> in the test.xml file) can be inserted somewhere in the main document:

```
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT stylesheet over the main document using a transformation scenario.

**Viewing the Expanded Content in Oxygen XML Author Eclipse plugin**

When a transformation scenario is applied on the main file, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to Author mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```
Combining XML Documents and Fragments Using XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. A main file (on page 2081) can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the DTD Entities method (on page 576) is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

Enabling XInclude Support in Oxygen XML Author Eclipse plugin

The XInclude support in Oxygen XML Author Eclipse plugin is enabled by default. It is controlled by the Enable XInclude processing option (on page 176) in the XML > XML Parser preferences page (on page 175). When enabled, Oxygen XML Author Eclipse plugin will be able to validate and transform documents comprised of parts added using XInclude.

Example: Using XInclude to Combine Files

A chapter file (introduction.xml) looks like this:

```xml
<?xml version="1.0"?>
<chapter>
  <title>Getting started</title>
  <section>
    <title>Section title</title>
    <para>Para text</para>
  </section>
</chapter>
```

The main article (main file) looks like this:

```xml
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN" "http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
  <title>Install guide</title>
  <para>This is the install guide.</para>
  <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
    href="introduction.xml">
    <xi:fallback>
In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the `xi` namespace to certain elements defined by the DocBook DTD.
- The `href` attribute of the `xi:include` element specifies that the `introduction.xml` file will replace the `xi:include` element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the `xi:fallback` element - a `FIXME` message.

**Example: Using XInclude to Combine Fragments of Files**

If you want to include only a fragment of a file in the *main file (on page 2081)*, the fragment must be contained in a tag having an `@xml:id` attribute and you must use an XPointer expression pointing to the `@xml:id` value.

**Notice:**
Oxygen XML Author Eclipse plugin supports the XPointer Framework and the XPointer element() Scheme, but it does NOT support the XPointer xpointer() Scheme.

For example, if the *main file* is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
    xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the file *(a.xml)* is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<a xml:id="a1" test</a>
```

after resolving the XPointer reference, the document is:
Viewing the Expanded Content in Oxygen XML Author Eclipse plugin

When a transformation scenario is applied on the main file, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to Author mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
  <xsl:template match="node() | @*">
    <xsl:copy>
      <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

XInclude 1.1 Features

Oxygen XML Author Eclipse plugin offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

- **Fragment Identifiers**

  You can use `xi:include` to reference a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how the `xi:include` gets expanded when the `@fragid` specifies a line range or character range, see Textual Inclusion Examples with RFC5147 Fragment Identifiers.

- **Attribute Copying**
Any *namespaced* attribute defined on the `<xi:include>` element will be passed to the root element of the included content.

For example, if you have this:

```xml
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
xml:id="sectInner1"/>
```

and `section2.xml` looks like this:

```xml
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
  xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
  <title>FS2</title>
  <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the `<xi:include>` section.

For more information, see Attribute Copying when Processing XML. Also, to see more examples, see Attribute Copying Examples.

---

**Refactoring XML Documents**

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author Eclipse plugin includes a specialized *XML Refactoring* tool that helps you manage the structure of your XML documents.

**XML Refactoring Tool**

The *XML Refactoring* tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the `XML Refactoring` action from one of the following locations:
• The XML menu.
• The Refactoring submenu from the contextual menu in the Project Explorer view (on page 244).
• The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 1762).

**Note:**
The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 584) or previewed (on page 584) also appear in the Refactoring submenu of the contextual menu in the DITA Maps Manager.

**XML Refactoring Wizard**

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

**Figure 182. XML Refactoring Wizard**
Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

Figure 183. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 184. XML Refactoring - Scope and Filters Wizard Page
Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2079) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 2085).

Filters

The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use build*.xml for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Preview

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the Finish button, the operation will be processed and Oxygen XML Author Eclipse plugin provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the
operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author Eclipse plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip:
Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for Attributes

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the Operation mode:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.
Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

   Element

   The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

   Local name

   The local name of the affected attribute.

   Namespace

   The namespace of the affected attribute.

New element section

   Local name

   The local name of the new element.

   Namespace

   The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

   Element

   The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

   Attribute

   The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:
Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

Refactoring Operations for Comments

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
Refactoring Operations for DITA Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

• Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
• DITA Map changes:
  • Removes the @lockmeta attribute.
  • Removes the <topicset> and <topicsetref> elements.
  • Removes the <anchor> and <anchorref> elements and the @anchorref attribute.
  • Migrates the @navtitle attribute as a <navtitle> element.
  • Migrates the @title attribute as a <title> element.
  • Converts the @copy-to attribute to a <resourceid> element.
  • Replaces the @print attribute with an @deliveryTarget attribute.
  • Convert topicmeta <linktext> to <linktitle>.
  • Removed <hasInstance>, <hasKind>, <hasNarrower>, <hasPart>, <hasRelated>, and <relatedSubjects> from subject scheme relationship tables in subject scheme, including <subjectRelTable>, <subjectRelHeader>, <subjectRel>, and <subjectRole>.
• DITA task changes:
  • Converts the <substep> element to a <step> element.
  • Converts the <substeps> element to a <steps> element.
• DITA topic changes:
  • Removes the @type attribute with the value fastpath.
  • Converts the @alt attribute to an <alt> element.
  • Replaces the <index-sort-as> element with a <sort-as> element.
  • Removes the <itemgroup> element.
  • Moves the contents of the <titlealts> element inside the <prolog>.
  • Removes the @domains attribute.
  • Renames <sectiondiv> to <div>.
  • Remove @query attribute from <link> element.
• Remove @specentry attribute from <stentry> element.

Remove the @spectitle attribute.

Convert conrefs to conkeyrefs

Use this operation to convert @conref attributes to @conkeyref attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 1906).

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))

Use this operation on topics that contain nested <topic> elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (on page 1835).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 1835).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 1835).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 1835).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 1835).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 1835).

**Rename Key**

Use this operation to rename a key. It also updates all references to it.

**Note:**

It does not work on DITA 1.3 key scopes.

**Generate IDs**

Use this operation to automatically generate unique IDs for elements.

**Scope and Filters:**

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for DITA Maps**

**Convert DITA Bookmap to Map**

Convert a DITA bookmap to a DITA map.

**Convert DITA Map to Bookmap**

Convert a DITA map to a DITA bookmap.

**Change or remove profiling attribute value**
Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g., for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute.

**Define keys for all topic references**

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element ( `<xref>` or `<link>` ) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the Validate and check for completeness action from the DITA Maps Manager toolbar to manually fix those problems. You can enable the Report duplicate keys checkbox to also report any keys that are defined more than once.

**Scope and Filters:**

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as `*` or `?`).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**
The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section

Local name

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name
The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

**Local name**

The local name of the *Wrapper element*.

**Namespace**

The namespace of the *Wrapper element*.

**Wrap element content**

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

**Local name**

The local name of the *Wrapper element* that will surround the content of the target.

**Namespace**

The namespace of the *Wrapper element* that will surround the content of the target.
**Refactoring Operations for Fragments**

**Insert XML fragment**

Use this operation to insert an XML fragment. This operation allows you to specify the following:

**XML Fragment**

The XML fragment to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

**Replace element content with XML fragment**

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the content of the target element.

**Replace element with XML fragment**

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.
Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Use this operation to add an NLM ‘BITS’ 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Use this operation to add a JATS ‘Blue’ 1.1 DOCTYPE declaration.

Normalize IDs
Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

Scope
Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

Filters section

Include files
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only
Excludes non-XML file types from the operation.

Refactoring Operations for Processing Instructions

Accept all tracked changes, remove all Oxygen-specific comments and highlights
Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes
Accepts all application-specific tracked changes (from elements and attributes).

Remove comments
Removes all application-specific comments.

Remove highlights
Removes all application-specific highlights.

Delete processing instructions
Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

**Processing instruction target**

The target name of the processing instructions to delete.

**Note:**
Processing instructions that are outside the root element are not deleted because the serializer preserves the content before and after the root.

**Refactoring Operations for Publishing Template**

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

**Migrate HTML Page Layout Files to v21**

Use this operation to convert custom HTML page layout files (on page 969) that are included in a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Author Eclipse plugin version 21.0.

**Migrate HTML Page Layout Files to v22**

Use this operation to convert custom HTML page layout files (on page 969) that are included in a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Author Eclipse plugin version 22.0.

**Update HTML Pages**

**Attention:**
This operation is only used by Oxygen XML Author Eclipse plugin and should not be used manually.

**Additional Notes:**

- There are some operations that allow `<ANY>` for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options > Preferences > XML > XSLT-XQUERY > XPath (on page 184) page. This preferences page can be
Storing and Sharing Refactoring Operations

Oxygen XML Author Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing. To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (on page 85).
- A folder that you specify in the Load additional refactoring operations from text box (on page 180) in the XML Refactoring preferences page (on page 180).
- The refactoring folder from the Oxygen XML Author Eclipse plugin installation directory ($OXYGEN_INSTALL_DIR/refactoring/).

Sharing Refactoring Operations

The purpose of Oxygen XML Author Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as framework (on page 2080) or projects.

After storing operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Author Eclipse plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in $OXYGEN_INSTALL_DIR/refactoring/i18n/translation.xml.

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A digital signature provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:
A digital signature must provide a way to verify that the data has not been modified or replaced to ensure integrity.

The signature must provide a way to establish the identity of the data's signer for authentication.

The signature must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A public key system is used to create the digital signature and it is also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, XML-Signature Syntax and Processing). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The XML Signature is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of canonicalization (on page 2078) and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a non-canonicalized document could possibly be different from one produced from a canonicalized (on page 2078) document. The canonical (on page 2078) form of an XML document is physical representation of the document produced by the method described in this specification. The XML canonicalization (on page 2078) method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. XML canonicalization is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the canonical form of the original document before application processing with the canonical form of the document result of the application processing.
A digital signature over the canonical form of an XML document or document subset allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the canonical forms that they were computed for) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Author Eclipse plugin:

- **Canonical XML (or Inclusive XML Canonicalization)** (XMLC14N) - Used for XML where the context doesn't change.

  Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization** (EXCC14N) - Designed for canonicalization where the context might change.

  Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form, comments are removed, including the delimiter for comments outside the document element.

The three operations, **Canonicalize** (on page 600), **Sign** (on page 601), and **Verify Signature** (on page 603), are available from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu.

Related Information:
- Certificates (on page 600)
- Canonicalizing Files (on page 600)
Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called keystores (on page 2081).

All keystore entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No keystore can store an entity if its alias already exists in that keystore and cannot store trusted certificates generated with keys in its keystore.

Oxygen XML Author Eclipse plugin provides two types of keystores: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. In a PKCS 12 keystore you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the keystore.

To configure the options for a certificate or to validate it, open the Preferences dialog box (on page 61) and go to XML > XML Signing Certificates. This opens the certificates preferences page (on page 180).

Canonicalizing Files

You can select the canonicalization (on page 2078) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode.

The Canonicalize dialog box allows you to set the following options:

- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2078) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-
signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2078) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2078) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2078) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

**Related Information:**

Digital Signatures Overview (on page 597)

**Signing Files**

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the Sign action from the Source submenu when invoking the contextual menu in Text mode.

The following options are available:

**Note:**

If Oxygen XML Author Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 180) where you can configure a valid certificate.

⚠️ Could not obtain a valid certificate. You must configure a valid certificate.
• **Transformation Options** - See the Digital Signature Overview (on page 597) section for more information about these options.

  - **None** - If selected, no canonicalization (on page 2078) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2078) method is used.

  **Note:**
  Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

  - **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2078) method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2078) method is used.

  **Note:**
  Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

  - **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2078) method is used.

• **XPath** - The XPath expression provides the fragments of the XML document to be signed.

• **ID** - Provides ID of the XML element to be signed.

• **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (on page 597) for more information.

• **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 597) for more information.

• **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.

• **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
Verifying Signature

You can verify the signature of a file by selecting the Verify Signature action from the Source submenu when invoking the contextual menu in Text mode. The Verify Signature dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Author Eclipse plugin includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Author Eclipse plugin installation directory includes a samples folder that contains a file called personal.xml. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple <person> elements inside the <personnel> element.

Suppose you want to digitally sign the specific <person> element that contains the id=robert.taylor. To do this, follow this procedure:

1. Open the personal.xml file in Oxygen XML Author Eclipse plugin in Text editing mode.
2. Right-click anywhere in the editor and select the Sign action from the Source submenu. The Sign dialog box is displayed.
3. If Oxygen XML Author Eclipse plugin cannot find a valid certificate, click the link at the top of the dialog box to configure a valid certificate. This opens the XML Signing Certificates preferences page (on page 180) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the Sign dialog box.
   a. Select one of the Transformation Options (on page 602). For the purposes of this example, select the Inclusive with comments option.
   b. Specify the appropriate XPath expression for the specific element that needs to be signed. For this example, type /personnel/person in the XPath text box.
c. Enter the specific ID that needs to be signed. For this example, type robert.taylor in the ID field.

d. Select the Envelope option (on page 602) and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the Verify Signature action from the Source submenu of the contextual menu.

Signing Files (on page 601)
Verifying Signature (on page 603)

Editing CSS Stylesheets

Oxygen XML Author Eclipse plugin includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- Create new CSS files and templates - You can use the built-in new file wizards to create new CSS documents or templates (on page 221).
- Open and Edit CSS files - CSS files can be opened and edited in a source editing mode.
- Validation - Presents validation errors in CSS files.
- Content completion - Offers proposals for properties and the values that are available for each property.
- Syntax highlighting - The syntax highlighting in Oxygen XML Author Eclipse plugin makes CSS files more readable.
- Shortcut to open resources - You can use Ctrl + Single-Click (Command + Single-Click on macOS) to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Related Information:
CSS Support in Author Mode (on page 1602)
Supported CSS Selectors (on page 1608)
Supported CSS Properties (on page 1615)
CSS Extensions (on page 1628)

Validating CSS Stylesheets

Oxygen XML Author Eclipse plugin includes a built-in CSS Validator, integrated with general validation support. This makes the usual validation features (on page 519) for presenting errors also available for CSS stylesheets.
The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the CSS validation preferences (on page 64). The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen (on page 1628) that can be used in Author mode (on page 220). That means all Oxygen-specific extensions are accepted in a CSS stylesheet by the built-in CSS validator (on page 604) when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named CustomProperties.xml that has the following structure:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.oxygenxml.com/ns/css
http://www.oxygenxml.com/ns/css/CssProperties.xsd"
    xmlns="http://www.oxygenxml.com/ns/css"
>
    <property name="custom">
        <summary>Description for custom property.</summary>
        <value name="customValue"/>
        <value name="anotherCustomValue"/>
    </property>
</css_keywords>
```

2. Go to your desktop and create the builtin/css-validator/ folder structure.

3. Press and hold Shift and right-click anywhere on your desktop. From the contextual menu, select Open Command Window Here.

4. In the command line, run the jar cvf custom_props.jar builtin/ command.

5. Go to [OXYGEN_INSTALL_DIR]/lib and create the endorsed folder. Copy the custom_props.jar file to [OXYGEN_INSTALL_DIR]/lib/endorsed.

Content Completion in CSS Stylesheets

A Content Completion Assistant (on page 2078), similar to the one available for XML documents (on page 292) offers the CSS properties and the values available for each property. It can be manually activated with the Ctrl + Space (Command + Space on macOS) shortcut and is context-sensitive when invoked for the value of a property. The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments (on page 296) into CSS stylesheets. The code templates that are proposed include form controls, actions, and Author mode operations.
The properties and values available are dependent on the CSS Profile selected in the CSS preferences (on page 64). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile CSS 3 with Oxygen extensions includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen XML Author Eclipse plugin (on page 1628) that can be used in Author mode (on page 220).

Proposals for CSS Selectors - After inserting a CSS selector, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting @media or @import <url> rules, the content completion assistance will propose a list of supported media types.

Related Information:
Specify Custom CSS Properties (on page 605)

Syntax Highlighting in CSS Files

Oxygen XML Author Eclipse plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the Preferences dialog box (on page 61).
2. Go to Editor > Syntax Highlight (on page 161).
3. Select and expand the CSS section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:
Syntax Highlight Preferences (on page 161)

CSS Outline View

The Outline view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.
You can synchronize the selection in the Outline view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the Outline view, Oxygen XML Author Eclipse plugin highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

**Folding in CSS Stylesheets**

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents *(on page 289)* are also available in CSS stylesheets.

---

**Note:**

To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

---

**Formatting and Indenting CSS Stylesheets (Pretty Print)**

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents *(on page 311)* is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

**Minifying CSS Stylesheets**

*Minification* (or compression) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the Minify CSS action. Oxygen XML Author Eclipse plugin opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Author Eclipse plugin performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.
The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

**Note:**
To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **XML** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

---

**Editing StratML Documents**

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Author Eclipse plugin supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline view** (on page 299). Oxygen XML Author Eclipse plugin implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

---

**Editing XLIFF Documents**

XLIFF (**XML Localization Interchange File Format**) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Author Eclipse plugin provides the following support for editing XLIFF documents:

- **XLIFF Version 1.2, 2.0, and 2.1 Support:**
  - New document templates for XLIFF documents.
  - A default CSS file (**xliff.css**) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.
  - Validation and content completion support using local catalogs. The default catalog (**catalog.xml**) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xml/`.
XLIFF Version 2.0 and 2.1 Enhanced Support:

Support for validating XLIFF 2.0 and 2.1 documents using modules. For version 2.0, the default modules are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.0/modules and for version 2.1, they are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.1.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document from a template (on page 228), Oxygen XML Author Eclipse plugin opens it in Text mode. Aside from the normal editing features found in Text mode, you can also switch to Author mode where Oxygen XML Author Eclipse plugin offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 and 2.1 documents, you can also change the style of the visual editing mode. The Styles drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 and 2.1 documents in Author mode:

- Default
- Classic
- Translate

Editing JavaScript Documents

This section explains the features of the Oxygen XML Author Eclipse plugin JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Author Eclipse plugin allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.
The contextual menu of the JavaScript editor offers the following actions:

- **Cut**
  
  Allows you to cut fragments of text from the editing area.

- **Copy**
  
  Allows you to copy fragments of text from the editing area.

- **Paste**
  
  Allows you to paste fragments of text in the editing area.

- **Toggle Comment**
  
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

- **Toggle Line Comment**
  
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

**Go to Matching Bracket**

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Author Eclipse plugin moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note:**

A rectangle decorates the opening or closing bracket that matches the current one, at all times.
Allows you to select one of the following actions:

**To Lower Case**
Converts the selection content to lower case characters.

**To Upper Case**
Converts the selection content to upper case characters.

**Capitalize Lines**
Converts to upper case the first character of every selected line.

**Join and Normalize Lines**
Joins all the rows you select to one row and normalizes the content.

**Insert new line after**
Inserts a new line after the line at the cursor position.

**Modify all matches**
Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Open**
Allows you to select one of the following actions:

- • **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- • **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

**Compare**
Select this option to open the Compare Files tool to compare the file you are editing with a file you choose in the dialog box.

**Validating JavaScript Files**
You have the possibility to validate the JavaScript document you are editing. Oxygen XML Author Eclipse plugin uses the Mozilla Rhino library for validation. For more information about this library, go to [https://github.com/mozilla/rhino](https://github.com/mozilla/rhino). The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Author Eclipse plugin can validate a JavaScript document both on-request and automatically.
Content Completion in JavaScript Documents

When you edit a JavaScript document, the Content Completion Assistant (on page 2078) presents you a list of the elements you can insert at the cursor position. It can be manually activated with the Ctrl + Space (Command + Space on macOS) shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- function
- variable
- object
- property
- method

Note:
These icons decorate both the elements from the content completion list of proposals and from the Outline view (on page 613).

Figure 186. JavaScript Content Completion Assistant

```javascript
function newPage(filename, overlay) {
    divs = document.getElementsByTagName("div");
    if (divs) {
        var xdiv = divs[0];
    }
    if (xdiv) {
        var xid =
            TypeInfo - TypeInfo
            UE UIEvent - UIEvent
            User data Handler - User data Handler
            if (mytoc) {
                alert(msg)
                mytoc.lastU();
            } else {
                clearInterval(id_set_interval)
                clearInterval(id_set_timeout);
            }
    } else {
        var td = tddiv.getElementsByTagName("s").item(0);
        ta.style.textDecoration = "underline"
        mytoc.lastUnderlined = ta;
    }
}
```

The Content Completion Assistant collects:
• Method names from the current file and from the library files.
• Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

**Syntax Highlighting in JavaScript Documents**

Oxygen XML Author Eclipse plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the *Preferences* dialog box *(on page 61).*
2. Go to *Editor > Syntax Highlight* *(on page 161).*
3. Select and expand the *JavaScript* section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the *Preview* pane.

Related Information:

- Syntax Highlight Preferences *(on page 161)*

**JavaScript Outline View**

Oxygen XML Author Eclipse plugin present a list of all the components of the JavaScript document you are editing in the *Outline* view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.
The following icons decorate the elements in the Outline view depending on their type:

- Ь - function
- v - variable
- □ - object
- ⓢ - property
- Ь - method

The contextual menu of the JavaScript Outline view contains the usual Cut, Copy, Paste, and Delete actions. From the Settings menu, you can select the Update selection on cursor move option to synchronize the Outline view with the editing area.

**Editing HTML Documents**

Oxygen XML Author Eclipse plugin provides a special framework for editing HTML files (html or htm file extensions) with a variety of specialized editing features, including validation, content completion, syntax highlighting, HTML-specific actions, and more. You can edit HTML documents in Text or Author mode.

Oxygen XML Author Eclipse plugin also includes a built-in XHTML framework (on page 728) (files with the http://www.w3.org/1999/xhtml namespace or with the xhtml or xht file extension) that has a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). Oxygen XML Author Eclipse plugin also includes support for importing HTML files as an XML document (on page 1426).
Resources

For more information about the HTML support in Oxygen XML Author Eclipse plugin, see the following resources:

- Video: HTML Support in Oxygen.

Related information

XHTML Document Type (Framework) (on page 728)

HTML Editor

Oxygen XML Author Eclipse plugin includes a specialized HTML editor and various editing features for files that have the html or htm file extensions. The encoding is detected automatically based on the value specified in the @charset attribute of the <meta> element.

Note:

If an HTML document has an XHTML namespace, or there is an XSD schema declared, or there is a PUBLIC ID specified in a DOCTYPE, or there is a SYSTEM ID with a value other than "about:legacy-compact", then the document will be opened as an XHTML file.

New Document Template

Oxygen XML Author Eclipse plugin includes a new document template to help you get started creating HTML content. It is available when creating new documents from templates (on page 228) and can be found in the New Document folder or by typing html in the search field.

Text Mode Editor

You can edit HTML files in the Text editing mode (on page 280) using all of its useful features (on page 280). It includes content completion (on page 618) based on a special HTML schema, syntax highlighting (on page 619), a specialized Outline view (on page 620) that presents the structure, folding support (on page 619), and more.

HTML documents support formatting and indenting single or multiple documents to make them more readable. The formatting works even if the document is not XML well-formed and it also works on embedded CSS or JavaScript code. The HTML formatting details are similar to those for XML documents. For details, see Formatting and Indenting XML Documents (on page 311).

Author Mode Editor

You can edit HTML files in the visual Author editing mode (on page 339), but when opening an HTML document in Author mode, if it is not considered well-formed according to XML standards, you will see a warning message at the top of the editor explaining that once you make a modification, the document will...
be automatically converted to proper XML structure. For more details, see XML Well-Formedness Details for HTML Documents (on page 616).

When editing HTML documents in Author mode, you have access to many of the same authoring features and actions as you have with XHTML documents (on page 729). You also have the benefit of CSS rendering and you can specify a CSS file to be associated with an HTML document (on page 621).

**HTML-Specific Contextual Menu Actions**

There are some specialized actions (available in the contextual menu when you right-click anywhere in the current HTML document) that invoke features unique to HTML documents. These contextual menu actions include:

- **View in Browser/System Application**
  
  Opens the HTML document in your default browser.

- **Minify HTML**
  
  Compresses the HTML document by removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers.

- **HTML to XML Well-formed (Available in both Text and Author modes)**

  Converts the currently edited HTML document to be XML well-formed. This means that unclosed tags will be properly closed, unquoted attribute values will be quoted, and more. This is helpful if, for example, you use XSLT stylesheets while applying transformations on HTML documents (since the transformation will require the HTML document to be XML well-formed).

**XML Well-Formedness Details for HTML Documents**

When opening an HTML document in Author mode, if it is not XML well-formed, you will see a warning message at the top of the editor explaining that once you make a modification, the document will be automatically converted to proper XML structure. Examples of things that are automatically converted include:

- Missing end tags are added to applicable elements.
- Empty tags are closed.
- Missing quote characters are added to applicable attributes.
- Entity references that are allowed in the HTML5 specification are converted to the corresponding character.

**Tip:**

It is also possible to manually convert HTML documents to be XML well-formed. There are two ways to do this, depending on whether you want to convert a single document or batch convert multiple documents at once:
• **Single Document** - To convert a single HTML document, right-click anywhere in the currently open HTML document (in the main editor) and select **HTML to XML Well-formed**.

• **Multiple Documents** - To batch convert multiple HTML documents at once, go to the **Project Explorer** view, select the documents you want to convert, then right-click and select **HTML to XML Well-formed**.

**Notes:**
- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the **Results** pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

**HTML Validation**

Oxygen XML Author Eclipse plugin includes a built-in default validator used for validating HTML documents. It is based upon the W3C HTML Validator and the HTML documents are validated against the **W3C HTML5 specification**. The validator in Oxygen XML Author Eclipse plugin only supports HTML5 structure. It presents the errors in the editor similar to XML documents (on page 521). It also checks the embedded CSS content and the warnings and errors are presented similar to the **CSS editor** (on page 604).

**Validating HTML Against a Schematron**

It is also possible to validate HTML documents against a Schematron schema. Besides the default HTML validator, Oxygen XML Author Eclipse plugin also includes a built-in **HTML Schematron Validator** engine. There are several ways to validate an HTML document against a Schematron:

- **Configure a Validation Scenario** - You can create or edit a validation scenario (on page 530), change the **File type** column to **HTML Document**, change the **Validation engine** column to **HTML Schematron Validator**, and specify the Schematron document in the **Schema** column.

- **Manually Validate a Single Document** - You can use the **Validate with** action from the **Validate** drop-down menu on the toolbar. This opens a dialog box where you can specify the Schematron document to validate the current document against.

- **Batch Validate Multiple Documents** - You can select multiple HTML documents in the **Project Explorer** view, right-click, and use the **Validate with schema** action from the **Validate** submenu. This opens a dialog box where you can specify the Schematron document to validate the selected documents against.
Notes:

- The Schematron must use the HTML5 namespace to reference the elements from the instance.
- Implicit HTML elements (i.e. `<html>`, `<body>`, `<tbody>`) must be included in an XPath expression in the Schematron document, even if they are missing from the HTML document.

Tip:

The Oxygen XML Author Eclipse plugin installation directory includes a samples folder that contains numerous sample files to help you learn about features, certain file types, and XML technologies. For example, inside the samples folder, there is an html folder with a schematron subfolder where you can find some samples that illustrate HTML validation against a Schematron schema.

Validating HTML Against Other Types of Schema

If your HTML document is XML well-formed, you could also configure a validation scenario to validate it as an XML document against other types of schemas. You would create or edit a validation scenario (on page 530), make sure the File type column is set to XML Document, select the appropriate Validation engine, and specify the schema document in the Schema column.

HTML Content Completion Assistant

Oxygen XML Author Eclipse plugin includes an intelligent Content Completion Assistant (on page 2078) that offers proposals for inserting HTML structures that are valid at the current editing location. Content completion is even available for CSS and JavaScript code that is embedded in an HTML document.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (on page 61), go to Editor > Content Completion, and deselect the Enable content completion option (on page 110).

Figure 188. Content Completion Assistant in HTML

```xml
<table>
  <data>
    <dataList>
      <details>
        <meta>
          <textarea>
            <!-- HTML5 Specs -->
          </textarea>
        </meta>
      </details>
    </dataList>
  </data>
</table>
```

The `table` element represents data with more than one dimension, in the form of a table.
Using the Content Completion in HTML

For HTML documents, the Content Completion Assistant uses a built-in schema and the list of proposals depend on the RELAX NG schema specified in the HTML framework. Using the content completion feature is the same as with any other XML document. For more details, see:

- Using the Content Completion Assistant in Text Mode (on page 292)
- Using the Content Completion Assistant in Author Mode (on page 365)

Code Templates in the Content Completion

Oxygen XML Author Eclipse plugin includes a set of built-in code templates for HTML documents that can be selected from the Content Completion Assistant. The code templates are displayed with a . symbol in the content completion list. You can also define your own code templates and share them with others. For more information, see Code Templates (on page 296).

Content Completion for XPath Expressions

When entering XPath expressions in the XPath Builder view, the Content Completion Assistant is available as you type to help you compose query patterns.

Syntax Highlighting in HTML Documents

Oxygen XML Author Eclipse plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

For HTML documents, it handles attributes without quotes, unclosed or void elements, and it also offers highlighting for embedded CSS or JavaScript content.

To customize the colors or styles used for the syntax highlighting colors for HTML files, follow these steps:

1. Open the Preferences dialog box (on page 61).
2. Go to Editor > Syntax Highlight (on page 161).
3. Select and expand the XHTML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:
Syntax Highlight Preferences (on page 161)

Folding in HTML

In a large HTML document, elements can be collapsed so that only the needed data remains in focus. The folding features available for XML documents (on page 289) are also available in HTML documents, but it also provides folding for nested elements that are not closed.
Minifying HTML Documents

Minification (or compression) of an HTML document is the practice of removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers. While a minified HTML document gains in terms of execution performance, it is more difficult to read.

To minify an HTML document, right-click anywhere in the editor for an HTML document that is open in Text mode (or right-click an HTML document in the Project Explorer view and select the Minify HTML action. This opens a dialog box with the following options:

**Output file**

Use this option to set the name and location of the resulting compressed/minified HTML document.

**Remove comments**

If selected (default), all the HTML comments and also the comments from embedded CSS or JavaScript code blocks will be removed from the resulting output file.

**Compress on a single line**

If selected (default), the resulting output file will consist of a single line, as all the 'new line' characters from the source document are removed.

**Open output file in editor**

If selected (default), the resulting output file will be opened in Oxygen XML Author Eclipse plugin.

When you click OK, the resulting HTML document is a compressed version of the original file for the purpose of enhanced performance, while losing some readability. The source HTML document is not affected.

**HTML Outline View**

The Outline view for HTML documents displays the structure of the HTML document you are editing. By default, it is displayed on the left side of the editor. In addition to the normal features available in the Outline view for XML documents (on page 299), the HTML Outline view also handles void elements, elements that are not closed, or attributes without quotes, and presents the tree structure of the HTML document correctly.
Querying HTML Documents with XPath

Oxygen XML Author Eclipse plugin provides a dedicated XPath Builder view that allows you to compose complex XPath expressions and execute them over HTML documents (even if they are not well-formed according to XML standards). The XPath Builder view offers content completion as you type to help you compose expressions.

Associating a CSS with an HTML Document

The rendering of an HTML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium.

To associate a CSS with an HTML document:

1. Use the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the XML menu.
2. In the resulting dialog box, specify the URL for the CSS file and optionally a title, and click OK.

Result: A CSS association is added in the HTML document in a `<link>` element, as specified in the W3C stylesheet specification.

Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their
fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Author Eclipse plugin provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common among most Markdown applications, the editor in Oxygen XML Author Eclipse plugin also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in DITA maps (on page 2079) and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

**Resources**

For more information about editing Markdown documents in Oxygen XML Author Eclipse plugin, see our webinar: Oxygen Markdown Support.

**Markdown Editor**

Oxygen XML Author Eclipse plugin provides an intuitive, dynamic, and easy-to-use Markdown editor. It is a split-screen editor with two panels that are synchronized in real time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

**Markdown Text Editor Pane (Left Side)**

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Author Eclipse plugin.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Author Eclipse plugin uses an integration of rules (on page 632) that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Author Eclipse plugin syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting (on page 628).
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Author Eclipse plugin automatic spell checking feature (on page 266) that reports possible misspelled words as you type. You simply need to select the Automatic spell check option in the Spell Check preferences page (on page 157), then click the Select editors button and select Markdown Editor.
• **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions *(on page 625)* are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.

**WYSIWYG Preview Pane (Right Side)**

The right pane is a WYSIWYG Preview pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML, XDITA (Lightweight DITA XML), or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the Preview pane. There are two tabs available in the Preview pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The Preview pane includes the following features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.

- **Synchronous caret and scroll synchronization** - Moving the cursor in the editor area will display the corresponding move in the Preview area.

- **Export Options** - The DITA tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic *(on page 628)*. The XDITA tab includes a contextual menu action to export (convert) the current Markdown document to a Lightweight DITA topic *(on page 628)*. Similarly, the HTML tab includes a contextual menu action to export (convert) it to an XHTML document *(on page 628)*.

- **Automatic Validation** - As you edit Markdown documents, they are validated automatically *(on page 628)*. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the Preview pane or Results view *(on page 308)* at the bottom of the editor.

- **Print Feature** - The Markdown editor includes a Print action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the Preview pane.

- **Preview Markup** - The Markdown editor includes a **Tags Display Mode** drop-down menu *(on page 627)* that is available on the toolbar and it allows you to control the amount of markup that is displayed in the Preview pane.

- **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support *(on page 1888)* in Oxygen XML Author Eclipse plugin.
Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Author Eclipse plugin, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the **Markdown** document template.
3. Click **Next**.
4. Choose the storage path and file name for the new document.
5. Click the **Finish** button.

**Result:** A new Markdown document is created and it is opened in the specialized Markdown Editor (on page 622).

Related Information:

Markdown Editor Syntax Rules and Specifications (on page 632)
Actions Available in the Markdown Editor (on page 625)
Working with Markdown Documents in DITA (on page 1888)
Creating New Markdown Documents (on page 624)
Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Author Eclipse plugin for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

Toolbar Actions

The following default actions are available on the Markdown toolbar when editing Markdown documents:

- **Header (1st Level)**
  - Inserts an *atx-style* first-level header ([on page 632]) at the cursor position.

- **Header (2st Level)**
  - Inserts an *atx-style* second-level header ([on page 632]) at the cursor position.

- **Header (3rd Level)**
  - Inserts an *atx-style* third-level header ([on page 632]) at the cursor position.

- **Horizontal Rule**
  - Inserts a horizontal rule ([on page 633]) at the cursor position.

- **Bold (Strong)**
  - Marks the selected text with [bold](on page 634).

- **Italic (Emphasis)**
  - Marks the selected text with [italics](on page 634).

- **Strikethrough**
  - Marks the selected text with a strikethrough ([on page 634]).

- **Code Block**
  - Inserts (or surrounds selected text in) a [codeblock](on page 638).

- **Blockquote**
  - Inserts a [blockquote](on page 637) at the cursor position.

- **Insert Link**
  - Opens the [Insert Link](dialog box that allows you to define a [link](on page 634) to insert at the cursor position.
Insert Image

Opens the Insert Image dialog box that allows you to define an image (on page 636) to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the Browse drop-down menu.

Insert Ordered List

Inserts an ordered list (on page 640) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an unordered list (on page 640) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a task list (on page 641) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a table (on page 642) at the cursor position.
Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the Preview pane and offers the following choices:

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block (on page 2077) and inline elements (on page 2080).

- **Full Tags**
  Displays full tag names without attributes for both block elements and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Block Tags without Element Names**
  Displays tags for block elements but without element names for a more compact version of Block Tags mode. You can still see the element names by hovering over the tags.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page (on page 125) where you can configure the Tags Display Mode options.

Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

- **Cut, Copy, Paste**
  Use these actions to execute the typical editing actions on the currently selected content.

- **Show/Hide Preview**
  A toggle action that shows or hides the Preview pane.
Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as XDITA Topic

Converts the current Markdown document into a Lightweight DITA XML topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the Preview pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Syntax Highlighting in the Markdown Editor

Oxygen XML Author Eclipse plugin supports syntax highlighting in the Markdown editor to make it easier to read the semantics of the structured content by displaying each type of XML code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the Preferences dialog box (on page 61).
2. Go to Editor > Syntax Highlight (on page 161).
3. Select and expand the Markdown section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Syntax Highlight Preferences (on page 161)
- Markdown Editor (on page 622)

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the Preview pane. If a change results in an error that prevents the
parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results view (on page 308)** at the bottom of the editor.

Examples of the type of errors that will be reported include headers being in the wrong order or the syntax of a document begins with something other than a 1st level header.

### Validating Markdown Documents with Schematron

It is possible to validate Markdown documents with Schematron rules. There are two ways to create an association between Markdown documents and Schematron files:

- You can configure an association using the [Markdown preferences page (on page 163)](on page 163). You can specify a Schematron file to validate converted HTML content, as well as one to validate converted DITA content.
- You can create a Schematron association for Markdown documents by adding a [catalog mapping (on page 567)](on page 567) for one of the following URIs:
  - [http://www.oxygenxml.com/schematron/validation/markdown-as-html](http://www.oxygenxml.com/schematron/validation/markdown-as-html) - The obtained Schematron will be applied over HTML conversions.
  - [http://www.oxygenxml.com/schematron/validation/markdown-as-dita](http://www.oxygenxml.com/schematron/validation/markdown-as-dita) - The obtained Schematron will be applied over DITA conversions.

The catalog mapping is a fallback in case the Schematron validation is disabled in the [Markdown preferences page (on page 163)](on page 163) or the path to the Schematron file is empty.

**Warning:**

If you are using a **custom version of DITA-OT (on page 73)**, the mapping information might not be generated properly, causing issues with the Schematron validation. For example, error locations may not be accurate or synchronization may fail.

**Tip:**

Inside the samples folder, there is a **schematron-validation** folder with some files you can use to see how Schematron validation can be done with Markdown files. The path of the folder is: [OXYGEN_INSTALL_DIR]/samples/markdown/schematron-validation/.

**Related Information:**

### Working with Markdown Documents in DITA

Oxygen XML Author Eclipse plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics.
and the DITA tab in the Preview pane provides a visualization of how the DITA topic will look after conversion. Likewise, the XDITA tab in the Preview pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the Preview pane.

**Export Markdown as a DITA Topic**

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

**Working with Markdown Documents in the DITA Maps Manager**

Oxygen XML Author Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 1762). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.
Figure 193. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Author Eclipse plugin is about to make.

**Convert**

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

**Tip:**

Oxygen XML Author Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Project Explorer view (on page 244), open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.
DITA-Related Markdown Syntax

For a list of Markdown rules and syntax examples that are specific to DITA, see the Markdown DITA Syntax Reference.

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Author Eclipse plugin uses rules that were integrated from the most common set of default Markdown syntax rules along with many of the GitHub Flavored Markdown rules.

This topic lists the Oxygen XML Author Eclipse plugin implementation of the most commonly used syntax rules.

Headers

The Markdown editor supports two styles of headers, Setext and Atx.

- **Setext Style**

  Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

  **Example: Setext Style Headers**

  ```
  First-Level Header (H1)
  ================

  Second-Level Header (H2)
  =============
  ```

- **Atx Style**

  Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

  **Example: Atx Style Headers**

  ```
  # First-Level Header

  ## Second-Level Header
  ```
Horizontal Rules (for HTML output only)

You can produce a horizontal rule tag `<hr>` by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

**Example: Horizontal Rules**

* * *

*****

---------------------------------------

_ _ _ _

---

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

**Important:**

When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag `<br>`. When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

**Example: Paragraphs**

This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)**
  
  Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.
  
  *italic*  
  _italic_

- **Bold (Strong)**
  
  Text wrapped with two asterisks or underscores produces a bold (strong) tag.
  
  **bold**  
  __bold__

- **Strikethrough**
  
  In HTML only, text wrapped with two tildes (~) produces a strikethrough tag.
  
  ~~strikethrough~~

- **Underline**
  
  Text wrapped with two plus signs (+++) produces an underline tag.
  
  +++underline++

Tip:
You can also combine these styling rules. For example, **BoldText _ItalicText_ BoldText** would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, \*literal asterisks\*).

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**
  
  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you reference a local resource on the same server, you can use relative paths.
Examples: Inline Link

With a title:

Text with [example link text](http://www.example.com/path "Title") inline link and title.

Without a title:

Text with [example link text](http://www.example.com/path) inline link without a title.

Relative path:

Text with [example link text](/relative_path/) inline link with relative path.

• Reference Links

Reference-type links use a second set of square brackets that include a label (link identifier) to reference the target for the link (link identifier may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"

Other notes about Reference Links:

◦ You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

[id]: http://example.com/long/path/to/resource/here
"Optional Title Here"

◦ The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

[My Link []]

and then defined as:

[My Link]: http://example.com/

Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.
Note:
These automatic links only work properly in HTML conversions. The Preview pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

• **URLs**

By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

```html
<http://example.com/>
```

For example, in HTML it is converted to:

```html
<a href="http://example.com">http://example.com/</a>
```

• **Email Addresses**

Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting spambots.

```html
<address@example.com>
```

In HTML, it is converted to something like:

```html
<a href="&#x6D;ailto:addre&#115;ss@example.co&#109;@">address@exampl...</a>
```

**Images**

The Markdown editor uses an image syntax that is intended to resemble the syntax for two types of links *(inline and reference)*. In both cases, the syntax for images begins with an exclamation mark, followed by *Alt* attribute text surrounded by square brackets, and then followed by a set of parentheses that contain the URL or path to the image.

• **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the *Alt* attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

**Examples: Inline Images**

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
```
Without a title:

Text with ![Alt text](/path/to/img.jpg) inline link without a title.

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

Text with ![Alt text1][id] a reference-type image.

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

[id]: url/to/image "Optional Title"

**Blockquotes**

The Markdown editor uses email-style greater than characters (>) for blockquotes. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is clearer) if you put a > before every line.

- **Example: Blockquotes**

  > This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
  > consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
  > Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
  >
  > Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
  > id sem consectetuer libero luctus adipiscing.

- **Example: Nested Blockquotes**

  Blockquotes can be nested by adding additional levels of > characters.

  > This is the first level of quoting.
  >
  > > This is nested blockquote.
  >
  > Back to the first level.

- **Example: Blockquotes with Other Markdown Elements**

  Blockquotes can also contain other Markdown elements (such as headers, lists, and code blocks).
Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

  You can quote or emphasize code within a sentence (inline) with single backticks (``). The text within the backticks will not be formatted.

  **Example: Inline Code Emphasis**

  This is a normal sentence with a `code` in the middle.

- **Code Blocks**

  You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

  **Example: Code Block**

  This is a normal paragraph:

  ```
  This is a code block
  ```

  This is a normal paragraph:

  ```
  ... 
  ```

  This is a code block

  ```
  ... 
  ```

  One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

  **Example: Code Block with Indentation**
tell application "something"
  beep
end tell

For example, in HTML the result would look like this:

<pre><code>tell application "Foo"
  beep
end tell
</code></pre>

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Author Eclipse plugin Markdown editor syntax highlight supports the following languages: Java, JavaScript, CSS, and Python. When publishing Markdown content as part of a DITA project, more language values are supported and produce syntax highlights in the published WebHelp or PDF outputs: Adding Syntax Highlights for Codeblocks in the Output (on page 1010).

**Example: Syntax Highlighting in Code Block**

```css
input[type="submit"] {
  color: white;
  font-weight: bold;
...```

**Inline XHTML (for HTML output only)**

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

**Example: Inline XHTML**

This is a regular paragraph.

<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>

This is another regular paragraph.
Lists

The Markdown editor supports ordered and unordered lists. You can also insert blockquotes (on page 637) and code blocks (on page 638) inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

• **Unordered Lists**

For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (−) interchangeably.

* List item 1  
+ List item 2  
− List item 3

• **Ordered Lists**

For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

1. List item 1  
8. List item 2  
5. List item 3

• **Nested Lists**

You can create nested lists by indenting lines by three spaces.

1. Ordered list item 1  
   1. Nested ordered list item 1  
   2. Nested ordered list item 2  
      * 2nd level nested unordered list item 1  
      * 2nd level nested unordered list item 2  
         * 3rd level nested unordered list item 1  
   2. Ordered list item 2

• **Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

* List item 1  

* List item 2

For both DITA and HTML output, this would result in:

```html
<ul>
  <li><p>List item 1</p></li>
  <li><p>List item 2</p></li>
</ul>
```
List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

1. This is a list item with two paragraphs. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
   
   Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus. Donec sit amet nisl. Aliquam semper ipsum sit amet velit.

2. Suspendisse id sem consectetuer libero luctus adipiscing.

Blockquotes Inside Lists

To put a blockquote within a list item, the blockquote delimiters (>) need to be indented so that they are under the first letter of the text after the list item marker.

* A list item with a blockquote:
  
  > This is a blockquote
  > inside a list item.

Code Blocks Inside Lists

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

* A list item with a code block:

  This is a code block inside a list item

  ...

  This is a code block inside a list item using the backticks method
  ...

Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (− [ ]). To mark a task as complete, use − [x].

Example: Task Lists
Definition Lists

You can create definition lists by using a colon plus a space for each list item.

Example: Definition Lists

Term 1
: Definition A
: Definition B

Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

• Creating a Table

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Column 1 Row 1 Cell</td>
<td>Column 2 Row 1 Cell</td>
</tr>
<tr>
<td>Column 1 Row 2 Cell</td>
<td>Column 2 Row 2 Cell</td>
</tr>
</tbody>
</table>

• Formatting Rules in Table Cells

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inline code</code></td>
<td>Content with <strong>bold text</strong> inside cell</td>
</tr>
</tbody>
</table>

• Aligning Text in Tables

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

<table>
<thead>
<tr>
<th align="left">Left-aligned</th>
<th align="center">Center-aligned</th>
<th align="right">Right-aligned</th>
</tr>
</thead>
<tbody>
<tr>
<td align="left">Content Cell</td>
<td align="center">Content Cell</td>
<td align="right">Content Cell</td>
</tr>
</tbody>
</table>

• Joining Cells (Span a Cell Over Multiple Columns)
You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (|| for two, ||| for three, and so on).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
<th>Third Header</th>
<th>Fourth Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>--------------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Content Cell</td>
<td>&quot;Cell Span Over 3 Columns&quot;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Emoji**

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (::EMOJICODE::).

**Example: Emoji**

```markdown
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the Preview pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

**Backslash Escapes**

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

`\*literal asterisks\*`

The Markdown editor provides backslash escapes for the following characters:

\ 
` 
* 
_ 
{} 
[] 
() 
# 
+ 
- . 
! 

**Automatic Escaping for Special Characters**

The Markdown editor includes support for automatically escaping special characters such as angle brackets (&lt; &gt; ) and ampersands (&). If you want to use them as literal characters, you must escape them as entities,
as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, `<b>`) are treated as literal characters and escaping is not necessary.

<table>
<thead>
<tr>
<th>Literal Character</th>
<th>Escaping Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>&lt;</td>
</tr>
<tr>
<td>&gt;</td>
<td>&gt;</td>
</tr>
<tr>
<td>&amp;</td>
<td>&amp;</td>
</tr>
</tbody>
</table>

**Footnotes**

The Markdown editor in Oxygen XML Author Eclipse plugin supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

  Here is a footnote reference, [^1]

  [^1]: Here is the footnote.

- **Example: Normal Footnote with Multiple Blocks**

  Here is a footnote reference, [^longnote]

  [^longnote]: Here is the footnote with multiple blocks.

  Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.

- **Example: Inline Footnote**

  Here is an inline note.^[Inlines notes are easier to write, since you don’t have to pick an identifier and move down to type the note.]

**DITA-Related Markdown Syntax**

For information about unique Markdown features for DITA projects, see [Working with Markdown Documents in DITA](on page 1888). Also, for a list of Markdown rules and examples for DITA, see the [Markdown DITA Syntax Reference].

Built-in XML Frameworks (Document Types)

Oxygen XML Author Eclipse plugin includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. Oxygen XML Author Eclipse plugin includes fully supported built-in frameworks (on page 2080) for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) with a full set of features, as well as support for other document types with more generic features (on page 279).

The built-in frameworks (on page 2080) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. These settings include:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Built-in transformation scenarios used for publishing XML documents.
- XML Catalogs (on page 2085) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in Author mode.

It is also possible to create and configure your own custom frameworks (document types). For more information, see the Creating and Configuring Custom Frameworks (on page 1430) section.

For extensive details about the DITA editing features included in Oxygen XML Author Eclipse plugin, see the DITA Authoring chapter (on page 1752).

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 4 document when one of the following conditions are true:

- The root element name is `<book>` or `<article>`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML.`
Default Document Templates

There are a variety of default DocBook 4 templates available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > DocBook 4.

The default templates for DocBook 4 documents are located in the
{OXYGEN_INSTALL_DIR}/frameworks/docbook/templates/Docbook 4 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is docbookxi.dtd and it is stored in {OXYGEN_INSTALL_DIR}/frameworks/docbook/4.5/dtd/.

Default CSS

The default CSS files used for rendering DocBook content in Author mode are stored in
{OXYGEN_INSTALL_DIR}/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Default XML Catalog

The default XML Catalog (on page 2085), catalog.xml, is stored in
{OXYGEN_INSTALL_DIR}/frameworks/docbook/.

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the DocBook 4 section in the Configure Transformation Scenario(s) dialog box (on page 898).

For more information, see the DocBook Transformation Scenarios (on page 811) section.

Related Information:

Editing XML Documents in Author Mode (on page 339)
Editing XML Documents in Text Mode (on page 280)
Adding Tables in DocBook (on page 431)
DocBook 4 Author Mode Actions

A variety of actions are available for DocBook 4 documents in the **DocBook4** menu, toolbar, contextual menu, and the *Content Completion Assistant (on page 2078).*

DocBook 4 Toolbar Actions

The following default actions are available on the DocBook toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross reference (link)**
    Opens a dialog box that allows you to select a target to insert as a hypertext link.

  - **Cross reference (xref)**
    Inserts a cross reference to other parts of the document.

  - **Web Link (ulink)**
    Inserts a link that addresses its target with a URL (Universal Resource Locator).

  - **Insert OLink**
    Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the values of the @targetdoc and @targetptr attributes that are present in a **Targetset (on page 691)** file.
After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed allowing you to easily identify the `@targetptr` for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for `targetdoc` and `targetptr`, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset URL** will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the `xreftext` field and make sure the **Insert xreftext in the OLink** option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Edit OLink**

Opens a dialog box that allows you edit an existing `OLink`. See the **Insert OLink** action for more information.

**Insert Image**

Opens a dialog box that allows you to select the path of an image to insert at the cursor position *(on page 464)*. Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.
Opens a Choose Media dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

- **Insert Section**
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `<sect1>`, then a `<sect2>` is inserted. By default, this action also inserts a `<para>` element as a child node. The `<para>` element can be deleted if it is not needed.

- **Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on macOS))**
  Promotes the current node as a sibling of the parent node.

- **Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on macOS))**
  Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List
Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

**Insert Procedure List**

Inserts a DocBook `<procedure>` element. A `<step>` child element is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element [on page 2077]) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**
Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DocBook4 Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DocBook4** menu at the top of the interface):

- **Edit Attributes**
  Displays an in-place attributes editor *(on page 379)* that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  Allows you to change the profiling attributes *(on page 414)* defined on all selected elements.

- **Cut (Ctrl + X (Command + X on macOS))**
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on macOS))**
  Places a copy of the currently selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on macOS))**
  Inserts the current clipboard content into the document at the cursor position.

- **Paste special submenu**
  This submenu includes the following special paste actions:

  - **Paste As XInclude**
    Allows you to create an `<xi:include>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

  - **Paste as link**
    Allows you to create a `<link>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

  - **Paste as xref**
    Allows you to create an `<xref>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Image Map Editor**
  This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image**
**Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DocBook *framework*:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element* *(on page 2077)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:**

  If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

- **Insert Image**

  Inserts an *image reference* *(on page 464)* at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**

  Opens a *Choose Media* dialog box *(on page 492)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in *Author* mode so that it can be played directly from there.

- **Insert Equation**

  Opens the *XML Fragment Editor* that allows you to insert and edit *MathML* notations *(on page 494).*

- **Insert Paragraph**

  Inserts a new *paragraph* element at current cursor position.

- **Insert Section**

  Inserts a new *section* element in the document, depending on the current context.

- **Insert XInclude**

  Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.
Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- \#<decimal value> - e.g. \#65
- \&#<decimal value> - e.g. \&#65
- \#x<hexadecimal value> - e.g. \#x41
- \&#x<hexadecimal value> - e.g. \&#x41

Section submenu

The following actions are available in this submenu:

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on macOS))

Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on macOS))

Demotes the current node a child of the previous node.

Link submenu

The following actions are available in this submenu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the values of the @targetdoc and @targetptr attributes that are present in a Targetset (on page 691) file.
After you choose the Targetset URL, the structure of the target documents is presented. For each target document (@targetdoc), its content is displayed allowing you to easily identify the @targetptr for the <olink> element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an <olink> using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the <olink>, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Edit OLink**

Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

**Table actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).
Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu gives you access to all the usual contextual menu actions.

Generate IDs

Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

Note:
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Select submenu

This submenu allows you to select the following:
Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:
• 0x0045 will be converted to $E$
• 0x0125 to $H$
• 265 to $ɥ$
• 2190 to $←$

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

∪! Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

grese Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Segue Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the **Position cursor between tags** option *on page 111* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option *on page 111* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with `[tag]` *(Alt + Shift + Forward Slash)*

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Review submenu

This submenu includes the following actions:

✔ Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

✔ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

❌ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

❌ Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.

✔️ Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

✍️ Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

✍️ Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).
Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**

  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**

  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))**

  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**

  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**

  Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.
Floating Contextual Toolbar for DocBook

Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 196. DocBook Floating Contextual Toolbar

![Floating Contextual Toolbar Image]

The floating contextual toolbar is automatically displayed when editing DocBook documents in the following situations:

- When a `<para>` or `<listitem>` element has a selection inside, the floating toolbar includes actions such as `B` Bold, `I` Italic, `U` Underline, `T` Subscript, and `T^2` Superscript.
- When an `<imagedata>` or `<videodata>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When an `<olink>` element is selected, the floating toolbar includes an Edit OLink action.
- When a `<link>` or `<include>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When a `<programlisting>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the @language attribute.
- When an `<itemizedlist>`, `<orderdlist>`, `<variablelist>`, or `<procedure>` element is selected, the floating toolbar includes actions for converting it to a different type of list or sorting the list.
- When a `<listitem>`, `<varlistentry>`, or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<tr>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
- When an `<entry>` or `<td>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DocBook 4 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project Explorer view (on page 244) or DITA Maps Manager view (on page 1762) and dropping it into a DocBook 4 document that is edited in Author mode, creates a link to the dragged file (the `<ulink>` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 244) and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `<inlinegraphic>` DocBook element with a @fileref attribute).
Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
    <title>Administering User Accounts</title>
    <para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

You may need to update your

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

when you get a new machine.

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a main target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.
Tip: Oxygen XML Author Eclipse plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard** *(on page 228)* that will help you get started.

Example: The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db"> 
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db"> 
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db"> ]>
<targetset>
  <targetsetinfo>
    Description of this target database document, which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide" baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide"> &agt targets; </document>
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```
4. Generate the target data files by executing a DocBook transformation scenario. Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

**Example:** An example of a target.db file:

```xml
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xreftext>How to administer user accounts</xreftext>
  <div element="part" href="#d5e4" number="1">
    <ttl>First Part</ttl>
    <xreftext>Part I, "First Part"</xreftext>
  </div>
  <div element="chapter" href="#d5e6" number="1">
    <ttl>Chapter Title</ttl>
    <xreftext>Chapter 1, Chapter Title</xreftext>
    <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
      <ttl>Section1 Title</ttl>
      <xreftext>xreflabel_here</xreftext>
    </div>
  </div>
</div>
```

When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed, allowing you to easily identify the appropriate `@targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `@targetdoc` and `@targetptr` attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called target.xml, `dbadmin` is selected for the target document (`@targetdoc`), and `bldinit` is selected as the value for the `@targetptr` attribute. Notice that you can also add XREF text into the `<olink>` by using the `xreftext` field.
6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

**DocBook 5 Document Type (Framework)**

*DocBook* is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

**File Definition**

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`.

**Default Document Templates**

There are a variety of default *DocBook 5* templates available when creating new documents from templates [on page 228] and they can be found in: Framework Templates > DocBook 5 > DocBook 5.0 and Framework Templates > DocBook 5 > DocBook 5.1.
New document templates for both DocBook 5 documents are located in the 
{OXYGEN_INSTALL_DIR}/frameworks/docbook/templates/Docbook5.0 folder.

New document templates for both DocBook 5.1 documents are located in the 
{OXYGEN_INSTALL_DIR}/frameworks/docbook/templates/Docbook5.1 folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected is docbookxi.rng and it is stored 
in {OXYGEN_INSTALL_DIR}/frameworks/docbook/5.0/rng/ (or for DocBook 5.1 in 
{OXYGEN_INSTALL_DIR}/frameworks/docbook/5.1/rng/). Other types of schemas for various 
DocBook versions are also located in various folders inside the {OXYGEN_INSTALL_DIR}/frameworks/ 
docbook/ directory.

**Default CSS**

The default CSS files used for rendering DocBook content in Author mode is stored in 
{OXYGEN_INSTALL_DIR}/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

**Transformation Scenarios**

Oxygen XML Author Eclipse plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Author Eclipse plugin also includes a DocBook 5.1 transformation scenario for Assembly documents (on page 689). All of them are listed in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 898).

For more information, see the DocBook Transformation Scenarios (on page 811) section.

Editing XML Documents in Text Mode (on page 280)
Adding Tables in DocBook (on page 431)
DocBook 5 Author Mode Actions

A variety of actions are available for DocBook 5 documents in the DocBook5 menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

DocBook 5 Toolbar Actions

The following default actions are available on the DocBook toolbar when editing in Author mode (by default, most of them are also available in the DocBook5 menu and in various submenus of the contextual menu):

**Bold**

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

**Italic**

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

**Underline**

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

🔗 Link Actions Drop-Down Menu

The following link actions are available from this menu:

**Cross reference (link)**

Opens a dialog box that allows you to select a target to insert as a hypertext link.

**Cross reference (xref)**

Inserts a cross reference to other parts of the document.

**Web Link (ulink)**

Inserts a link that addresses its target with a URL (Universal Resource Locator).

**Insert OLink**

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the values of the @targetdoc and @targetptr attributes that are present in a Targetset (on page 691) file.
After you choose the Targetset URL, the structure of the target documents is presented. For each target document (@targetdoc), its content is displayed allowing you to easily identify the @targetptr for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the `xreftext` field and make sure the Insert xreftext in the OLink option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Edit OLink**

Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

**Insert Image**

Opens a dialog box that allows you to select the path of an image to insert at the cursor position (on page 464). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.
Opens a Choose Media dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

- **Insert Section**
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `<sect1>`, then a `<sect2>` is inserted. By default, this action also inserts a `<para>` element as a child node. The `<para>` element can be deleted if it is not needed.

- **Promote Section** (`Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on macOS)`)  
  Promotes the current node as a sibling of the parent node.

- **Demote Section** (`Ctrl + Alt + RightArrow (Command + Alt + RightArrow on macOS)`)  
  Demotes the current node a child of the previous node.

- **Insert Paragraph**
  Inserts a new paragraph element at current cursor position.

- **Insert Equation**
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert Itemized List**
  Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

- **Insert Variable List**
Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

**Insert Procedure List**

Inserts a DocBook `<procedure>` element. A `<step>` child element is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element [on page 2077]) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**
Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DocBook5 Contextual Menu Actions**

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DocBook5 menu at the top of the interface):

- **Edit Attributes**
  
  Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  
  Allows you to change the profiling attributes (on page 414) defined on all selected elements.

- **Cut (Ctrl + X (Command + X on macOS))**
  
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on macOS))**
  
  Places a copy of the currently selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on macOS))**
  
  Inserts the current clipboard content into the document at the cursor position.

- **Paste special submenu**

  This submenu includes the following special paste actions:

  - **Paste As XInclude**
    
    Allows you to create an `<xi:include>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

  - **Paste as link**
    
    Allows you to create a `<link>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

  - **Paste as xref**
    
    Allows you to create an `<xref>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Image Map Editor**

  This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image
Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions that are specific to the DocBook framework:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:**
  
  If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Image**

  Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**

  Opens a Choose Media dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Insert Equation**

  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

- **Insert Paragraph**

  Inserts a new paragraph element at current cursor position.

- **Insert Section**

  Inserts a new section element in the document, depending on the current context.

- **Insert XInclude**

  Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.
Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

Style submenu

This submenu includes the following text styling actions:

- **B Bold**
  Emphasizes the selected text by surrounding it with a `bold` tag. You can use this action on multiple non-contiguous selections.

- **I Italic**
  Emphasizes the selected text by surrounding it with an `italic` tag. You can use this action on multiple non-contiguous selections.

- **U Underline**
  Emphasizes the selected text by surrounding it with an `underline` tag. You can use this action on multiple non-contiguous selections.

- **T́ Subscript**
  Surrounds the selected text with a `subscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

- **T² Superscript**
  Surrounds the selected text with a `superscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Section submenu

The following actions are available in this submenu:

- **Promote Section** *(Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on macOS))*
  Promotes the current node as a sibling of the parent node.

- **Demote Section** *(Ctrl + Alt + RightArrow (Command + Alt + RightArrow on macOS))*
  Demotes the current node a child of the previous node.
Link submenu

The following actions are available in this submenu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the values of the @targetdoc and @targetptr attributes that are present in a Targetset (on page 691) file.

Figure 199. Insert OLink Dialog Box

After you choose the Targetset URL, the structure of the target documents is presented. For each target document (@targetdoc), its content is displayed allowing you to easily identify the @targetptr for the <olink> element that will be inserted.

You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an <olink> using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.
To insert XREF text into the `<olink>`, enter the text in the `xreftext` field and make sure the **Insert xreftext in the OLink** option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Edit OLink**

Opens a dialog box that allows you edit an existing `OLink`. See the **Insert OLink** action for more information.

**Table actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

 SPLITS THE CELL AT THE CURSOR LOCATION. IF OXYGEN XML AUTHOR ECLIPSE PLUGIN DETECTS MORE THAN ONE OPTION TO SPLIT THE CELL, A DIALOG BOX WILL BE DISPLAYED THAT ALLOWS YOU TO SELECT THE NUMBER OF ROWS OR COLUMNS TO SPLIT THE CELL INTO.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**
This submenu gives you access to all the usual contextual menu actions.

**Generate IDs**

Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**
The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an \texttt{id} attribute.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

### Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \( \text{0x0045} \) will be converted to \( \text{E} \)
- \( \text{0X0125} \) to \( \text{ĥ} \)
- \( \text{265} \) to \( \text{ɥ} \)
- \( \text{2190} \) to \( \text{←} \)

**Note:**
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

### Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**
- Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**
- Allows you to change an attribute into an element.

**Delete attribute**
- Allows you to remove one or more attributes.

**Rename attribute**
- Allows you to rename an attribute.

**Replace in attribute value**
- Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
- Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
- Allows you to delete elements.

**Delete element content**
- Allows you to delete the content of elements.

**Insert element**
- Allows you to insert new elements.

**Rename element**
- Allows you to rename elements.

**Unwrap element**
- Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

### Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

### Review submenu

This submenu includes the following actions:

- **Track Changes**
  
  Enables or disables the *Track Changes (on page 2084)* support for the current document.

- **Accept Change(s) and Move to Next**
  
  Accepts the *Tracked Change (on page 2084)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

- **Accept All Changes**
  
  Accepts all *Tracked Changes (on page 2084)* in the current document.

- **Reject Change(s) and Move to Next**
  
  Rejects the *Tracked Change (on page 2084)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

- **Reject All Changes**
  
  Rejects all *Tracked Changes (on page 2084)* in the current document.

- **Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2084)*. The comment will appear in a callout and a tooltip when
hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

![Highlight]

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

![Add Comment]

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

![Show/Edit Comment]

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

![Remove Comment]

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

![Manage Reviews]

Opens the Review view (on page 410).

### Folding submenu

This submenu includes the following actions:

- ![Toggle Fold]
  Toggles the state of the current fold.

- ![Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS)]
  Folds all the elements except the current element.

- ![Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS)]
  Folds the elements indented with one level inside the current element.

- ![Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS)]
  Unfolds all child elements of the currently selected element.
Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DocBook

Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 200. DocBook Floating Contextual Toolbar

The floating contextual toolbar is automatically displayed when editing DocBook documents in the following situations:

- When a `<para>` or `<listitem>` element has a selection inside, the floating toolbar includes actions such as **Bold**, **Italic**, **Underline**, **Subscript**, and **Superscript**.
- When an `<imagedata>` or `<videodata>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When an `<olink>` element is selected, the floating toolbar includes an Edit OLink action.
- When a `<link>` or `<include>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When a `<programlisting>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the @language attribute.
- When an `<itemizedlist>`, `<orderdlist>`, `<variablelist>`, or `<procedure>` element is selected, the floating toolbar includes actions for converting it to a different type of list or sorting the list.
- When a `<listitem>`, `<varlistentry>`, or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<tr>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
• When an `<entry>` or `<td>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
• When a `<table>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DocBook 5 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project Explorer view (on page 244) and dropping it into a DocBook 5 document that is edited in Author mode, creates a link to the dragged file (the `<link>` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 244) and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `<imageobject>` DocBook element with an `<imagedata>` child element and a `@fileref` attribute).

Tip:
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a Mail Administrator Guide with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
```

You may need to update your

```
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
```

when you get a new machine.
To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a main target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

---

**Tip:**

Oxygen XML Author Eclipse plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard (on page 228)** that will help you get started.

**Example:** The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document, which is for the examples in olink doc.
  </targetsetinfo>
  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```
4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the `collect.xref.targets` parameter is set to yes. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

**Example:** An example of a `target.db` file:

```xml
<ttl>Administering User Accounts</ttl>
<xreftext>How to administer user accounts</xreftext>
<ttl>First Part</ttl>
<xreftext>Part I, "First Part"</xreftext>
<ttl>Chapter Title</ttl>
<xreftext>Chapter 1, Chapter Title</xreftext>
<ttl>Section1 Title</ttl>
<xreftext>Section 1 Title</xreftext>
```

```xml
</div>
```

When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document (@targetdoc), its content is displayed, allowing you to easily identify the appropriate @targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the @targetdoc and @targetptr attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (@targetdoc), and `bldinit` is selected as the value for the @targetptr attribute. Notice that you can also add XREF text into the `<olink>` by using the `xreftext` field.

**Figure 201. Insert OLink Dialog Box**

6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.
DocBook 5.1 Assembly

The DocBook Assembly document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as DocBook 5.1 topics (on page 690)) to form a hierarchical structure for a larger publication.

An Assembly document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An Assembly may identify one or more collections.
- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `<structure>` element, an `<output>` element can be used to identify the type of output to be generated and `<module>` elements can be used to identify the resources to be included. An Assembly may identify one or more structures.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of structures during assembly. An Assembly may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An Assembly may identify any number of transformations.

For detailed information about the DocBook Assembly document type, see DocBook 5.1: The Definitive Guide - DocBook Assemblies.

File Definition

A file is considered to be an Assembly when the root name is `assembly`.

Default Document Templates

A default Assembly document template is available when creating new documents from templates (on page 228) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that can be applied on an Assembly file to generate an assembled (merged) DocBook file. The scenario is called DocBook Assembly and is found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 898).
Resources

- DocBook 5.1: The Definitive Guide - DocBook Assemblies
- DocBook 5.1 Specifications
- Sample files: [OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/

DocBook 5.1 Topic

The DocBook Topic document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA Topic and can be used as modular resources in conjunction with DocBook 5.1 Assembly (on page 689) documents.

File Definition

A DocBook file is considered to be a Topic when the root name is topic.

Default Document Templates

A default Topic document template is available when creating new documents from templates (on page 228) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is docbookxi.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/.

Transformation Scenarios

Since DocBook Topics are modular resources, they are assembled and transformed in the DocBook Assembly transformation process (on page 689). You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 898).

Resources

- DocBook 5.1: The Definitive Guide - Topic
- DocBook 5.1 Specifications
- Sample files: [OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/
DocBook Targetset Document Type (Framework)

DocBook Targetset documents are used to resolve cross references with the DocBook Olink.

File Definition

A file is considered to be a Targetset when the root name is `targetset`.

Default Document Templates

A default DocBook Targetset Map document template is available when creating new documents from templates (on page 228) and it can be found in: Framework Templates > DocBook Targetset.

The default template for DocBook Targetset documents is located in the 

```bash
[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset
```

Default Schema for Validation and Content Completion

The default schema, `targetdatabase.dtd`, for this type of document is stored in

```bash
[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/
```

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (`task`, `concept`, `reference`, `glossary entry`).

For much more detailed information, resources, and instructions, see the DITA Authoring (on page 1752) chapter.

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `<concept>`, `<task>`, `<reference>`, `<dita>`, or `<topic>`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
The root element of the file has a `@DITAArchVersion` attribute for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (on page 80) is selected from the Document Type Association preferences page (on page 79).

**Default Document Templates**

There are a variety of default DITA topic templates available when creating new documents from templates (on page 228) and they can be found in various folders inside: Framework Templates > DITA.

The default templates for DITA topic documents are located in the `{OXYGEN_INSTALL_DIR}/frameworks/dita/templates/topic` folder.

**Default Schema for Validation and Content Completion**

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

**Default CSS**

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: `{OXYGEN_INSTALL_DIR}/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

**Default XML Catalogs**

The default XML Catalogs (on page 2085) for the DITA topic document type are as follows:

- `DITA-OT-DIR/catalog-dita.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/dita/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/dita/plugin/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/dita/styleguide/catalog.xml`

**Transformation Scenarios**

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 898).

**Resources**

- DITA Specifications
- DITA Style Guide Best Practices for Authors

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross Reference**
    Opens the Cross Reference (xref) dialog box (on page 1935) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2079) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 1935).

  - **File Reference**
    Opens the File Reference dialog box (on page 1936) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in
your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

Web Link

Opens the Web Link dialog box (on page 1936) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 1936) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Tip:

You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Related Link to File

Opens the File Reference dialog box (on page 1937) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Related Link to Web Page

Opens the Web Link dialog box (on page 1937) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Insert Image

Opens the Insert Image dialog box (on page 1838) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.
Insert Media Resource

Opens the Insert Media dialog box (on page 1842) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an <object> element and it is rendered in Author mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

- **Insert Section**
  Inserts a new <section> element in the document, depending on the current context.

- **Insert Concept**
  Inserts a new <concept> element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  Inserts a new <task> element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

- **Insert Topic**
  Inserts a new <topic> element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

- **Insert Reference**
  Inserts a new <reference> element, depending on the current context. A reference is a top-level container for a reference topic.

- **Insert Paragraph**
  Inserts a new paragraph at current cursor position.

- **Reuse Content**
  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 1907) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 1908), content key references (@conkeyref) (on page 1911), or key references to metadata (@keyref) (on page 1914).

- **Insert step or list item**
  Inserts a new list or step item in the current list type.
**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).
Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

- **Edit Attributes**
  
  Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  
  Allows you to change the profiling attributes (on page 414) defined on all selected elements.

- **Cut** (Ctrl + X (Command + X on macOS))
  
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy** (Ctrl + C (Command + C on macOS))
  
  Places a copy of the currently selected content in the clipboard.

- **Paste** (Ctrl + V (Command + V on macOS))
  
  Inserts the current clipboard content into the document at the cursor position.

- **Paste special submenu**

  This submenu includes the following special paste actions that are specific to the DITA framework:

  - **Paste as content reference**
    
    Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

  - **Paste as content key reference**
    
    Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2079). To use this action, you must first do the following:
1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).
Note:
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Image
Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource
Opens a Choose Media dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

Insert Equation
Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

Insert Note
Inserts a new <note> element at the current cursor position.

Insert Code Block
Inserts a new <codeblock> element at current cursor position.

Insert Menu Cascade
Inserts a new <menucascade> element at current cursor position.

Insert Paragraph
Inserts a new <p> (paragraph) element at current cursor position.

Insert Section
Inserts a new <section> element in the document, depending on the current context.

Insert Topic
Inserts a new <topic> element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:
• #<decimal value>- e.g. #65
• &#<decimal value>- e.g. &#65
• #x<hexadecimal value>- e.g. #x41
• &#x<hexadecimal value>- e.g. &#x41

**Style submenu**

This submenu includes the following text styling actions:

**B** Bold

Emphasizes the selected text by surrounding it with a `<b>` (bold) tag. You can use this action on multiple non-contiguous selections.

**I** Italic

Emphasizes the selected text by surrounding it with an `<i>` (italic) tag. You can use this action on multiple non-contiguous selections.

**U** Underline

Emphasizes the selected text by surrounding it with a `<u>` (underline) tag. You can use this action on multiple non-contiguous selections.

**T<sub>** Subscript

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**T<sup>** Superscript

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**{ }** Code

Surrounds the selected text with a `<codeph>` tag.

**UI Control**

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

**../** Filepath

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image**
Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the Other Actions submenu provides access to the other actions):

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference
Opens the **Cross Reference (xref)** dialog box ([on page 1935](#)) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map ([on page 2079](#))** structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics ([on page 1935](#))](#).

### File Reference

Opens the **File Reference** dialog box ([on page 1936](#)) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. For more information, see [Linking in DITA Topics ([on page 1935](#))](#).

### Web Link

Opens the **Web Link** dialog box ([on page 1936](#)) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. For more information, see [Linking in DITA Topics ([on page 1935](#))](#).

### Related Link to Topic

Opens the **Cross Reference (xref)** dialog box ([on page 1936](#)) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics ([on page 1935](#))](#).

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

### Related Link to File

Opens the **File Reference** dialog box ([on page 1937](#)) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics ([on page 1935](#))](#).
Related Link to Web Page

Opens the Web Link dialog box (on page 1937) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:**
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**

  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 1907) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 1908), content key references (@conkeyref) (on page 1911), or key references to metadata (@keyref) (on page 1914).

- **Push Current Element**

  Opens the Push current element dialog box (on page 1917) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 1907).

Replace Reference with Content

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

Replace All References with Content

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

Create Reusable Component
Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the Replace selection with content reference option is selected in the dialog box, the selection will be replaced with a content reference (@conref). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (@conref and @conrefend). For more information, see Creating a Reusable Content Component (on page 1920).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 1921).

**Search References (Ctrl + Shift + G (Command + Shift + G on macOS))**

Finds the references to the @id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2079) (opened in the DITA Maps Manager view (on page 1762)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

**Figure 202. Search References to Ancestors Dialog Box**

Tip: If you are invoking the action on an image, see Searching for References to Images (on page 1841) for details about what will be reported.

**Find Similar Topics**

Opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements. It is helpful for quickly finding related topics that can be added as related links.

**Show Key Definition**

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2079) that contains the definition of the key with the element that defines that key selected.

**About Element submenu**

This submenu includes the following actions:
Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2078).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**
The content marked as deleted with *change tracking (on page 2084)* is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding *Unicode character (on page 272)*. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} will be converted to \texttt{E}
- \texttt{0X0125} to \texttt{ĥ}
- \texttt{265} to \texttt{ɥ}
- \texttt{2190} to \texttt{←}

**Note:** For more information about finding the hexadecimal value of a character, see *Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275)*.

**Refactoring submenu**

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’ (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions
A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert @conrefs to @conkeyrefs**

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).
Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.
Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✔ Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

✔ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.
Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Manage IDs submenu
This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

### Rename in
Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

### Search References
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

### Search References in
Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

### Search Occurrences in file
Searches for the occurrences of the ID in the current document.

### Folding submenu
This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on macOS))
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad- (Command + NumPad- on macOS))
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on macOS))
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on macOS))
  Unfolds all elements in the current document.

### Inspect Styles
Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

### Options
Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.
Floating Contextual Toolbar for DITA

Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 203. DITA Floating Contextual Toolbar

The floating contextual toolbar is automatically displayed when editing DITA documents in various situations, including:

- When a `<p>`, `<li>`, or `<shortdesc>` element has a selection inside, the floating toolbar includes actions such as **Bold**, *Italic*, _Underline_, a Link submenu, and more.
- When an `<image>` or `<xref>` element is selected:
  - If the element has an `@href` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  - If the element has a `@keyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an `<object>` element is selected:
  - If the element has a `@data` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  - If the element has a `@datakeyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.
- When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.
- When a `<ul>` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.
- When an `<ol>` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.
- When an `<li>` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
- When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.
DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project Explorer view (on page 244) or DITA Maps Manager view (on page 1762) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the \texttt{<xref>} DITA element with the \texttt{@href} attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 244) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA \texttt{<image>} element with an \texttt{@href} attribute).

\textbf{Tip:}

For information about customizing Author mode actions for a particular framework (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

Related Information:

Customizing the Author Mode Editing Experience for a Framework (on page 1442)

DITA Map Document Type (Framework)

\textit{DITA maps (on page 2079)} are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. \textit{DITA maps} allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the DITA Authoring (on page 1752) chapter.

File Definition

A file is considered to be a \textit{DITA map} document when one of the following conditions are true:

- The root element name is one of the following: \texttt{<map>}, \texttt{<bookmap>}.  
- The public ID of the document is \texttt{-//OASIS//DTD DITA Map or -//OASIS//DTD DITA BookMap}.  
- The root element of the file has a \texttt{@class} attribute that contains the value \texttt{map/map} and a \texttt{@DITAArchVersion} attribute from the \texttt{http://dita.oasis-open.org/architecture/2005/} namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (on page 80) from the Document Type Association preferences page (on page 79) is selected.
Default Document Templates

There are a variety of default DITA map templates available when creating new documents from templates (on page 228) and they can be found in various folders inside: Framework Templates > DITA Map.

The default templates for DITA map documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside DITA-OT-DIR/dtd/ or DITA-OT-DIR/schema/.

Default CSS

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: [OXYGEN_INSTALL_DIR]/frameworks/dita/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Default XML Catalogs

The default XML Catalogs (on page 2085) for the DITA map document type are as follows:

- [OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml
- DITA-OT-DIR/catalog-dita.xml

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes numerous built-in transformation scenarios that allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 898).

For more information, see the DITA Map Transformation Scenarios (on page 1944) section.

Related Information:

Selecting a Root Map (on page 1778)

DITA Authoring (on page 1752)

Getting Started with DITA (on page 1753)
DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  Opens a New DITA file dialog box (on page 1826) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box (on page 1786) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the Reuse Content dialog box (on page 1907) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box (on page 1786) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box (on page 1786) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  Allows you to change the properties of rows in relationship tables.
Insert Relationship Row
Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column
Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column
Deletes the table column where the cursor is located.

Delete Relationship Row
Deletes the table row where the cursor is located.

Move Up
Moves the selected node up one position on its same level.

Move Down
Moves the selected node down one position on its same level.

Promote
Moves the selected node up one level to the level of its parent node.

Demote
Moves the selected node down one level to the level of its child nodes.

DITA Map Contextual Menu Actions
The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

Edit Properties
Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1797).

Cut (Ctrl + X (Command + X on macOS))
Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))
Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))
Inserts the current clipboard content into the document at the cursor position.

Paste special submenu
This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**
Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

**Paste as content key reference**
Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2079)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the **Context combo box (on page 1766)** points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select **Edit Properties**, and enter a value in the **Keys** field.

**Paste as link**
Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**
Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the **Context combo box (on page 1766)** points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select **Edit Properties**, and enter a value in the **Keys** field.

**Insert submenu**
This submenu includes the following insert actions that are specific to the DITA Map framework:

- **Insert New DITA Resource**
  Opens a New DITA file dialog box (on page 1826) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box (on page 1786) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the Reuse Content dialog box (on page 1907) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box (on page 1786) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box (on page 1786) that allows you to insert a topic group at the cursor position.

- **Insert Entity**
  Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

  - `#<decimal_value>` - e.g. #65
  - `&#<decimal_value>` - e.g. &#65
  - `#x<hexadecimal_value>` - e.g. #x41
  - `&#x<hexadecimal_value>` - e.g. &#x41

- **Relationship Table > Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Generate IDs**
Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:**
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

**Search References**
Finds the references to the @href or @keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 1762)). The current topic/map reference element must have an @href or @keys attribute defined to complete the search.

**Show Key Definition**
Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2079) that contains the definition of the key with the element that defines that key selected.

**Select submenu**
This submenu allows you to select the following:

**Element**
Selects the entire element at the current cursor position.

**Content**
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**
Selects the entire parent element at the current cursor position.

**Text submenu**
This submenu contains the following actions:

**To Lower Case**
Converts the selected content to lower case characters.
To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

• 0x0045 will be converted to E
• 0X0125 to ĥ
• 265 to ũ
• 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with [tag] (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.
Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.
Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

odynamically created

Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.
**Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2084)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the *Review view (on page 410)*.

**Folding submenu**

This submenu includes the following actions:

**Toggle Fold**

Toggles the state of the current fold.

**Collapse Other Folds** *(Ctrl + NumPad/ (Command + NumPad/ on macOS))*

Folds all the elements except the current element.

**Collapse Child Folds** *(Ctrl + NumPad- (Command + NumPad- on macOS))*
Folds the elements indented with one level inside the current element.

**Expand Child Folds** *(Ctrl + NumPad+ (Command + NumPad+ on macOS))*

Unfolds all child elements of the currently selected element.

**Expand All** *(Ctrl + NumPad* (Command + NumPad* on macOS))*

Unfolds all elements in the current document.

**About Element > Go to Definition**

Moves the cursor to the definition of the current element.

**Inspect Styles**

Opens the CSS Inspector view *(on page 386)* that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the Author mode preferences page *(on page 125)* where you can configure various options with regard to the Author editing mode.

**Floating Contextual Toolbar for DITA**

Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The floating contextual toolbar is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).

**DITA Map Drag/Drop Actions**

Dragging a file from the Project Explorer view *(on page 244)* or DITA Maps Manager view *(on page 1762)* and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a `<topicref>`, `<chapter>`, `<part>`, etc.) at the drop location.

**Opening a Topic from a DITA Map in Author Mode**

If a DITA map is open in the Author visual editing mode, you can open a referenced topic by clicking the icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

**Tip:**

For information about customizing Author mode actions for a particular framework *(on page 2080)* (document type), see the Customizing the Author Mode Editing Experience for a Framework *(on page 1442)* section.
XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element is `<html>`.

Default Document Templates

There are a variety of default XHTML templates available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > XHTML.

The default templates for XHTML documents are located in the `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- **XHTML 1.0** - `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/dtd/` or `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/nvdl/`.
- **XHTML 1.1** - `{OXYGEN_INSTALL_DIR}/frameworks/xhtml11/dtd/` or `{OXYGEN_INSTALL_DIR}/frameworks/xhtml11/schema/`.
- **XHTML 5** - `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in Author mode are stored in `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Default XML Catalogs

The default XML Catalogs (on page 2085) for the XHTML document type are as follows:

- `{OXYGEN_INSTALL_DIR}/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/relaxng/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/nvdl/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/xhtml11/dtd/xhtmlcatalog.xml`
Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the XHTML section in the Configure Transformation Scenario(s) dialog box (on page 898).

Related Information:
Editing HTML Documents (on page 614)
Editing XML Documents in Text Mode (on page 280)
Editing XML Documents in Author Mode (on page 339)
Adding Tables in XHTML Documents (on page 455)
XHTML Specifications

XHTML Validation

XHTML documents can be validated in Oxygen XML Author Eclipse plugin using the same validation features as with any other XML document (on page 517). In addition, Oxygen XML Author Eclipse plugin includes a built-in validator engine (W3C XHTML Validator) based upon the W3C Nu HTML Checker that can be used to validate HTML or XHTML documents.

To use the W3C XHTML Validator engine:

1. Create or edit a validation scenario (on page 530) (e.g. select the Configure Validation Scenario(s) from the toolbar).
2. Change the File type column to XML Document and select W3C XHTML Validator in the Validation engine column.
3. Click OK and Apply Associated to run the validation.

Related Information:
W3C Nu HTML Checker
Validating XML Documents (on page 517)

XHTML Author Mode Actions

A variety of actions are available for XHTML documents that can be found in XHTML menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).
XHTML Toolbar Actions

The following default actions are available on the XHTML toolbar when editing in Author mode (by default, they are also available in the XHTML menu and some of them are in various submenus of the contextual menu):

**Bold**
Changes the style of the selected text to **bold** by surrounding it with the `<b>` tag. You can use this action on multiple non-contiguous selections.

**Italic**
Changes the style of the selected text to *italic* by surrounding it with `<i>` tag. You can use this action on multiple non-contiguous selections.

**Underline**
Changes the style of the selected text to *underline* by surrounding it with `<u>` tag. You can use this action on multiple non-contiguous selections.

**Link**
Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the **Browse** drop-down menu.

**Insert Image**
Inserts a graphic object at the cursor position. This is done by inserting an `<img>` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

**Insert Media Resource**
Opens a **Choose Media** dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

**Headings Drop-down Menu**
A drop-down menu that includes actions for inserting `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>` elements.

**Insert Paragraph**
Insert a new paragraph element at current cursor position.

**Insert Equation**
Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations (on page 494).

**Insert List Item**
Inserts a list item in the current list type.
**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert a definition list at the cursor position**

Inserts a definition list (`<dl>` element) with one list item (a `<dt>` child element and a `<dd>` child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element [on page 2077]) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**
Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)
Deletes the table column located at the cursor position or multiple columns in a selection.

Delete Row(s)
Deletes the table row located at the cursor position or multiple rows in a selection.

Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the XHTML menu at the top of the interface):

Edit Attributes
Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.

Edit Profiling Attributes
Allows you to change the profiling attributes (on page 414) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))
Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))
Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))
Inserts the current clipboard content into the document at the cursor position.

Image Map Editor
This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.
This submenu includes the following insert actions:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:**
  
  If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Link**
  
  Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the `Browse` drop-down menu.

- **Insert Image**

  Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**

  Opens a Choose Media dialog box that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Insert Equation**

  Opens the XML Fragment Editor that allows you to insert and edit MathML notations.

- **Insert Paragraph**

  Inserts a new paragraph element at current cursor position.

- **Headings Drop-down Menu**

  A drop-down menu that includes actions for inserting `<h1>`-`<h6>` elements.

- **Insert Entity**
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Style submenu**

This submenu includes the following text styling actions:

**B Bold**

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

**I Italic**

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

**U Underline**

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

**T Subscript**

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**T` Superscript**

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Table actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (*Above* or *Below* the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.
**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  
  Selects the entire element at the current cursor position.

- **Content**
  
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  
  Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

- **To Lower Case**
  
  Converts the selected content to lower case characters.
To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to Е
- 0x0125 to ĥ
- 265 to ü
- 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with ‘[tag]’ (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.
**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  - Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  - Allows you to change an attribute into an element.

- **Delete attribute**
  - Allows you to remove one or more attributes.

- **Rename attribute**
  - Allows you to rename an attribute.

- **Replace in attribute value**
  - Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  - Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  - Allows you to delete elements.

- **Delete element content**
  - Allows you to delete the content of elements.

- **Insert element**
  - Allows you to insert new elements.

- **Rename element**
  - Allows you to rename elements.
Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✔️ Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

✔️ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔✓ Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

❌ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

❌× Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.
Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))
Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project Explorer view (on page 244) and dropping it into an XHTML document that is edited in Author mode, creates a link to the dragged file (the `<a>` element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 244) and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `<img>` element with the `@src` attribute).

Tip:
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

TEI P5 Document Type (Framework)

The TEI (Text Encoding Initiative) document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.
File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is http://www.tei-c.org/ns/1.0.
- The public ID of the document is -//TEI P5.

Default Document Templates

There are a variety of default TEI P5 templates available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > TEI P5.

The default templates for TEI P5 documents are located in the \[OXYGEN_INSTALL_DIR\]/frameworks/tei/templates/TEI P5 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is tei_all.rng and it is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/custom/schema/relaxng/.

Default CSS

The default CSS files used for rendering TEI content in Author mode are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Default XML Catalogs

The default XML Catalogs (on page 2085) for the TEI P5 document type are as follows:

- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/stylesheet/catalog.xml

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the TEI P5 section in the Configure Transformation Scenario(s) dialog box (on page 898).

Adding Tables in TEI Documents (on page 458)

TEI P5 Author Mode Actions

A variety of actions are available for TEI P5 documents that can be found in TEI P5 menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

TEI P5 Toolbar Actions

The following default actions are available on the TEI P5 toolbar when editing in Author mode (by default, they are also available in the TEI P5 menu and some of them are in various submenus of the contextual menu):

**Bold**
Changes the style of the selected text to **bold** by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

**Italic**
Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

**Underline**
Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

**Insert Section**
Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

**Insert Paragraph**
Insert a new paragraph element at current cursor position.

**Insert Image**
Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**
Inserts a list item in the current list type.

**Insert Ordered List**
Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.
Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the TEI P5 menu at the top of the interface):

- **Edit Attributes**
  - Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  - Allows you to change the profiling attributes (on page 414) defined on all selected elements.

- **Cut (Ctrl + X (Command + X on macOS))**
  - Removes the currently selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on macOS))**
  - Places a copy of the currently selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on macOS))**
  - Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions:

- **Insert Table**
  - Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected
content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Image**
Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Paragraph**
Inserts a new paragraph element at current cursor position.

**Insert Section**
Inserts a new section element in the document, depending on the current context.

**Insert Entity**
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Generate IDs**
Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**
The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an **@id** attribute.

**Table actions**
The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.
Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to ĥ
- 265 to ɥ
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  
  Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**
  
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  
  - If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
**Surround with '[tag]'** *(Alt + Shift + ForwardSlash)*

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  
  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  
  Allows you to change an attribute into an element.

- **Delete attribute**
  
  Allows you to remove one or more attributes.

- **Rename attribute**
  
  Allows you to rename an attribute.

- **Replace in attribute value**
  
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

![Track Changes]
Enables or disables the *Track Changes (on page 2084)* support for the current document.

**Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 2084)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

**Accept All Changes**

Accepts all *Tracked Changes (on page 2084)* in the current document.

**Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 2084)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

**Reject All Changes**

Rejects all *Tracked Changes (on page 2084)* in the current document.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2084)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**
  Unfolds all elements in the current document.

About Element >  Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

TEI P5 Drag/Drop Actions

Dragging a file from the Project Explorer view (on page 244) and dropping it into a TEI P5 document that is edited in Author mode, creates a link to the dragged file (the `<ptr>` element with the `@target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a TEI P5 document inserts a graphic element (the `<graphic>` element with the `@url` attribute) at the drop location, similar to the Insert Image toolbar action.
Tip:
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

Customization of TEI Frameworks Using the Latest Sources

The TEI P5 (on page 741) framework (on page 2080) is available as a public project at the following SVN repository: https://github.com/TEIC/oxygen-tei. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.
   This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.
2. Customize the TEI framework in Oxygen XML Author Eclipse plugin.
   a. Set the Oxygen XML Author Eclipse plugin frameworks folder to the oxygen/frameworks subfolder of the folder of the SVN working copy.
      Open the Preferences dialog box (on page 61), go to Global, and set the path of the SVN working copy in the Use custom frameworks option.
   b. Open the Preferences dialog box (on page 61), go to Document Type Association > Locations, and select Custom.
3. Build a JAR (on page 2080) file with the TEI framework.
   The SVN project includes a build.xml file that can be used for building a JAR file using the Ant tool.
   The command that should be used:
   ```
   ant -f build.xml
   ```
4. Distribute the JAR file to the users that need the customized TEI framework.
   The command from the above step creates a file tei.zip in the dist subfolder of the SVN project.
   Each user that needs the customized TEI framework will receive the tei.zip file and will unzip it in the frameworks folder of the Oxygen XML Author Eclipse plugin install folder.

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework (on page 2080) for Oxygen XML Author Eclipse plugin.
1. Go to https://code.google.com/p/oxygen-tei/;
2. Go to Downloads;
3. Download the latest uploaded .zip file;
4. Unpack the .zip file and copy its content in the Oxygen XML Author Eclipse plugin frameworks folder.

**TEI ODD Document Type (Framework)**

The *TEI ODD* (Text Encoding Initiative - One Document Does it all) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.

**File Definition**

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is .odd.
- The document namespace is http://www.tei-c.org/ns/1.0.

**Default Document Templates**

There is a default TEI ODD document template available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > TEI ODD.

The default template is located in the [OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI ODD folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected in the TEI ODD document is tei_odds.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

**Default CSS**

The default CSS files used for rendering TEI ODD content in Author mode are stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

**Default XML Catalogs**

The default XML Catalogs (on page 2085) for the TEI ODD document type are as follows:
Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the TEI ODD section in the Configure Transformation Scenario(s) dialog box (on page 898).

Resources

- Oxygen Video Tutorial: Editing TEI Documents in Author Mode
- TEI: Getting Started with ODD

Related Information:
- Editing XML Documents in Author Mode (on page 339)
- Editing XML Documents in Text Mode (on page 280)

TEI ODD Author Mode Actions

A variety of actions are available for TEI ODD documents that can be found in TEI ODD menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

TEI ODD Toolbar Actions

The following default actions are available on the TEI ODD toolbar when editing in Author mode (by default, they are also available in the TEI ODD menu and some of them are in various submenus of the contextual menu):

- **Bold**
  Changes the style of the selected text to *bold* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *bold*. You can use this action on multiple non-contiguous selections.

- **Italic**
  Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *italic*. You can use this action on multiple non-contiguous selections.

- **Underline**
  Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *ul*. You can use this action on multiple non-contiguous selections.

- **Insert Section**
  Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

- **Insert Paragraph**
Insert a new paragraph element at current cursor position.

**Insert Image**

Inserts an image reference *(on page 464)* at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element *(on page 2077)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that only lists, paragraphs, or inline content can be converted to tables.

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.
**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**TEI Contextual Menu Actions**

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the TEI ODD menu at the top of the interface):

- **Edit Attributes**
  
  Displays an in-place attributes editor (on page 379) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**

  Allows you to change the profiling attributes (on page 414) defined on all selected elements.

- **Cut (Ctrl + X (Command + X on macOS))**

  Removes the currently selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on macOS))**

  Places a copy of the currently selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on macOS))**

  Inserts the current clipboard content into the document at the cursor position.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DocBook framework:

- **Insert Table**
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Image
Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Paragraph
Inserts a new paragraph element at current cursor position.

Insert Section
Inserts a new section element in the document, depending on the current context.

Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. &#65
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. &#x41

Generate IDs
Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Select submenu

This submenu allows you to select the following:
Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

 материалов (Document Types) | 762

- **Toggle Comment**

  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**

  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**

  Moves the current node or selected nodes after the subsequent node.

- **Split Element**

  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**

  Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**

  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• 0x0045 will be converted to Ꞑ
• 0x0125 to Ꞓ
• 265 to ꞌ
• 2190 to ꞇ
• If the **Position cursor between tags** option *(on page 111)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option *(on page 111)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’ (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  
  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  
  Allows you to change an attribute into an element.

- **Delete attribute**
  
  Allows you to remove one or more attributes.

- **Rename attribute**
  
  Allows you to rename an attribute.

- **Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Oxygen XML Author Eclipse Plugin 24.1 | 9 - Built-in XML Frameworks (Document Types) | 765

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✓ Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

✓ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✓ Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

✗ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✗ Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.

✓ Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

✓ Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

✓ Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).
Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**
  Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.
**TEI ODD Drag/Drop Actions**

Dragging a file from the Project Explorer view (on page 244) and dropping it into a TEI ODD document that is edited in Author mode, creates a link to the dragged file (the `<ptr>` element with the `@target` attribute) at the drop location.

---

**Tip:**
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

---

**Related Information:**
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

---

**jTEI Document Type (Framework)**

The jTEI (Journal of the Text Encoding Initiative) document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 framework.

**File Definition**

A file is considered to be a jTEI document when the root element is named `TEI`, it is in the namespace `http://www.tei-c.org/ns/1.0`, and the `@rend` attribute is set to "jTEI".

**Default Document Templates**

There is a default jTEI Article template available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > TEI JTEI.

The default template is located in the `[/OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI jTEI` folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in `[/OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

**Default CSS**

The default CSS file (`jtei.css`) that is used for rendering jTEI in Author mode is stored in `[/OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).
Default XML Catalogs

The default XML Catalogs (on page 2085) for jTEI are as follows:

- \{OXYGEN_INSTALL_DIR\}/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- \{OXYGEN_INSTALL_DIR\}/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- \{OXYGEN_INSTALL_DIR\}/frameworks/tei/xml/tei/stylesheet/catalog.xml

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the TEI JTEI section in the Configure Transformation Scenario(s) dialog box (on page 898).

Resources

- Adding Tables in TEI Documents (on page 458)

JATS Document Type (Framework)

The JATS (NISO Journal Article Tag Suite) document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string \-NLM// DTD.

Default Document Templates

There are some default JATS templates available when creating new documents from templates (on page 228) and they can be found in: Framework Templates > JATSKit - NISO JATS and NLM BITS

The default templates for JATS documents are located in the \{OXYGEN_INSTALL_DIR\}/frameworks/jats/templates/ folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in \{OXYGEN_INSTALL_DIR\}/frameworks/jats/lib/schemas/.
Default CSS

The default CSS files used for rendering JATS content in Author mode are stored in 
\verb|[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/author-css|.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Default XML Catalog

The default XML Catalog (on page 2085), jatskit-catalog.xml, is stored in 
\verb|[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas|.

Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the JATSKit section in the Configure Transformation Scenario(s) dialog box (on page 898).

JATS Author Mode Actions

A variety of actions are available for JATS documents that can be found in JATS menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2078).

JATS Toolbar Actions

The following default actions are available on the JATS toolbar when editing in Author mode (by default, they are also available in the JATS menu and in various submenus of the contextual menu):

- **Paragraph Level Drop-Down Menu**
  - ![Insert Paragraph](Insert a new paragraph element at current cursor position.)
  - ![Insert Unordered List](Insert an unordered list.)
Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Boxed Text**

Inserts or wraps content in a box with a shaded background.

- **Code**

Inserts or wraps content in a `<code>` element.

- **Display Quote**

Inserts or wraps content in a `<disp-quote>` element.

- **Figure**

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

- **Graphic Figure**

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

- **Bold**

Surrounds the selected text with a `<bold>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**

Surrounds the selected text with an `<italic>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**

Surrounds the selected text with an `<underline>` tag. You can use this action on multiple non-contiguous selections.

- **Monospace**

Inserts or wraps content with a `<monospace>` element.

- **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.
You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

- **Insert Row**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Delete Row(s)**
  Deletes the table row located at the cursor position or multiple rows in a selection.

- **Insert Column**
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Delete Column(s)**
  Deletes the table column located at the cursor position or multiple columns in a selection.

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Insert Image**
  Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert MathML**
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

- **Subscript**
Surrounds the selected text with a \textit{subscript} tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

\textbf{Superscript}

Surrounds the selected text with a \textit{superscript} tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

\textbf{JATS Contextual Menu Actions}

The following actions are available in the contextual menu when editing in \textit{Author} mode (most of them are also available in the \textit{JATS} menu at the top of the interface):

\textit{Edit Attributes}

Displays an \textit{in-place attributes editor (on page 379)} that allows you to manage the attributes of an element.

\textit{Edit Profiling Attributes}

Allows you to change the \textit{profiling attributes (on page 414)} defined on all selected elements.

\textit{Cut (Ctrl + X (Command + X on macOS))}

Removes the currently selected content from the document and places it in the clipboard.

\textit{Copy (Ctrl + C (Command + C on macOS))}

Places a copy of the currently selected content in the clipboard.

\textit{Paste (Ctrl + V (Command + V on macOS))}

Inserts the current clipboard content into the document at the cursor position.

\textit{Image Map Editor}

This action is available in the contextual menu when it is invoked on an image. This action applies an \textit{image map} to the current image (if one does not already exist) and opens the \textit{Image Map Editor} dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

\textit{Boxed Text}

Inserts or wraps content in a box with a shaded background.

\textit{Insert submenu}

This submenu includes the following insert actions:

\textit{Figure}

Inserts a \textit{fig} element with a \textit{title} (inside a \textit{caption} element). This action opens a dialog box that allows you to enter the text for the title for the figure.

\textit{Graphic Figure}
Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

**Display Quote**
Inserts or wraps content in a `<disp-quote>` element.

**Insert Paragraph**
Inserts a new `paragraph` element at current cursor position.

**Insert Image**
Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Entity**
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Style submenu**
This submenu includes the following text styling actions:

- **Monospace**
  Inserts or wraps content with a `<monospace>` element.

- **Bold**
  Emphasizes the selected text by surrounding it with a `bold` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with an `italic` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with an `underline` tag. You can use this action on multiple non-contiguous selections.

- **List** > **Insert Unordered List**
Oxygen XML Author Eclipse Plugin 24.1 | 9 - Built-in XML Frameworks (Document Types) | 774

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

List > Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Code

Inserts or wraps content in a `<code>` element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note:
The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0x0125 to ĥ
- 265 to ɥ
- 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 275).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
Joins two adjacent block elements (on page 2077) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 111) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 111) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’ (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**

  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**
Allows you to insert an XML fragment.

**Replace element content with XML fragment**
Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the Track Changes (on page 2084) support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all Tracked Changes (on page 2084) in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all Tracked Changes (on page 2084) in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Highlight**
  Enables the highlighting tool that allows you to mark text in your document.

- **Colors**
  Allows you to select the color for highlighting text.
Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad– (Command + NumPad– on macOS))

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles
Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

**JATS Drag/Drop Actions**

Dragging a file from the Project Explorer view (on page 244) and dropping it into a JATS document that is edited in Author mode, creates a link to the dragged file (the `<ext-link>` element with the `@xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a JATS document inserts an image element (the `<inline-graphic>` element with the `@xlink:href` attribute) at the drop location, similar to the Insert Image toolbar action.

**Tip:**

For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

**Related Information:**

Customizing the Author Mode Editing Experience for a Framework (on page 1442)

**EPUB Document Type (Framework)**

**EPUB** is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. You can view the contents and structure of this type of file (on page 1353) in the Project Explorer view or main editing pane.

Three distinct frameworks (on page 2080) are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

**Note:**

Oxygen XML Author Eclipse plugin supports OPF 2.0, OPF 3.0, and OPF 3.1.
File Definition

A file is considered to be an EPUB document if it has a file extension of .epub.

Default Document Templates

There are a variety of default EPUB templates available when creating new documents from templates (on page 228) and they can be found the following folders in Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1.

- The default templates for the NCX document types are located in the {OXYGEN_INSTALL_DIR}/frameworks/ncx/templates folder.
- The default templates for the OCF document types are located in the {OXYGEN_INSTALL_DIR}/frameworks/ocf/templates folder.
- The default template for the OPF 2.0 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/templates/2.0 folder.
- The default template for the OPF 3.0 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/templates/3.0 folder.
- The default template for the OPF 3.1 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/templates/3.1 folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:

- The default schema files for the NCX document types are located in the {OXYGEN_INSTALL_DIR}/frameworks/ncx/schemas folder.
- The default schema files for the OCF document types are located in the {OXYGEN_INSTALL_DIR}/frameworks/ocf/schemas folder.
- The default schema files for the OPF 2.0 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/schemas/2.0 folder.
- The default schema files for the OPF 3.0 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/schemas/3.0 folder.
- The default schema files for the OPF 3.1 document type is located in the {OXYGEN_INSTALL_DIR}/frameworks/opf/schemas/3.1 folder.

Related Information:

Working with Archive Files (on page 1355)

Other Supported Document Types

Along with the fully supported built-in frameworks (document types) (on page 646), Oxygen XML Author Eclipse plugin also provides limited support (including document templates) for editing a variety of other
document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Author Eclipse plugin include:

- **EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1)** *(on page 780)* - A standard for e-book files.
- **OOXML *(on page 1355)* - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF *(on page 1355)* - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- **DocBook Targetset *(on page 691)* - For resolving cross-references when using olinks.
- **Schematron Quick Fixes (SQF) *(on page 556)* - An extension of the ISO standard Schematron, allows developers to define Quick Fixes *(on page 2083)* for Schematron errors.
- **MathML *(on page 494)* - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- **XLIFF (1.2, 2.0, 2.1) *(on page 608)* - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- **CSS *(on page 604)* - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- **Markdown *(on page 621)* - A lightweight markup language with plain text formatting syntax that can be converted to HTML or DITA.
- **JavaScript *(on page 609)* - Programming language of HTML and the Web.
- **XMLSpec - A markup language for W3C specifications and other technical reports.
- **DITAVAL - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- **Daisy XML** - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- **EAD** - Encoded Archival Description is an XML standard for encoding archival finding aids.
- **KML - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- **Maven Project & Settings** - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- **Oasis XML Catalog** - An XML Catalog *(on page 2085)* document that describes a mapping between external entity references and locally-cached equivalents.
- **Other Non-XML Files *(on page 241)* - Oxygen XML Author Eclipse plugin also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.
10. Additional XML Editing Frameworks (Document Types)

Oxygen XML Author Eclipse plugin supports custom frameworks (document types) contributed by the XML community (for example, the S1000D framework (on page 783)). They provide support for additional functionality and XML vocabularies.

Similar to the built-in frameworks (on page 2080), the additional frameworks may define:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Built-in transformation scenarios used for publishing XML documents.
- XML Catalogs (on page 2085) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in Author mode.

S1000D Document Type (Framework)

S1000D is an international specification for the procurement and production of technical publications (mainly used in aerospace and aviation industries). It is an XML-based specification for preparing, managing, and using equipment maintenance and operations information.

S1000D is articulated based on three main notions:

- **Data Module** - It is an XML file that defines a standalone information unit.

- **Data Module Structure** - It defines how a Data Module is divided:
  - The Identification and Status part that identifies the Data Module within the CSDB structure.
  - The Content part that is the detailed information of the Data Module.

- **Common Source DataBase (CSDB)** - It defines how the Data Modules are arranged inside a publication.

Oxygen XML Author Eclipse plugin does not have default built-in support for S1000D, but a company called Amplexor has developed a framework that can be installed in Oxygen XML Author Eclipse plugin to add support for S1000D documents.

To install the framework in Oxygen XML Author Eclipse plugin, follow these steps:
1. Download or clone the framework on GitHub and install it as an additional framework (on page 80).

2. Download the S1000D specifications package that contains samples and schemas at S1000D Downloads.

3. Copy the XML Schema files from [ZIP]\XML Schema Package\xml_schema_flat into the corresponding version of the xml_schema_flat folder.

If you want more advanced S1000D editing features, you can ask some of our partners.

OpenAPI (Swagger) Document Type (Framework)

The OpenAPI specification is a community-driven open specification that defines a standard, programming language-agnostic interface description for HTTP APIs, which allows both humans and computers to discover and understand the capabilities of a service without requiring access to source code, additional documentation, or inspection of network traffic. Use cases for machine-readable API definition documents include interactive documentation, code generation for documentation, automation of test cases, and more. OpenAPI documents describe an APIs services and are represented in either YAML or JSON formats.

In Oxygen XML Author Eclipse plugin, you can, of course, edit OpenAPI documents in Text mode, but Oxygen XML Author Eclipse plugin also includes a built-in framework that renders OpenAPI (Swagger) documents in the Author visual editing mode. The framework is an extension of the JSON framework. When opening a detected OpenAPI document in Author mode, you will have access to some form controls, collapsible sections, and other features to help you visualize and edit these documents.

Tip:
There is an OpenAPI sample document named petsore.json located in [OXYGEN-INSTALL-DIR]/samples/json/openapi that you can use to see how these documents are rendered in Oxygen XML Author Eclipse plugin.

For more details about the OpenAPI Specification, along with example documents, go to https://github.com/OAI/OpenAPI-Specification.
11. Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end-users. This process is known as a transformation.

Oxygen XML Author Eclipse plugin includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Author Eclipse plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

**Warning:**

Keep in mind that there could be instances where there are differences between what you see in Author mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain complex referencing.

**Transformation Scenarios**

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

**Note:**

You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Author Eclipse plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML
Author Eclipse plugin includes preconfigured built-in transformation scenarios (on page 786), but you can also create new transformation scenarios (on page 816).

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see [XML Transformation with XSLT (on page 817)] and [XML Transformation with XQuery (on page 833)].
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see [XSLT Transformation (on page 862)].
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see [XQuery Transformation (on page 886)].
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see [SQL Transformation (on page 894)].
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see [DITA-OT Transformation (on page 843)].
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see [Ant Transformation (on page 859)].

**Note:**

Status messages generated during the transformation process are displayed in the Console view (on page 277) (the Enable Oxygen consoles option (on page 165) must be selected in the View preferences page (on page 165)).

**Built-in Transformation Scenarios**

Oxygen XML Author Eclipse plugin includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the Configure Transformation Scenario(s) dialog box (on page 898) or Transformation Scenarios view (on page 903). All the built-in document types (frameworks) (on page 2080) that are included in Oxygen XML Author Eclipse plugin have
various transformation scenarios in their specific sections, including the most popular frameworks, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or Transform submenu in the contextual menu of the Project Explorer view (on page 244):

• **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on macOS))** - If you have associated transformation scenarios for the current document, this action will simply apply the association (on page 897) and begin the transformation process. If an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 898) where you can choose the scenarios you want to apply.

• **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS))** - This action will open the Configure Transformation Scenario(s) dialog box (on page 898) where you can choose the scenarios you want to apply.

**Note:**

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an xml-stylesheet processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Author Eclipse plugin prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

**Related Information:**

Creating New Transformation Scenarios (on page 816)

Editing a Transformation Scenario (on page 894)

Configure Transformation Scenario(s) Dialog Box (on page 898)

Applying Associated Transformation Scenarios (on page 897)

Transformation Scenarios View (on page 903)

**DITA Map Transformation Scenarios**

Built-in transformation scenarios allow you to transform DITA maps (on page 2079) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Author Eclipse plugin also includes a special Run DITA-OT Integrator (on page 808) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 898).
A variety of transformations scenarios are available for DITA maps (on page 2079):

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator (on page 808)** - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2026). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.

---

**Important:**
If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

---

**Related Information:**
- Editing a Transformation Scenario (on page 894)
- Configure Transformation Scenario(s) Dialog Box (on page 898)
- Applying Associated Transformation Scenarios (on page 897)
- DITA Topic Transformation Scenarios (on page 1966)

---

**DITA Map WebHelp Responsive Transformation**

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 908) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Author Eclipse plugin also provides numerous possibilities for customizing the WebHelp Responsive output (on page 989).

**WebHelp Responsive Transformation Scenario**

To publish a DITA map (on page 2079) as WebHelp Responsive output, follow these steps:
1. Select the Editor Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 1762) toolbar.

2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.

3. If you want to configure the transformation, click the Edit button.

   **Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates Tab (on page 1969)** - This tab contains a set of built-in publishing templates (on page 950) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 989).
   - **Parameters Tab (on page 1975)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 789) below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - **Feedback Tab (on page 1976)** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
   - **Filters Tab (on page 1977)** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab (on page 1979)** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab (on page 1981)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

### General Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the DITA map. The default value is en-us.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

- **editlink.remote.ditamap.url**
  
  Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be
set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Author Eclipse plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are
considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the @class attribute can be used to exclude specific HTML elements from indexing. For example, the div.not-indexed value will not index all div elements that have a @class attribute with the value of not-indexed. Use a comma separator to specify more than one element.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the <loc> elements in the generated sitemap.xml file. If this parameter is specified, the loc element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the loc element will only contain the relative path of the page (the relative file path from the @href attribute of a <topicref> element from the DITA map, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the <changefreq> element in the generated sitemap.xml file. The <changefreq> element is optional in sitemap.xml. If you leave this parameter set to its default empty value,
then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is `yes`.

**webhelp.enable.html.fragments.cleanup**

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to `true` (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to `false`, the transformation will fail if at least one HTML fragment is not well-formed.

**webhelp.fragment.after.body**

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.main.page**

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.topic.page**
This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

**webhelp.fragment.after.search.input.main.page**

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.topic.page**

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.search.page**

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.terms.page**

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
**webhelp.fragment.after.toc_or_tiles**

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.after.top_menu**

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.body**

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.body.main.page**

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.body.topic.page**

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.body.search.page**

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.body.terms.page**

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.logo_and_title**

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**
This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.topic.page**

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.search.page**

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.terms.page**

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top_menu**

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

⚠️ **Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author Eclipse plugin (do not use it with a trial license).

**webhelp.fragment.head**

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
**webhelp.fragment.head.main.page**

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.topic.page**

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.search.page**

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.terms.page**

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header**

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.main.page**

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.topic.page**

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.search.page**

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.terms.page**
This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area**

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**
This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toolbar**

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toolbar**

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment after the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.content**

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.content**
This parameter can be used to display a given XHTML fragment after the topic’s content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.feedback`

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.feedback`

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.topic.toc`

This parameter can be used to display a given XHTML fragment before the topic’s table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.topic.toc`

This parameter can be used to display a given XHTML fragment after the topic’s table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.custom.search.engine.results`

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

`webhelp.fragment.custom.search.engine.script`

This parameter can be used to replace WebHelp’s built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

`webhelp.merge.nested.topics.related.links`

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

`webhelp.search.stop.words.exclude`

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

`webhelp.show.breadcrumb`

Specifies if the breadcrumb component will be presented in the output. The default value is yes.
**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.index/terms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is **yes**.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to **no**.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is **yes**.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is **yes**.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is **yes**.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is **yes**. The **webhelp.merge.nested.topics.related.links** parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

**webhelp.show.publication.toc**

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is **yes**.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an **@id** attribute and the section corresponding to the current scroll position is highlighted. The default value is **yes**.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is **yes**.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for **chunked** topics. The default value is **yes**.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:
- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.activated.on.click**

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are **collapsed** or **expanded** (default value).

**Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output**

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

**webhelp.pdf.link.url**

Specifies the target URL for the PDF link component.

**webhelp.pdf.link.text**

Specifies the text for the PDF link component.

**webhelp.pdf.link.icon.path**

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.
webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Author Eclipse plugin includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

• Oxygen PDF Chemistry - A built-in processor that is bundled with Oxygen XML Author Eclipse plugin. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.

• Prince Print with CSS (not included in the Oxygen XML Author Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.

• Antenna House Formatter (not included in the Oxygen XML Author Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 1762) toolbar.
2. Select the DITA Map PDF - based on HTML5 & CSS transformation scenario.
3. If you want to configure the transformation, click the Edit button.
**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 1969)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

![Figure 204. DITA Map to PDF Templates](image)

- **Parameters Tab (on page 1975)** - This tab includes numerous parameters that can be set to customize the transformation.
- **Filters Tab (on page 1977)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 1979)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 1981)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the **dita.css.list** parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
- **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry, Prince XML**, or **Antenna House**.
Oxygen XML Author Eclipse Plugin 24.1 | 11 - Publishing | 804

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 172).
- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click OK and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see CSS-based DITA to PDF Customization (on page 1115).

**Related Information:**

**DITA Map PDF - based on XSL-FO Transformation**

Oxygen XML Author Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2079) to PDF output.

**Creating a DITA Map PDF - based on XSL-FO Transformation Scenario**

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the ✗ Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 1762) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (on page 2080) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
show.changes.and.comments - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.

customization.dir - Specifies the path to a customization directory.

directory.present.only.path.to.topic - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

### DITA Map MS Office Word Transformation

Oxygen XML Author Eclipse plugin comes bundled with a transformation scenario that allows you to convert **DITA maps (on page 2079)** to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This plugin contains a Word document named **Normal.docx** (located in: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:**
You can make general modifications to the **Normal.docx** template file to alter the published output.

### Configuring the Transformation Scenario

To configure a **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager (on page 1762)**.
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager (on page 1762)** toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:

   - **dotx.file** - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
   - **core.xsl** - Specifies the path to a core metadata stylesheet.
   - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
   - **document.xsl** - Specifies the path to a main document stylesheet.
   - **comments.xsl** - Specifies the path to a comments stylesheet.
   - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
   - **footnotes.xsl** - Specifies the path to a footnote stylesheet.
5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system’s default word processing application (such as Microsoft Word).

---

**DITA Map Markdown Transformation**

Using the **Configure Transformation Scenarios** toolbar button, you can create a new transformation scenario of the type **DITA-OT transformation** and then choose one of the Markdown-specific output types:

- GitHub-flavored Markdown
- Markdown
- GitBook

More information about the Markdown output types is available in the DITA-OT documentation: [https://www.dita-ot.org/dev/topics/dita2markdown.html](https://www.dita-ot.org/dev/topics/dita2markdown.html).

The generated Markdown content can be used with a static web site generator (such as MKDocs) to build a web site: [https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html](https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html).

---

**DITA Map CHM (Compiled HTML Help) Transformation**

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Author Eclipse plugin needs [Microsoft HTML Help Workshop](https://www.microsoft.com) to be installed on your computer. Oxygen XML Author Eclipse plugin automatically detects if [HTML Help Workshop](https://www.microsoft.com) is installed and uses it.

**Note:**

[HTML Help Workshop](https://www.microsoft.com) might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hhc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using [HTML Help Workshop](https://www.microsoft.com).
Changing the Output Encoding

Oxygen XML Author Eclipse plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Author Eclipse plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**
The format of the `htmlhelp.locale` parameter is `LL-CC`, where LL represents the language code (`en`, for example) and CC represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheets to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to `yes` to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
  - `map2hhcImpl.xsl` - This file is used to compile the table of contents.
  - `map2hhpImpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.
DITA Map Kindle Transformation

Oxygen XML Author Eclipse plugin requires KindleGen to generate Kindle output from DITA maps (on page 2079). To install KindleGen for use by Oxygen XML Author Eclipse plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 1762).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

Run DITA-OT Integrator Transformation

Oxygen XML Author Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2082). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 898).

⚠️ Attention:
The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 73).

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Author Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 898) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 903)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 897).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Author Eclipse plugin with your normal permissions.

Installing a DITA-OT Plugin (on page 2026)
Integrating a DITA Specialization (on page 2038)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 1806) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 1762) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 843).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 308) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - **Informational** - The transformation encountered a condition of which you should be aware.
     - **Warning** - The transformation encountered a problem that should be corrected.
     - **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - Click the See More icon to open a web page that contains more details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Troubleshooting DITA Transformation Problems (on page 1989)

DITA Topic Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 898).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xs:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS (on page 1161) or publishing template (on page 1130) that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected context DITA map (root map) (on page 1766) so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set (on page 2004) to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).

The transformation scenario also supports a parameter named args.enable.root.map.key.processing that can be used to specify whether or not the values for @keyref and @conkeyref attributes within the transformed topics are resolved. The possible values are:

- **no** - This means that the values for all @keyref and @conkeyref attributes are ignored in the transformation. This results in lower processing times.
- **yes** - This means that the values for any @keyref and @conkeyref attributes found in the transformed topic are processed and resolved using the value of the args.root.map parameter.
• **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.

• **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

---

**DocBook Transformation Scenarios**

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Author Eclipse plugin also includes a DocBook 5.1 transformation scenario for Assembly documents. All of them are listed in the DocBook 4 and DocBook 5 sections in the Configure Transformation Scenario(s) dialog box *(on page 898)*.

**DocBook to WebHelp Classic Transformation**

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The WebHelp Classic layout and features *(on page 1081)* are designed for desktop systems and include a familiar classical style. Oxygen XML Author Eclipse plugin also provides numerous possibilities for customizing the WebHelp Classic output *(on page 1088)*.

**WebHelp Classic Transformation Scenario**

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click **Apply associated**.

**Result:** When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.
Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**l10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.copyright**

Adds a small copyright text that appears at the end of the Table of Contents pane.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `<div>` or `<span>` element, and the code for each `<script>` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    !-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
  </script>
</div>
```
webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note:

You can deploy documentation for multiple products on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ ' ( ). { } = ; * % + & .

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note:

Multiple documentation versions can be deployed on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ ' ( ). { } = ; * % + & .

webhelp.search.ranking
If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in CSS from the \OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Deploying the Oxygen Feedback Comments Component for DocBook (on page 1087)

DocBook to DITA Transformation

Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on macOS)) action from the toolbar or the XML menu.
   - To customize the transformation or change the scenario that is associated with the document, use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.
2. Select the DocBook to DITA transformation scenario in the DocBook 4 or DocBook 5 section.
3. Click the Apply associated button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.
DocBook to PDF Transformation

Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   ◦ To apply the transformation scenario to a newly opened file, use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on macOS)) action from the toolbar or the XML menu.
   ◦ To customize the transformation or change the scenario that is associated with the document, use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.
2. Select the DocBook PDF transformation scenario in the DocBook 4 or DocBook 5 section.
3. Click the Apply associated button to run the transformation.

For information about customizing the PDF output for DocBook content, see DocBook to PDF Output Customization (on page 1344).

DocBook to EPUB Transformation

Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```css
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```
2. In the CSS, specify where this font is used. To set it as default for `<h1>` elements, use the `font-family` rule, as in the following example:

   h1 {
     font-size: 20pt;
     margin-bottom: 20px;
     font-weight: bold;
     font-family: "MyFont";
     text-align: center;
   }

3. Open the Configure Transformation Scenario(s) dialog box (on page 898), select the DocBook EPUB transformation scenario in the DocBook 4 or DocBook 5 section, and click Edit.

4. In the Parameters tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   Note:
The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

**DocBook PDF (Show Change Tracking and Comments)**

Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and tracked changes (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the Configure Transformation Scenario(s) button.
2. Select DocBook PDF (Show Change Tracking and Comments) in the DocBook 5 section.
3. If you need to configure the transformation, click the Edit (on page 894) or Duplicate (on page 896) button, make your changes to the scenario, and click OK.
4. Click the Apply Associated button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

**Creating New Transformation Scenarios**

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Author Eclipse plugin and how to create each type of transformation.
XML Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an XML transformation with XSLT scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XSLT.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 903). Click the New Scenario drop-down menu button and select XML transformation with XSLT.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the *Browse* drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 193), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 818) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 832). Otherwise, a value is mandatory in this field.

**XSL URL**
Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use "xml-stylesheet" declaration**

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 183). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 821) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 191). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens a Configure parameters dialog box (on page 819) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 818). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 820) that define extension Java functions or extension XSLT elements used in the transformation.

**Additional XSLT stylesheets**

Opens a dialog box for adding XSLT stylesheets (on page 820) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.
XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 820), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```xml
<doc>'test.xml'</doc>//entry
//person[@atr='val']
```

Note:

1. The `<doc>` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 199) (such as `${cfdu} [current file directory]`) to specify other locations: `doc('${cfdu}/test.xml')/*/`

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 199) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 199) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.
Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:
Editor Variables (on page 199)

XSLT Extensions

The Extensions button opens a dialog box that allows you to specify the JARS (on page 2080) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

Tip:
You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 199) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up

Moves the selected stylesheet up in the list.

Down
Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 191) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Mode** ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 821), the value in this option takes precedence.

**Template** ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 821), the value in this option takes precedence.

Tip:

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Author Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

**Use a configuration file** ("-config")

Select this option if you want to use a Saxon 10.6 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Enable Optimizations** ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Line numbering** ("-l")

Line numbers where errors occur are included in the output messages.
Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

• **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
• **Off** - (default setting) Suppresses DTD validation.
• **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**
Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

• **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
• **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
• **None** ("none") - Strips no whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 10.6 processors.
Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 10.6 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 61) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 179).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**
Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[]{SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {  
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
```
2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:
To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Author Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 85).
- In a validation scenario (on page 531), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 818) to open a dialog box where you can add libraries.

### FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:
• **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
• **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an **external processor (on page 168)**.

**Output Tab (XSLT Transformations)**

When you **create a new transformation scenario (on page 816)** or **edit an existing one (on page 894)**, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **.Insert Editor Variables (on page 199)** button, or the **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

---

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.
• **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Author Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 161).

• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Author Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.
Attention:

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Oxygen XML Author Eclipse plugin Browser View

The Oxygen XML Author Eclipse plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

![Browser View](image)

Oxygen XML Author Eclipse plugin Text View

The Oxygen XML Author Eclipse plugin Text view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

![Text View](image)

Text View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:
**Clear**

Removes all content from the view.

**Copy**

Copies the selected content to the clipboard.

**Select All**

Selects all content in the view.

**Format and Indent**

Formats *(pretty-prints (on page 2082))* the content in this view.

**Find/Replace**

Allows you to perform search and replace operations.

**Save Results**

Saves the content in the view to a file in text format.

---

**Configuring an XSLT Processor for Generating Output**

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author Eclipse plugin.

**Supported XSLT Processors**

Oxygen XML Author Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2 - Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5 - Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 10.6 Home Edition (HE), Professional Edition (PE) - Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 10.6 Enterprise Edition (EE) - Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences *(on page 179)*.
Oxygen XML Author Eclipse plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

Note:
Oxygen XML Author Eclipse plugin can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Author Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author Eclipse plugin.

Tip:
As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environmental variable and add the bin folder for all four archives.
4. Restart Oxygen XML Author Eclipse plugin.

**Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:**
The `xsltproc` processor can be configured from the **XSLTPROC** options page (on page 194).

**CAUTION:**
There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2085) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

• **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 816).

Oxygen XML Author Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

• **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 816).
Oxygen XML Author Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• .NET 1.0 (Legacy) - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• .NET 2.0 (Legacy) - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

Configuring Custom XSLT Processors

Oxygen XML Author Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to XML > XSLT-XQuery > Custom Engines.
2. Click the + New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 183).
4. Click OK.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author Eclipse plugin linked message (on page 528), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Saxon 6.5.5** - [http://saxon.sourceforge.net/saxon6.5.5/extensions.html](http://saxon.sourceforge.net/saxon6.5.5/extensions.html)

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 818) in the **Edit scenario** dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the **New** button and select XML transformation with XQuery.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 903). Click the ![+] New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
XQuery Tab

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 193), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 183). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 836) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 191). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (on page 835) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual
menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 836) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
<entry>
  //person[@atr='val']
</entry>
```

**Note:**

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 199) (such as `$cfdu` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')` for all locations.
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable (on page 199) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable (on page 199) can be inserted in the text box using the **Insert Editor Variables** button.
button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

Editor Variables *(on page 199)*

**XQuery Extensions**

The Extensions button is used to specify the JAR *(on page 2080)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the ↑ Move up or ↓ Move down buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file ("-config")**
  
  Sets a Saxon 10.6 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations ("-opt")**
This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignore")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.

**Enable profiling ("-TP")**

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**

The profiling support works only if the [Present as a sequence transformation option](#) (on page 839) is not set.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 10.6 Enterprise Edition (EE) are as follows:
Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.
FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 168).

Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.}
Open in Browser/System Application

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note:
To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 161).
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Author Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:
When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.
• Image URLs are relative to - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ✂ Insert Editor Variables (on page 199) button, or the ⌂ Browse button.

XML to PDF Transformation with CSS

This type of transformation uses the Oxygen PDF Chemistry processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an XML to PDF transformation with CSS scenario, use one of the following methods:

• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XML to PDF transformation with CSS.
• Go to Window > Show View and select Transformation Scenarios to display this view (on page 903). Click the ✂ New Scenario drop-down menu button and select XML to PDF transformation with CSS.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the Oxygen PDF Chemistry processing engine and numerous tips for customizing the output, see the Oxygen Chemistry User Guide.

CSS Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the ✂ Insert Editor Variables (on page 199) button, or the browsing actions in the ⌂ Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

CSS URL
Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

**Apply CSS stylesheets set in the current framework**

If selected, CSS stylesheets that are specified in the framework (in the Document Type configuration CSS subtab (on page 87)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the CSS URL field (on page 841).

**Note:**

If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the Document Type configuration CSS subtab (on page 87)).
- CSS files referenced directly in the document.
- CSS files specified in the CSS URL field (on page 841).

**Processor options link**

Opens the CSS-based Processors preferences page (on page 172) where you can configure some options for generating PDF output.

**Output Tab (XML to PDF Transformation with CSS)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Output File section**

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).
Debugging section

**Dump the intermediate annotated XML**
Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

**Dump the FO file**
Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

**Console options link**
Opens the [CSS-based Processors preferences page](on page 172) where you can configure some options for generating PDF output.

**DITA-OT Transformation**
This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA-OT Transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the New button and select **DITA-OT Transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view (on page 903). Click the **New Scenario** drop-down menu button and select **DITA-OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

**Figure 207. DITA Transformation Type Dialog Box**
Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Skins Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA-OT transformations with the **WebHelp Classic** output type and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

**Figure 208. Skins Tab**

The **Skins** tab includes the following sections:

**Built-in Skins**

This section presents the built-in skins that are included in Oxygen XML Author Eclipse plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation
project that is stored on the Oxygen XML Author Eclipse plugin website, click the Online preview link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

![Note:]

The output can also be styled by setting the `args.css` parameter in the Parameters tab. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.

**Create custom skin**

Use this link to open the [WebHelp Skin Builder (on page 1089)](on page 1089) tool.

**Templates Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 950). You can use one of them to publish your documentation or as a starting point for a new publishing template.
Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Author Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Author Eclipse plugin scans the locations specified in the DITA > Publishing preferences page (on page 77) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.
Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 991) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 77) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1138). Clicking this button will open a template package configuration dialog box (on page 1972) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Warning Icon]

Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 77) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1138). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**
Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**
Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**
This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**
Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map).
WebHelp Responsive (on page 788) or DITA Map to PDF - based on HTML5 & CSS (on page 802)). This option specifies that the custom template will include a WebHelp Responsive customization.

Include HTML Page Layout Files

For WebHelp Responsive customizations, select this option if you want to copy the default HTML Page Layout Files (on page 969) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (on page 788) or DITA Map to PDF - based on HTML5 & CSS (on page 802)). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

Figure 210. Template Package Configuration Dialog Box
FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA-OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Author Eclipse plugin.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Author Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:
• XEP was configured as an external FO Processor in the FO Processors option page (on page 168).
• The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
• XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Author Eclipse plugin installation directory.

Antenna House

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

• Environment variable set by Antenna House installation (the newest installation version will be used).
• Antenna House was added as an external FO Processor in the Oxygen XML Author Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. Edit the transformation scenario.
2. Open the Parameters tab (on page 1975).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

FO Processors Preferences (on page 168)
XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 877)

Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:
• A simple text field for simple parameter values.
• A combo box with some predefined values.
• A file chooser and an editor variable (on page 199) selector to simplify setting a file path as the value of a parameter.

**Note:**
To input parameter values at runtime, use the ask editor variable (on page 200) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the 📋 Insert Editor Variables (on page 199) button or the ⚥ Browse button.

**Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**
Transformation parameters that are defined in an Oxygen Publishing Template (on page 1130) descriptor file are displayed in italics. After creating a publishing template (on page 1138) and adding it to the templates gallery (on page 991), when you select the template in the Templates tab (on page 1969), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**
DITA Open Toolkit Documentation

**Feedback Tab (DITA-OT Transformations)**
When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use **Oxygen Feedback** to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback** administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an **Oxygen Publishing Template (on page 1130)**, either as an HTML fragment extension point (on page 960) or as a transformation parameter (on page 959) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

### Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.
Figure 212. Edit Filters Tab

You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2079), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

**Note:**

If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 1975)), the filters are combined (neither file takes precedence over the other).

**Use profiling condition set**

Sets the profiling condition set (on page 2004) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.
Note:
The colors and styles of the profiled content (on page 2010) settings are used for rendering it in Author mode but are not applied in the output.

Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

Figure 213. Advanced Settings Tab

You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Author Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected,
other options (Custom build file, Build target, Ant Home) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**
Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the Parameters tab, the transformation is started as an ANT process instead of using the executable.

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (on page 1975) is used. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse button.](

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as `-diagnostics`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author Eclipse plugin.

**Note:**
It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default the application will use a maximum of 512 megabytes when used with the 32-bit Java Virtual Machine and one gigabyte with the 64-bit Java Virtual Machine.
Libraries

By default, Oxygen XML Author Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2080) files or additional class paths) to be used by the transformer.

Tip:
You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

Figure 214. Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.

**Note:**

If the [DITA map](on page 2079) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ![Insert Editor Variables](on page 199) button, or the ![Browse](button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML
file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Ant Transformation**

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Author Eclipse plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant (on page 2077)* version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

**Tip:**

Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the **Output** tab, click the **Libraries** button (on page 859) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see [https://ant.apache.org/manual/install.html#librarydependencies](https://ant.apache.org/manual/install.html#librarydependencies).

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the **XML** menu. Then click the **New** button and select **ANT transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view (on page 903). Click the **New Scenario** drop-down menu button and select **ANT transformation**.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Options Tab (Ant Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

**Working directory**

The path of the current directory of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.

**Build file**
The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as -diagnostics).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author Eclipse plugin.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to -Xmx2g, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an -Xmx value in this field, by default the application will use a maximum of 512 megabytes when used with the 32-bit Java Virtual Machine and one gigabyte with the 64-bit Java Virtual Machine.

**Libraries**

By default, Oxygen XML Author Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2080) files or additional class paths) to be used by the transformer.

Tip:

You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

**Parameters Tab (Ant Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.
The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 199) selector to simplify setting a file path as the value of a parameter.

**Note:**
To input parameter values at runtime, use the ask editor variable (on page 200) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 199) button or the Browse button.

**Edit**
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

### Output Tab (Ant Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Open**
Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.
• **In System Application** - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).

• **In Editor** - The file specified in the Open text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

**Show console output**

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

• **When build fails** - Displays the console output log only if the build fails.

• **Always** - Displays the console output log, regardless of whether or not the build fails.

**XSLT Transformation**

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an XSLT transformation scenario, use one of the following methods:

• Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS))** action from the toolbar or the XML menu. Then click the **New** button and select **XSLT transformation**.

• Go to **Window > Show View** and select **Transformation Scenarios** to display this view (on page 903). Click the **New Scenario** drop-down menu button and select **XSLT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XSLT Tab**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 199) button, or the browsing actions in the
Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:
If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 193), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 863) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 832). Otherwise, a value is mandatory in this field.

XSL URL
Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration
If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XML URL field.

Transformer
This drop-down menu presents all the transformation engines available to Oxygen XML Author Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 183). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options
Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 821) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 191). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters
Opens a Configure parameters dialog box (on page 819) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 864). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions.
and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 820) that define extension Java functions or extension XSLT elements used in the transformation.

**Additional XSLT stylesheets**

Opens a dialog box for adding XSLT stylesheets (on page 820) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

**XSLT Parameters**

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 820), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```
doc('test.xml')/entry
//person[@atr='val']
```

**Note:**

1. The doc function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 199) (such as \${cfdu} [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')/*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 199) can be inserted in the text box using the \( \text{Insert Editor Variables} \)
button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An **editor variable (on page 199)** can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

**Editor Variables (on page 199)**

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the **JARS (on page 2080)** and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add, Edit, and Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **Move up** or **Move down** buttons.

**Additional XSLT Stylesheets**

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:
Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an editor variable (on page 199) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

### Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 191) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

### Saxon-HE/PE/EE Options

The advanced options for Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Mode ("-im")**
  
  A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 866), the value in this option takes precedence.

- **Template ("-it")**
  
  A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 866), the value in this option takes precedence.

**Tip:**

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Author Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

- **Use a configuration file ("-config")**
  
  Select this option if you want to use a Saxon 10.6 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration
Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-I")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note:

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all `ignorable` whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long
as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 10.6 processors.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using [http://[URL]]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The advanced options that are specific for Saxon 10.6 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 61) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 179).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.
Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

   ```java
target static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }
}
```
```java
@Override
public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
}

@Override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:
To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Author Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 85).
- In a validation scenario (on page 531), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 818) to open a dialog box where you can add libraries.

**FO Processor Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor *(on page 168)*.

---

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario *(on page 816)* or edit an existing one *(on page 894)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📁. **Insert Editor Variables** *(on page 199)* button, or the 🗄 **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

---

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.
• **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Author Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 161).

• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Author Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** (on page 199) button, or the **Browse** button.
Attention:
If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author Eclipse plugin.

Supported XSLT Processors

Oxygen XML Author Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2 - Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5 - Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 10.6 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 10.6 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 179).

**Note:**
Oxygen XML Author Eclipse plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:**
Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the
Oxygen XML Author Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author Eclipse plugin.

**Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Author Eclipse plugin uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

**Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the bin folder for all four archives.
4. Restart Oxygen XML Author Eclipse plugin.

**Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:**
The Xsltproc processor can be configured from the XSLTPROC options page (on page 194).

**CAUTION:**
There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the `OXYGEN_INSTALL_DIR/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 816).

  Oxygen XML Author Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

  Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 816).
Oxygen XML Author Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 1.0 (Legacy)** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

  You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

  You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 2.0 (Legacy)** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

  You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

  You can get the .NET Framework version 2.0 from the Microsoft website.

### Configuring Custom XSLT Processors

Oxygen XML Author Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box *(on page 61)* and go to XML > XSLT-XQuery > Custom Engines.
2. Click the + New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine *(on page 183).*
4. Click OK.

**Note:**

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author Eclipse plugin linked message *(on page 528)*, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- Saxon 10.6 - http://www.saxonica.com/documentation9.5/index.html#extensibility

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 818) in the Edit scenario dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Author Eclipse plugin installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (on page 168).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (on page 878).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

   ```xml
   <fop version="1.0">
   <renderers>
   ```
b. Open the Preferences dialog box *(on page 61)*, go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters *(on page 817)* and set the font name (for example, Arial Unicode MS) to the body.font.family and title.font.family parameters.
- For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters *(on page 817)* and set the font name (for example, Arial Unicode MS) to the bodyFont and sansFont parameters.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
  - DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml - The `<font-face>` element included in each `<physical-font>` element that has the charset="default" attribute must contain the name of the font (for example, Arial Unicode MS)
  - DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf - An `<auto-detect>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the mime="application/pdf" attribute:

```
<renderer mime="application/pdf">
  ...
  <fonts>
    <auto-detect/>
  </fonts>
  ...
</renderer>
```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.
Important:
On Windows, fonts are located into the `C:\Windows\Fonts` directory. On macOS, they are placed in `/Library/Fonts`. To install a new font on your system, it is enough to copy it in the `Fonts` directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP *(on page 877)*.

1. Locate the font.

   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

   **Note:**
   DITA PDF transformations have their own `fop.xconf` *(`DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`)*. If the font is not installed in the system, it needs to be referenced in the `fop.xconf`.

   a. For information about registering the font in the FOP Configuration, see: https://xmlgraphics.apache.org/fop/2.3/fonts.html.
   b. Open the Preferences dialog box *(on page 61)*, go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content.

   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   **DocBook Example:** For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters *(on page 817)*, and set the font name (for example, Arialuni) to the `body.font.family` and `title.font.family` parameters.

   **TEI Example:** For TEI documents, you can start with the built-in scenario called TEI PDF, edit the XSLT parameters *(on page 817)*, and set the font name (for example, Arialuni) to the `bodyFont` and `sansFont` parameters.

   **DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:
   - `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font.
   - `DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - A `<font>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute.

   For more information, see: https://xmlgraphics.apache.org/fop/2.1/fonts.html.
Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Author Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older versions of Oxygen XML Author Eclipse plugin, use the following procedures to enable such support.

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Author Eclipse plugin, follow this procedure:

1. Create a folder called \fop\ in the \{OXYGEN_INSTALL_DIR\}/lib folder.
2. Download the compiled JAR (on page 2080) from OFFO.
3. Copy the \fop-hyph.jar\ file into the \{OXYGEN_INSTALL_DIR\}/lib/fop folder.
4. Restart Oxygen XML Author Eclipse plugin.

Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Author Eclipse plugin, follow these steps:

1. Create a folder called \fop\ in the \{OXYGEN_INSTALL_DIR\}/lib folder.
2. Download the \fop-pdf-images\ JAR libraries.
3. Copy the libraries into the \{OXYGEN_INSTALL_DIR\}/lib/fop folder.
4. Restart Oxygen XML Author Eclipse plugin.

How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: \{OXYGEN_INSTALL_DIR\}/tools/config/logback.xml.

   \textbf{Note:}\n   You need write access to this folder, so if you do not have administrator permissions, you might first need to copy the file to another location where you have write access.

   2. Edit the \texttt{<root>} element (inside the \texttt{<configurations>} element), change its level to \texttt{debug}, and save the file.
   3. Restart Oxygen XML Author Eclipse plugin and re-run the transformation.
Tip:
To make it easier to analyze the data in the logs, it is recommended that you use a small input file when trying to reproduce the problem.

4. Once you are finished with the debugging session, remember to edit the logback.xml file and change the `<root>` element back to its original value. Otherwise, performance could be affected.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an XProc transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XProc transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 903). Click the New Scenario drop-down menu button and select XProc transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:
Integrating an External XProc Engine (on page 885)

XProc Tab

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

XProc URL

Specify the source XProc file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor
Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (on page 181).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:

- **New**
  - Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (on page 199) and custom editor variables (on page 208) can be used to specify the URL.

- **Edit**
  - Opens an Edit dialog box that allows you to modify the selected port and its URL. The built-in editor variables (on page 199) and custom editor variables (on page 208) can be used to specify the URL.

- **Delete**
  - Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

- **List of Ports**
  - In this section, you can use the New and Delete buttons to add or remove ports.

- **List of Parameters**
  - This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in
the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

**Editor Variable Information**

The built-in editor variables ([on page 199](#)) and custom editor variables ([on page 208](#)) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

**Outputs Tab (XProc Transformations)**

When you create a new transformation scenario ([on page 816](#)) or edit an existing one ([on page 894](#)), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

- **New**
  - Opens an **Edit** dialog box that allows you to add a new output port and its URL. An editor variable ([on page 199](#)) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view ([on page 308](#)).**

- **Edit**
  - Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An editor variable ([on page 199](#)) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view ([on page 308](#)).**

- **Delete**
  - Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

- **Open in Editor**
  - If this option is selected, the XProc transformation result is automatically opened in an editor panel.

- **Open in Browser/System Application**
  - If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can
specify the path by using the text field, its history drop-down, the \textit{Insert Editor Variables} (on page 199) button, or the browsing actions in the \textit{Browse} drop-down list.

\textbf{Results}

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

\textbf{Figure 215. XProc Transformation Results View}

\textbf{Options Tab (XProc Transformations)}

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The \textit{Options} tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

\textit{List of Options}

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the \textit{Filter} text box to search for a specific term in the entire options collection. You can use the \textit{New} and \textit{Delete} buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

\textit{Editor Variable Information}

The built-in editor variables (on page 199) and custom editor variables (on page 208) can be used for specifying the URI. This section provides more information about the editor variables that can be used.
Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

2. Uncomment the `system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/` system property.
3. Uncomment the `system-property name="com.renderx.xep.CONFIG" file="../tools/xep/xep.xml"/` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Author Eclipse plugin.

Integrating an External XProc Engine

Oxygen XML Author Eclipse plugin includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a Processor drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the XProc preferences page (on page 181). Otherwise, if the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Author Eclipse plugin: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: xprocAPI.zip.

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a Java archive (JAR) (on page 2080) from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `<engine>` element are as follows:
   a. `name` - The name of the XProc engine.
   b. `description` - A short description of the XProc engine.
   c. `class` - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
   d. `version` - The version of the integration.
   e. `engineVersion` - The version of the integrated engine.
f. **vendor** - The name of the vendor / implementer.

g. **supportsValidation** - **true** if the engine supports validation (otherwise, **false**).

The `<engine>` element has only one child, `<runtime>`. The `<runtime>` element contains several `<library>` elements with the `@name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named **MyXprocEngine**) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.

6. Place that new folder (e.g. **MyXprocEngine**) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (e.g. **MyXprocEngine**). The `plugin.xml` file would look like this:

```xml
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
  description="Contribute Morgana XProc"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension
    type="AdditionalXProcEngine" path="MyXprocEngine/"/>
</plugin>
```

**Related Information:**

**Creating an XProc Transformation Scenario (on page 881)**

**XQuery Transformation**

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:**

When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the ✨Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the **New** button and select **XQuery transformation**.

- Go to Window > Show View and select ✨Transformation Scenarios to display this view (on page 903). Click the ✨**New Scenario** drop-down menu button and select **XQuery transformation**.
Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario *(on page 816)* or edit an existing one *(on page 894)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

- **XML URL**
  
  Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 199)* button, or the browsing actions in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

  **Note:**
  
  If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the **advanced Saxon preferences page** *(on page 193)*, the XML input of the transformation is passed to that URI resolver.

- **XQuery URL**
  
  Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(on page 199)* button, or the browsing actions in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

- **Transformer**
  
  This drop-down menu presents all the transformation engines available to Oxygen XML Author Eclipse plugin for performing a transformation. These include the built-in engines and the **external engines defined in the Custom Engines preferences page** *(on page 183)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

- **Advanced options**
  
  Allows you to configure the **advanced options of the Saxon HE/PE/EE engine** *(on page 836)* for the current transformation scenario. To configure the same options globally, go to the **Saxon-**
HE/PE/EE preferences page (on page 191). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens the Configure parameters dialog box (on page 835) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you cannot use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 836) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```xml
<doc>('test.xml')//entry
//person[@atr='val']
```

Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 199) (such as `${cfdu}` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New
Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable ([on page 199](#)) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable ([on page 199](#)) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

Editor Variables ([on page 199](#))

**XQuery Extensions**

The **Extensions** button is used to specify the JAR ([on page 2080](#)) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **Move up** or **Move down** buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.
Saxon-HE/PE/EE Options

The advanced options for Saxon 10.6 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 10.6 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:
The profiling support works only if the Present as a sequence transformation option (on page 839) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 10.6 Professional Edition (PE) and Enterprise Edition (EE) only:
Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 10.6 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration.
programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

- **Perform FO Processing**
  - Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

- **Input**
  - Choose between the following options to specify which input file to use:
    - XQuery result as input - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
    - XML URL as input - The FO processor is applied to the input XML file.

- **Method**
  - The output format of the FO processing. The available options depend on the selected processor type.

- **Processor**
  - Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 168).

**Output Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

- **Present as a sequence**
  - Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

- **Prompt for file**
  - At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the \Insert Editor Variables (on page 199) button, or the \Browse button.

Open in Browser/System Application

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- Output file - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- Other location - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the \Insert Editor Variables (on page 199) button, or the \Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- XML - If this is selected, Oxygen XML Author Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 161).
- XHTML - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Author Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-
in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**SQL Transformation**

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an SQL transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select SQL transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 903). Click the New Scenario drop-down menu button and select SQL transformation.

Both methods open the New Scenario dialog box. This dialog box allows you to configure the following options that control the transformation:

**Name**

The unique name of the SQL transformation scenario.

**SQL URL**

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

**Connection**

Allows you to select a connection from a drop-down list. To configure a connection, use the Advanced options button to open the Data Source preferences page (on page 65).

**Parameters**

Allows you to add or configure parameters for the transformation.

**Editing a Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.
To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 898) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Tip:** You could also select the scenario and the Edit button in the Transformation Scenarios view (on page 903) to achieve the same result.

   **Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

   **Figure 216. Edit Scenarios Configuration Dialog Box**

   ![Edit DITA Scenario](image)

**Transformation Types**

The Configure Transformation Scenario(s) dialog box (on page 898) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):
DITA-OT - This type of transformation includes configurable options in the following tabs:
  ◦ Templates Tab (on page 1969)
  ◦ FO Processor Tab (on page 1974) (Available for PDF output)
  ◦ Parameters Tab (on page 1975)
  ◦ Filters Tab (on page 1977)
  ◦ Advanced Tab (on page 1979)
  ◦ Output Tab (on page 1981)

ANT - This type of transformation includes configurable options in the following tabs:
  ◦ Options Tab (on page 859)
  ◦ Parameters Tab (on page 860)
  ◦ Output Tab (on page 861)

XSLT - This type of transformation includes configurable options in the following tabs:
  ◦ XSLT Tab (on page 817)
  ◦ FO Processor Tab (on page 825)
  ◦ Output Tab (on page 826)

XProc - This type of transformation includes configurable options in the following tabs:
  ◦ XProc Tab (on page 881)
  ◦ Inputs Tab (on page 882)
  ◦ Parameters Tab (on page 882)
  ◦ Outputs Tab (on page 883)
  ◦ Options Tab (on page 884)

XQuery - This type of transformation includes configurable options in the following tabs:
  ◦ XQuery Tab (on page 834)
  ◦ FO Processor Tab (on page 839)
  ◦ Output Tab (on page 839)

Related Information:
Creating New Transformation Scenarios (on page 816)
Duplicating a Transformation Scenario (on page 896)
Configure Transformation Scenario(s) Dialog Box (on page 898)
Applying Associated Transformation Scenarios (on page 897)

Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:
1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.

**Step Result:** The Configure Transformation Scenario(s) dialog box (on page 898) is opened.

2. Select the particular transformation scenario and click the Duplicate button at the bottom of the dialog box or from the contextual menu.

**Tip:**

You could also select the scenario and the Duplicate button in the Transformation Scenarios view (on page 903) to achieve the same result.

**Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 895).

**Related Information:**

Creating New Transformation Scenarios (on page 816)

Editing a Transformation Scenario (on page 894)

**Applying Associated Transformation Scenarios**

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (on page 898) or Transformation Scenarios view (on page 903)), Oxygen XML Author Eclipse plugin included an Apply Transformation Scenario(s) action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 898) where you can choose the scenarios you want to apply.

The Apply Transformation Scenario(s) action can be initiated from any of the following methods:

- Use the Alt + Shift + T, T (Command + Alt + T, T on macOS) keyboard shortcut.
- Click the Apply Transformation Scenario(s) button on the main toolbar.
- Click the Apply Transformation Scenario(s) button on the toolbar in the Transformation Scenarios view (on page 903).
- Right-click a file in the Project Explorer view (on page 244) and select Transform > Apply Transformation Scenario(s).
- Use the Apply Associated button in the Configure Transformation Scenario(s) dialog box (on page 898).
Configure Transformation Scenario(s) Dialog Box

You can use the Configure Transformation Scenario(s) dialog box for editing existing transformation scenarios or creating new ones.

To open this dialog box, use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the toolbar or the XML menu.

The dialog box includes the following options and features:

**Search Filter Field**

You can begin typing text in the search field at the top of the dialog box to filter the scenarios shown in the table below this field.

**Settings**

Use this drop-down to access the following options:
Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Author Eclipse plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Scenarios Table Section

The middle section of the dialog box is a table that displays the scenarios that you can apply to the current document. The table includes following sortable columns:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the Show Type contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Author Eclipse plugin, see the Transformation Types section (on page 895).
If you right-click in the header area, the following options are accessible:

**Show Type**
Use this option to display the transformation type of each scenario.

**Show Storage**
Use this option to display the storage location of the scenarios.

**Group by Type**
Select this option to group the scenarios by their type.

**Group by Storage**
Select this option to group the scenarios by their storage location.

**Ungroup all**
Select this option to ungroup all the scenarios.

**Reset Layout**
Select this option to restore the default settings of the layout.

If you right-click any particular transformation scenario, the following actions are accessible:

**Edit**
This button opens the Edit Scenario configuration dialog box (on page 894) that allows you to configure the options of the transformations scenario.

**Duplicate**
Use this button to create a duplicate transformation scenario (on page 896).

**Remove**
Use this button to remove custom transformation scenarios.

**Import scenarios**
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**
When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.
Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and options:

New

This button allows you to create a new transformation scenario (on page 816).

Edit

This button opens the Edit Scenario dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the Transformation Types section (on page 895).

Note:
If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Author Eclipse plugin displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario (on page 896) to edit instead.

Duplicate

Use this button to create a duplicate transformation scenario (on page 896).

Remove

Use this button to remove transformation scenarios.

Note:
Removing scenarios associated with a defined document type is not allowed.

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note:
When this option is selected, the Association column is hidden.

Run in parallel (DITA-OT or Ant scenarios)
This option is available if you select multiple DITA-OT or Ant type scenarios. Selecting this option results in the transformations being done in parallel, instead of sequentially. It should help to reduce the amount of time it takes for the publishing to finish when transforming large projects.

**Attention:**

If multiple selected DITA-OT scenarios have the same output or temporary files folder, this option is not available since the process would need to read and write content to the same folder in this case.

**Associated scenarios section**

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon (×) to the right of the scenario name.

**Save and close**

Saves the current configuration and closes the dialog box.

**Apply associated**

Use this button to apply the associated scenarios and run the transformation on the current document.

**Cancel**

Cancels any changes made in the dialog box and reverts to the previously saved association.

**Tip:**

Your selections in the **Configure Transformation Scenarios(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

**Related Information:**

- Editing a Transformation Scenario *(on page 894)*
- Duplicating a Transformation Scenario *(on page 896)*
- Applying Associated Transformation Scenarios *(on page 897)*
- Creating New Transformation Scenarios *(on page 816)*
- Sharing Transformation Scenarios *(on page 903)*
Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the **Project Explorer view (on page 248)** without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. Select the files you want to transform and from the contextual menu, select **Transform > Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.

2. Use Oxygen XML Author Eclipse plugin **editor variables (on page 199)** to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate **editor variable (on page 199)** is assigned for the input file. For example, for a **DocBook PDF transformation**, make sure the **XML URL** input box is set to the **${currentFileURL}** editor variable (on page 205). For a DITA PDF transformation, make sure the **args.input** parameter is set to the **${cf}** editor variable (on page 204).
   b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an **XML transformation with XSLT**, switch to the **Output** tab and set the path of the output file using a construct of **editor variables (on page 199)**, such as **${cfd}/${cfn}.html**.

3. Now that the logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation, you can select **Transform > Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.

4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform > Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

**Related Information:**

**Editor Variables (on page 199)**

**Sharing Transformation Scenarios**

The transformation scenarios and their settings can be shared with other users by **exporting them to a specialized scenarios file (on page 198)** that can then be imported.

**Transformation Scenarios View**

You can manage the transformation scenarios by using the **Transformation Scenarios view**. To open this view, select **Window > Show View > Transformation Scenarios**.
Oxygen XML Author Eclipse plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the Configure Transformation Scenario(s) dialog box (on page 898).

By default, Oxygen XML Author Eclipse plugin presents the items in the following order:

1. Scenarios that match the current framework (on page 2080).
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  Select this option to run the current transformation scenario.

- **New**
This drop-down menu contains a list of the scenarios that you can create (on page 816). Oxygen XML Author Eclipse plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 895).

Remove

Removes the current scenario from the list. This action is also available by using the Delete key.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the scenarios that you export.

Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor
Select this option to only display the scenarios that Oxygen XML Author Eclipse plugin can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Author Eclipse plugin adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.
Your selections in the Transformation Scenarios view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Output Customization

Oxygen XML WebHelp provides the ability to generate two different types of output, WebHelp Responsive and WebHelp Classic. Each type has its own set of options and features. The WebHelp Responsive variant is available for DITA documents while the WebHelp Classic variants are available for DocBook.

WebHelp Responsive Output for DITA

WebHelp Responsive features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the Bootstrap responsive front-end framework and is available for DITA document types.
WebHelp Responsive output can be generated by using the DITA Map WebHelp Responsive (on page 788) transformation scenario.

For an in-depth look at WebHelp Responsive features and the publishing process, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a tiles or tree style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

Figure 219. WebHelp Responsive Output on a Normal Screen

![WebHelp Responsive Output on a Normal Screen](image-url)
Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the tiles presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.
**Main Page - Tree Layout**

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

1. Logo Component *(on page 911)*
2. Title Component *(on page 911)*
3. Search Input Component *(on page 912)*
4. Menu Component *(on page 912)*
5. Index Terms Link Component *(on page 912)*
6. Topic Tiles Component *(on page 912)*
7. Footer Component *(on page 912)*
The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the webhelp.logo.image transformation parameter (on page 1065). For the target URL, use the webhelp.logo.image.target.url parameter (on page 1065).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1012) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter (on page 1074).

**Search Input**

An input text field where you can enter search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association (on page 1012) is done in the DITA map.

**Tree Table of Contents**

An area that contains first and second-level topic titles from your publication.

**Page Footer**

WebHelp Responsive output footer.

**Topic Page**

The Topic Page is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 223. Topic Page

The layout components displayed in this page are:

1. Logo Component (on page 914)
2. Title Component (on page 913)
3. Search Input Component (on page 914)
4. Menu Component (on page 914)
5. Index Terms Link Component (on page 914)
6. Expand/Collapse All Sections Component (on page 914)
7. Navigation Links Component (on page 914)
8. Print Link Component (on page 914)
9. Breadcrumb Component (on page 914)
10. Publication Table of Contents Component (on page 915)
11. Topic Content Component (on page 914)
12. Topic Table of Contents Component (on page 915)

**Topic Page Components**

The title of the publication. It is usually taken from the DITA map title.
Logo
Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image transformation parameter (on page 1065). For the target URL, use the `webhelp.logo.image.target.url parameter (on page 1065).`

Menu
Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1012) topic.

Index Terms Link
Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link parameter (on page 1074).`

Search Input
An input text field where you can enter search queries.

Navigation Links
The navigation links (Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type attribute`. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence parameter` and set its value to yes to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip:
To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links parameter` to no.

Expand/Collapse Sections Button
Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link
A print icon that opens the print dialog box for your particular browser.

Breadcrumb
Presents the path of the current displayed DITA topic.

Topic Content
Presents the content of the associated DITA topic.
Publication Table of Contents

A Table of Content for the publication displayed in the left side of the screen. You can use the button to collapse the table of contents (or the button to expand it).

Topic Table of Contents (On this page links)

A table of contents for the topic displayed on the right side with a heading named On this page and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two elements and each must have an attribute. You can use the button to collapse the table of contents (or the button to expand it).

Page Footer

WebHelp Responsive output footer.

Search Page

The Search Page presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the button at the top-right side of the page. The Search field also includes an autocomplete feature.
Figure 224. Search Results Page

1. Logo Component (on page 916)
2. Title Component (on page 916)
3. Search Input Component (on page 917)
4. Menu Component (on page 917)
5. Index Terms Link Component (on page 917)
6. Search Results Component (on page 917)
7. Footer Component (on page 917)

Search Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the webhelp.logo.image transformation parameter (on page 1065). For the target URL, use the webhelp.logo.image.target.url parameter (on page 1065).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1012) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter (on page 1074).

Search Input

An input text field where you can enter search queries.

Search Results

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

Page Footer

WebHelp Responsive output footer.

Auto-complete Suggestions in the Search Text Field

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```xml
<prolog>
  <metadata>
    <keywords>
      <indexterm>databases</indexterm>
    </keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Related information
WebHelp Responsive Search Engine (on page 919)

Index Terms Page

The Index Terms Page page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 225. Index Terms Page

1. Logo Component (on page 919)
2. Title Component (on page 919)
3. Menu Component (on page 919)
4. Index Terms Link Component (on page 919)
5. Index Terms Component (on page 919)
Index Terms Page Components

The layout components displayed in this page are:

Publication Title
The title of the publication. It is usually taken from the DITA map title.

Logo
Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1065). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1065).

Menu
Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1012) topic.

Index Terms Link
Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1074).

Index Terms Alphabet
An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Terms
The first letter of the index along with the list of index terms.

Page Footer
WebHelp Responsive output footer.

Search Engine

Search engine has two main components:

Search indexer
It is also known as a spider. This component is active when you publish your documentation to WebHelp and it is responsible for creating the search index. This component traverses all HTML pages (for DITA topics) to gather information.

Search interface
This component is an interface between the user and the search index. It helps the user to search through the search index and displays results in the search page.

**Search Field and Results Page**

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

**5-Star Rating Mechanism and Sorting**

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

**Tag Element Scoring Values**

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1023).

**Search Rules**

Rules that are applied during a search include:
- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a **phrase search**.

- **Boolean Search** is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).

- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords).

- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.

- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

- When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始之前 (notice the space between the second and third symbols) in the search field.

**Tip:**
The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a `<keywords>` element weighs more than an `<H1>` HTML element).

**Excluded Terms**

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the stop words includes: *a*, *an*, *and*, *are*, *as*, *at*, *be*, *but*, *by*, *for*, *if*, *in*, *into*, *is*, *it*, *no*, *not*, *of*, *on*, *or*, *such*, *that*, *the*, *their*, *then*, *there*, *these*, *they*, *this*, *to*, *was*, *will*, *with*.

**Related Information:**
*WebHelp Responsive HTML5 Pages: Search Page* (on page 915)

**Context-Sensitive Help System**

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

**Generating Context-Sensitive Help**

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:
The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources (resourceid element or @id attribute):

**resourceid**

The resourceid element is mapped into the appContext element and can be specified in either the topicref within a DITA map or in a prolog within a DITA topic. The resourceid element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an @appid attribute is used.

**Note:**

Multiple @appid values can be associated with a single appname value (and multiple @appname values can be associated with a single @appid value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the @appid and @appname attributes should be unique within the context of a single root map (on page 2083). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

**Example: The resourceid Element Specified in a DITA Map**

The resourceid element can be specified in a topicmeta element within a topicref.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```
Example: The `<resourceid>` Element Specified in a DITA Topic

The `<resourceid>` element can be specified in a `<prolog>` element within a DITA topic.

```xml
<task id="app-help1">
    <title>My App Help</title>
    <prolog>
        <resourceid appname="myapp" appid="functionid1"/>
        <resourceid appname="myapp" appid="functionid2"/>
    </prolog>
    ...
</task>
```

For more information about the `<resourceid>` element, see DITA Specifications: `<resourceid>`.

id

If a `<resourceid>` element is not declared in the DITA map or DITA topic (as described above), the `@id` attribute that is set on the topic root element is mapped into the `<appContext>` element.

Important:

You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `cshelp.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

`cshelp.html?contextId=myDITATopic`
Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

contextId

The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page.

Note:

You can use an anchor (on page 2077) in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

appname

You can use this parameter in conjunction with contextId to search for this value in the corresponding appname attribute value in the mapping file.

http://localhost/webhelp/cshelp.html?contextId=topicID&appname=myApplication

Another parameter indicates the search query:

searchQuery

You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for growing flowers, the URL should look like this: http://localhost/webhelp/index.html?searchQuery=growing%20flowers.

Accessibility

Oxygen XML WebHelp Responsive output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.
Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

Related Information:
DITA-OT Day 2017 Presentation: Accessibility in DITA-OT

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdesc>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdesc href="http://www.example.org/birds/puffin.html"
            scope="external"
            format="html"/>
</image>
```

Related Information:
Darwin Information Typing Architecture (DITA) Specification `<image>` element
Web Accessibility Tutorials: Alt Decision Tree

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated...
if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>
  <area>
    <shape>circle</shape>
    <coords>324, 210, 14</coords>
    <xref href="parts/ports.dita#ports_topic/suction_port" format="dita">Suction Port</xref>
  </area>
</imagemap>
```

Darwin Information Typing Architecture (DITA) Specification `<imagemap>` element

### Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `<scope>`, `<id>`, and `<headers>` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Related Information:
Darwin Information Typing Architecture (DITA) Specification `<table>` element

### Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

#### Table 10. Example: Oxygen Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Date</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evolution of TC 2018</td>
<td>May 31 - June 1, 2018</td>
<td>Sofia, Bulgaria</td>
</tr>
</tbody>
</table>
Table 10. Example: Oxygen Events (continued)

<table>
<thead>
<tr>
<th>Event</th>
<th>Date</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Markup UK</td>
<td>June 9 - 10, 2018</td>
<td>London, United Kingdom</td>
</tr>
<tr>
<td>Balisage 2018 - The Markup Conference</td>
<td>July 31 - August 3, 2018</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>

```xml
<table colsep="1" rowsep="1" frame="all">
  <title>Oxygen Events</title>
  <tgroup cols="3">
    <colspec colname="COLSPEC0" colwidth="1*"/>
    <colspec colname="COLSPEC1" colwidth="1.1*"/>
    <colspec colname="newCol3" colwidth="1*"/>
    <thead>
      <row>
        <entry colname="COLSPEC0" valign="top">Event</entry>
        <entry colname="COLSPEC1" valign="top">Date</entry>
        <entry>Location</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>Evolution of TC 2018</entry>
        <entry>May 31 - June 1, 2018</entry>
        <entry>Sofia, Bulgaria</entry>
      </row>
      <row>
        <entry>Markup UK</entry>
        <entry>June 9 - 10, 2018</entry>
        <entry>London, United Kingdom</entry>
      </row>
      <row>
        <entry>Balisage 2018 - The Markup Conference</entry>
        <entry>July 31 - August 3, 2018</entry>
        <entry>Rockville, Maryland, USA</entry>
      </row>
    </tbody>
  </tgroup>
</table>
```
Table with Header Cells in the First Column Only

For this type of table, you have to set the `rowheader="firstcol"` attribute on the `<table>` element to identify the header column.

**Table 11. Example: Oxygen Events**

<table>
<thead>
<tr>
<th>Event</th>
<th>Evolution of TC 2018</th>
<th>Markup UK</th>
<th>Balisage 2018 - The Markup Conference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>May 31 - June 1, 2018</td>
<td>June 9 - 10, 2018</td>
<td>July 31 - August 3, 2018</td>
</tr>
<tr>
<td>Location</td>
<td>Sofia, Bulgaria</td>
<td>London, United Kingdom</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>

```xml
<table rowheader="firstcol" colsep="1" rowsep="1" frame="all">
    <title><b>Oxygen Events</b></title>
    <tgroup cols="4">
        <colspec colname="COLSPEC0" colwidth="1*"/>
        <colspec colname="COLSPEC1" colwidth="1.1*"/>
        <colspec colname="newCol3" colwidth="1*"/>
        <colspec colname="newCol4" colwidth="1*"/>
        <tbody>
            <row>
                <entry>Event</entry>
                <entry>Evolution of TC 2018</entry>
                <entry>Markup UK</entry>
                <entry>Balisage 2018 - The Markup Conference</entry>
            </row>
            <row>
                <entry>Date</entry>
                <entry>May 31 - June 1, 2018</entry>
                <entry>June 9 - 10, 2018</entry>
                <entry>July 31 - August 3, 2018</entry>
            </row>
            <row>
                <entry>Location</entry>
                <entry>Sofia, Bulgaria</entry>
                <entry>London, United Kingdom</entry>
                <entry>Rockville, Maryland, USA</entry>
            </row>
        </tbody>
    </tgroup>
</table>
```
Table with Header Cells in the Top Row and First Column

For this type of table, you can use `<thead>` to identify header rows and `<rowheader>` to identify a header column.

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition

VPAT® Version 2.3 – April 2019

Product Name/Version

Oxygen XML WebHelp Responsive

Product Description

Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With Oxygen XML WebHelp Responsive, your published content is accessible, interactive, and convenient.
Oxygen XML Author Eclipse Plugin 24.1 | 11 - Publishing | 931

Date
May 2019

Contact Information
support@oxygenxml.com

Notes

Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the U.S. Government Section 508 accessibility standards and the Web Content Accessibility Guidelines (WCAG). For details, see WebHelp Responsive Accessibility (on page 924).

Evaluation Methods Used:

The following applications were used for testing Oxygen XML WebHelp Responsive:

• Desktop browsers: Chrome, Firefox, Safari, Edge.
• Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator.

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

<table>
<thead>
<tr>
<th>Standard/Guideline</th>
<th>Included In Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Content Accessibility Guidelines 2.0</td>
<td>Level A - Yes</td>
</tr>
<tr>
<td></td>
<td>Level AA - Yes</td>
</tr>
<tr>

<tr>
<td>Web Content Accessibility Guidelines 2.1</td>
<td>Level A - Yes</td>
</tr>
<tr>
<td></td>
<td>Level AA - Yes</td>
</tr>
<tr>
<td></td>
<td>Level AAA - No</td>
</tr>
<tr>
<td>Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018</td>
<td>Yes</td>
</tr>
<tr>
<td>EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)</td>
<td>No</td>
</tr>
</tbody>
</table>

Terms

The terms used in the Conformance Level information are defined as follows:

• **Supports**: The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
• **Partially Supports**: Some functionality of the product does not meet the criterion.
• **Does Not Support**: The majority of product functionality does not meet the criterion.
• **Not Applicable**: The criterion is not relevant to the product.
• **Not Evaluated**: The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

**WCAG 2.x Report**

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

**Table 1: Success Criteria, Level A**

**Chapter 4: Hardware**

Notes: Not Applicable - Oxygen XML WebHelp Responsive is not a hardware product.
Chapter 5: Software

Notes: Oxygen XML WebHelp Responsive is a web application, not a software product. However, the web application includes authoring functionality, hence Chapter 5: Software 504 Authoring Tools applies to this product.

### Publishing Templates

An **Oxygen Publishing Template** defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for Oxygen Publishing Template packages:

![Diagram of Oxygen Publishing Template Package (WebHelp Responsive)]

![Diagram of Oxygen Publishing Template Package (PDF)]

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

Related Information:
- How to Create a Publishing Template (on page 989)
- How to Edit a Packed Publishing Template (on page 991)
Publishing Templates Gallery

Oxygen XML Author Eclipse plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the *Templates* tab when editing a WebHelp Responsive transformation scenario in Oxygen XML Editor/Author. Each one also includes an **Online preview** icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

---

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.
Built-in Templates Location

All built-in templates are stored in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (on page 1138). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's Template tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.
Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with the template. It is an XML file that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-tree.png"/>

    <!-- Resources (CSS, favicon, logo and others) -->
    <resources>
      <!-- Main CSS file -->
      <css file="flowers.css"/>

      <!-- Resources to copy to the output folder -->
      <fileset>
        <include name="resources/***"/>
        <exclude name="resources/**/.svn"/>
        <exclude name="resources/**/.git"/>
      </fileset>
    </resources>

    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
      <parameter name="webhelp.top.menu.depth" value="3"/>
    </parameters>
  </webhelp>
</publishing-template>
```
Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
    <name>Lorem Ipsum</name>
    <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
...
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```
<publishing-template>
...

    <author>
        <name>John Doe</name>
        <email>jdoe@example.com</email>
        <organization>ACME</organization>
        <organizationUrl>http://www.example.com/jdoe</organizationUrl>
    </author>
...
```

Webhelp Element

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the template tags (on page 956), template preview image (on page 956), resources (on page 957) (such as CSS, JS, fonts, logos), transformation parameters (on page 959), HTML fragment extensions (on page 960) (used to add fragments to placeholders), XSLT extensions (on page 960), or HTML page layout files (on page 969).
Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each `tag` is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
  ...
  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>dark</tag>
    </tags>
  </webhelp>
</publishing-template>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.
Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

**Warning:**

All paths set in the `@file` attribute must be relative.

This section is defined using the `<resources>` element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.
- **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the `<favicon>` element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
  - `<target-url>` - will redirect the user to the specified URL if they click the logo in the output.
  - `<alt>` - provides an alternate text for the logo image.
- **JavaScript AMD module** - The path to a JavaScript module that uses the AMD (Asynchronous Module Definition) format. This module will be loaded in the output HTML pages using the RequireJS library. It can be referenced using the `<js-amd-module>` element. For more information, see How to Insert JavaScript AMD Modules (on page 1006).
- **Additional Resources (graphics, JS, fonts, folders)** - For other resources (such as images referenced in CSS, JavaScript, fonts, entire folders, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the ANT FileSet.
<css file="css/custom_fonts.css"/>

<favicon file="images/favicon.png"/>

<logo
    file="images/logo.png"
    target-url="http://www.example.com"
    alt="Alternate text for the logo image"/>

<js-amd-module file="js/template-main.js"/>

<fileset>
    <include name="common/**/*"/>
    <include name="JS/**/*"/>
    <exclude name="**/*.svn"/>
    <exclude name="**/*.git"/>
</fileset>
</resources>

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: [WebHelp_OUTPUT_DIR]/oxygen-webhelp/template. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

**Figure 228. Template Resources Mapping**

Related Information:

How to Add a Favicon in WebHelp Systems *(on page 1020)*
Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.show.main.page.toc"
        value="yes"/>
      <parameter
        name="webhelp.top.menu.depth"
        value="3"/>
      <parameter
        name="webhelp.fragment.welcome"
        value="html-fragment/webhelp.fragment.welcome.html"
        type="filePath"/>
    </parameters>
  </webhelp>
</publishing-template>
```

The following information can be specified in the `<parameter>` element:

**Parameter name**

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (on page 1065) or a DITA-OT HTML-based output parameter.

**Note:**

It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:**

JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: string or filepath. The string value is default.
After creating a publishing template (on page 1138) and adding it to the templates gallery (on page 991), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**

The publishing templates can include one or more supported XSLT extension points (on page 1078). They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension id="com.oxygenxml.webhelp.xsl.dita2webhelp"
                       file="xsl/customDita2webhelp.xsl"/>
            <extension id="com.oxygenxml.webhelp.xsl.createMainPage"
                       file="xsl/customMainPage.xsl"/>
        </xslt>
    </webhelp>
</publishing-template>
```

For a full list of the supported extension points, see: XSLT-Import and XSLT-Parameter Extension Points (on page 1078).

**Note:**

You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

**HTML Fragment Placeholders**

The HTML pages contain component placeholders that can be used to insert custom HTML fragments either by specifying a well-formed XHTML fragment or referencing a path to a file that contains a well-formed XHTML fragment (for details on how the file or fragment needs to be constructed, see How to Insert Custom HTML Content (on page 1001)).

These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section. You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
    ...
    <webhelp>
        ...
    </webhelp>
</publishing-template>
```
Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. Some of the placeholder parameters are global and can be used in all type of pages (main page, topic page, search results page, index terms page), while others are applicable for certain type of pages. The following diagram illustrates the predefined placeholders that are global (can be used in any of the types of pages).

Figure 229. Global Predefined Placeholders Diagram

1. Header (on page 962)
2. After Header (on page 962)
3. Before Body (on page 962)
4. Before Logo and Title (on page 962)
5. After Logo and Title (on page 962)
6. Before Top Menu (on page 962)
Global Placeholder Parameters

The following placeholder parameters can be used in any of the type of pages (main page, topic page, search results page, index terms page). The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

- 1 = webhelp.fragment.head - Displays the specified XHTML fragment in the header section.
- 2 = webhelp.fragment.after.header - Displays the specified XHTML fragment after the header section.
- 3 = webhelp.fragment.before.body - Displays the specified XHTML fragment before the body.
- 4 = webhelp.fragment.before.logo_and_title - Displays the specified XHTML fragment before the logo and title.
- 5 = webhelp.fragment.after.logo_and_title - Displays the specified XHTML fragment after the logo and title.
- 6 = webhelp.fragment.before.top_menu - Displays the specified XHTML fragment before the top menu.
- 7 = webhelp.fragment.after.top_menu - Displays the specified XHTML fragment after the top menu.
- 8 = webhelp.fragment.before.search.input - Displays the specified XHTML fragment before the search input component.
- 9 = webhelp.fragment.after.search.input - Displays the specified XHTML fragment after the search input component.
- 10 = webhelp.fragment.before.main.content.area - Displays the specified XHTML fragment before the main content area.
- 11 = webhelp.fragment.after.main.content.area - Displays the specified XHTML fragment after the main content area.
- 12 = webhelp.fragment.footer - Displays the specified XHTML fragment in the footer section.
- 13 = webhelp.fragment.after.body - Displays the specified XHTML fragment after the body.

Main Page Placeholder Parameters

The following placeholder parameters can be used in the main page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

- webhelp.fragment.head.main.page - Displays the specified XHTML fragment in the header section.
- webhelp.fragment.after.header.main.page - Displays the specified XHTML fragment after the header section.
- webhelp.fragment.before.body.main.page - Displays the specified XHTML fragment before the body.
• **webhelp.fragment.before.search.input.main.page** - Displays the specified XHTML fragment before the search input component.

• **webhelp.fragment.after.search.input.main.page** - Displays the specified XHTML fragment after the search input component.

• **webhelp.fragment.before.main.content.area.main.page** - Displays the specified XHTML fragment before the main content area

• **webhelp.fragment.after.main.content.area.main.page** - Displays the specified XHTML fragment after the main content area.

• **webhelp.fragment.after.body.main.page** - Displays the specified XHTML fragment after the body.

• **webhelp.fragment.before.toc_or_tiles** - Displays the specified XHTML fragment before the main table of contents or tiles component on the main page.

• **webhelp.fragment.after.toc_or_tiles** - Displays the specified XHTML fragment after the main table of contents or tiles component on the main page.

---

**Topic Page Placeholder Parameters**

The following placeholder parameters can be used in the *topic page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

• **webhelp.fragment.head.topic.page** - Displays the specified XHTML fragment in the header section.

• **webhelp.fragment.after.header.topic.page** - Displays the specified XHTML fragment after the header section.

• **webhelp.fragment.before.body.topic.page** - Displays the specified XHTML fragment before the body.

• **webhelp.fragment.before.search.input.topic.page** - Displays the specified XHTML fragment before the search input component.

• **webhelp.fragment.after.search.input.topic.page** - Displays the specified XHTML fragment after the search input component.

• **webhelp.fragment.before.main.content.area.topic.page** - Displays the specified XHTML fragment before the main content area

• **webhelp.fragment.after.main.content.area.topic.page** - Displays the specified XHTML fragment after the main content area.

• **webhelp.fragment.after.body.topic.page** - Displays the specified XHTML fragment after the body.

• **webhelp.fragment.before.topic.toolbar** - Displays the specified XHTML fragment before the toolbar buttons above the topic content in the topic page.

• **webhelp.fragment.after.topic.toolbar** - Displays the specified XHTML fragment after the toolbar buttons above the topic content in the topic page.

• **webhelp.fragment.before.topic.breadcrumb** - Displays the specified XHTML fragment before the breadcrumb component in the topic page.

• **webhelp.fragment.after.topic.breadcrumb** - Displays the specified XHTML fragment after the breadcrumb component in the topic page.

• **webhelp.fragment.before.publication.toc** - Displays the specified XHTML fragment before the publication's table of contents component in the topic page.
• **webhelp.fragment.after.publication.toc** - Displays the specified XHTML fragment after the publication's table of contents component in the topic page.

• **webhelp.fragment.before.topic.content** - Displays the specified XHTML fragment before the topic's main content in the topic page.

• **webhelp.fragment.after.topic.content** - Displays the specified XHTML fragment after the topic's main content in the topic page.

• **webhelp.fragment.before.feedback** - Displays the specified XHTML fragment before the Oxygen Feedback commenting component in the topic page.

• **webhelp.fragment.after.feedback** - Displays the specified XHTML fragment after the Oxygen Feedback commenting component in the topic page.

• **webhelp.fragment.before.topic.toc** - Displays the specified XHTML fragment before the topic's table of contents component in the topic page.

• **webhelp.fragment.after.topic.toc** - Displays the specified XHTML fragment after the topic's table of contents component in the topic page.

**Search Results Page Placeholder Parameters**

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment:

• **webhelp.fragment.head.search.page** - Displays the specified XHTML fragment in the header section.

• **webhelp.fragment.after.header.search.page** - Displays the specified XHTML fragment after the header section.

• **webhelp.fragment.before.body.search.page** - Displays the specified XHTML fragment before the body.

• **webhelp.fragment.before.search.input.search.page** - Displays the specified XHTML fragment before the search input component.

• **webhelp.fragment.after.search.input.search.page** - Displays the specified XHTML fragment after the search input component.

• **webhelp.fragment.before.main.content.area.search.page** - Displays the specified XHTML fragment before the main content area.

• **webhelp.fragment.after.main.content.area.search.page** - Displays the specified XHTML fragment after the main content area.

• **webhelp.fragment.before.body.search.page** - Displays the specified XHTML fragment after the body.

• **webhelp.google.search.script** - Replaces the search input component with a Google search component.

**Index Terms Page Placeholder Parameters**

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment:

• **webhelp.fragment.head.terms.page** - Displays the specified XHTML fragment in the header section.

• **webhelp.fragment.after.header.terms.page** - Displays the specified XHTML fragment after the header section.
• **webhelp.fragment.before.body.terms.page** - Displays the specified XHTML fragment before the body.
• **webhelp.fragment.before.search.input.terms.page** - Displays the specified XHTML fragment before the search input component.
• **webhelp.fragment.after.search.input.terms.page** - Displays the specified XHTML fragment after the search input component.
• **webhelp.fragment.before.main.content.area.terms.page** - Displays the specified XHTML fragment before the main content area
• **webhelp.fragment.after.main.content.area.terms.page** - Displays the specified XHTML fragment after the main content area.
• **webhelp.fragment.after.body.terms.page** - Displays the specified XHTML fragment after the body.

### Using String Values in Placeholder Parameter Values

If you use strings for values of HTML fragment placeholder parameter values, the string values are written to files in the transformation's temporary directory. The values of the associated parameters reference the paths of the temporary files. This means that the HTML fragments will have a uniform processing in the *WebHelp's XSLT Module*.

**Example:**

Suppose the placeholder parameter has the following string value:

```text
# String value
webhelp.fragment.welcome = <p>This is an HTML paragraph.</p>
```

A new file that contains the parameter's value is created:

```text
[temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
<p>This is an HTML paragraph.</p>
```

The parameter's value then becomes:

```text
# Absolute file path as value
webhelp.fragment.welcome= [temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

**Related Information:**

[How to Insert Custom HTML Content (on page 1001)](#)

### WebHelp Responsive Macros

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```text
${macro-name}
```

or
A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

**Implementations**

The following *macros* are supported:

**i18n**

For localizing a string.

\[ \$\{i18n\{string.id\}\} \]

**param**

Returns the value of a transformation parameter.

\[ \$\{param\{webhelp.show.main.page.tiles\}\} \]

**env**

Returns the value of an environment variable.

\[ \$\{env\{JAVA_HOME\}\} \]

**system-property**

Returns the value of a system property.

\[ \$\{system-property\{os.name\}\} \]

**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the rules of the XSLT *formatDateTime* function specification.

\[ \$\{timestamp\\{[h1]:[m01] [P] [M01]/[D01]/[Y0001]\}\} \]

**path**

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

\[ \$\{path\{oxygen-webhelp-template-dir\}\} \]
Note:
New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<html:xsl:template name="wh-macro-custom-path">
  <html:xsl:param name="pathId"/>
  <html:xsl:value-of select="$pathId"/>
</html:xsl:template>
```

**map-xpath**

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

**Tip:**
Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

**topic-xpath**

Can be used to execute an XPath expression over the current topic.

**Tip:**
Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

**oxygen-webhelp-build-number**

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

**Extensibility**

To add new macros, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl` file.

```
<!-- Extension template for expanding custom macro constructs -->
<html:xsl:template name="wh-macro-extension">
  <html:xsl:param name="name"/>
  <html:xsl:param name="params"/>
  <html:xsl:param name="contextNode"/>
  <html:xsl:param name="matchedString"/>
</html:xsl:template>
```
The **wh-macro-extension** template has the following parameters:

- **name** - The name of the current *macro*.
- **params** - List of parameters of the current *macro* as a string sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the *macro* was declared.
- **matchedString** - The entire value of the matched *macro* as specified in the HTML template page.

**Combining WebHelp Responsive and PDF Customizations in a Template Package**

An *Oxygen Publishing Template* package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.
Related Information:

Publishing Template Package Contents for PDF Customizations (on page 1132)

HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (main, search, topic, index) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

**Warning:**

It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them. Instead, use any of the other methods described in Publishing Template Package Contents for WebHelp Responsive Customizations (on page 953).

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.
If you do use the `html-page-layout-files` element, you must specify all four types of pages (`main`, `search`, `topic`, `index`). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed DITA map (on page 2079).

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the Publication Title component can be used in all pages, but the Navigation Breadcrumb component can only be used in the Topic Page.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `<whc:component_content>` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:
Main Page

The **Main Page** is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a **Tiles** or **Tree** style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

**Figure 230. Examples of Main Page Components for a Tiles Style of Layout**

1. Publication Logo *(on page 972)*
2. Publication Title *(on page 972)*
3. Search Input *(on page 973)*
4. Main Menu *(on page 973)*
5. Index Terms Link *(on page 974)*
6. Topic Tiles *(on page 973)*
7. Print Link *(on page 973)*
Figure 231. Examples of Main Page Components for a Tree Style of Layout

1. Publication Logo (on page 972)
2. Publication Title (on page 972)
3. Search Input (on page 973)
4. Main Menu (on page 973)
5. Index Terms Link (on page 974)
6. Table of Contents (on page 974)
7. Print Link (on page 973)

The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the webhelp.logo.image transformation parameter (in the Parameters tab in the transformation scenario). You can set the webhelp.logo.image.target.url parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: wh_logo.

Search Input (webhelp_search_input)

This component is used to generate the input widget associated with search function in the output. To generate this component, the <whc:webhelp_search_input> element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: wh_search_input.

Print Link (webhelp_print_link)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the <whc:webhelp_print_link> element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: wh_print_link.

Main Menu (webhelp_top_menu)

This component generates a menu with all the documentation topics. To generate this component, the <whc:webhelp_top_menu> element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: wh_top_menu.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1012).

Main Page Topic Tiles (webhelp_tiles)
This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_tiles
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
   <!-- Place holder for tile's image -->
   <whc:webhelp_tile_image/>

   <div class="wh_tile_text">
      <!-- Place holder for tile's title -->
      <whc:webhelp_tile_title/>

      <!-- Place holder for tile's shordesc -->
      <whc:webhelp_tile_shortdesc/>
   </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page (on page 1017).

**Main Page Table of Contents** (*webhelp_main_page_toc*)

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link** (*webhelp_indexterms_link*)

This component can be used to generate a link to the index terms page (*indexterms.html*). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources** *(webhelp_skin_resources)*

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
The following components can be referenced in the *Topic Page* file:

- **Publication Title** (webhelp_publication_title)
This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Topic Breadcrumb (webhelp_breadcrumb)**

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `<whc:webhelp_breadcrumb>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_breadcrumb
```

In the output, you will find an element with the class: `wh_breadcrumb`. This component will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

**Navigation Links (webhelp_navigation_links)**
This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class: `wh_navigation_links`. This component will contain the links to the next and previous topics.

**Print Link** (*webhelp_print_link*)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Topic Content** (*webhelp_topic_content*)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class: `wh_topic_content`.

**Publication TOC** (*webhelp_publication_toc*)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of the current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_toc
```

In the output, you will find an element with the class: `wh_publication_toc`. This component will contain links to the topics referenced in the DITA map. It also includes an expand/collapse button (either `<` to collapse or the `>` to expand).

**Topic TOC** (*webhelp_topic_toc*)

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and
the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `<whc:webhelp_topic_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: `wh_topic_toc`. This component will contain links to the sections within the current topic. It also includes an expand/collapse button (either ▶ to collapse or the ◄ to expand).

**Expand/Collapse Sections** (webhelp_expandCollapseSections)

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `<whc:webhelp_expandCollapseSections>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_expandCollapseSections
```

In the output, you will find an element with the class: `webhelp_expandCollapseSections`.

**Topic Feedback** (webhelp_feedback)

This component generates a placeholder for where the comments section will be presented. To generate this component, the `<whc:webhelp_feedback>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_feedback
```

**Main Menu** (webhelp_topMenu)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_topMenu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topMenu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu](on page 1012).

**Index Terms Link** (webhelp_indextermsLink)
This component can be used to generate a link to the index terms page (\texttt{indexterms.html}). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the \texttt{<whc:webhelp_indexterms_link>} element must be specified in the HTML file as in the following example:

\begin{verbatim}
<whc:webhelp_indexterms_link
\end{verbatim}

In the output, you will find an element with the class: \texttt{wh\_indexterms\_link}. This component will contain a link to the \texttt{indexterms.html} page.

**Child Links** (\texttt{webhelp_child_links})

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the \texttt{<whc:webhelp_child_links>} element must be specified in the HTML file as in the following example:

\begin{verbatim}
<whc:webhelp_child_links
\end{verbatim}

**Related Links** (\texttt{webhelp_related_links})

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the \texttt{<whc:webhelp_related_links>} element must be specified in the HTML file as in the following example:

\begin{verbatim}
<whc:webhelp_related_links
\end{verbatim}

**Link to Skins Resources** (\texttt{webhelp_skin_resources})

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the \texttt{<whc:webhelp_skin_resources>} element must be specified in the HTML file as in the following example:

\begin{verbatim}
<whc:webhelp_skin_resources/>
\end{verbatim}

In the output, you will find a link to the skin resources.

**Search Results Page**

The \textit{Search Results Page} is the page generated that presents search results in the WebHelp Responsive output. The name of the HTML file that defines this page is \texttt{wt\_search.html} and it is located in the following directory: \texttt{DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates}.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.
Figure 233. Examples of Search Results Page Components

1. Publication Logo (on page 981)
2. Publication Title (on page 981)
3. Search Input (on page 982)
4. Main Menu (on page 982)
5. Index Terms Link (on page 983)
6. Search Results (on page 982)
7. Print Link (on page 982)

The following components can be referenced in the Search Results Page (wt_search.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo (webhelp_logo)**
This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Search Results (webhelp_search_results)**

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_results
```

In the output, you will find an element with the class: `wh_search_results`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1012).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The Index Terms Page is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.
Figure 234. Example of Index Terms Page Components

1. Publication Logo (on page 984)
2. Publication Title (on page 984)
3. Search Input (on page 985)
4. Main Menu (on page 985)
5. Index Terms Link (webhelp_indexterms_link) (on page 985)
6. Print Link (on page 985)

The following components can be referenced in the Index Terms Page (wt_terms.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the webhelp.logo.image transformation parameter (in the Parameters tab in the transformation scenario). You can set the webhelp.logo.image.target.url parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: wh_logo.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: wh_search_input.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: wh_print_link.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: wh_top_menu.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1012).

**Index Terms Link (webhelp_indexterms_link)**
This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the indexterms.html page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

---

**Generating WebHelp Responsive Output**

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

**Running WebHelp Responsive from Oxygen XML Editor/Author**

To publish a DITA map (on page 2079) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Feedback Tab** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**Automating the WebHelp Responsive Output for DITA**

DITA-based WebHelp output can be generated from an automated publishing process using a command line outside of Oxygen XML Editor/Author or an automatic publishing system, such as Jenkins or Travis. However, to do this, you must purchase an additional Oxygen XML WebHelp license.

**Related Information:**
Generating WebHelp Responsive Output for DITA

**Deploying an Oxygen Feedback Comments Component**

You can add a comments component in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by Oxygen Feedback, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

**Oxygen Feedback** includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an Oxygen Feedback site configuration in the administration interface, copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the Feedback tab in the WebHelp Responsive transformation scenario dialog box (on page 1976).

An add-on is also available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

**Adding the Feedback System to WebHelp Responsive Documentation**

**Prerequisite**

To install and manage Oxygen Feedback, you will need to obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.
Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click on Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.

2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.

3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.

4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic. Click Continue.

5. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      iii. Select and duplicate the DITA Map WebHelp Responsive scenario.
      iv. Go to the Feedback tab.
      v. Click the Edit button and paste the generated installation fragment.
   b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
      iii. Use the webhelp.fragment.feedback parameter in your command-line script to specify the path to the file you just created. For example:

        ```
        dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml
        ```

6. [Optional] If you want the Oxygen Feedback comments component to fill the entire page width, contribute a custom CSS file (use the args.css parameter to reference it) that contains the following style rule:

        ```
        div.footer {
            float: none;
        }
        ```

For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.
Also, to see a demonstration of Oxygen Feedback being integrated into WebHelp Responsive output, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

**Customizing WebHelp Responsive Output**

Oxygen XML Author Eclipse plugin provides support for customizing the WebHelp Responsive output to suit your specific needs. The WebHelp Responsive output is based upon the Bootstrap responsive front-end framework and is available for DITA document types.

To change the overall appearance of your WebHelp Responsive output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

For an in-depth look at WebHelp Responsive features and some customization tips, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

**Working with Publishing Templates**

An Oxygen Publishing Template (on page 2082) defines all aspects of the layout and styles of the WebHelp Responsive output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the WebHelp Responsive output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

Related Information:

Publishing Template Package Contents for WebHelp Responsive Customizations (on page 953)

**How to Create a Publishing Template**

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

**Creating a Publishing Template Starting from Scratch**

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.

2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.
3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2082) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the Save template as button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (*DITA Map WebHelp Responsive* or *DITA Map to PDF - based on HTML5 & CSS*). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.
7. **Optional:** For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default *HTML Page Layout Files (on page 969)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.
   
   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.
9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

### How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2082)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project Explorer** view.
3. Using the **Project Explorer** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

**Related Information:**
- Publishing Template Package Contents for PDF Customizations *(on page 1132)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 953)*

### How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:
1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
   This will open the preferences page.
3. Click the **Add** button and specify the location of your template directory.
   Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**How to Use a Publishing Template from a Command Line**

Before you run the transformation, you need to know if the publishing template has a single template descriptor file or multiple descriptor files *(on page 954)*. If you don't know, open the ZIP archive or folder and check for files with the `.opt` extension.

**Using a Publishing Template with a Single Descriptor**

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the `webhelp.publishing.template` parameter *(on page 1065)*. This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Command-Line Example:**

- **Windows:**
  ```
  dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  ```

- **Linux/macOS:**
  ```
  dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  ```

**Tip:**
You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.
Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the `webhelp.publishing.template` (on page 1065) and `webhelp.publishing.template.descriptor` (on page 1065) parameters.

The `webhelp.publishing.template` (on page 1065) parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor` (on page 1065) parameter specifies the name of the descriptor you want to use.

**Command-Line Example:**

- **Windows:**

  ```batch
  dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

- **Linux/macOS:**

  ```
  dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

Tip:

You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).
Troubleshooting: Errors Encountered when Loading Templates

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file (on page 954) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠ Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure (on page 954).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (on page 954), a warning icon (⚠) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (on page 956) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Author Eclipse plugin can be converted to the Publishing Template format that was introduced in Oxygen XML Author Eclipse plugin version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 24.0 Publishing Templates to Version 24.1

If you have a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 24.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Author Eclipse plugin version 24.1:

1. In the Project Explorer view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 243) and the easiest way to do this is to drag and drop the folder).

   Note:
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.
3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v24.1, then click Next.
4. The Scope should be left as Selected project resources.
5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click Finish to perform the conversion.
Result: The converted Publishing Template can now be used in version 24.1.

- Convert Version 21 Publishing Templates to Version 22 (on page 996)
- Convert Version 20 Publishing Templates to Version 21 (on page 997)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 997)

Convert Version 23 Publishing Templates to Version 24

If you have a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 23.0 or 23.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author Eclipse plugin version 24:

1. In the Project Explorer view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 243) and the easiest way to do this is to drag and drop the folder).

   Note:
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.

3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v24, then click Next.

4. The Scope should be left as Selected project resources.

5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click Finish to perform the conversion.

Result: The converted Publishing Template can now be used in version 24.

Related information
- Convert Version 24.0 Publishing Templates to Version 24.1 (on page 994)
- Convert Version 22 Publishing Templates to Version 23 (on page 996)
- Convert Version 21 Publishing Templates to Version 22 (on page 996)
- Convert Version 20 Publishing Templates to Version 21 (on page 997)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 997)
Convert Version 22 Publishing Templates to Version 23

If you have a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 22.0 or 22.1, it is not necessary to convert it to version 23 because there were no structural changes made for the HTML layout files (on page 969) between the two versions.

Related information
- Convert Version 24.0 Publishing Templates to Version 24.1 (on page 994)
- Convert Version 23 Publishing Templates to Version 24 (on page 995)

- Convert Version 20 Publishing Templates to Version 21 (on page 997)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 997)

Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author Eclipse plugin version 22:

1. In the Project Explorer view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 243) and the easiest way to do this is to drag and drop the folder).

   **Note:**
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.
3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v22, then click Next.
4. The Scope should be left as Selected project resources.
5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click Finish to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 22.

Convert Version 20 Publishing Templates to Version 21

If you have a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 20.0 or 20.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author Eclipse plugin version 21.0 or 21.1:

1. In the Project Explorer view, add the root directory for your custom Publishing Template (you can use a linked folder and the easiest way to do this is to drag and drop the folder).

   **Note:**
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.
4. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v21, then click Next.
5. The Scope should be left as Selected project resources.
6. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
7. Click Finish to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 21.0 or 21.1.

- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 997)

Convert Version 19 (and Older) Publishing Templates to Version 20

With the introduction of the Publishing Template concept in Oxygen XML Author Eclipse plugin version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format (version 20.0 or 20.1) by following this procedure:
1. Set Oxygen XML Author Eclipse plugin to point to the DITA-OT distribution that contains your old template:
   a. Go to **Options > Preferences > DITA**.
   b. Select **Custom** in the **DITA Open Toolkit** section and specify the DITA-OT directory that contains your old template.
2. Edit a **WebHelp Responsive** transformation scenario.
3. Select your old custom template in the **Templates** tab.
4. Click on the **Save Template as** button, complete the required fields, and save the template.
5. Reset the option set in step 1 to its previous value.
6. Edit the **WebHelp Responsive** transformation scenario again.
7. This time, use the **Choose custom template** button to select your converted template.
8. Save the scenario and use it to generate the WebHelp Responsive output.

**Result:** The converted template is now in a Publishing Template format for version 20.

- Convert Version 21 Publishing Templates to Version 22 *(on page 996)*
- Convert Version 20 Publishing Templates to Version 21 *(on page 997)*

### Convert Version 19 (and Older) Publishing Templates to Version 21

If you have a custom template that was created in Oxygen XML Author Eclipse plugin version 19.1 or older and you want to convert it to be compatible with Oxygen XML Author Eclipse plugin version 21.0 or 21.1, you need to apply two conversion procedures:

1. Convert the old template to a version 20 Publishing Template by using this procedure: **Convert Version 19 (and Older) Publishing Templates to Version 20 *(on page 997)*.**
2. Convert that version 20 Publishing Template to version 21 by using this procedure: **Convert Version 20 Publishing Templates to Version 21 *(on page 997)*.**

**Result:** The converted Publishing Template can now be used in version 21.0 or 21.1.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an Oxygen Publishing Template (on page 2082) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

Tip:
When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

   ```
   .wh_footer {
     font-size: 15px;
     line-height: 1.7em;
     background-color: #000;
   }
   ```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the background-color attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:
4. Save the custom CSS file at a location of your convenience.
5. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1000) or the args.css parameter (on page 1000).

Referencing the CSS Using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Using the Project Explorer view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 954) associated with your publishing template and add your custom CSS in the resources section.

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <resources>
   ...
   <css file="resources/MyCustom.css"/>
   </resources>
   ...
   </webhelp>
   ...
   </publishing-template>
   ```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.
How to Insert Custom HTML Content

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file (or specifying it in a well-formed XHTML fragment) that will be referenced in the transformation (either from an Oxygen Publishing Template (on page 2082) or using one of the HTML fragment placeholder parameters (on page 1066)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the content of the file is not XML Well-formed (on page 517), the transformation will automatically convert non-well-formed HTML content to a well-formed XML equivalent (assuming the webhelp.enable.html.fragments.cleanup transformation parameter is set to true).

  For example, if the HTML content includes several `<script>` or `<link>` elements, the XML fragment would have multiple root elements and to make it well-formed, it would be wrapped it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents.

  Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

  **Note:**

  The converted fragments are stored in a file located in the `whr-html-fragments` subfolder of the transformation's temporary directory.

  **Tip:**

  If you do not want the transformation to automatically convert non-well-formed content into well-formed XML content, you can set the webhelp.enable.html.fragments.cleanup transformation parameter to false. This will instead cause the transformation to fail if at least one HTML fragment is not well-formed.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```xml
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css"
    href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

If you want that the path of your resource to be relative to the templates directory (on page 950), you can use the `${oxygen-webhelp-template-dir}` macro.
To copy the referenced resources to the output directory, follow the procedure in: *How to Copy Additional Resources to Output Directory (on page 1051).*

- **Inline JavaScript or CSS Content:**

**JavaScript:**

```xml
<script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
</script>
```

**CSS:**

```xml
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>
```

**Note:**

If you have special characters (e.g. &, <) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

Otherwise, the WebHelp transformation automatically wraps inline JavaScript or CSS content in an XML comment. Also, if the commented content contains constructs that are not allowed in an XML comment, those constructs are escaped.

**[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```xml
<script type="text/javascript">
<!--
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
</script>
```
Using WebHelp Macros

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

```html
<script type="text/javascript" src="${path(oxygen-webhelp-template-dir)}/"></script>
```

- **In text content** - Using the `<whc:macro>` template component:

```html
<script type="text/javascript">
    var outDirPath = '<whc:macro value="${path(oxygen-webhelp-output-dir)}" xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
    console.log("The output directory path is: ", outDirPath);
</script>
```

**Note:**

When using the `<whc:macro>` element, you should also include the `xmlns:whc="http://www.oxygenxml.com/webhelp/components"` namespace declaration for the `whc` prefix. This is necessary for the XML fragment to be well-formed.

The following *macros* are supported:

- **i18n**
  
  For localizing a string.

  `$i18n{string.id}`

- **param**
  
  Returns the value of a transformation parameter.

  `$param{webhelp.show.main.page.tiles}`

- **env**
  
  Returns the value of an environment variable.

  `$env{JAVA_HOME}`

- **system-property**
  
  Returns the value of a system property.
${\text{system-property(os.name)}}

**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

${\text{timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}}$

**path**

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

${\text{path(oxygen-webhelp-template-dir)}}$

**Note:**

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

**map-xpath**

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

**Tip:**

Available in all template layout HTML pages.

${\text{map-xpath(/map/title)}}$

**topic-xpath**

Can be used to execute an XPath expression over the current topic.
Tip:
Available only in the topic HTML page template (wt_topic.html).

```xml
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

Oxygen XML Author Eclipse Plugin 24.1 | 11 - Publishing | 1005

```xml
${oxygen-webhelp-build-number}
```

Returns the current WebHelp distribution ID (build number).

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 989).
2. Insert the HTML content in a file that is XML well-formed (for example, custom-html.xml).
3. Using the Project Explorer view, copy your custom XML file in a folder inside publishing the template root folder (for example, in the custom_footer_template/html-fragments folder).
4. Open the template descriptor file (on page 954) associated with your publishing template and add a reference to the custom HTML fragment in the html-fragments section.

```xml
<publishing-template>

...<webhelp>

...<html-fragments>

<fragment

  file="html-fragments/custom-html.xml"

  placeholder="webhelp.fragment.head"/>

</html-fragments>

</webhelp>

...</publishing-template>
```

Note:
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 960).

5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

**Note:**
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 960).

4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the `<head>` element of your output document.

**Related Information:**
- HTML Fragment Placeholders (on page 960)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 953)

### How to Insert JavaScript AMD Modules

In the WebHelp Responsive output, you may want to include a JavaScript module that uses the Asynchronous Module Definition (AMD) format. Unlike the traditional JavaScript resources that are loaded using `<script>` tags, these modules are loaded using the RequireJS library. For the traditional JavaScript libraries, the standard procedure to contribute your script to the output would be to use an HTML fragment file as described here (on page 1001).

Although following the procedure that uses HTML fragments (on page 1001) would result in having your JS file included in the output, loading the JS code in the browser will result in an error. Since your JS module uses the AMD API, it cannot be loaded using a `<script>` element. For example, because many jQuery plugins use the AMD format, it will be difficult for you to use those libraries in your custom WebHelp output.

Normally, a JavaScript AMD module can be loaded in one of the following ways:

- **As a top-level script**, using the `data-main` attribute of the `<script>` element used to load the RequireJS library.

```html
<script data-main="js/template-main.js" src="/js/require.js"></script>
```

However, since WebHelp already loads its internal JS modules using RequireJS, a top-level script is already specified and you cannot specify another top-level script in the same page. Therefore, this approach cannot be used to load your custom JS module in Oxygen XML WebHelp, leaving you with only the following option.

- **As a dependency module**, using a `require()` call from the top-level (main) script or from one of its dependency modules. This means that you would have to alter one of the WebHelp core JS libraries and inject a `require()` call to load your custom module:
Contributing JavaScript AMD Modules Using a Publishing Template

Oxygen XML WebHelp provides the ability to contribute a custom JavaScript Asynchronous Module Definition (AMD) resource in the output by referencing it in the Publishing Template descriptor file (on page 954). This module is automatically copied to the output directory and it is automatically loaded in the output HTML pages using a require() call. Thus, you can include your scripts in the output without altering WebHelp's core JavaScript libraries.

This module may contain all of your custom functionality or can be used to load other AMD JavaScript modules. The additional sub-modules can be stored either locally in your custom Publishing Template or on a remote web server.

Important:
To enable loading of a JS module you should set the webhelp.enable.template.js.module.loading parameter to yes (the default value is no) in the Publishing Template descriptor file or in the transformation scenario.

The JavaScript Modules

The JS Modules sample template contains a main JavaScript module (template-main.js) that loads other modules stored in the template package or in a remote location on the Internet.

Besides the main JavaScript example, the template contains 3 other sub-modules:

- **red.js** - Changes the font color of the publication title.

```javascript
define(['require'], function (require) {
  require(['./red', './italic', './tables']);
});
```

- **italic.js** - Changes the font style of your publication title.

```javascript
define(['jquery'], function ($) {
  $(document).ready(function () {
    // Make the title red
    $('.wh_publication_title a').attr('style', 'color:red');
  });
});
```
define(['jquery'], function ($) {
  $(document).ready(function () {
    // Make the title italic
    $('a.wh_publication_title').wrapInner('<i></i>);
  });
});

- **tables.js** - Loads the DataTables jQuery plugin from a CDN.

```javascript
define(['jquery',
  'https://cdn.datatables.net/1.10.16/js/jquery.dataTables.min.js'], function ($) {
  $(document).ready(function () {
    $('.table').DataTable();
  });
});
```

The JavaScript modules are stored in the Publishing Template package as follows:

```javascript
[template-dir]
[js]
  template-main.js
  italic.js
  red.js
  tables.js
```

**Notes:**

- The main module should be referenced in the Publishing Template descriptor file (on page 954) by specifying its path relative to the base directory of the template.

```xml
<js-amd-module file="js/template-main.js"/>
```

- The main JS module is copied automatically to the output directory, but the sub-modules are not. To instruct the Publishing Template engine to copy those modules to the output directory you should include a `<fileset>` section in the Publishing Template descriptor file (on page 954).

```xml
<fileset>
  <include name="js/*.js"/>
</fileset>
```

- The main module can reference other modules bundled in the publishing template package as follows:
Relative to template directory - Prefix their paths with the ID of the template directory: `template-base-dir` (for example: `template-base-dir/js/italic`).
Relative to the name of the current JS module - Use `./` to prefix the paths of the referenced modules.
The `.js` extension should be omitted for local modules, because the `RequireJS` library will add it automatically.

Related Information:
How to Insert Custom HTML Content (on page 1001)

How to Change Numbering Styles for Ordered Lists

Ordered lists (`<ol>`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

   ```xml
   <ol outputclass="number-alpha">
       <li>A</li>
       <li>B</li>
       <li>C</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
       list-style-type:lower-alpha;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1009) or the `args.css` parameter (on page 1010).

Referencing the Custom CSS from a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Using the Project Explorer view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file (on page 954) associated with your publishing template and add your custom CSS in the `resources` section.

   ```xml
   <publishing-template>
       ...
       <webhelp>
   ```
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Adding Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the <codeblock> element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the <codeblock> element in the editor and in the Attributes view, click on the Value cell for the @outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the <codeblock> element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

...<resources>
...<css file="resources/MyCustom.css"/>

• language-bourne
• language-c
• language-cpp
• language-csharp
• language-css
• language-ini
• language-java
• language-javascript
• language-json
• language-lua
• language-perl
• language-php
• language-python
• language-ruby
• language-sql
• language-xml
• language-xquery

Attention:
It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

Tip:
Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:
This codeblock:

```xml
<codeblock outputclass="language-xml">
  <p>This code is an example of how to use a coderef.</p>
  <codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would result in this in the output:

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```
How to Show or Hide Navigation Links in Topic Pages

The topic pages (on page 912) in WebHelp Responsive output can contain navigation links (Previous/Next arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `@collection-type attribute`. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```xml
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence"/>
  <topicref href="../topics/Childtopic.dita"/>
</topicref>
</map>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map (on page 2079) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:
1. Open the DITA map in the Text editing mode of Oxygen XML Author Eclipse plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```xml
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

**Customizing the CSS**

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```css
.wh_top_menu *[data-id='growing-flowers'] {
  display: none;
}
```
3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1000) or the `args.css` parameter (on page 1000).

**How to Hide the Entire Menu**

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

**Using a Publishing Template**

To hide the menu using an Oxygen Publishing Template (on page 950), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Open the template descriptor file (on page 954) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the `parameters` section with its value set to `no`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.show.top.menu" value="no"/>
    </parameters>
  </webhelp>
</publishing-template>
```
3. Open the **DITA Map WebHelp Responsive** transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a template.
2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to `no`.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

**How to Add a Welcome Message in the WebHelp Responsive Main Page**

The main page of the WebHelp Responsive output contains a set of **empty placeholders (on page 960)** that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

**Using a Publishing Template**

To add a customized welcome message in the main page of the WebHelp Responsive output using an **Oxygen Publishing Template (on page 950)**, follow this procedure:

1. If you have not already created a Publishing Template, see **How to Create a Publishing Template (on page 1138)**.
2. Open the **template descriptor file (on page 954)** associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the **parameters** section with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <parameters>
   <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
   </parameters>
   </webhelp>
   </publishing-template>
   ```

3. Open the **DITA Map WebHelp Responsive** transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.

### Using a Transformation Scenario in Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a template.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.

### How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of **empty placeholders** that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.footer` parameter displays the custom content at the bottom of the page.

### Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an **Oxygen Publishing Template** ([on page 950](#)), follow this procedure:

1. If you have not already created a Publishing Template, see **How to Create a Publishing Template** ([on page 1138](#)).
2. Open the **template descriptor file** ([on page 954](#)) associated with your publishing template and add the `webhelp.fragment.footer` parameter in the **parameters** section with its value set to one of the following:
A small well-formed XHTML fragment.
- A path to a file that contains well-formed XHTML content.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.fragment.footer" value="c:\myFooter.xhtml"/>
    </parameters>
  </webhelp>
</publishing-template>
```

**Important:**
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author Eclipse plugin (do not use it with a trial license).

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the *Choose Custom Publishing Template* link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, your custom footer will be displayed at the bottom of the page.

### Using a Transformation Scenario in Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of *Oxygen XML Editor/Author* requires an additional license and some additional setup:

- You must have a valid license for the *Oxygen XML WebHelp Plugin* ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The *Oxygen XML WebHelp Plugin* must be installed and integrated.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.fragment.footer` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.
Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The tiles version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map (on page 2079). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author Eclipse plugin.
2. Add the following metadata information in the <topicref> element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

   ```xml
   <topicmeta>
   <data name="wh-tile">
   <data name="hide" value="yes"/>
   </data>
   </topicmeta>
   ```

Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID growing-flowers). The CSS file should have content that is similar to this:
3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1000) or the args.css parameter (on page 1000).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author Eclipse plugin.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

   ```
   <topicmeta>
     <data name="wh-tile">
       <data name="image" href="img/tile-image.png" format="png">
         <data name="attr-width" value="64"/>
         <data name="attr-height" value="64"/>
       </data>
     </data>
   </topicmeta>
   ```

   **Note:**
   The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile to include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

   ```
   .wh_tile[data-id='growing-flowers'] > div {
     background-image: url('resources/flower.png');
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1000) or the args.css parameter (on page 1000).
Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Add a Logo Image in the Title Area

You can customize WebHelp Responsive output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 950), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Open the template descriptor file (on page 954) associated with your publishing template and add the <logo> element in the <resources> section and set the @file attribute value to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the @target-url attribute.
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.logo.image parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the webhelp.logo.image.target.url parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a favicon to your WebHelp output using an Oxygen Publishing Template (on page 950), follow this procedure:

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 989).
2. Open the template descriptor file (on page 954) associated with your publishing template and add the <favicon> element in the resources section. The path to the image is relative to the template root folder.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <favicon file="images/favicon.png"/>
    </resources>
  </webhelp>
  ...
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: Browsers that provide favicon support display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the *Parameters* tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

**How to Add Video and Audio Objects in DITA WebHelp Output**

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

**Adding Videos to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(on page 1842)*.
   - Drag (or copy) the video file from your system explorer or the **Project Explorer** view *(on page 244)* and drop (or paste) it into your document.
   - Manually add an `<object>` element, as in one of the following examples:

```xml
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:

```xml
<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4"/>
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

**Result:** The transformation converts the `<object>` element to an HTML5 `<video>` element.

```xml
<video controls="controls"> <source type="video/mp4" src="MyVideo.mp4"/> </video>
```

**Adding Audio Clips to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(on page 1842)*.
   - Drag (or copy) the audio file from your system explorer or the **Project Explorer** view *(on page 244)* and drop (or paste) it into your document.
   - Manually add an `<object>` element, as in one of the following examples:

```xml
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:
2. Apply a **DITA to WebHelp** transformation to obtain the output.

**Result:** The transformation converts the `<object>` element to an HTML5 `<audio>` element.

```html
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

### Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the **Insert Media Object toolbar action (on page 1842)** or by manually adding an `<object>` element, as in one of the following examples:

   ```html
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   ```

   or, instead of the `@data` attribute, you can specify the object using a parameter like this:

   ```html
   <object outputclass="iframe">
     <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   </object>
   ```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to `true`:

   ```html
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   <param name="allowfullscreen" value="true"/>
   </object>
   ```

   **Tip:**
   If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: [here (on page 1844)](http://someurl)), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to `true`.

3. Apply a **DITA to WebHelp** transformation to obtain the output.

**Result:** The transformation converts the `<object>` element to an HTML5 `<iframe>` element.

```html
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

For more information, see the following video demonstration:

https://www.youtube.com/embed/IIX11gS4WaU
How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"

src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM"

>

</script>
```

**Result:** The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\indexer\indexer\scoring.properties.

The values that can be edited in the scoring.properties file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
```
2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (on page 2079) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   **Example:** Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a .bak file extension. You could create a simple text file (for example, named exclude.properties), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the webhelp.search.custom.excludes.file parameter to specify the path to the file that contains the excluded file patterns (for example, exclude.properties in step 1). The parameter can be specified in the parameters section of the template descriptor file (on page 959) associated with your
publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the @search attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any <topicref> that you want to exclude from search results, set the @search attribute to no. For example:

```xml
<topicref href="../topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.

How to Optimize Search Results

A DITA Map WebHelp transformation scenario produces a sitemap.xml file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows web admins to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

### Important:

If the webhelp.sitemap.base.url parameter is specified, the loc element will contain the value of this parameter plus the relative path to the page. If the webhelp.sitemap.base.url parameter is not specified, the loc element will only contain the relative path of the page.

You can also set these additional parameters:

- **webhelp.sitemap.change.frequency** - Specifies how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
- **webhelp.sitemap.priority** - Specifies the priority of each page (a value ranging from 0.0 to 1.0).

The structure of the sitemap.xml file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

  Note: The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD hh:mm:ss`.

- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:
1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.

2. Open the **Parameters** tab and set a value for the following parameters:
   - `webhelp.sitemap.base.url` - The URL of the location where your WebHelp system is deployed.

     **Note:**
     This parameter is required for Oxygen XML Author Eclipse plugin to generate the `sitemap.xml` file.

   - `webhelp.sitemap.change.frequency` - How frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
   - `webhelp.sitemap.priority` - The priority of each page (value ranging from 0.0 to 1.0).

3. Run the transformation scenario.

4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

### How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the **Lucene Kuromoji Japanese analyzer** can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

**Restriction:**
The **Kuromoji** analyzer does not work if your WebHelp output is accessed locally. In this scenario, a warning message will be displayed informing you that the **Kuromoji** analyzer is disabled.

It is possible to hide this warning message by using a transformation parameter named `webhelp.enable.search.kuromoji.js`. By default, its value is **yes**, which means the **Kuromoji** analyzer is enabled by default. To hide the warning message, set the value of that parameter to **no** using either of the methods listed below. When it is set to **no**, the **Kuromoji** analyzer is disabled even if you deploy your WebHelp output on a web server.

### Using a Publishing Template

To add a logo in the title area of your WebHelp output using an **Oxygen Publishing Template** (on page 950), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).

2. Open the **template descriptor file** (on page 954) associated with your publishing template and add the `default.language` parameter in the **parameters** section with its value set to `ja-jp`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
</webhelp>
</publishing-template>```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

   **Note:** Alternatively, you could set the @xml:lang attribute on the root of the DITA map (on page 2079) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

### Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

#### How to Localize the Interface of WebHelp Responsive Output

Oxygen XML Author Eclipse plugin comes with support for the following built-in languages: English, French, German, Japanese, and Chinese. It is possible to edit existing localization strings or add a new language.

Static labels used in the WebHelp output are stored in translation files that have the strings-lang1-lang2.xml name format, where lang1 and lang2 are ISO language codes. For example, the US English labels are kept in the strings-en-us.xml file.

These translation files are collected from two locations:
• `DITA-OT-DIR/plugins/org.dita.base/xsl/common` folder - DITA-OT's default translations (generated text for `<note>`, `<fig>`, and `<table>` elements).

• `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization` folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

**Related Information:**
How to Index Japanese Content (on page 1027)

Customizing Generated Text

**Modifying the Existing Strings**

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.

2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```xml
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>
  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```xml
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the translation files (on page 1028) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```xml
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
</strings>
```
5. Use the **Run DITA-OT Integrator** transformation scenario ([on page 808](#)) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box ([on page 898](#)).

### Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
     <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

   ```xml
   <strings xml:lang="pl-PL">
     ...
   </strings>
   ```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

   ```xml
   <strings xml:lang="pl-PL">
     ...
     <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
     <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
     ...
   </strings>
   ```
7. Copy the common DITA-OT strings defined in the DITA-OT-DIR/plugins/org.dita.base/xsl/common/strings-en-us.xml file. It defines a set generated text available for HTML-based transformations (such as <note>, <fig>, and <table> elements). Translate the content of each <str> element.

```xml
<strings xml:lang="pl-PL">
...  
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
...  
  <str name="Figure">Polish translation for 'Figure'</str>
  <str name="Table">Polish translation for 'Table'</str>
...  
</strings>
```

8. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 898).

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (on page 2079) and set the @xml:lang attribute on its root element (<map>). The corresponding attribute value can be set for following RTL languages:

- **ar-eg** - Arabic
- **he-il** - Hebrew
- **ur-pk** - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ Like widget to your WebHelp output using an Oxygen Publishing Template (on page 950), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
- The file must be well-formed.
- The code for each `<script>` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```xml
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
        (function(d, s, id) {
            var js, fjs = d.getElementsByTagName(s)[0];
            if (d.getElementById(id)) return;
            js = d.createElement(s); js.id = id;
            js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
            fjs.parentNode.insertBefore(js, fjs);
        })(document, 'script', 'facebook-jssdk');
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
data-show-faces="true" data-share="true"/>
</div>
```

4. Open the template descriptor file (on page 954) associated with your publishing template.
5. Use one of the parameters that begin with `webhelp.fragment` (on page 960) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```xml
<publishing-template>
    ...
    <webhelp>
    ...
    <html-fragments>
        <fragment file="HTML-fragments/facebook-widget.xml"
            placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
</webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.
Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Facebook Developers](https://developers.facebook.com/) website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
    (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
  <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
</div>
```

4. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a **template**.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment (on page 960)`. Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

**How to Add Tweet Button in WebHelp Responsive Output**

It is possible to integrate **Twitter** into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

**Using a Publishing Template**

To add a Twitter™ **Tweet** widget to your WebHelp Responsive output using an **Oxygen Publishing Template (on page 950)**, follow this procedure:
1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    !function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http/.test(d.location) ? 'http' : 'https';
      if (!d.getElementById(id)) {
        js = d.createElement(s);
        js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
  </script>
</div>
```

4. Open the template descriptor file (on page 954) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 960) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the tweet-button.xml file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment file="HTML-fragments/tweet-button.xml"
                placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```
Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Twitter™ Tweet widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
     <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
     <script>
       function (d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/test(d.location) ? 'http': 'https';
         if (! d.getElementById(id)) {
           js = d.createElement(s);
           js.id = id;
           js.src = p + '://platform.twitter.com/widgets.js';
           fjs.parentNode.insertBefore(js, fjs);
         }
       }
       (document, 'script', 'twitter-wjs');
     </script>
   </div>
   
   4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment` **(on page 960)**. Set that parameter to reference the `tweet-button.xml` file that you created earlier.

6. Click **Ok** and run the transformation scenario.

### How to Integrate Google Analytics in WebHelp Responsive Output

You can use **Google Analytics** to track and report site data for your **WebHelp Responsive** output.

#### Using a Publishing Template

To integrate **Google Analytics** into your WebHelp Responsive output using an **Oxygen Publishing Template** **(on page 950)**, follow this procedure:

1. Create a new **Google Analytics account** (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A **Tracking Code** looks like this:

   ```
   (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Open the **template descriptor file** **(on page 954)** associated with your publishing template.

6. Use the `webhelp.fragment.after.body` parameter **(on page 1066)** in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate Google Analytics into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]|||
function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*
new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
6. Switch to the Parameters tab. Edit the webhelp.fragment.after.body parameter (on page 1066) and set it to reference the googleAnalytics.xml file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending <body> element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click Ok and run the transformation scenario.

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the Google Search Engine into your WebHelp Responsive output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the Google Search Engine into your WebHelp Responsive output using an Oxygen Publishing Template (on page 950), follow this procedure:
1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine component for your site.

**Important:**
For the Layout, you must select Results only for the Google Search Engine to work with Oxygen XML WebHelp Responsive.

4. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() { 
  var cx = '0008821088977588983:8mn4k_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called googlecse.html.
6. Open the template descriptor file (on page 954) associated with your publishing template and add the webhelp.google.search.script parameter in the parameters section with its value set to reference the googlecse.html file that you created earlier.

```xml
<publishing-template>
...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.google.search.script"
        value="resources/googlecse.html"
        type="filePath"/>
    </parameters>
  </webhelp>
</publishing-template>
```

7. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site.

Important:
For the Layout, you must select Results only for the Google Search Engine to work with Oxygen XML WebHelp Responsive.

4. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called googlecse.html.
6. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a *template*.

7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

9. Click **Ok** and run the transformation scenario.

### Ant Extensions for WebHelp Responsive

The WebHelp Responsive plugin provides extension points that allow you to implement custom Ant targets to perform additional operations before and after certain processing stages. The following extension points are available in WebHelp Responsive:

- **whr-init-pre**
  Runs a custom Ant target before the `whr-init` processing stage.

- **whr-init-post**
  Runs a custom Ant target after the `whr-init` processing stage.

- **whr-collect-indexterms-pre**
  Runs a custom Ant target before the `whr-collect-indexterms` processing stage.

- **whr-collect-indexterms-post**
  Runs a custom Ant target after the `whr-collect-indexterms` processing stage.

- **whr-toc-xml-pre**
  Runs a custom Ant target before the `whr-toc-xml` processing stage.

- **whr-toc-xml-post**
  Runs a custom Ant target after the `whr-toc-xml` processing stage.

- **whr-context-help-map-pre**
  Runs a custom Ant target before the `whr-context-help-map` processing stage.

- **whr-context-help-map-post**
  Runs a custom Ant target after the `whr-context-help-map` processing stage.

- **whr-sitemap-pre**
  Runs a custom Ant target before the `whr-sitemap` processing stage.
To use Ant extension points for WebHelp Responsive, follow these steps:

1. In the `DITA-OT-DIR/plugins/` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.ant.extensions`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that extends the WebHelp Responsive plugin and specifies an Ant extension point with your custom Ant project file that contains the new build targets. For example:
3. Create the **custom_build_file.xml** file (in the folder you created in step 1) that contains your custom Ant project implementing one or more extension points:

```xml
<project name="custom.ant.extensions.integrator" basedir=".">
  <target name="custom-whr-init-pre" extensionOf="whr-init-pre">
    <echo>Extension point that executes before whr-init</echo>
  </target>
  <target name="custom-whr-init-post" extensionOf="whr-init-post">
    <echo>Extension point that executes after whr-init</echo>
  </target>
</project>
```

4. Integrate the plugin into the DITA-OT. In the **DITA-OT-DIR/bin** directory of the **DITA Open Toolkit**, run one of the following scripts, depending on your operating system:

- **Windows**: `DITA-OT-DIR/bin/dita.bat --install`
- **Linux/macOS**: `sh DOTA-OT-DIR/bin/dita --install`

5. Execute a DITA Map to WebHelp Responsive transformation script.

### XSLT Extensions for WebHelp Responsive

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- **Use XSLT-import extension points** from an **Oxygen Publishing Template (on page 2082)**.

  **Note:**
  Use this method if you want to affect only the transformations that use this *publishing template*.

- **Use XSLT-import extension points** from a DITA-OT extension plugin.

  **Note:**
  This method will affect all the outputs generated with the WebHelp system.
How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (on page 1130).

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
    <copyrfirst>
        <year>2002</year>
    </copyrfirst>
    <copyrlast>
        <year>2017</year>
    </copyrlast>
    <bookowner>
        <organization>SyncRO Soft SRL</organization>
    </bookowner>
</bookrights>
```

Figure 236. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins \com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template (on page 971) to expand its components. The main page template declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
    <whc:include_html href="${webhelp.fragment.footer}"
</div>
```
In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]">
    <!-- Apply the default processing -->
    <xsl:next-match/>

    <!-- Add a div containing the copyright information -->
    <div class="copyright_info">
        <xsl:choose>
            <!-- Adds the start-end years if they are defined -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
                <span class="copyright_years">
                    &amp;nbsp; <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                    - <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
                </span>
            </xsl:when>

            <!-- Adds only the first year if last is not defined. -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
                <span class="copyright_years">
                    © <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                </span>
            </xsl:when>
        </xsl:choose>

        <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
            <span class="organization">
                <xsl:text>. All rights reserved.</xsl:text>
            </span>
        </xsl:if>
    </div>
</xsl:template>
```

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
You should have the custom_footer_template folder linked in your project.

3. Using the Project Explorer view, create an xslt folder inside the project root folder. You should have the custom_footer_template/xsl folder in your project.

4. Create your customization stylesheet (for example, custom_mainpage.xsl) in the custom_footer_template/xsl folder. Edit it to override the template that produces the footer section:

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]"><xsl:next-match/>

<!-- Add a div containing the copyright information -->
<div class="copyright_info">
  <xsl:choose>
    <!-- Adds the start-end years if they are defined -->
    <xsl:when test="exists($toc/*/topicmeta/*/bookrights/*/copyrfirst) and exists($toc/*/topicmeta/*/bookrights/*/copyrlast)">
      <span class="copyright_years">
        ©<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrfirst"/>
        -<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrlast"/>
      </span>
    </xsl:when>
    <!-- Adds only the first year if last is not defined. -->
    <xsl:when test="exists($toc/*/topicmeta/*/bookrights/*/copyrfirst)">
      <span class="copyright_years">
        ©<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrfirst"/>
      </span>
    </xsl:when>
  </xsl:choose>

  <xsl:if test="exists($toc/*/topicmeta/*/bookrights/*/bookowner/*/organization)">
    <span class="organization">
      <xsl:text>
      </xsl:text>
      <xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/bookowner/*/organization"/>
    </span>
  </xsl:if>
</div>
```
5. Open the template descriptor file (on page 954) associated with your publishing template and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.webhelp.xsl.createMainPage` XSLT extension point.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        file="xslt/customMainPage.xsl"
        id="com.oxygenxml.webhelp.xsl.createMainPage"/>
    </xslt>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

Use Case 2: Add Generation Time in the Output Footer

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

![Figure 237. Generation Time Added in the WebHelp Footer](image)

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), modify the template by adding the following XSLT code at the end.

```xsl
<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(
      current-dateTime(),
      '[h1]:[m01] [P] on [M01]/[D01]/[Y0001'].' )"/>
  </div>
</xsl:if>
```
Note:
You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the template descriptor file (on page 954) associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.footer.add.generation.time"
        value="yes"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. In the Parameters tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA Bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

Note:
This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the Bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
</bookrights>
```
The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template (on page 971) declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>
  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -
          <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>
    </xsl:choose>
  </div>
</xsl:template>
```
<xsl:template match="*:div[contains(@class, 'footer-container')]
mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>
  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <!-- Adds only the first year if last is not defined. -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
      <span class="copyright_years">
        ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
      </span>
    </xsl:when>
    </xsl:choose>
    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:text>.
</xsl:text>
        <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
        <xsl:text> All rights reserved. </xsl:text>
      </span>
    </xsl:if>
  </div>
</xsl:template>

You can implement this functionality with a WebHelp extension plugin that uses the
com.oxygenxml.webhelp.xsl.createMainPage extension point (on page 1079). This extension point allows
you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example,
com.oxygenxml.webhelp.responsive.custom.footer).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your
customization stylesheet. For example:

   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
       file="custom_mainpage.xsl"/>
   </plugin>

3. Create your customization stylesheet (for example, custom_mainpage.xsl), and edit it to override the
template that produces the footer section:
<div class="copyright">
  <xsl:choose>
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
      <span class="copyright_years">© <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/> - <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/></span>
    </xsl:when>
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
      <span class="copyright_years">© <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/></span>
    </xsl:when>
  </xsl:choose>
  <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
    <span class="organization">.<xsl:text> All rights reserved.</xsl:text></span>
  </xsl:if>
</div>

4. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 898).

5. Run a DITA Map WebHelp Responsive transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSL T-Parameter Extension Point to Control if Generation Time is Displayed in the Output

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or not this customization is active. In this case, you can use the com.oxygenxml.webhelp.xsl.createMainPage.param extension point (on page 1080).

Figure 239. Generation Time Added in the WebHelp Footer
To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (on page 1047).
2. In the customization stylesheet that you just created (for example, custom_mainpage.xsl), declare webhelp.footer.add.generation.time as a global parameter and modify the template by adding the following XSLT code at the end.

```xml
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(
      current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

3. Edit the plugin.xml file to specify the com.oxygenxml.webhelp.xsl.createMainPage.param extension point and a custom parameter file by adding the following line:

```xml
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, params.xml). It should look like this:

```xml
<dummy>
  <param name="webhelp.footer.add.generation.time"
    expression="${webhelp.footer.add.generation.time}" if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 898).
6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (on page 1975), specify the desired value (yes or no) for your custom parameter (webhelp.footer.add.generation.time).
7. Run the transformation scenario.

**Related Information:**

- [DITA-OT] XSLT-Parameter Extension Points

**Miscellaneous Customization Topics**

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

**How to Copy Additional Resources to Output Directory**

You can copy additional resources (such as graphics, JavaScript, CSS, entire folders, or other resources) to the output directory either by using an Oxygen Publishing Template (on page 2082) or the webhelp.custom.resources parameter.
Copying Additional Resources to the Output Directory using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1138).
2. Add a new `<fileset>` element in the resources section of the template descriptor file (on page 957).

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <fileset>
        <include name="custom-resources/**/**"/>
        <exclude name="**/*.git"/>
      </fileset>
    </resources>
  </webhelp>
  ...
</publishing-template>
```

**Note:**
Relative paths in the descriptor file are relative to the template root folder.

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Results:** All files from the custom resources directory will be copied to the WebHelp Output Directory/oxygen-webhelp/template folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed Edit links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.
Using a Publishing Template

To embed an Edit link in the DITA Map WebHelp Responsive output using an Oxygen Publishing Template (on page 950), follow this procedure:

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 989).
2. Open the template descriptor file (on page 954) associated with your publishing template and add the following parameters with their values set to the URLs:
   - editlink.ditamap.edit.url - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser’s address bar.
   - editlink.additional.query.parameters - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. &tags-mode=no-tags).

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="editlink.ditamap.edit.url" value="webdav-https://dav.box.com/dav/my.ditamap"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

  ```
  ```

- **macOS/ Linux:**

  ```
  ```
Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an Edit link in the DITA Map WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - editlink.ditamap.edit.url - The URL of the Oxygen XML Web Author that have opened the DITA map for editing.
   - editlink.additional.query.parameters - Optional query parameters to be appended to each generated edit link. Must start with & (e.g.: &tags-mode=no-tags).
3. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block elements (on page 2077) (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template

To flag content in DITA Map to WebHelp output using an Oxygen Publishing Template (on page 950), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the @audience attribute set to programmer, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```
3. Open the template descriptor file (on page 954) associated with your publishing template and add the `args.filter` parameter in the `parameters` section with its value set to the path of the DITAVAL file you created.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="args.filter" value="resources/myFile.ditaval"/>
    </parameters>
  </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note: For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a DITA Map to WebHelp transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab (with the **Use DITAVAL File** option).
5. Run the transformation scenario.

**Related Information:**
Filtering Profiling Values with a DITAVAL File *(on page 2018)*

## How to View MathML Equations in HTML Output

By default, only **Firefox** can render **MathML** equations embedded in the **HTML** code. **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM"
L*>
</script>
```

**Alternate Method for DITA**

For DITA documents, you can also use the following procedure:

1. Create an XML file that contains a script similar to the one shown in the example above.
2. Edit the DITA Map transformation scenario and open the **Parameters** tab.
3. Set the following parameter to point to the XML file created in step 1:
   - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your XML file.
   - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your XML file.
   - **Any other type of HTML-based publishing** - Set the `args.hdf` parameter to point to your XML file.
4. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

## How to Disable Caching in WebHelp Responsive Output

In cases where a set of WebHelp Responsive pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a web browser on the client side, (rather than re-using an outdated cached version in the browser).

To disable caching in WebHelp Responsive output, follow this procedure:
1. Create a new well-formed XML file and add the following code snippet:

```xml
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

**Note:**
The code should look like this:

```html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
  </head>
</html>
```

2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** Your additional content is included at the end of the `<head>` element of your output document.

### How to Configure a Custom Search Engine

It is possible to integrate a custom search engine into your WebHelp Responsive output. This is done by using the following transformation parameters:

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

To integrate a custom search engine into your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template *(on page 1138)*.
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
   - A file named `custom-search-results-fragment.xml`.
   - A file named `custom-search-script-fragment.xml`.
   - A folder named `js`. 
3. In the `custom-search-results-fragment.xml` file, define the HTML structure that will be used as the search results area. For example:

```xml
<div id="custom-search-results">...</div>
```

**Note:**
The custom search engine script will need to find an HTML element from the HTML structure that will be used as the search results area and write the search results inside it. In this example, it is the `<div>` element with the id `custom-search-results`.

4. In the `js` folder, create a file named `custom-search.js`.

5. As a starting point, you can copy the following content to the `custom-search.js` file:

```javascript
$(document).ready(function () {
  const params = new URLSearchParams(window.location.search);
  const searchQuery = params.get('searchQuery');
  // Implement your custom search engine
  // Display the search results
});
```

**Important:**
The value entered by the user in the search page will be available in the URL's query parameters in a parameter named `searchQuery`.

**Attention:**
`URLSearchParams` is not supported on all browsers (it is used as an example). A list with the supported browsers can be found [here](#). A different solution should be used if you need to support other browsers.

6. Implement your custom search engine.

**Note:**
The search results should be pushed into the `<div>` element created earlier with the id `custom-search-results`.

7. In the `custom-search-script-fragment.xml` file, define the scripts that are required for your custom search engine to run. For example:

```xml
<div>
  <script src="${oxygen-webhelp-template-dir}/js/custom-search.js"></script>
</div>
```
8. Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see Template Resources (on page 957) for more details):

```xml
<fileset>
  <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the custom search engine. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```xml
<html-fragments>
  <fragment file="custom-search-script-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.script"/>
  <fragment file="custom-search-results-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.results"/>
</html-fragments>
```

10. Run the transformation with this publishing template selected.

How to Add a Link to PDF Documentation

It is possible to add a component in your WebHelp output that links to an external PDF resource. For example, it could link to the PDF equivalent of the documentation. This is achieved by configuring some transformation parameters and the link component is added in the header/breadcrumb stripe, next to the navigation links.

The transformation parameters used for generating a PDF link component in the WebHelp Responsive output are:

- `webhelp.pdf.link.url`
  Specifies the target URL for the PDF link component.

- `webhelp.pdf.link.text`
  Specifies the text for the PDF link component.

- `webhelp.pdf.link.icon.path`
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- `webhelp.show.pdf.link`
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: `yes` (default) and `no`.

- `webhelp.pdf.link.anchor.enabled`
Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

How to Add a Custom Component for WebHelp Output

This topic explains how to use several customization methods to define and implement a custom component for WebHelp output pages.

Predefined components

The WebHelp output is based on a set of HTML Page Layout Files (on page 969) that define the default layout of the generated pages. Each layout file is made of a set of various components. Each component is described using an associated XML element that is processed at the generation time resulting in its associated component being included in the output pages.

Here are a few examples of predefined components: Logo, Title, Menu, Search Input, Topics Tiles, Topic Breadcrumb, Topic Content, Publication Table of Contents. A complete list with all the available components is available here: Layout of the Responsive Page Types (on page 908).

For example, the page component that is used to define the Search Input field in the WebHelp HTML pages is defined as follows:

<!-- Search form -->

<whc:webhelp_search_input class="navbar-form wh_topic_page_search search" role="form"/>

At publishing time, the above component will be expanded into:

<div class="wh_search_input navbar-form wh_topic_page_search search">
  <form id="searchForm" method="get" role="search" action="../search.html">
    <div>
      <input type="search" placeholder="Search 
          class="wh_search_textfield ui-autocomplete-input" id="textToSearch" name="searchQuery" aria-label="Search query" required="required"
          autocomplete="off"/>
      <button type="submit" class="wh_search_button aria-label="Search">
          <span class="search_input_text">Search</span>
      </button>
    </div>
  </form>
</div>

Customization Methods

The most common customization methods for the WebHelp Responsive output include:
• Apply custom CSS styles (on page 999) to change the default layout and styles.
• Insert additional HTML content (on page 1001) using one of the available HTML Fragment Placeholder parameters (on page 960).
• Extend the default processing using XSLT Extension Points (on page 960).
• Configure available Transformation Parameters (on page 1065).

Use Case: Custom Link Component

For the subsequent procedure, suppose you have a DITA project for a User Manual and you also have various video demonstrations available on your website that supplement the documentation. You may want to link a video demonstration for a particular feature it its associated DITA topic in the WebHelp output.

You could simply add a link somewhere in your DITA topic, but this approach would not be very suitable for a printable (PDF) version of your User Manual. Thus, you need to include the link to the associated video demonstration only in the WebHelp output of your User Manual (and not the PDF version).

One way to link a video with its associated topic is to include its URL in the metadata section. For example:

```xml
<prolog>
  <metadata>
    <othermeta name="video-link" content="https://www.youtube.com/watch?v=zNmXfKWXw08"/>
  </metadata>
</prolog>
```

Next, you need to instruct WebHelp to pick up the URL from the metadata and generate a link in a specific location of the HTML output page. You can achieve this by creating your own WebHelp custom component.

Creating a Custom Component

You can combine several of the available customization methods to define and implement your own WebHelp custom component.

To create a custom component that displays a link to the current topic's associated video tutorial, follow these steps:

1. Define your component. For example, it may have the following form:

   ```xml
   <comp:video-link xmlns:comp="http://example.com/custom-components"/>
   ```

   The component is an XML element that belongs to a custom defined namespace.
2. Insert the component in your topic pages. To do this, you will have to save the associated XML element in an HTML Fragment file (for example, named `video-link-fragment.xml`).

3. Reference the HTML Fragment file in your current Publishing Template's descriptor file (on page 954) and associate it with an HTML Fragment placeholder that is available for the topic pages (`webhelp.fragment.before.topic.toolbar` in this case):

```xml
<html-fragments>
  <fragment file="component/html-fragment/video-link-fragment.xml" placeholder="webhelp.fragment.before.topic.toolbar"/>
</html-fragments>
```

**Note:**

The HTML Fragment file is referenced using a path relative to the Publishing Template root directory.

4. Create a custom XSLT file that processes the custom component and picks up the video URL available in the current topic's metadata and generates a link to the page that contains the video:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:comp="http://example.com/custom-components"
                 exclude-result-prefixes="xs comp"
                 version="3.0">

  <!-- Custom component implementation -->
  <xsl:template match="comp:video-link" mode="copy_template">
    <xsl:param name="ditaot_topicContent" tunnel="yes"/>
    <!-- Look for a 'video-link' <meta> element in the current topic content -->
    <xsl:variable name="videoLinkMeta" select="$ditaot_topicContent//*:meta[@name='video-link']"/>
    <xsl:if test="exists($videoLinkMeta)">
      <div class="video-link-container">
        <a href="{$videoLinkMeta[1]/@content}" class="video-link" target="_blank" aria-label="Video">
          <span>Video</span>
        </a>
      </div>
    </xsl:if>
  </xsl:template>
</xsl:stylesheet>
```

The HTML content generated for your component will look like this:
5. Reference the above XSL file in your Publishing Template's descriptor file using the XSLT extension point associated with the XSL module that generates an HTML file for each DITA topic:

```xml
<xslt>
  <extension file="component/xsl/video-link-impl.xsl"
             id="com.oxygenxml.webhelp.xsl.dita2webhelp"/>
</xslt>
```

6. Create a custom CSS file that contains the rules for styling the output for your component:

```css
@import url('https://fonts.googleapis.com/icon?family=Material+Icons');

.video-link-container {
  display: flex;
  align-items: center;
  flex-grow: 10;
  justify-content: flex-end;
}

.video-link {
  display: flex;
  align-items: center;
  color: #fff !important;
}

.video-link:before {
  content: "smart_display";
  font-family: 'Material Icons';
  font-size: 20px;
  display: inline-block;
  word-wrap: normal;
  white-space: nowrap;
}

.video-link span {
  display: none;
}
```
7. Reference the above CSS file in your Publishing Template's descriptor file:

```xml
<resources>
    <!-- .... -->
    <css file="component/css/video-link.css"/>
</resources>
```

**Result:** An icon that is a link to the video appears in the header stripe in the output page.

**Figure 241. Custom Link to Video Component**

**Sample Publishing Template**

A sample Publishing Template that contains all the above customizations is available here: [https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component](https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component).

**How to Group Related Links by Type**

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

<table>
<thead>
<tr>
<th>Related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Topic</td>
</tr>
<tr>
<td>Target Concept</td>
</tr>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>

It is possible to group the links by target type (topic type) by setting the `webhelp.rellinks.group.mode=group-by-type` parameter. The output will look like this:

<table>
<thead>
<tr>
<th>Related concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Concept</td>
</tr>
<tr>
<td>Related tasks</td>
</tr>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>
WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

`webhelp.publishing.template`

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Note:**
The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

**Note:**
Relative paths are resolved based on the current working directory.

`webhelp.publishing.template.descriptor`

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

`webhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`webhelp.favicon`

The file path that points to an image to be used as a favicon in the WebHelp output.

`webhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

`webhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

`webhelp.logo.image.alt`
Specifies a value that will be set in the `@alt` attribute of the logo image. If the parameter is not specified, the `@alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

**Oxygen Feedback Parameter**

`webhelp.fragment.feedback`

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**HTML Fragment Extension Parameters**

`webhelp.enable.html.fragments.cleanup`

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to `true` (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to `false`, the transformation will fail if at least one HTML fragment is not well-formed.

`webhelp.fragment.after.body`

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.body.main.page`

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.body.search.page`

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.body.terms.page`

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.body.topic.page`

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.feedback`
This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.header`

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.header.main.page`

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.header.search.page`

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.header.terms.page`

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.header.topic.page`

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.logo_and_title`

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.main.content.area`

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.main.content.area.main.page`

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.main.content.area.topic.page`
This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.main.page**

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.search.page**

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.terms.page**

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.topic.page**

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top_menu**

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo_and_title**

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use webhelp.fragment.before.search.input.main.page instead.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.before.search.input.main.page
This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.search.page
This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.terms.page
This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.topic.page
This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles
This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu
This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.breadcrumb
This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.content
This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toc
This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toolbar
This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.fragment.footer**

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

⚠️ **Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author Eclipse plugin (do not use it with a trial license).

**webhelp.fragment.head**

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.main.page**

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.search.page**

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.terms.page**

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.topic.page**
This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**Output Component Parameters**

**webhelp.default.collection.type.sequence**

Specifies if the sequence value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

**webhelp.enable.sticky.header**

Controls whether or not the header section will remain sticky in the output. Possible values are yes (default) or no.

**webhelp.enable.sticky.publication.toc**

Controls whether or not the publication table of contents will remain sticky in the output. Possible values are yes (default) or no.

**webhelp.enable.sticky.topic.toc**

Controls whether or not the topic table of contents will remain sticky in the output. Possible values are yes (default) or no.

**webhelp.figure.title.placement**

Controls the placement of the title for figures (relative to the image). Possible values include top (default) and bottom.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:
• **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
• **topic** - The TOC will only include links for the current topic and its direct children.
• **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

• **left**
• **right** (default)
• **top**
• **bottom**
• **hidden** - The tooltip will not be displayed.

**webhelp.rellinks.group.mode**

Specifies the related links grouping mode. All links can be grouped into a single "Related Information" heading or links can be grouped by their target type (topic, task, or concept). Allowed values: **single-group** (default) or **group-by-type**.

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is **yes**.

**webhelp.show.changes.and.comments**

When set to **yes**, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is **no**.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.full.size.image**

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is **yes**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is **yes**.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a **tree style** layout, this parameter should be set to **no**.

**webhelp.show.main.page.toc**
Specifies if the table of contents will be presented in the main page of the output. The default value is **yes**.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is **yes**.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is **yes**.

**webhelp.show.publication.toc**

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is **yes**.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is **yes**.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is **yes**.

**webhelp.table.title.placement**

Controls the placement of the title for tables. Possible values include **top** (default) and **bottom**.

**webhelp.top.menu.activated.on.click**

When this parameter is activated (set to **yes**), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to **no** (default), hovering over a menu item displays the menu content.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is **3**. A value of **0** means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are **collapsed** or **expanded** (default value).

**Search-Related Parameters**

**webhelp.enable.search.autocomplete**

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is **yes**.
**webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

```
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.index.elements.to.exclude**

Specify a list of HTML elements that will not be indexed by the search engine. The value of the `class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `div` elements that have a `class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.search.stop.words.exclude**

Specify a list of words that will be excluded from the default list of `stop words` that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

**webhelp.search.stop.words.include**

Specify a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

**webhelp.sitemap.base.url**
Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the DITA map, appended to this base URL value).

**webhelp.sitemap.change.frequency**

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

### Publishing Speedup Parameters

**parallel**

A common parameter with other transformation types. When set to true (default value is false), the publishing pre-processing stages are run in parallel slightly improving the publishing time.

**store-type**

A common parameter with other transformation types. When set to memory, the processing stages use internal memory to store temporarily processed documents, thus decreasing the publishing time but slightly increasing the amount of internal memory used for the process. When publishing on Windows, setting this parameter can decrease the publishing times by about one-third.

---

**Note:**

The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

### Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

**webhelp.pdf.link.url**
Specifies the target URL for the PDF link component.

**webhelp.pdf.link.text**

Specifies the text for the PDF link component.

**webhelp.pdf.link.icon.path**

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

**webhelp.pdf.link.anchor.enabled**

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

**webhelp.show.pdf.link**

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

**WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points**

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

**Extension Points from an Oxygen Publishing Template**

The publishing template allows you to specify an XSLT extension point. The extension point will only affect the transformations that use the particular template.

**Important:**

While the publishing templates only support referencing one extension point at a time, you can use `xslt:include` or `xslt:import` to aggregate multiple modules.

For a specific example of how to use an extension in a publishing template, see: *How to Use an XSLT Extension Point from a Publishing Template* *(on page 1043)* topic.

**Example:**

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      ...
    </xslt>
  </webhelp>
  ...
</publishing-template>
```
Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<extension
id="com.oxygenxml.webhelp.xsl.createMainPage"
file="xsl/customMainPage.xsl"/>
</xslt>
```

XSLT-Import Extension Points

The following extension points are supported:

- **com.oxygenxml.webhelp.xsl.dita2webhelp**
  Extension point to override the XSLT stylesheet (dita2webhelp.xsl) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR/plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

- **com.oxygenxml.webhelp.xsl.createMainPage**
  Extension point to override the XSLT stylesheet (createMainPage.xsl) that produces the WebHelp Responsive main HTML page (index.html). The location of this file is `DITA-OT-DIR/plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

- **com.oxygenxml.webhelp.xsl.createNavLinks**
  Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the navLinks folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\`

- **com.oxygenxml.webhelp.xsl.createSearchPage**
  Extension point to override the XSLT stylesheet (createSearchPage.xsl) that produces the WebHelp Responsive search HTML page (search.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`

- **com.oxygenxml.webhelp.xsl.createIndexTermsPage**
Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndextermsPage.xsl`.

`com.oxygenxml.webhelp.xsl.createTocXML` Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the DITA map (on page 2079) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\tocDita.xsl`.

**XSLT-Parameter Extension Points**

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

- `com.oxygenxml.webhelp.xsl.dita2webhelp.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.dita2webhelp` extension point (on page 1079).

- `com.oxygenxml.webhelp.xsl.createMainPage.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1079).

- `com.oxygenxml.webhelp.xsl.createNavLinks.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createNavLinks` extension point (on page 1079).

- `com.oxygenxml.webhelp.xsl.createSearchPage.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createSearchPage` extension point (on page 1079).

- `com.oxygenxml.webhelp.xsl.createIndexTermsPage.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createIndexTermsPage` extension point (on page 1079).

- `com.oxygenxml.webhelp.xsl.createTocXML.param`  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createTocXML` extension point (on page 1080).

[DITA-OT] XSLT-Parameter Extension Points
WebHelp Classic Output for DocBook

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook. You can also integrate a feedback system that provides the ability for your users to add comments in the output. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using the [DocBook WebHelp Classic](on page 811) transformation scenario.

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the **WebHelp Classic** system consists of the following components:

**Left Pane or Frame**

This section on the left side of the help system includes the following tabs:

- **Content**
  
  A typical table of contents style presentation of your content. You can use the expand/collapse buttons to expand or collapse all the topics presented in the Table of Contents.

  **Note:**

  You can enhance the appearance of items in the *Table of Contents*. See the [Customizing WebHelp Classic Output chapter](on page 1088) for more details.

- **Index**

  Presents the index terms for your content. If your content does not contain any `<indexterm>` elements, this tab is not generated.

- **Search Results**

  This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the [Search Feature section](on page 1083).

**Upper Pane or Frame**

The upper section of the help system includes the following features:

- **Search Field**
Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the Search Results tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section \textit{(on page 1083)}.

Frames Option
Click on this option to display the output rendered in HTML frames.

Print Option
Opens a dialog box with various printing options and a print preview.

Navigation Links
You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the Parent topic, Previous topic, or Next topic. Links to the parent topics of the currently open topic are also presented at the top of the page.

Tip:
To hide the Parent, Next, and Previous links, you can edit the transformation scenario and set the value of the args.hide.parent.link parameter to yes.

Main Pane or Frame
The content of the help pages are rendered and displayed in this main section.
WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
- **Boolean Search** is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
- The space character separates keywords (an expression such as grow flowers counts as two separate keywords.
- Words composed by merging two or more words with colon ("."), minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始之前 (notice the space between the second and third symbols) in the search field.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:
  - The search term is included in a meta keyword.
  - The search term is in the title of the page.
  - The search term is in bold text in a paragraph.
  - The search term is in normal text in a paragraph.

Excluded Terms

To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.

WebHelp Classic Search Results Tab

When you enter search terms in the Search field at the top of the help system, the results are displayed in the Search Results tab in the left section. When you click on a result in the Search Results tab, that result is displayed in the main pane with the search terms highlighted. If you press Enter with the Search field empty, the highlights are removed.
Figure 243. WebHelp Classic Search Results Tab

Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1102).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:
Important:
Due to some security restrictions in certain browsers (Google Chrome), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html).

Warning:
Due to some restrictions in web browsers regarding JavaScript code, the frameless version (index.html start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html). When loading WebHelp Classic pages from the local file system, the frameset version (index_frames.html start page) of the WebHelp Classic system should be used instead (file:///...).

Related information
Deploying the Oxygen Feedback Comments Component for DocBook (on page 1087)

Generating WebHelp Classic Output for DocBook
The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command-line tool outside Oxygen XML Editor/Author.

Running from Oxygen XML Editor/Author
To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output
To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar.
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.
When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

**Automating the WebHelp Classic Output for DocBook**

DocBook-based WebHelp output can be generated from an automated publishing process using a command-line tool outside of Oxygen XML Editor/Author. However, to do this, you must purchase an additional Oxygen XML WebHelp license.

**Deploying the Oxygen Feedback Comments Component for DocBook**

You can add a comments component in your WebHelp Classic output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by Oxygen Feedback, a modern comment management system that can be integrated with your WebHelp Classic output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software.

An add-on is also available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

**Adding the Feedback System to WebHelp Classic Documentation**

**Prerequisite**

To install and manage Oxygen Feedback, you must obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

**Installation Procedure**

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.
2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.
4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic. Click Continue.

5. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
      iii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      v. Go to the Parameters tab.
      vi. Set the webhelp.footer.file parameter to reference the path of the fragment file created earlier.
   b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
      iii. Use the webhelp.footer.file parameter in your command-line script to specify the path to the file you created. For example:
      
      ```
      docbook.bat -Dwebhelp.footer.file=c:\path\to\feedback-install.xml
      ```

6. [Optional] If you want the Oxygen Feedback comments component to fill the entire page width, contribute a custom CSS file (use the html.stylesheet parameter to reference it) that contains the following style rule:

   ```
   div.footer {
   float: none;
   }
   ```

   For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.

**Customizing WebHelp Classic Output**

Oxygen XML WebHelp provides support for customizing the WebHelp Classic output to suit your specific needs. The WebHelp Classic type of output is designed for desktop systems and features a familiar tri-pane layout. You can use this system to publish DocBook documents. You can also integrate a feedback system to allow your users to add comments to your output.

To change the overall appearance of the WebHelp Classic output, you can use the visual WebHelp Skin Builder tool (on page 1089), which does not require knowledge of CSS language. If you are familiar with CSS and
coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

**Changing the Layout and Styles**

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

**WebHelp Skin Builder**

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to Oxygen XML website.
- A late version web browser.

To start the **Skin Builder**, use a web browser to go to [https://www.oxygenxml.com/webhelp-skin-builder](https://www.oxygenxml.com/webhelp-skin-builder).

**Skin Builder Layout**

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - Import - Opens an Import CSS dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - Export - Saves all properties as a CSS file.
- **Settings** - Includes a Highlight selection option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - Header
  - TOC Area
  - Vertical Splitter
  - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.
Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the Import button.
2. Use the elements in the Customize section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the Add button and choosing from the available properties.

   **Note:**
   If you want to revert a particular property to its initial value, click the Reset button.

3. When you are happy with the skin customizations you have made, click the Export button. All settings will be saved in a CSS file.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author Eclipse plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the Parameters tab, set the webhelp.skin.css parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX-PQx0

How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.
Tip:
When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the Parameters tab. Set the html.stylesheet parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To use a custom CSS to style WebHelp output and use a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file. Use the html.stylesheet parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

How to Add Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.
Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the content of the file is not *XML Well-formed (on page 517)*, (or fragments are not well-formed), the transformation will fail.

   A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>, <body>, <html/head>, or <html/body>` elements.

   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

     ```html
     <html>
     <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
     <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
     </html>
     ```

     To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1100).

   - **Inline JavaScript or CSS Content**:

     **JavaScript**:

     ```javascript
     <script type="text/javascript">
     /* Include JavaScript code here. */

     function myFunction() {
       return true;
     }
     </script>
     ```

     **CSS**:

     ```style
     /* Include CSS style rules here. */

     * {
       color:red
     }
     ```
2. Edit the WebHelp Classic transformation scenario.

3. Go to the Parameters tab.

4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.

Note:
If you want to include the content in the body element, use the `webhelp.body.script` parameter instead.

5. Click OK to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:

   - **Well-Formedness** - If the content of the file is not XML Well-formed (on page 517), (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

     ```html
     <html>
     <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
     <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
     </html>
     ```

     To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1100).

   - **Inline JavaScript or CSS Content**:

     **JavaScript**:

     ```script
     /* Include JavaScript code here. */
     
     function myFunction() {
       return true;
     }
     ```

     **CSS**:
<style>
/* Include CSS style rules here. */

* {
  color:red
}
</style>

**Note:**

If you have special characters (for example, &, <) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

**Important** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```javascript
<script type="text/javascript">
 <!--
/* Include JavaScript code here. */

function myFunction() {
  return true;
}
-->
</script>
```

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:**

If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

Related Information:

* How to Copy Additional Resources to Output Directory *(on page 1100)*
How to Change Number Styles for Ordered Lists

Ordered lists (<ol>) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```xml
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```css
ol.number-alpha{
  list-style-type: lower-alpha;
}
```

3. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the transformation scenario.

How to Change the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```css
.hasSubMenuClosed{
  background: url('../img/book_closed16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}

.hasSubMenuOpened{
  background: url('../img/book_opened16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Create a custom CSS file that assigns your desired icons to the \-hasSubMenuClosed and \-hasSubMenuOpened properties.

```css
\-hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

\-hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (\[OXYGEN_INSTALL_DIR\]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\).

3. Edit the WebHelp transformation scenario and open the Parameters tab. Set the \html.stylesheet parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important:**

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To assign other icons and use a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the \-hasSubMenuClosed and \-hasSubMenuOpened properties.

```css
\-hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

\-hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (\[DocBook XSL directory\]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\).
3. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

4. Execute the transformation script.

**How to Customize the Appearance of Selected Items in the Table of Contents**

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.

**Note:**

You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by using the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

**Adding Graphics and Media Resources**

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

**How to Add a Favicon in WebHelp Systems**

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DocBook WebHelp output using the WebHelp Classic transformation.

**Using Oxygen XML Editor/Author**

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the Parameters tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).
Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the file path that points to the image that will be use as the favicon using the webhelp.favicon parameter.
2. Execute the transformation script.

Result: Browsers that provide favicon support will display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).

How to Add a Logo Image in the Title Area

You can customize WebHelp Classic output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within Oxygen XML Editor/Author or using a command-line script outside of Oxygen XML Editor/Author.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a WebHelp Classic transformation scenario, then open the Parameters tab.
2. Specify the path to your logo in the webhelp.logo.image parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the webhelp.logo.image.target.url parameter.
4. Run the transformation scenario.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a logo in the title area of your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the path to your logo using the `webhelp.logo.image` parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.
3. Execute the transformation script.

How to Add Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using a `<mediaobject>` element, as in the following example:

   ```xml
   <mediaobject>
     <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
   </videodata>
   </mediaobject>
   ```

2. Apply a WebHelp transformation scenario to obtain the output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the Parameters tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: All files from the new directory will be copied to the root of the WebHelp output directory.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To copy additional resources to the output directory using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

Result: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
    src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```
Result: The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

   The values that can be edited in the scoring.properties file:

   ```
   h1 = 10
   h2 = 9
   h3 = 8
   h4 = 7
   h5 = 6
   h6 = 5
   b = 5
   strong = 5
   em = 3
   i=3
   u=3
   div.toc=-10
   title=20
   div.ignore=ignored
   meta_keywords = 20
   meta_indexterms = 20
   meta_description = 25
   shortdesc=25
   ```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.
How to Index Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Edit a DocBook to WebHelp transformation scenario and in the Parameters tab, set the value of the l10n.gentext.default.language parameter to ja.
2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To activate the Japanese indexing in your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Use the l10n.gentext.default.language parameter in your transformation script and set its value to ja.
2. Execute the transformation script.

Related information

How to Localize the Interface of DocBook to WebHelp Classic Output (on page 1103)

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DocBook WebHelp Classic transformations.

How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization
folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the *strings-[lang1]-[lang2].xml* file in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml">`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Related Information:

- How to Index Japanese Content in WebHelp Classic *(on page 1103)*

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, set the `@xml:lang` attribute with the corresponding attribute value:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Author Eclipse plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your WebHelp Classic output and the widget will appear in the footer sections of your WebHelp page.
Using Oxygen XML Editor/Author

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
     -->
     <div class="fb-like" data-layout="standard" data-action="like"
         data-show-faces="true" data-share="true"/>
   </div>
   ```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click Ok and run the transformation scenario.
Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Facebook™ Like widget to your WebHelp output using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
      }(document, 'script', 'facebook-jssdk'));
    --></script>
  <div class="fb-like" data-layout="standard" data-action="like"
  data-show-faces="true" data-share="true"/>
</div>
```
4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.

5. Execute the transformation script.

**How to Add Tweet Button in WebHelp Classic Output**

It is possible to integrate [Twitter](https://twitter.com) into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

**Using Oxygen XML Editor/Author**

To add a [Twitter](https://twitter.com)™ Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
     <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
     <script>
       !function(d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/test(d.location) ? 'http': 'https';
         if (!d.getElementById(id)) {
           js = d.createElement(s);
           js.id = id;
           js.src = p + '://platform.twitter.com/widgets.js';
           fjs.parentNode.insertBefore(js, fjs);
         }
         {document,
         'script', 'twitter-wjs');
       -->
     </script>
   </div>
   ```
4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the tweet-button.xml file that you created earlier.
7. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Twitter™ Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    !--
      function (d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0], p = /^http/.test(d.location) ? 'http' : 'https';
        if (!d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '://platform.twitter.com/widgets.js';
```
4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.

5. Execute the transformation script.

**How to Integrate Google Analytics in WebHelp Classic Output**

You can use Google Analytics to track and report site data for your WebHelp Classic output.

**Using Oxygen XML Editor/Author**

To integrate Google Analytics into your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/analytics.js','ga');

// Code goes here...

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.

6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
7. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.

8. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To integrate Google Analytics into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');

ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.html` file that you created earlier.
6. Execute the transformation script.

How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the Google Search Engine into your WebHelp Classic output and you can specify where you want the results to appear in your WebHelp page.
Using Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```html
   <script>
   (function() {
     var cx = '00088821088977588983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   }
   )();
   </script>
   
4. Save the script into a well-formed HTML file called googlecse.html.
5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
7. Switch to the Parameters tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.
8. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>.
9. Click Ok and run the transformation scenario.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To integrate the Google Search Engine into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '00088821088977588983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called googlecse.html.
5. Use the webhelp.google.search.script parameter in your transformation script and set its value to reference the googlecse.html file that you created earlier.
6. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

7. Execute the transformation script.

**Miscellaneous Customization Topics**

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

**How to Disable Caching in WebHelp Classic Output**

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following file: `%OXYGEN_INSTALL_DIR%\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`

2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

   `<meta http-equiv="Pragma" content="no-cache" />`

   `<meta http-equiv="Expires" content="-1" />`

3. Save your changes to the file.

4. Re-run your WebHelp transformation scenario.
How to Publish WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author (on page 1086), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. Use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

DITA to PDF Output Customization

Oxygen XML Author Eclipse plugin provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Author Eclipse plugin supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.
CSS-based DITA to PDF Customization

Oxygen XML Author Eclipse plugin comes bundled with a DITA-OT CSS-based PDF Publishing Plugin for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

**DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)**

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

**Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)**

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5-single-topic` transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.

Related Information:
- DITA Map PDF - based on HTML5 & CSS Transformation *(on page 802)*
- DITA PDF - based on HTML5 & CSS Transformation *(on page 1967)*

**Overview**

This section contains topics that provide a basic overview of the DITA-OT CSS-based PDF Publishing Plugin, technical details, and some additional resources to help you with your customizations.

**Tip:**
For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata.
- Transforming XML and HTML documents to PDF using CSS, Part 2 – Lists, Tables and Images.
- Transforming XML and HTML documents to PDF using CSS, Part 3 – Global Page Layout.
- Transforming XML and HTML documents to PDF using CSS, Part 4 – Advanced Functionalities.
Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: [https://www.w3.org/TR/CSS2/page.html](https://www.w3.org/TR/CSS2/page.html). Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: [https://www.oxygenxml.com/doc/ug-chemistry/](https://www.oxygenxml.com/doc/ug-chemistry/).

- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is *The DITA Style Guide - Best Practices for Authors* by Tony Self. It is available at: [www.ditastyle.com](http://www.ditastyle.com) and: [https://www.oxygenxml.com/dita/styleguide/webhelp-feedback/Artefact/c_DITA_Authoring_Concepts.html](https://www.oxygenxml.com/dita/styleguide/webhelp-feedback/Artefact/c_DITA_Authoring_Concepts.html). You can find all the details for every DITA element on OASIS website: [http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html](http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html).

Related Information:

DITA-OT DAY 2017: Using CSS to Style PDF Output

Supported Processors

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction *(on page 1210)* only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

Technical Details

The **DITA-OT CSS-based PDF Publishing Plugin** comes bundled in the Oxygen XML Editor/Author distributions. The plugin ID is: **com.oxygenxml.pdf.css**. It is installed in the **[OXYGEN-INSTALL-DIR]frameworks/dita/DITA-OT3.x/plugins/com.oxygenxml.pdf.css** folder.
It has the following transformation types:

- **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).
- **pdf-css-html5-single-topic** (*DITA PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.

3. Then it post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. The result is another merged map.
Note:
In the single topic transformation type (**DITA PDF - based on HTML5 & CSS**), these steps are simplified.

4. The merged DITA map or topic is transformed to a single HTML5 file.

   The generated HTML elements copy the class attributes from the original DITA elements. In this way you can either use selectors that were designed for DITA structure, or ones for the HTML structure - see: **Reusing the Styling for WebHelp and PDF Output (on page 1293)**. This step can apply customization **XSLT extension points (on page 1141)** that change the default processing.

5. In the last phase, it uses a collection of CSS files to style the merged map. References to the CSS files are collected from the **publishing template (on page 1132)**.
Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

**When the Transformation is Started from Oxygen**

To alter the memory allocation setting from the transformation scenario, follow these steps:

1. Open the **Configure Transformation Scenario(s)** dialog box.
2. Select your transformation scenario, then click **Edit**.
3. Go to the **Advanced** tab.
4. Locate the **JVM Arguments** and increase the default value. For instance, to set 2 gigabytes as the maximum amount of memory, you can use: `-Xmx2g`. If you do not specify the `-Xmx` value in this field, by default, the application will use a maximum of 512 megabytes when used with a 32-bit Java Virtual Machine and one gigabyte with a 64-bit Java Virtual Machine.

**Note:**

This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

**When the Transformation is Started from the Command Line**

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged XML document).
- From the Chemistry PDF CSS processor (the transformation of the merged XML document to PDF).

To solve both of them, you can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

**Example:** To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- **Windows**
  ```
  set ANT_OPTS=%ANT_OPTS% -Xmx1024M
  ```

- **Linux/macOS**
  ```
  export ANT_OPTS="$ANT_OPTS -Xmx1024M"
  ```

**Tip:**

To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.
If the Chemistry PDF CSS processor fails with an Out Of Memory Error, try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```
-DbaseJVMArgLine=-Xmx984m
```

### Transformation Parameters

This list includes the most common customization parameters that are available in the [DITA Map PDF - based on HTML5 & CSS](#) transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are supported.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.allow.external.coderefs</code></td>
<td>Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code>&lt;coderef&gt;</code> element. Allowed values are <code>yes</code> or <code>no</code> (default).</td>
</tr>
<tr>
<td><code>args.chapter.layout</code></td>
<td>Specifies whether chapter-level TOCs are generated for bookmaps. When set to <code>MINITOC</code>, a small section with links is added at the beginning of each chapter. The default is <code>BASIC</code>. For details, see: Table of Contents on a Page (Mini TOC) (on page 1244). Allowed values:</td>
</tr>
<tr>
<td>• <code>BASIC</code> - No chapter TOC is created.</td>
<td></td>
</tr>
<tr>
<td>• <code>MINITOC</code> - A chapter-level TOC will be generated.</td>
<td></td>
</tr>
<tr>
<td>• <code>MINITOC-BOTTOM-LINKS</code> - A chapter-level TOC will be generated, with the links under the chapter description.</td>
<td></td>
</tr>
<tr>
<td><code>args.css</code></td>
<td>You can use this to specify a list of CSS URLs to be used in addition to those specified in the <code>dita.css.list</code> parameter or publishing template. The files must have URL syntax and be separated using semicolons.</td>
</tr>
<tr>
<td><code>args.css.param.*</code></td>
<td>You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1322).</td>
</tr>
<tr>
<td><code>args.css.param.numbering</code></td>
<td>You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:</td>
</tr>
<tr>
<td>• <code>shallow</code> - Only the topics from the first level will be numbered (chapters). This is the default.</td>
<td></td>
</tr>
<tr>
<td>• <code>deep</code> - All the topics from the map will be numbered (nested topics up to level 3).</td>
<td></td>
</tr>
<tr>
<td>• <code>deep-chapter-scope</code> - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross</td>
<td></td>
</tr>
</tbody>
</table>
reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

- **deep-chapter-scope-no-page-reset** - Similar to **deep-chapter-scope**, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

For more details, see [Numbering Types](#) on page 1230.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>args.css.param.numbering-sections</strong></td>
<td>Controls whether or not the sections are included in the table of contents. When set to <strong>yes</strong> (sections are included), they are numbered according the numbering scheme set by the <strong>args.css.param.numbering</strong> parameter.</td>
</tr>
<tr>
<td><strong>args.css.param.show-onpage-lbl</strong></td>
<td>Controls whether or not the links will have an on page NN label after them. This parameter has different defaults, depending on the transformation type. For map transformations (<strong>pdf-css-html5</strong> trans type), the default is <strong>yes</strong>. For topic transformations (<strong>pdf-css-html5-single-topic</strong> trans type), the default is <strong>no</strong>.</td>
</tr>
<tr>
<td><strong>args.css.param.title.layout</strong></td>
<td>Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally, the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow) and a table layout where the number is placed in one cell and the text in the other (to avoid wrapping text under the chapter number).</td>
</tr>
<tr>
<td></td>
<td>- <strong>normal</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>table</strong> (avoid wrapping text under counter)</td>
</tr>
<tr>
<td><strong>args.draft</strong></td>
<td>Specifies whether or not the content of <strong>&lt;draft-comment&gt;</strong> and <strong>&lt;required-cleanup&gt;</strong> elements is included in the output.</td>
</tr>
<tr>
<td></td>
<td>Allowed values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>no</strong> (default) - No draft information is shown in the output.</td>
</tr>
<tr>
<td></td>
<td>- <strong>yes</strong> - The draft information is shown in the output.</td>
</tr>
<tr>
<td><strong>args.figurelink.style</strong></td>
<td>Specifies how cross references to figures are styled in output. Allowed values:</td>
</tr>
<tr>
<td>Arguments</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>args.gen.task.lbl</strong></td>
<td>Specifies whether or not to generate headings for sections within task topics. Allowed values: <strong>YES</strong> or <strong>NO</strong> (default). When set to <strong>YES</strong>, headings such as &quot;About this task&quot;, &quot;Before you begin&quot;, &quot;Procedure&quot;, or &quot;What to do next&quot;, are shown in the task contents.</td>
</tr>
<tr>
<td><strong>args.hyph.dir</strong></td>
<td>Specifies the directory that contains custom hyphenation dictionaries. For more details see: Hyphenation (on page 1271).</td>
</tr>
<tr>
<td><strong>args.input</strong></td>
<td>Specifies the main DITA map file for your documentation project.</td>
</tr>
<tr>
<td><strong>args.keep.output.debug.files</strong></td>
<td>Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: <strong>YES</strong> (default) or <strong>NO</strong>.</td>
</tr>
<tr>
<td><strong>args.output.base</strong></td>
<td>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</td>
</tr>
<tr>
<td><strong>args.rellinks.group.mode</strong></td>
<td>Specifies the related links grouping mode. All links can be grouped into a single &quot;Related Information&quot; group or links grouped by their target type (topic, task, or concept). Allowed values: <strong>single-group</strong> (default) or <strong>group-by-type</strong>. For more details see: How to Group Related Links by Type (on page 1301).</td>
</tr>
<tr>
<td><strong>args.tablelink.style</strong></td>
<td>Specifies how cross references to tables are styled in output. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>NUMBER</strong> - Only the number of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TITLE</strong> - Only the title of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>- <strong>NUMTITLE</strong> (default) - Both the title and number of the tables will be shown in links.</td>
</tr>
<tr>
<td><strong>clean.temp</strong></td>
<td>Specifies whether or not the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: <strong>yes</strong> (default) or <strong>no</strong>.</td>
</tr>
<tr>
<td><strong>chemistry.security.policy</strong></td>
<td>Specifies a Java policy file that applies to the Chemistry process. A template can be found here: plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/chemistry.policy.</td>
</tr>
<tr>
<td><strong>chemistry.security.workspace</strong></td>
<td>Specifies a directory where the temporary files and font cache created by the Chemistry process need to be stored. This becomes required when the <strong>chemistry.security.policy</strong> is specified.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>chemistry.security.resources.dir</td>
<td>Path to an additional folder that Chemistry will use to read its resources (CSS, images). The process already has read access to the input map folder, the publishing templates folder, and the OPE install folder. This optional parameter should only be used when the <code>chemistry.security.policy</code> parameter is set.</td>
</tr>
<tr>
<td>chemistry.security.resources.host</td>
<td>The host, specified as <code>name:port</code>, that Chemistry will use to get resources (e.g. CSS files, images, fonts). This optional parameter should only be used when the <code>chemistry.security.policy</code> parameter is set.</td>
</tr>
<tr>
<td>css.processor.path.anten-na-house</td>
<td>Path to the Antenna House executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\AHFCmd.exe</code> on Windows).</td>
</tr>
<tr>
<td>css.processor.path.chemistry</td>
<td>Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\chemistry.bat</code> on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry.</td>
</tr>
<tr>
<td>css.processor.path.prince</td>
<td>Path to the Prince executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\prince.exe</code> on Windows).</td>
</tr>
<tr>
<td>css.processor.type</td>
<td>Specifies the processor to use for the transformation. Allowed values: chemistry (default), antenna-house, or prince.</td>
</tr>
<tr>
<td>default.language</td>
<td>Specifies the default language for source documents. Examples: fr, de, zh, etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1326).</td>
</tr>
<tr>
<td>drop.block.margins.at.page-boundary</td>
<td>Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values: YES (default) or NO.</td>
</tr>
<tr>
<td>editlink.ditamap.edit.url</td>
<td>Use this parameter to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author or Content Fusion where they can make changes that can be saved to a file server. The value should be set as the edit URL of the main DITA map used for publishing your output. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.</td>
</tr>
<tr>
<td>editlink.additional.query.parameters</td>
<td>You can use this optional parameter to add additional parameters to be appended to each generated edit link. Each parameter must start with &amp; (for example: &amp;tags-mode=no-tags).</td>
</tr>
<tr>
<td>editlink.remote.ditamap.url (deprecated)</td>
<td>Use this parameter in conjunction with <code>editlink.web.author.url</code> to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>editlink.web.author.url (deprecated)</td>
<td>This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an <em>Edit</em> link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: <a href="https://www.oxygenxml.com/oxygen-xml-web-author/">https://www.oxygenxml.com/oxygen-xml-web-author/</a>.</td>
</tr>
<tr>
<td>enable.latin.glyph.substitutions</td>
<td>When set to <strong>yes</strong> (default), glyph substitution is enabled (if the particular font supports it). This applies to Latin-based scripts only (the substitutions are always enabled in other types of scripts). If you encounter problems rendering or copying accented glyphs (i.e. <em>umlauts</em> or other <em>diacritics</em>), it might be helpful to set this parameter to <strong>no</strong> to disable the font glyph substitutions. Another example of a case when you might need to disable the substitutions is a situation where an accented character cannot be mapped to a compound glyph, resulting in the glyph not being rendered in the PDF output.</td>
</tr>
<tr>
<td>Warnings:</td>
<td></td>
</tr>
</tbody>
</table>
| • Disabling substitutions also disables Latin ligatures.  
| • Disabling substitutions is not recommended unless absolutely necessary. It is better practice to use another font if you can find one that does not have the rendering issues. |
| figure.title.placement                              | Controls the title placement of the figures, relative to the image. Possible values include **top** (default) and **bottom**.                                                                                      |
| fix.external.refs.com.oxygenxml                     | The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: **true** or **false** (default). |
| hide.frontpage.toc.index.glossary                   | When set to **yes**, the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is **no**.                                                               |
| image.resolution                                   | You can use this parameter to set the default resolution used by images. It works mainly on *vector* images since *raster* images have their resolu-  |
The default is 96 (dpi). For more information, see [how to change images resolution](on page 1302).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.accessibility</td>
<td>When set to <strong>yes</strong>, the PDF output will be generated in compliance with the PDF/Universal Accessibility standard (also known as ISO 14289). The default is <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.version</td>
<td>Use this parameter to specify the version of the produced PDF. It has no impact on the set of PDF features used by the engine, but may be used to signal a compatibility level to the PDF readers. The default is <strong>1.5</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.printhq</td>
<td>Restricts high quality printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.assembledoc</td>
<td>Restricts assembling document (e.g. adding pages). Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.accesscontent</td>
<td>Restricts extracting text and graphics. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.fillinforms</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.annotations</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.print</td>
<td>Restricts printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.copy</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.restrict.edit</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>pdf.security.user.password</td>
<td>User password. The document can be opened using this password. When the owner password parameter is not specified, the user password gives full rights to the people using it. When the owner password parameter is specified, the people can open the document using the user password but restrictions will apply. Missing by default.</td>
</tr>
<tr>
<td>pdf.security.owner.password</td>
<td>Owner password. There are no restrictions for people using this password.</td>
</tr>
<tr>
<td>pdf.security.encrypt.metadata</td>
<td>Encrypts the metadata. By default active when other security parameters are set. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
</tr>
<tr>
<td>show.changes.and.comments</td>
<td>When set to <strong>yes</strong>, the user comments, colored highlights and tracked changes are shown in the output.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>show.changes.and.comments.as.changebars</td>
<td>When set to <em>yes</em> (default) and the <code>show.changes.and.comments</code> parameter is also set to <em>yes</em>, the user comments and tracked changes are shown as change bars in the PDF output. This parameter can be used in conjunction with the <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameter to choose whether the change bars are displayed in footnotes or sticky notes. You can override this from your customization CSS <em>(on page 1161)</em>.</td>
</tr>
<tr>
<td>show.changes.and.comments.as.pdf.sticky.notes</td>
<td>When set to <em>yes</em> (default) and the <code>show.changes.and.comments</code> parameter is also set to <em>yes</em>, the user comments and tracked changes are shown in the PDF output as sticky note annotations. When set to <em>no</em>, the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS <em>(on page 1161)</em>.</td>
</tr>
<tr>
<td>show.changed.text.in.pdf.sticky.notes.content</td>
<td>When set to <em>yes</em> (default) and both the <code>show.changes.and.comments</code> and <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameters are also set to <em>yes</em>, the inserted and deleted text is shown in the sticky note annotations. When set to <em>no</em>, only the <em>inserted</em> and <em>deleted</em> labels are shown in the annotations (this is useful for search scope).</td>
</tr>
<tr>
<td>show.image.map.area.numbers</td>
<td>When set to <em>yes</em>, a counter for each area from the image map will be displayed over the image, near the defined shape. The default is <em>no</em>.</td>
</tr>
<tr>
<td>show.image.map.area.shapes</td>
<td>When set to <em>yes</em>, each of the image map area shapes will be displayed with a translucent fill over the image. You can use this to debug your image maps. The default is <em>no</em>.</td>
</tr>
<tr>
<td>show.media.as.link</td>
<td>When set to <em>yes</em>, media objects will not appear and an external link will be generated for each one instead.</td>
</tr>
<tr>
<td>sort.and.group.glossentries</td>
<td>When set to <em>no</em> (default), elements in the glossary will be sorted based upon the document order. If set to <em>yes</em>, elements in the glossary will be sorted alphabetically and grouped by their first letter.</td>
</tr>
<tr>
<td>store-type</td>
<td>Setting this parameter to <em>memory</em> will increase the processing speed and thus, could help decrease the publishing time.</td>
</tr>
<tr>
<td>table.title.placement</td>
<td>Controls the placement of the title for tables. Possible values include <em>top</em> (default) and <em>bottom</em>.</td>
</tr>
<tr>
<td>table.title.repeat</td>
<td>Specifies whether or not a table caption should repeat on other pages when the table spans onto multiple pages. The caption is not repeated for tables nested in lists or other tables. Allowed values are <em>yes</em> (default) or <em>no</em>.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>use.css.for.embedded.svg</td>
<td>When set to <strong>yes</strong> (default), the CSS files specified in the publishing template or by the <code>args.css</code> parameter are also applied on embedded SVG elements. Allowed values are <strong>yes</strong> and <strong>no</strong>.</td>
</tr>
<tr>
<td>use.navtitles.in.all.links</td>
<td>Specifies whether a <code>&lt;navtitle&gt;</code> defined in a topic or a topic reference should be used as the display name for all links or only in the table of contents. Allowed values are <strong>yes</strong> and <strong>no</strong> (default).</td>
</tr>
<tr>
<td>parallel</td>
<td>Specifies whether or not certain pre-processing tasks should be run in parallel. Setting this parameter to <strong>true</strong> may add a small increase to the publishing speed. Allowed values are: <strong>true</strong> and <strong>false</strong> (default).</td>
</tr>
</tbody>
</table>

The following parameters can be used to specify a publishing template:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.publishing.template</td>
<td>Specifies the path to the folder containing the custom PDF template.</td>
</tr>
<tr>
<td>pdf.publishing.template.descriptor</td>
<td>Specifies the name of the descriptor file to be loaded from the PDF template folder or package. If it is not specified, the first encountered descriptor file will be loaded.</td>
</tr>
</tbody>
</table>

The following parameter is available on all DITA transformations when using the **Oxygen Publishing Engine**:  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| args.disable.security.checks | Specifies whether or not to load external entities that are not solved through catalogs. For security reasons, the default is **no**.  

Allowed values:  
- **yes**  
- **no** (default) |

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario (**pdf-css-html5-single-topic** trans type):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.root.map</td>
<td>Specifies the path of the root map file used to expand the key references in the published topic.</td>
</tr>
</tbody>
</table>
| args.enable.root.map.key.processing | Indicates whether or not the keys should be processed using the root map parameter.  

Allowed values:  
- **auto** (default)  
- **yes**  
- **no** |
Console Logging

To activate the logging of the last processing stage, involving the usage of the Chemistry processor to generate the PDF from the merged HTML, use the `--verbose` (or `-v`) DITA-OT parameter from the command line.

Note:
When the transformation is started from an Oxygen application, this parameter is automatically set.

License Key

Chemistry License

If you have an Oxygen PDF Chemistry license key, you will be able to generate PDF output that is not stamped with the Chemistry logo image.

To install your Chemistry license key:

- If you are using the version of Chemistry that comes bundled in Oxygen XML Editor/Author, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
- If you are using another Chemistry installation, make sure you place the `licensekey.txt` file in that folder.

Oxygen Publishing Engine License

If you have purchased a license for the Oxygen Publishing Engine, you will be able to produce both PDF and WebHelp output without any restrictions.

To install your Oxygen Publishing Engine license key, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR` folder.

Generating PDF Output

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

Generating PDF from a Command Line

To publish the PDF output from a command line outside of Oxygen XML Editor/Author, you can use the `dita` startup script that comes bundled with the DITA Open Toolkit distribution.

The command line supports all the parameters specific to the PDF transformation (on page 1120). Here is an example of how to write the commands:
Generating PDF from an Integration Server

PDF output can be automatically generated from a Continuous Integration/Continuous Delivery system, such as Jenkins.

To integrate PDF output with the Jenkins CI tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Author Eclipse plugin.
2. Go to the root of your Maven project and edit the pom.xml file to include the following fragment:

```xml
<project
    xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
                        http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.oxygenxml</groupId>
  <artifactId>oxygen-oxygen-pdf-css-generator</artifactId>
  <version>1.0</version>

  <properties>
    <!-- The path to Oxygen Publishing Engine -->
    <dita-ot-dir>/path/to/oxygen-publishing-engine-3.x</dita-ot-dir>
    <!-- The path to the DITA map that you want to process. -->
    <input-file>/path/to/map.ditamap</input-file>
    <!-- The path of the output directory. -->
    <output-dir>/path/to/output/folder</output-dir>
    <!-- The path to the PDF publishing template folder (containing the .opt file). -->
    <publishing-template>/path/to/template/folder</publishing-template>
  </properties>

  <build>
```

• Windows:

```bash
dita.bat -f pdf-css-html5 -i C:\path\to\map.ditamap -o C:\path\to\output\folder -v
```

• Linux/macOS:

```bash
dita -f pdf-css-html5 -i /path/to/map.ditamap -o /path/to/output/folder -v
```

Note:
You can use the long form of the command-line options (e.g. --format or --input). For more information about the build parameters, see DITA-OT: Building Output Using the dita Command.
3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Webinar: Introducing the Oxygen Publishing Engine for DITA

**Publishing Templates**

An *Oxygen Publishing Template* defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**
It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicon, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for Oxygen Publishing Template packages:

**Figure 244. Oxygen Publishing Template Package (WebHelp Responsive)**

```
- publishing template
  - CSS
    - oxygen-skin.css
  - JS
  - fonts
  - HTML-Fragments
    - webhelp.fragment.footer.html
    - webhelp.fragment.before.logo_and_title.html
  - XSLT-Extensions
    - topic_page_extension.xsl
  - page-templates
    - wt_index.html
    - wt_search.html
    - wt_topic.html
    - wt_terms.html
  - template_descriptor.opt
```

Publishing Template Package Contents for PDF Customizations

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>
  
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    
    <resources>
      <css file="flowers.css"/>
    </resources>
    
    <parameters>
      <parameter name="figure.title.placement" value="top"/>
    </parameters>
  </pdf>
</publishing-template>
```
Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a <name> element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a <description> and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
...
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the <author> element, a <name> is required and optionally you can include <email>, <organization>, and <organizationUrl>.

```
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
```

PDF Element

The <pdf> element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this <pdf> section specify the template tags (on page 1134), template preview image (on page
resources (on page 1135) (such as CSS files), transformation parameters (on page 1135), or XSLT extensions (on page 1136).

```
<pdf>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ...
  </resources>

  <parameters>
    ...
  </parameters>
</pdf>
```

**Template Tags**

The `<tags>` section provides meta information about the template (such as color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
  ...
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```

**Template Preview Image**

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
  ...
  <pdf>
```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>
```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

Transformation Parameters

You can also set one or more transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <parameters>
      ...
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```

The following information can be specified in the `<parameters>` element:

**Parameter name**

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.
Note:
It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention:
JVM arguments like -Xmx cannot be specified as a transformation parameter.

Parameter Value
The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type
The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1138) and adding it to the templates gallery (on page 1140), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points
The publishing templates support one or more XSLT extension points. They can be specified using the <xslt> element in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

For more information about the available extension points, see: XSLT Extensions for PDF Transformations (on page 1141).

Combining PDF and WebHelp Responsive Customizations in a Template Package
An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The
A template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>

    <preview-image file="flowers-preview.png"/>

    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>

    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>

    <preview-image file="flowers-preview.png"/>

    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>

    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```

Publishing Template Package Contents for WebHelp Responsive Customizations (on page 953)
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

![Figure 246. Choosing the Publishing Template Descriptor Document Template](image)

3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2082) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:
1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the **Save template as** button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.
7. **Optional:** For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 969) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

**How to Edit a Packed Publishing Template**

To edit an existing Oxygen Publishing Template *(on page 2082)* package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Project Explorer view.
3. Using the Project Explorer view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.

5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

### How to Use a Publishing Template in a PDF Transformation

#### From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (or from the **DITA PDF - based on HTML5 & CSS** transformation scenario).

The **Templates** tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a **DITA Map PDF - based on HTML5 & CSS** transformation (or a **DITA PDF - based on HTML5 & CSS** transformation scenario).

2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

   **Step Result:** This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

   **Step Result:** Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

**Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

#### From a Command Line

You can use the `pdf.publishing.template` parameter to point to the *.opt (publishing template) file:

```
dita.bat  
   --input=map\test.ditamap*  
   "-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"  
   --format=pdf-css-html5  
   ...  
```
Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```bash
dita.bat
--input=map\test.ditamap
-Dpdf.publishing.template=full_path_to_template_dir
-Dpdf.publishing.template.descriptor=my_template.opt
--format=pdf-css-html5
...
```

**Tip:**
You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Related Information:
Transformation Parameters *(on page 1120)*

### How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (`.xpr`).

### XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1:** Makes some changes on the merged map *(on page 1163)* and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

**Note:**
Use this when you need to filter DITA content.
2. **Stage 2**: Transforms the merged map (on page 1163) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: $DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5$.

**Note:**
Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a *Publishing Template* or a DITA-OT extension plugin.

**How to Use XSLT Extension Points for PDF Output from a Publishing Template**

The examples in this section demonstrate how to use XSLT extension points from an *Oxygen Publishing Template*.

**How to Style Codeblocks with a Zebra Effect**

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the *codeblock* is wrapped.

This effect can be done by altering the HTML5 output, creating a *div* for each line from the code block, then styling them.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see *How to Create a Publishing Template* (on page 1138).
2. Link the folder associated with the publishing template to your current project in the *Project Explorer* view.
3. Using the *Project Explorer* view, create an *xslt* folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
        <div class="zebra">
            <xsl:analyze-string regex="\n" select="."/>
            <xsl:matching-substring/>
        </div>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2html5"
                 file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the codeblock structure. For example:

```css
div.zebra {
  font-family: courier, fixed, monospace;
  white-space: pre-wrap;
}
div.zebra > *:nth-of-type(odd) {
  background-color: silver;
}
```

7. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```
8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

How to Remove the Related Links Section

Suppose that you want the related links sections to be removed from the PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:
   
   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 exclude-result-prefixes="xs"
                 version="2.0">

   <xsl:template match="*[contains(@class, ' topic/related-links ')]">
     <!-- Remove. -->
   </xsl:template>

   </xsl:stylesheet>
   ```
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:
   
   ```xml
   <publishing-template>
     ...
     <pdf>
       ...
     </pdf>
     
     <xslt>
       <extension
           id="com.oxygenxml.pdf.css.xsl.merged2merged"
           file="xslt/merged2mergedExtension.xsl"/>
     </xslt>
   </publishing-template>
   ```
6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.
How to Wrap Words in Markup

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).

2. Link the folder associated with the publishing template to your current project in the Project Explorer view.

3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.

4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="text()">

        <xsl:variable name="txt">
            <xsl:next-match/>
        </xsl:variable>

        <xsl:analyze-string regex="(\w|-)+" select="$txt">
            <xsl:matching-substring>
                <!-- A word -->
                <xsl:choose>
                    <xsl:when test="contains(., '-')">
                        <!-- A compound word -->
                        <code class="compound-word">
                            <xsl:value-of select="."/>
                        </code>
                    </xsl:when>
                    <xsl:otherwise>
                        <!-- A simple word -->
                        <xsl:value-of select="."/>
                    </xsl:otherwise>
                </xsl:choose>
            </xsl:matching-substring>
            <xsl:non-matching-substring>
        </xsl:analyze-string>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
...
<pdf>
...
<xslt>
<extension
  id="com.oxygenxml.pdf.css.xsl.merged2merged"
  file="xslt/merged2mergedExtension.xsl"/>
</xslt>
</pdf>
</publishing-template>
```

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.

---

**How to Convert Definition Lists into Tables**

Suppose you want your definitions lists (`<dl>`) to be displayed as tables in your PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).

2. Link the folder associated with the publishing template to your current project in the Project Explorer view.

3. Using the Project Explorer view, create an xslt folder inside the project root folder.

4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
<xsl:template match="*[contains(@class, ' topic/dl ')]">
  <xsl:call-template name="setaname"/>
  <xsl:apply-templates select="*[contains(@class, ' topic/dlentry ')] | *[contains(@class, ' topic/dd ')] | *[contains(@class, ' topic/dt ')]"/>
</xsl:template>

<xsl:template match="*[contains(@class, ' topic/dl ')]">
  <xsl:call-template name="commonattributes"/>
  <xsl:call-template name="setid"/>
  <xsl:apply-templates/>
</xsl:template>

<xsl:template match="*[contains(@class, ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>

<table>
  <xsl:call-template name="commonattributes"/>
  <xsl:call-template name="setid"/>
  <xsl:apply-templates/>
</table>

<xsl:template match="*[contains(@class, ' topic/dl ')]">
  <xsl:call-template name="commonattributes"/>
  <xsl:call-template name="setid"/>
  <xsl:apply-templates/>
</xsl:template>

<xsl:template match="*[contains(@class, ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>

<tr>
  <xsl:call-template name="commonattributes"/>
  <xsl:call-template name="setidaname"/>
  <xsl:apply-templates/>
</tr>
</xsl:template>

<xsl:template match="*[contains(@class, ' topic/dd ')] | *[contains(@class, ' topic/dt ')]">
  <xsl:call-template name="commonattributes"/>
  <xsl:call-template name="setid"/>
  <xsl:apply-templates select="../*[contains(@class, ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>
  <xsl:apply-templates/>
  <xsl:apply-templates select="../*[contains(@class, ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>
</xsl:template>

</xsl:template>
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

### How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xs:lt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0"/>

<!-- Match only top level tables (i.e tables that are not nested in other tables), that have footnotes. -->
<xsl:template match="*">
  *[contains(@class, 'topic/table')]
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2merged"/>
      <xsl:stylesheet file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```
6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the `glossary` structure. For example:

```xml
/* Customize footnote calls, inside the table. */
*{outputclass ~= 'table-fn-call'} {
  color: black;
  text-decoration: none;
  font-size: smaller;
  vertical-align: super;
  line-height: none;
}

/* Hide the "on page .." text that follows xrefs. */
*{outputclass ~= 'table-fn-call'}:after {
  display: none;
}

/* Customize the list containing all the table footnotes. */
*{outputclass ~= 'table-fn-container'} {
  border-top: 1pt solid black;
}

/* Customize footnotes display, below the table. */
*{outputclass ~= 'table-fn'} {
  font-size: lem;
}
*{outputclass ~= 'table-fn'}::marker {
  font-size: lem;
}
```

7. Open the template descriptor file (on page 1132) associated with your publishing template (the `.opt` file) and reference your custom CSS file in the `resources` element:

```xml
<publishing-template>
  ...
  <pdf>
  ...
  <resources>
    <css file="css/custom.css"/>
  </resources>
  ...
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.
How to Wrap Scientific Numbers in Tables Cells

In your PDF output, you may need to wrap scientific numbers on two lines when they are included in table cells.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see *How to Create a Publishing Template (on page 1138)*.

2. Link the folder associated with the publishing template to your current project in the *Project Explorer* view.

3. Using the *Project Explorer* view, create an *xslt* folder inside the project root folder.

4. In the newly created folder, create an XSL file (for example, named *merged2html5Extension.xsl*) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <!-- Matches text from table cells. -->
    <xsl:template match="*[contains(@class, ' topic/entry ') ]/text()">
        <xsl:analyze-string select="." regex="[0-9]\.[0-9]{2}e-[0-9]{2}"
            <!-- The cell contains a scientific number like 1.23e-08. -->
            <xsl:matching-substring>
                <xsl:variable name="text" select="concat(substring-before(., 'e'), 'e', substring-after(., 'e'))"/>
                <xsl:value-of select="$text"/>
            </xsl:matching-substring>
            <xsl:non-matching-substring>
                <xsl:value-of select="."/>
            </xsl:non-matching-substring>
        </xsl:analyze-string>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file (on page 1132)* associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the *com.oxygenxml.pdf.css.xsl.merged2html5* XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
```

Oxygen XML Author Eclipse Plugin 24.1 | 11 - Publishing | 1151
6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

### How to Use a Bullet for Tasks that Contain a Single Step

If a DITA **Task** document only contains one list item (a single `<step>` element), you probably want it to be rendered the same as an unordered list (displayed with a bullet instead of a number), as in the following example:

```xml
...<steps>
    <step>
        <cmd>My single step</cmd>
    </step>
</steps>...
```

Normally, the output will be rendered as:

```
1. The step
```

instead of:

```
  o The step
```

To change the default rendering so that a single step will be rendered with a bullet instead of a number, use an **Oxygen Publishing Template** and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an **xslt** folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs">
```
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```
<publishing-template>
  ...
  <pdf> ...
  <xslt>
    <extension id="com.oxygenxml.pdf.css.xsl.merged2html5"/>
    file="xslt/merged2html5Extension.xsl"
  </xslt>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```
*[outputclass ~="single"] {  
  list-style-type:circle !important;
  margin-left:2em;
}
```

7. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```
<publishing-template>
  ...
  <pdf> ...
  <resources>
    <css file="css/custom.css"/>
  </resources>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

How to Change the Critical Dates Format

By default, the dates are entered in a YYYY-MM-DD format (where YYYY is the year, MM is the number of the month, and DD is the number of the day). You can change the format (for example, to something like January 1, 2020) using an XSLT extension.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, 'topic/created')]/@date | *[contains(@class, 'topic/revised')]/@modified" mode="copy-meta">
        <xsl:attribute name="{name()}">
            <xsl:value-of select="format-date(., '[MNn] [D01], [Y0001]')"/>
        </xsl:attribute>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
```
6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

Formatting Dates and Times in XSLT

How to Remove Links from Terms

Your topics might contain multiple references to the same `<term>`. These terms can further be explained in the glossary. In this case, you may want to only keep the first occurrence of this term to be a link to the glossary and display the other terms as text.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/term ')]" name="topic.term">
        <!-- Save the current @href value -->
        <xsl:variable name="current-href" select="@href"/>
        <!-- Get the closest parent topic -->
        <xsl:variable name="closest-parent"
            select="ancestor::*[contains(@class, ' topic/topic ')][1]"/>
        <!-- Get the first <term> having the same href -->
        <xsl:variable name="first-term-with-same-href"
            select="($closest-parent/"
                *[contains(@class, ' topic/term ')[@href=$current-href]])[1]/">
        <!-- Call the HTML5 default template -->
        <xsl:variable name="result">
```

```xml```
5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:
6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

### How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

The examples in this section demonstrate how to use XSLT extension points from a **DITA-OT plugin**.

Instead of directly adding plugins inside the embedded DITA-OT, it is highly recommended to use an external **Oxygen Publishing Engine** so that you will not lose any of your customizations anytime you upgrade the product in the future.

You just need to follow these steps before starting your custom DITA-OT plugins:

1. Download the **Oxygen Publishing Engine** and unzip it inside a folder where you have full write access.
2. Create your custom plugin(s) inside the **DITA-OT-DIR\plugins\** folder.
3. Go to **Options > Preferences > DITA**, set the **DITA Open Toolkit** option to **Custom**, and specify the path to the unzipped folder.

⚠️ **Warning:**

The path must end with: **oxygen-publishing-engine-3.x**.

### How to Style Codeblocks with a Zebra Effect

Suppose you want your **codeblocks** to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the **codeblock** is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the **DITA-OT-DIR\plugins\** folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.codeblocks">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5"
         file="custom_codeblocks.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, **custom_codeblocks.xsl**) with the following content:
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
exclude-result-prefixes="xs"
version="2.0">
  <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
    <div class='zebra'>
      <xsl:analyze-string regex="\n" select=".">
        <xsl:matching-substring/>
        <xsl:non-matching-substring>
          <div><xsl:value-of select="."/></div>
        </xsl:non-matching-substring>
      </xsl:analyze-string>
    </div>
  </xsl:template>
</xsl:stylesheet>

4. Use the **Run DITA-OT Integrator** transformation scenario (on page 808) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.

5. Create a custom CSS file with rules that style the `codeblock` structure. For example:

```css
div.zebra {
  font-family: courier, fixed, monospace;
  white-space: pre-wrap;
}

div.zebra > *:nth-of-type(odd) {
  background-color: silver;
}
```

6. Edit a **DITA Map PDF - based on HTML5 & CSS** transformation scenario and reference your custom CSS file (using the `args.css` parameter).

7. Run the transformation scenario.

**How to Remove the Related Links Section**

Suppose you want the **related links** sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:
3. Create your customization stylesheet (for example, `custom_related_links.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/related-links ')]">
        <!-- Remove. -->
    </xsl:template>

</xsl:stylesheet>
```

4. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

### How to Use Custom Parameters in XSLT Stylesheets

Suppose you want to add an attribute with a custom value inside a `<div>` element.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.param`).

2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.css.param">
       <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5.parameters" file="params.xml"/>
       <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom.xsl"/>
   </plugin>
   ```

   **Note:**
   The `com.oxygenxml.pdf.css.xsl.merged2html5` extension point can also be called from a Publishing Template.

3. Create a `params.xml` file that specifies the name of the custom attribute with the following content:
4. Create your customization stylesheet (for example, `custom.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:param name="custom-param"/>

    <xsl:template match="*[contains(@class, ' topic/div ')]">
        <div>
            <xsl:call-template name="commonattributes"/>
            <xsl:call-template name="setid"/>
            <xsl:if test="$custom-param">
                <xsl:attribute name="custom" select="$custom-param"/>
            </xsl:if>
            <xsl:apply-templates/>
        </div>
    </xsl:template>

</xsl:stylesheet>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Duplicate the DITA Map PDF - based on HTML5 & CSS transformation scenario, then in the Parameters tab click New to create a new parameter (e.g. named `custom.param` with the value of `customValue`).

7. Run the transformation scenario.

Adding parameters to existing XSLT steps

**DITA-OT Extension Points**

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the `plugin.xml` file. For more information, see DITA Open Toolkit Extension Points.

**Related Information:**

XSLT Extensions for PDF Transformations (on page 1141)
How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the `args.css` parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the `com.oxygenxml.pdf.css.init` extension point and set the value of the `extension.css` ANT property to the path of the custom CSS file:

1. In your `plugin.xml` file, add:

   ```xml
   <feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
   ```

2. Create a file named `init.xml` with the following ANT content:

   ```xml
   <root>
     <property name="extension.css"
       value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"/>
     <!-- add here more init stuff if needed -->
   </root>
   ```

**Note:**
The name of the root element does not matter. The content of this element will be copied in an initialization template.

**Important:**
Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin (on page 1157)

Customizing PDF Output Using CSS

The publishing process is driven by a customization CSS.

**Tip:**
If you use the default Chemistry processor in Oxygen XML Editor/Author, you can use LESS instead of CSS. In this case, the customization files should have the `.less` extension.
To change the styling of the output for the **DITA Map PDF - based on HTML5 & CSS** and the **DITA PDF - based on HTML5 & CSS** transformation scenarios:

1. Create the CSS file that will contain all of your customizations. It is recommended to create this file in your project directory so you can edit it easily.
2. Add your custom CSS rules. As a good starting point you can:
   ◦ Check the various topics in this section for assistance with specific types of customizations.
   ◦ Use the Oxygen Styles Basket (on page 1162) to generate basic selectors for common content.
3. For linking the CSS file, you have two options:
   ◦ Create a publishing template, create the customization CSS file inside the template folder, and link it to the publishing template descriptor. For assistance, see Publishing Templates (on page 950).
   ◦ Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

**Tip:**

For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata

**Oxygen Styles Basket**

The Oxygen Styles Basket is a handy free-to-use web-based visual tool that helps you to fine-tune the CSS file that is used to customize your PDF or WebHelp output. You simply pick and mix aspects from galleries to add and adjust the rules in your custom CSS file.

It is based on galleries that you can use to pick and mix styling aspects to create a custom look and feel. Various different types of aspects can be selected to be integrated in the CSS stylesheet (such as fonts, tables, lists, spacing, code). It is also possible to re-upload a previously generated CSS for further customization.

You can see the results of your changes in the Preview pane or you can click the See Results toolbar button to see the results in a generated preview version of either PDF or WebHelp output. When you are finished with your customization, you can Download the results as a CSS file or a Publishing Template Package that you can use in your transformation process.
Figure 247. Oxygen Styles Basket Interface

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

Merged Map File

Depending on the type of transformation, one or more merged map files are created at some point during the transformation stages. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the merged map file. This can be found in the out/pdf-css directory and it has the .merged.html file extension (you will also find a .merged.xml file that aggregates the entire ditamap structure). You can open the HTML files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (Format and Indent) to make the structure easier to read.

2. Check that the CSS selectors are written correctly against the document structure.

3. If you still cannot identify the problem, then inspect how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:
1. Open the file ending in `.merged.html`.

2. Click on the element you want to inspect.

3. Activate the **Chrome Developer Tools** by using > More Tools > Developer Tools, or press `CTRL + SHIFT + I`.

4. Activate the **Rendering pane** by using > More Tools > Rendering:

5. In the **Rendering pane**, select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in `@media print {...}`.
Note:
This allows you to debug the styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

Tip:
In the left pane of the Developer Tools interface, you can inspect elements and their styles in the Elements tab. You can click on any of the links to display the applied CSS files in the Styles tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.

CAUTION:
Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Inspecting the Applied Styles Using Oxygen XML Editor/Author
To inspect styles:

1. In Oxygen XML Editor/Author, open the file ending in .merged.html.
2. [Optional] From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in @media print {...}.
3. Click on the element you want to style. Use the Inspect Styles action from the Contextual Menu. A specialized CSS Inspector view will show the built-in CSS rules.

Tip:
With this file open in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

Note:
This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.

CAUTION:
Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Other techniques
These are some other techniques you may find useful:
• Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
• Try to use the `!important` notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
• To figure out how the elements are mapped to PDF, you can use this fragment in the customization CSS:

```css
* {
  border: 1pt solid blue !important;
}

*:before(1000) {
  content: oxy_name() !important;
  color: orange;
}

*:before(999) {
  content: "[ class='" attr(class) '"]" !important;
  color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

**How to Speed up CSS Development and Debugging**

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can use the merged map *(on page 1163)* and transform it directly to PDF.

1. Transform your DITA Map to PDF using the DITA Map PDF - based on HTML5 & CSS transformation scenario.
2. Open the merged file *(on page 1163)* (*.merged.html) that is located in the output directory in the editor.
3. Configure an XML to PDF transformation with CSS scenario. Do not set CSS files here since the merged file already contains pointers to the stylesheets. This scenario uses the Chemistry CSS processor.
4. **Optional**: Enable the output of the CSS processor using the following preferences page: Options > Preferences > XML > PDF Processors > CSS Processor.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.
**Fastpath:**
If your changes involve only element styling, with no specific paged media CSS rules and properties, you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (on page 1163).

---

**How to Write XPath Expressions**

This topic contains some guidelines for writing XPath expressions. They are used to extract the content from the merged DITA map document.

This is an example where the product name meta-information is placed before the front page title:

```xml
//*[class="front-page/front-page-title"]:before {
    text-align: left;
    content: oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()")
    display:block;
}
```

**Notes:**

- Do not use the DITA element names directly. You must use the DITA @class attribute instead, as these attributes are propagated to the merged elements (including HTML `<div>` elements) while the element names can be lost. By using the class selectors, you also cover DITA specializations.
- Use the `[1]` XPath predicate to select the first value from the document. For example, `<oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()")>[1]">. The meta-information might be copied multiple times in the output, inherited by the `<topicref>` elements, so you can get many more values than expected.
- Do not use strings as values for the pseudo-elements content, as the string values are not supported for pseudo-elements. Instead, use the XPath directly.
- Use the Oxygen XPath Builder view to test the XPath expressions.

**Related Information:**

How to Debug XPath Expressions (on page 1167)

---

**How to Debug XPath Expressions**

You can use the content extracted from the document using the `oxy_xpath` function in your pseudo-elements (`:before, :after`) or in string-set variables.

For example, the following XPath finds the publication author, set in the DITA map:
To debug an XPath expression:

1. Read the XPath Expressions Guidelines (on page 1167).
2. Begin by transforming your document using your customization CSS.
3. In the output folder, you will find a [MAP_NAME].merged.html file (or if you are using the DITA Map PDF - based on HTML5 & CSS transformation, a [MAP_NAME].merged.html file).
4. Open the merged file in the Oxygen XML Editor/Author.
5. Activate the XPath Builder view (Window > Show View > XPath/XQuery Builder).
6. Paste your XPath expression and click the Execute XPath button. Check if it returns the expected results.

The XPath builder has a function that allows it to display the document path of the current element from the editor (Settings drop-down menu > Update on cursor move). Alternatively, you can right-click the element in the merged document and select the Copy XPath action, then paste it in the XPath builder.

**Default Page Definitions**

All page definitions are found in: [PLUGIN_DIR]css/print/p-pages-and-headers.css.

**Note:**
This is listed solely for illustration purposes, as the plugin might use something different.

There are page definitions for the default page, chapter page, table of contents page, front matter page, back matter page, index page, large tables page, and blank page.
Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    }
}

@page :right {
    @top-right {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    }
}
```

**Tip:**
To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml
@page :left, table-of-contents:left, chapter:left {
    @top-left {
        content: "...";
    }
}

@page :right, table-of-contents:right, chapter:right{
    @top-right {
        content: "...";
    }
}
```

Chapter Page

This is inherited from the default page. The chapter page is associated with the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter. If you need to add other information to the chapter headers, make sure you override these rules in your CSS:

```xml
@page chapter{
    /* Currently inherit from the default page. */
}
```
/* No headers on the chapter first page. */
@page chapter:first: left {
    @top-left {
        content: none;
    }
}

@page chapter:first: right {
    @top-right {
        content: none;
    }
}

Table of Contents Page

The table of content page. It clears the headers and uses a lower roman page number in the header.

@page table-of-contents {
    @top-left { content: none; }
    @top-center { content: none; }
    @top-right { content: none; }
    @bottom-left { content: none; }
    @bottom-center { content: none; }
    @bottom-right { content: none; }
}

@page table-of-contents: left {
    @top-left {
        content: string(toc-header) " | " counter(page, lower-roman);
    }
}

@page table-of-contents: right {
    @top-right {
        content: string(toc-header) " | " counter(page, lower-roman);
    }
}

/* Do not put a header on the first page of the TOC */
@page table-of-contents:first: left {
    @top-left {
        content: none;
    }
}

@page table-of-contents:first: right {
    @top-right {

Front Matter and Back Matter Page

The bookmap front matter and back matter page. It clears the headers.

```xml
@page matter-page {
  @top-left-corner { content:none }
  @top-center { content:none }
  @top-right-corner { content:none }
  @bottom-left-corner { content:none }
  @bottom-left { content:none }
  @bottom-center { content:none }
  @bottom-right { content:none }
  @bottom-right-corner { content:none }
}

@page matter-page: left {
  @top-left { content: counter(page, lower-roman); }
}

@page matter-page: right {
  @top-right { content: counter(page, lower-roman); }
}
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```xml
@page index {
  @top-left-corner { content:none }
  @top-left { content:none }
  @top-right { content:none }
  @top-right-corner { content:none }
  @top-center { content:none }
  @bottom-left-corner { content:none }
  @bottom-left { content:none }
  @bottom-right { content:none }
  @bottom-right-corner { content:none }
  @bottom-center { content: counter(page, lower-alpha);
    font-size: 11pt;
}
```
When transformed, the page layout is spread on two columns.

**Large Tables Page**

The big tables are placed on a rotated page, with orientation landscape:
Blank Page

The following example clears the header for the blank pages that may be created by a page-break-before, page-break-after, or by using double side pagination (on page 1251):

```css
@page :blank{
    @top-left {
        content: none;
    }
    @top-right {
        content: none;
    }
}
```

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-page-size.css file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```css
@page {
    padding-top:0.2em;
    padding-bottom:0.2em;
    size: us-letter;
    margin: 1in;
}
```
How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS (on page 1161), use:

```
@page {
  size: A4;
  margin: 2cm;
}
```

If you need different margins depending on the page side:

```
@page {
  size: A4;
  margin: 2cm;
}
@page :left{
  margin-right: 4cm;
}
@page :right{
  margin-left: 4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page orientation. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS (on page 1161), use:

```
@page {
  size: us-letter landscape;
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication mainly uses a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleed outside of the page, you could use a wider page setting (landscape).
1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, wide), you can set the attribute on the root element of the topic or on the `<topicref>` element from the map.

   ![Note]
   
   The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the merged map (on page 1163).

2. In your customization CSS (on page 1161), match the output class and associate it with a named page. In the following example, the page has a landscape orientation and small margins. This technique works for any element (e.g. a table or list) not just for a topic.

   ```css
   @page wide-page {
       size: letter landscape;
       margin: 0.5in;
   }

   *[outputclass = 'wide'] {
       page: wide-page !important;
   }
   
   ![Note]
   
   The `!important` rule is necessary to override the default page settings.

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (on page 1226):

- `parttitle`
  
  Set to the title of the current part (only for DITA bookmaps that use parts).

- `chaptitile`
  
  Set to the title of the current chapter (Shallow and Deep numbering).

- `sectiontitle`
  
  Set to the title of each section (Deep numbering only).

To see where the default page rules are defined, see: Default Page Definitions (on page 1168).

Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach, in this case, is to take a look at the rules from the numbering CSS (on page 1226), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).
Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (on page 1168).

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the top-left or top-right page margin boxes:

```css
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        counter(page);
    }
}

@page :right{
    @top-right {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        counter(page);
    }
}
```

If you want to change this, you should use the content CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```css
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        counter(page);
    }
    @top-left-corner {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        counter(page);
        white-space: nowrap;
        text-align: left;
    }
}

@page :right{
    @top-right {
```
Note:
The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: How to Decorate the Header by Using a Background Image on the Entire Page (on page 1186).

How to Display Chapter's Headers on First Page

By default, the header is not displayed on the first page of each chapter:

```xml
/* No headers on the chapter first page. */
@page chapter:first:left{
  @top-left {
    content: none;
  }
}
@page chapter:first:right{
  @top-right {
    content: none;
  }
}
```

If you want to display them on the first page, you just need to override the above default rules with the following default content:

```xml
@page chapter:first:left{
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}
@page chapter:first:right{
  @top-right {
    content: none;
  }
}
```
How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so-called page margin boxes, a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```css
@page {
    margin-top:3cm !important;
    margin-bottom:3cm !important;
    margin-left:2cm !important;
    margin-right:2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the Default Page Definitions (on page 1168) for details.

Note that the page margin boxes fill the entire page margin. This means the margin-top, for example, dictates the height of the @top-left-corner, @top-left, @top-center, @top-right, @top-right-corner margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use padding properties:

```css
@page {
    @top-left {
        content: "...
        padding: 1cm;
    }
    ..
}
```

How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (on page 1161), add a CSS rule similar to this:

```css
@page {
    font-size: 12pt;
    font-family: "Arial";
}
```
Important:
These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```
@page table-of-contents {
  font-size: 12pt;
  font-family: "Arial";
}
```

Related Information:
How to Change the Header of the Table of Contents (on page 1242)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map is by using the `<topicmeta>` element for the `<topicref>` topic reference:

```
...  
<topicref href="topics/installing.dita">  
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
  ...
```

In the above example, there is set of key value pairs with the name `header-data`. This information is automatically copied into the content in the merged map file (on page 1163), like this:

```
<topic ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
  
  <data class="- topic/data * name="header-data" value="ID778-3211"/>
  ...
```

This information can be extracted from the CSS:

```
/* Define the string set variable that contains the text extracted from the data element */
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-data"] {
  string-set: hdrstr attr(value);
}
```
/* Using the value='none' stops applying the image. */

/* Use the string set variable in one of the page margin boxes. */

Notes:
The string set is applied to all pages that follow the data element, until another data element changes it:

...  
<topicref href="topics/installing.dita">
   <topicmeta>
      <data name="header-data" value="ID778-3211"/>
   </topicmeta>
</topicref>

<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
   <topicmeta>
      <data name="header-data" value="ID990-3200"/>
   </topicmeta>
</topicref>

<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->

To clear the text, use the none value:

...  
<topicref href="..."> <!-- The string set is void now -->

...
How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```xml
...<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
...```

In the above example, there is set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1163), like this:

```xml
<topic is-chapter="true" ...>
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc">
    You install components to make them available for your solution.
  </shortdesc>
  <prolog class="- topic/prolog">
    ...
  </prolog>
  <data class="- topic/data * name="header-image" value="img/installing.png"/>
  ...
</topic>
```

This information can be picked up from CSS:

```css
/* Define the string set variable that contains an URL */
*[class ~="topic/topic"] *[class ~="topic/data"] [name="header-image"] {  
  string-set: imgst oxy_url(oxy_xpath('/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class ~="topic/topic"] *[class ~="topic/data"] [name="header-image"] [value="none"] {  
  string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(imgst);
    font-size: 0; /* remove the font ascent and descent */
  }
}
```
Details: The @value attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the @xtrf attribute was used from the root element of the merged map document, extracted using the oxy_xpath function.

Notes:

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:

```xml
...<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="/img/installing.png"/>
  </topicmeta>
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="topics/change.dita">
  <topicmeta>
    <data name="header-image" value="/img/change.png"/>
  </topicmeta>
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>

To clear the image, use the none value:

```xml
...
  <data name="header-image" value="none"/>
...
```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:
For this, you need to specify a rule that matches all the right pages and adds that content in the bottom-center. In your customization CSS (on page 1161), add the following CSS rule:

```css
@page :right {
  @bottom-center {
    content: "© 2017 - My Company Ltd \A All rights reserved";
    font-size: 0.5em;
    color: silver;
  }
}
```

**Note:**
Other page rules (such as the table-of-contents) override the contents of the @bottom-center because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents:right {
  ...
}
```

**Note:**
To use new lines (\n characters) in your headers or footers, use the \A notation, as in the example above.

### How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

   ```xml
   ...
   End topic
   Footer container topic
   Footer content topic 1
   Footer content topic 2
   ```

2. Add an ```@outputclass=footer``` on the ```<topic>``` root element of the footer container topic, or on its ```<topicref>``` in the map.
3. Use the CSS `position: fixed` property to position this topic to the bottom of the page:

```css
*[outputclass = "footer"] {
  position: fixed;

  bottom: 0.5in;
  left: 0.5in;

  width: 5in;
  height: 200pt;
}
```

**Note:**
Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

**Method 2: Using the float:footnote CSS Property**

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

```css
*[outputclass = "footer"] {
  float: footnote;
}

*[outputclass = "footer"]:footnote-call{
  color: transparent;
  font-size: 0;
}

*[outputclass = "footer"]:footnote-marker{
  color: transparent;
  font-size: 0;
}
```

**Note:**
Use transparent colors and/or zero size font to avoid the display of the footnote counters.

**How to Add a Background Image to the Header**

A common use-case is to add a background image to one of the page corners.

```css
@page :left {
  @bottom-left-corner{
```
Important:
Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use the `[@top-left]` or `[@top-right]` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (on page 1186)):

```xml
@page :left {
    @top-left {
        content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat: no-repeat;
        background-position: 50% 50%;
    }
}
```

Note:
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related Information:
- Images and Figures (on page 1301)
- How to Add a Background Image for the Cover (on page 1201)
- How to Add a Link in Headers and Footers (on page 1186)
How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the `<a>` element inside an SVG document. For example, suppose you have the following SVG document named `custom.svg`:

```
<svg viewBox="0 0 100 40" xmlns="http://www.w3.org/2000/svg">
    <text x="10" y="25">PDF Chemistry</text>
  </a>
</svg>
```

This creates an SVG link with PDF Chemistry displayed as its text (the content of the `<text>` element).

**Note:**
If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```
@page {
  @top-left {
    content: url("custom.svg");
  }
}
```

Method 2: Using the CSS `-oxy-link` Property

It is also possible to add a link inside the document header (or footer) by using the `-oxy-link` property on the `@page` margin box declaration. The entire page margin box will behave as a link and will be clickable.

```
@page {
  @top-left {
    content: "Link";
    -oxy-link: "https://www.oxygenxml.com/";
    color: blue;
  }
}
```

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.
This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```css
@page :left, chapter: left, chapter: first: left {
  background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
  background-repeat: no-repeat;
  background-position: 50% 50%;
  background-size: 8.5in 11.5in; /* Optional: Adapt to your page size. */
}
```

For a list of all the possible page names, see: Default Page Definitions (on page 1168).

Related Information:
How to Add a Background Image for the Cover (on page 1201)

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

- Use an SVG image as the background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (on page 1184).
- Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```css
@page {
  @top-right {
    content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
      oxy_label(text, "Product", styles, "color:blue; text-decoration:underline");
```  

You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```css
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; "));
```

**Note:**
These functions work only with the Chemistry CSS processor.
Note:
You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```css
@page {
  @top-right {
    color: red;
    content: oxy_label(text, "My Company", styles, "color:black")
      ,
      string(chaptetitle); /* This inherits the styling from @top-right*/
  }
}
```

- Use two adjacent page margin boxes, and style them differently:

```css
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align:right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align:left;
  }
}
```

How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as `map title`, `part title`, `chapter title`, and `section title`, ending in the page number.

```css
   content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " 
   counter(page);
```

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (on page 1161), add the following CSS rule:

```css
@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}
```
Important:

Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:
  ```css
  @page :left, table-of-contents:left, chapter:left{
    ...
  }
  @page :right, table-of-contents:right, chapter:right{
    ...
  }
  ```

- Add an `!important` classifier just before the semi-colon.
  ```css
  @top-right {
    content: string(chaptertitle) " | " counter(page) !important;
  }
  ```

How to Change the Header Separators (Between Sections and Chapter Titles)

There are some strings defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

1. "My Publication" is the value of the `maptitle` string.
2. "Introduction" is the value of the `chaptertitle` string.
3. "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (on page 1161), add the following CSS rule:

```css
*[class ~="topic/topic"] [is-part] > *[class ~="topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~="topic/topic"][is-chapter]:not([is-part]) > *[class ~="topic/title"] {
```
If you enabled the deep numbering for chapters and subsections *(on page 1230)*, then use:

```xml
/*
 * Alter the string sets that are shown in the header of the page.
 */
*[class = "map/map"]*[p|numbering="deep"] *[class = "topic/topic"]*[is-part] > *[class
  = "topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle ""
  ; /* Avoid propagating a past chapter title on a new part */
}
*[class = "map/map"]*[p|numbering="deep"] *[class = "topic/topic"]*[is-chapter]:not([is-part]) >
  *[class = "topic/title"] {
  string-set: chaptertitle " - " counter(chapter) " - " content(), sectiontitle "";
}
*[class = "map/map"]*[p|numbering="deep"] *[class = "topic/topic"]*[is-chapter]:not([is-part]) >
  *[class = "topic/topic"] > *[class = "topic/title"] {
  string-set: sectiontitle " - " counter(chapter) "." counter(section1) " - " content();
}
```

### How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your customization CSS *(on page 1161)*:

```css
@page :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

If you intend to modify just the headers of the table of contents, use the `table-of-contents` page rule selector:

```css
@page table-of-contents: :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
```
How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```xml
@page front-page {
    @top-center {
        content: "Created: " oxy_xpath('//*'[contains(@class, " topic/created "])[1]');
    }
}
```

Example 1: Compute the Number of Words

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```xml
@page front-page {
    @bottom-center {
        content: "Number of words: 
        oxy_xpath("string-length(normalize-space(/)) - \n        string-length(translate(normalize-space(/),' ','')) +1");
    }
}
```

Note:
The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with `/` or `//`. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.

Tip:
XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
    <metadata>...
            ...
    <data name="cover">
        <image href="product-cover.png" outputclass="cover-image"/>
    </data>
</bookmeta>
```
If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```xml
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri(//*[contains(@outputclass, 'cover-image')]/@href),
                        document-uri(/));
  }
}
```

**Example 3: Insert the Current Date in the Footer**

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```xml
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```

**Example 4: Picking up Metadata from the Original Map**

Another example is to use the `oxy_xpath` function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the `@xtrf` attribute that is set on the root element of the merged map. This attribute contains the URL of the input map:

```xml
:root{
  string-set: maptitle oxy_xpath("document(@xtrf)/*[contains(@class, " map/map ")]/*[contains(@class, " topic/title ")]/text()");
}
```
How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

**Method 1: Add a Border in the Page Margin Boxes**

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (`top-left-corner, top-left, top-center, top-right, top-right-corner`).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```css
@page chapter, chapter:first:left:right, front-page{

    padding-top: 1em;

    @top-left {
        content: "Custom header";
        color: gray;
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

    @top-center{
        content: " ";
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

    @top-right{
        content: " ";
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

    @top-right-corner{
```
Note:
The `padding-top: 1em;` is used to avoid the border at the bottom of the header that joins with the page content.

**Method 2: Use a Background Image**

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (on page 1184).

**How to Change the Headings Using a Parameter**

Suppose you need to change the headings of your publication by specifying a static text in a parameter.

First, establish a name for your parameter (it must start with the `args.css.param.` prefix). For example, you could name it `args.css.param.Heading.text`. It will have the text value that you will pass when starting the transformation. This parameter does not have to be registered anywhere as it will be automatically recognized and passed as an XML attribute on the root of the merged file, as specified in Styling Through Custom Parameters (on page 1322).

Next, alter your customization CSS to make use of the parameter value. In the example below, the text is placed in the central part of the header:

```xml
@page front-page, table-of-contents, chapter {
  @top-center{
    content: oxy_xpath("/header/heading/text");
  }
}
```

Note:
You can use any XPath 2.0 here. It will be executed in the context of the merged map document, so you can collect data from it. You can use `if/then/else` expressions if your parameter is a switch.
The text does not affect the first pages from the page sequences because the built-in CSS page rules (on page 1168) clear the content from the headers. If you need the text content on all pages, you might consider adding an !important keyword after the content property value, or increase the specificity of the page selectors, like this:

```css
@page front-page,
  table-of-contents,
  table-of-contents:first: left,
  table-of-contents:first: right,
  chapter:first: left,
  chapter:first: right{
  @top-center{
    ...
  }
}
```

Another use case is to alter the string-sets that are used in the headers (not the headers directly), as it is explained here: How to Use XPath Computed Data or Images in the Header or Footer (on page 1191). You can use this technique to alter the chapter titles as in the following example:

```css
*[class =~ "map/map"]*[numbering~='deep']
  *[class =~ "topic/topic"]*[is-chapter]:not([is-part]) >
    *[class =~ "topic/title"] {
      string-set:
        chartertitle " | " counters(chapter-and-sections, ".") " - "
        oxy_xpath("//*/heading.text") content(),
        sectiontitle "",
    }
```

**Note:**
This is a rule copied from p-numbering-deep.css and it may change if future versions.

### How to Change the Headings depending on the Language

It is possible to customize the text displayed in the headings depending on the language of the publication.

In this case, you can simply use of the @lang attribute in your customization CSS. In the following example, the page counter displayed in the bottom part of the page is preceded by the word "Page", according to the selected language:

```css
@page chapter {
  @bottom-center {
    content: oxy_xpath("if (@lang='es') then " 'Página' \
      else if (@lang='it') then "Pagina' \
      else 'Page'") " " counter(page);
  }
```
Note:
Backslashes (\) are used to split the XPath into multiple lines to make it easier to read.

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an @page and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
3. In your DITA topic, set the @outputclass attribute on the topic root (or any element) to contain one of the page-break-before, page-break-after, or page-break-avoid values. If you want to control the page breaking from the DITA map, use the @outputclass attribute on the <topicref>, with any of the values mentioned above.

Double Side Pagination (on page 1251)
Oxygen PDF Chemistry: Controlling Page Breaks

Page Breaks - Built-in CSS

Page break properties are used in: [PLUGIN_DIR]css/print/p-page-breaks.css.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the page-break-inside CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS (on page 1161):

```css
*[class ~="topic/table"] {
    page-break-inside:avoid;
}
*[class ~="topic/ol"] {
    page-break-inside:avoid;
}
*[class ~="topic/ul"] {
    page-break-inside:avoid;
}
```
Note:
Since the task steps are inherited from topic/ol, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```css
*[class =~ "task/steps"] {
  page-break-inside: auto;
}
```

Note:
Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break before all the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your customization CSS (on page 1161):

```css
*[class =~ "map/map"] > *[class =~ "topic/topic"] > *[class =~ "topic/topic"] {
  page-break-before: always;
}
```

If you need to break at third or fourth level topics, add more `.. > *[class =~ "topic/topic"]` selectors to the expression.

If you want to force a page break for a specific topic, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

- `page-break-before`  
  Use this for a page break before the marked element.

- `page-break-after`  
  Use this for a page break after the marked element.

- `page-break-avoid`  
  Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```xml
<topic outputclass="page-break-before" ... >
```

Note:
You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.
You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```xml
<ol outputclass="page-break-avoid" .../>
```

**How to Add a Blank Page After a Topic**

If you want to add a new blank page after a topic, add the following rules to your customization CSS (on page 1161).

Style the separating blank page:

```css
@page topic-separating-page{
  @top-left {
    content: "";
  }
  @top-right {
    content: "";
  }
  @top-center {
    content: "This page is blank";
  }
}
```

Associate this page to the :after pseudo-element of the topic:

```css
*[class~="topic/topic"] [outputclass~="add-separator-page"]:after {
  content: " ";
  display: block;
  page: topic-separating-page;
}
```

In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```xml
<topic outputclass="add-separator-page"> ... </topic>
```

The :after pseudo-element will be created next to the topic content and will be placed on the topic-separating-page.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:**
You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.
How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a subsequent page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS *(on page 1161)*:

```css
:root {
    widows: 4;
    orphans: 4;
}
```

**Note:**
As a difference from the W3C standard, the *widows* and *orphans* CSS properties are applied to lists as well (the default is 2). This means that a list that spans consecutive pages will have either zero or at least 2 lines on each of the pages.

How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```css
*[class =~ "topic/topic"] [is-chapter] {
    -oxy-page-group:auto;
}
```

Related Information:
Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The merged map file *(on page 1163)* contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" ...
    </bookmeta>
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<oxy:front-page-title>
  <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
    class="- topic/title bookmark/booktitle ">
    <booklibrary class="- topic/ph bookmark/booklibrary ">Retro Tools</booklibrary>
    <mainbooktitle class="- topic/ph bookmark/mainbooktitle ">Tasks</mainbooktitle>
  </booktitle>
  <booktitlealt class="- topic/ph bookmark/booktitlealt ">Product tasks</booktitlealt>
</oxy:front-page-title>
</oxy:front-page>
```

**Cover Page - Built-in CSS rules**

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```css
@media print {
  *[class="front-page/front-page"] { 
    page: front-page; 
  }

  /* Prevents the front-page title margin collapsing */
  *[class="front-page/front-page"]:before(1000) { 
    display:block; 
    content:"\A";
  }
```
Note:
This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the front-page. This makes it easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of :after pseudo-elements bound to the front page title.

To set the size to an SVG image, you should specify the @width and @height attributes on the <svg> root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

<svg>
<polygon points="17.78 826.21 577.51 ...."/>
Next, make sure you also specify the @viewBox attribute on the <svg> root element that defines the abstract rectangle that contains the drawing:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
</svg>
```

The following SVG document has the @width, @height, and @viewBox attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN" "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110">
  <desc>A gradient as big as a page.</desc>
  <defs>
    <linearGradient id="lc"
      x1="0%" y1="0%"
      x2="0%" y2="100%"
      spreadMethod="pad">
      <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
      <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
    </linearGradient>
  </defs>
  <rect x="5" y="5" width="100" height="100" rx="10" ry="10"
    style="fill:url(#lc); stroke: #005000; stroke-width: 3;"/>
  <text x="33%" y="50%" color="#FFFFAA">Sample</text>
</svg>
```

This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

**Note:**

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS *(on page 1161)*, add the following:

```css
@page front-page {
  background-image: url("us-letter.svg");
  background-position: center;
  background-repeat: no-repeat;
}```
For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@page front-page {
  background-image: url("company-logo.svg");
  background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis. */
  background-repeat: no-repeat;
}
```

**Note:**
The text from the SVG or PDF background images is searchable in the PDF reader.

### How to Use Different Background Cover Images Based on Bookmap or Map Info

It is common to use the same CSS file for customizing multiple publications, and you may need to set a different cover for each of them. The solution is to use an XPath expression to extract some information from the document, and based on that, select the SVG images.

```css
@page front-page {
  background-image: url(oxy_xpath("\
    if(/*[contains(@class, ' topic/prodname ')][1] = 'gardening') then 'bg-gardening.svg' else\
    if(/*[contains(@class, ' topic/prodname ')][1] = 'soil') then 'bg-soil.svg'\
    else 'bg-default.svg'\
    "));
  background-position: center;
}
```

The backslash (`\`) is used to continue the expression string on the subsequent lines (there should be no spaces after it). For more use cases solved using XPath, see: Metadata (on page 1210).

### How to Change Styling of the Cover Page Title

Match the front page title element in your customization CSS (on page 1161) based on its class attribute:

```css
*[class =~ "front-page/front-page-title"] {
  margin-top: 1in;
  font-size: 3em;
}
```
Important:
Make sure the sum of the top and bottom margins and paddings for this element do not exceed the physical dimension of the page. If this happens, an extra blank page may appear before the cover page. Usually, it is enough to specify only the top margin.

How to Add Text to the Cover Page
If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS (on page 1161), add the following:

```css
* [class ~="front-page/front-page-title"] :after(1) {
    display: block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align: center;
}

* [class ~="front-page/front-page-title"] :after(2) {
    display: block;
    content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
    font-size: large;
    color: red;
    text-align: center;
    font-style: italic;
}
```

The result is:

```
Retro Tools
Product tasks
Tasks and what they can do

DRAFT VERSION
DO NOT DISTRIBUTE WITHOUT PERMISSION
```
To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `after` elements, see: How to Show Metadata in the Cover Page (on page 1216).

**Related Information:**
How to Show Metadata in the Cover Page (on page 1216)

### How to Place Cover on the Right or Left Side

In your customization CSS (on page 1161), add the following CSS rules:

```css
*[class ~="front-page/front-page"]{
    page-break-before: left;
}
```

**Note:**
This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

**Related Information:**
Double Side Pagination (on page 1251)

### How to Add a Second Cover Page and Back Cover Page

It is possible to add a second cover page after the front-page by defining another page-selector:

```css
@page second-cover {
    @top-left {content: none};
    @top-right {content: none};
    @bottom-center {content: none};

    background-image: url("second-cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}
```

```css
*[class ="front-page/front-page"]:after{
    page: second-cover;
    page-break-after: always;
    display: block;
}
```
If you want to add a back cover page, you should use an `:after` pseudo element on the map itself:

```
*[class =~ "map/map"]:after
```

and bind it to another `@page` declaration:

```
@page back-cover {
    @top-left {content: none};
    @top-right {content: none};
    @bottom-center {content: none};

    background-image: url("back-cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

*[class =~ "map/map"]:after {
    page: back-cover;
    content: "\2002";
}
```

**Note:**
For any `background-image`, it is recommended to use SVG instead of PNG (or JPG) because it scales it to the page size.

**Tip:**
To add multiple cover pages, use multiple-leveled pseudo selectors, such as `:after(1), :after(2)`. Remember that the larger the value, the more distant the pseudo element is to the target element.

**How to Dynamically Add a Second Cover Page**

It is possible to dynamically set the path to the SVG image that will be displayed on the secondary cover page.

First, you need to declare a `<data>` element in the `bookmap`'s metadata that contains the URL to your cover image:

```
<bookmap>
    <booktitle>...
    ...
    </booktitle>
    <bookmeta>
```

```
Next, you need to modify the page declaration inside your CSS stylesheet and replace the `background-image` property value with the result of the `oxy_xpath()` function:

```css
@page second-cover {
  ...
  background-image: url(oxy_xpath("//*"[contains(@class, 'bookmap/bookmeta')]/"*[contains(@class, 'topic/data')][@name='second-cover-url']/@value")
  ...}
```

**Tip:**
You can reuse the same stylesheet on multiple maps. You just need to change the data value for each of them.

**How to Add a Specific Number of Empty Pages After the Cover Page**

In your customization CSS *(on page 1161)*, add the following CSS rules:

```css
@page my-blank-page {
  /* Hide the page numbers */
  @top-left {content: none};
  @top-right {content: none};
}

*[class ~='front-page/front-page']:after(1){
  page:my-blank-page;
  display:block;
  content: '\2002';
  color:transparent;
  page-break-after:always;
}

*[class ~='front-page/front-page']:after(2){
```
Note:
The \2002 character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:
How to Force an Odd or Even Number of Pages in a Chapter (on page 1253)

How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS (on page 1161), declare a new page layout:

```css
@page copyright-notice-page {
  @top-left {
    content: none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content: none;
  }
}
```

The element with the class `front-page/front-page` element contains the title of the publication and generates the cover page. A synthetic `:after` element is created that follows this element and it is placed on a different page.
If you need to add more content as blocks, use the :after(2), :after(3) pseudo-elements:

```html
*{class="front-page/front-page"]:after(2) {
    display: block;
    page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
    content: "Some more styled text";
    color:red;
}
```

If you want to extract information from the document, use the oxy_xpath() function. For example, if the copyright info is stored in the map like this:

```xml
<map ...
    <topicmeta>
        <copyright>
            <copyyear year="2018"/>
            <copyrholder>MyCorp Inc.</copyrholder>
        </copyright>
    </topicmeta>
...
```

then use this:

```html
*{class="front-page/front-page"]:after(3) {
    display: block;
    page: copyright-notice-page;
    content: "Year: "
}
```
oxy_xpath('//*[contains(@class, " front-page/front-page")]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyyear ")]/*[year]

"A Holder:"

oxy_xpath('//*[contains(@class, " front-page/front-page")]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyrholder ")]/*[year]

{color: green;}

Related Information:
How to Debug XPath Expressions (on page 1167)

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS (on page 1161):

*[class =~ 'map/map'] > *[class =~ 'toc/toc'] {
  display: none !important;
}

*[class =~ 'map/map'] > *[class =~ 'front-page/front-page']{
  display: none !important;
}

*{class='topic/topic'}[is-chapter] {
  -oxy-page-group: auto;
}

Metadata

DITA has a solid vocabulary for specifying metadata. There are <prolog> elements in the topics, and <topicmeta>, <bookmeta> elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (on page 1163), the metadata section is placed inside the <oxy:front-page> element. This is different from the original placement in the map or bookmark (after the title), but allows for the usage of information from it in the title page.
Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The bookmeta metadata section is inherited from topicmeta:

```
xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
ditaarch:DITAArchVersion="1.3" >

<bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
class="- map/topicmeta bookmap/bookmeta">
  <author class="- topic/author ">Howe Tuduit</author>
  <bookid class="- topic/data bookmap/bookid">
    <isbn class="- topic/data bookmap/isbn">071271271X</isbn>
    <booknumber class="- topic/data bookmap/booknumber">SG99-9999-00</booknumber>
    <maintainer class="- topic/data bookmap/maintainer">
      <organization class="- topic/data bookmap/organization">ACME Tools</organization>
      <person class="- topic/data bookmap/person />
    </maintainer>
  </bookid>
  <bookrights class="- topic/data bookmap/bookrights">
    ...
  </bookrights>
  <bookowner class="- topic/data bookmap/bookowner">
    <organization class="- topic/data bookmap/organization">ACME Tools, Inc.</organization>
  </bookowner>
</bookmeta>

<oxy:front-page-title>
  ...
</oxy:front-page-title>
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map bookmap/bookmap bookmap" ...

<div class=" front-page/front-page front-page">
```
Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge" class="- map/map "
     ditaarch:DITAArchVersion="1.3">
...
</map>

  <topicmeta class="- map/topicmeta ">
    <author class="- topic/author ">Dan C</author>
    <metadata class="- topic/metadata ">
      <prodinfo class="- topic/prodinfo ">
        <prodname class="- topic/prodname ">oXygen PDF CSS DITA Plugin</prodname>
      </prodinfo>
    </metadata>
  </topicmeta>
</oxy:front-page>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge" class="- map/map "
     ditaarch:DITAArchVersion="1.3">

</div>
```

```
<div class=" front-page/front-page front-page">
</div>
```

```
<div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">Dan C</div>
    <div class="- topic/metadata metadata">
        <div class="- topic/prodinfo prodinfo">
            <div class="- topic/prodname prodname">oXygen PDF CSS DITA Plugin</div>
        </div>
    </div>
</div>
```

**Metadata - Built-in CSS rules**

The `[PLUGIN_DIR]/css/print/p-meta.css` file contains the rules that extract metadata.

**How to Create a Searchable PDF**

To make a PDF searchable, you need to add some `<keyword>` or `<indexterm>` elements inside bookmaps, maps, or topics. Most of the search engines will parse the resulting document and extract those keywords and create a search base.

**Note:**

Both `<keyword>` and `<indexterm>` elements can be combined inside the `<keywords>` element. They will be equally processed by the search engine.

In the generated PDF, keywords are displayed in the Document Properties.
Bookmaps

If you want your keywords to appear inside a bookmap, you need to define them inside the `<bookmeta>` element:

```xml
<bookmap>
...

<bookmeta>
  <keywords>
    <keyword>web server</keyword>
    <keyword>hard disk</keyword>
  </keywords>
</bookmeta>
```

Maps

If you want your keywords to appear inside a map, you need to define them inside the `<topicmeta>` element:

```xml
<map>
...

<topicmeta>
  <keywords>
    <keyword>flowers</keyword>
    <indexterm>care and preparation</indexterm>
    <keyword>seasons</keyword>
  </keywords>
</topicmeta>
```

Topics

If you want your keywords to appear inside one or more topics, you need to define them inside the `<prolog>` element:

```xml
<topic>
...

<prolog>
  <metadata>
    <keywords>
      <indexterm>iris</indexterm>
    </keywords>
  </metadata>
</prolog>
```

⚠️ Warning:

Keywords must be at map level or at topic level, you cannot combine them.
How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```
<map>
    ...
    <topicmeta>
        ...
        <audience type="programmer" job="programming" experiencelevel="expert"/>
    
```

To collect the `@type` attribute, add the following in your customization CSS (on page 1161):

```css
*[class =~ "map/map"] > *[class =~ "map/topicmeta"] > *[class =~ "topic/audience"] {  
    -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

**Notice:**

It is best to use the class selector (such as `*[class =~ "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

**Note:**

The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

**Tip:**

You can define multiple key value pairs by separating them with commas:

```
-oxy-pdf-meta-custom: "Audience" attr(type), "Job" attr(job)
```

The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:
How to Show Metadata in the Cover Page

The following CSS extensions are used in the subsequent examples:

- **oxy_xpath** - Executes an XPath expression and returns string content. Use this whenever you need to extract data from an element other than the one matched by the CSS rule selector.

- **:after(N)** - Creates more than one after pseudo-element. The argument value represents how far the generated content is from the real content. For example, in the second code snippet in the next section (on page 1217), the content of the :after is closer to the title (upper) than the content of the :after(2).

**Note:**
The attr() CSS function can also be used but it is limited to extracting attribute values from the matched element.
Processing Metadata for Bookmaps

Suppose you need to present the **Author** and the **ISBN** (when it exists) just under the publication title and suppose your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tuduit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
      <booknumber>SG99-9999-00</booknumber>
    </bookid>
  </bookmeta>
  ...
</bookmap>
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so if you need to add the information after it, in your customization CSS *(on page 1161)*, add the following CSS rules:

```css
*[class ~="bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath("//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, " topic/author ")]/text()");
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class ~="bookmap/booktitle"]:after(2) {
  display: block;
  content: oxy_xpath("if(//*[contains(@class, " bookmap/isbn ")]) then concat("ISBN ", //*[contains(@class, " bookmap/isbn ")]/text()) else "";
  text-align: center;
  color: gray;
}
```
Processing Metadata for DITA Maps

Suppose you need to present the Revision Date just under the publication title and suppose your DITA map contains:

```xml
<map>
  <title>Growing Flowers</title>
  <topicmeta>
    <critdates>
      <revised modified="2021-04-26"/>
    </critdates>
  </topicmeta>
  ...
</map>
```

The entire `<title>` element content is displayed on the first page of the PDF. If you need to add the information after it, add the following CSS rules in your customization CSS (on page 1161):

```css
*[^class ~="front-page/front-page-title"] > *[^class ~="topic/title"]:after {
  display: block;
  content: "last revision " oxy_xpath("// *[contains(@class, " map/topicmeta "])[1] \\
  // *[contains(@class, " topic/revised "])//@modified");
  margin-top: 4em;
  text-align: center;
  color: grey;
}
```

**Note:**
The [1] predicate is used to avoid duplicated results as the topicmeta is included in all children topics.

Generating Synthetic Pages for Metadata

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content in it. Add the following rules in your customization CSS (on page 1161):

```css
@page page-for-meta {
  background-color: yellow; /* Just to see it better*/
  @top-left-corner {
    content:""; /* Remove the default header */
  }
  @top-right-corner {
    content:""; /* Remove the default header */
  }
}
*[^class ~="bookmap/booktitle"]:after {
```
How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using string-sets.

If you need to add some of the map metadata to the header of the front page (for example, the creation date), add the following CSS rules in your customization CSS (on page 1161):

```
*{class ~="front-page/front-page"][class ~="map/topicmeta"][class ~="topic/critdates"][class ~="topic/created"] {
  string-set: mapcreated attr(date);
}

@page front-page {
  @top-center {
    content: "Created: " string(mapcreated);
  }
}
```

Note:
The front-page is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Remove or Change the PDF Keywords

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your customization CSS (on page 1161):

```
:root {
  -oxy-pdf-meta-keywords:"
}
```
To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:

```xml
:root {
  -oxy-pdf-meta-keywords:"alpha, beta, gamma";
}
```

If you need to extract them by other criteria from the merged map, you can use the `oxy_xpath()` function instead of the hard-coded list.

### How to Remove the PDF Publication Title Property

The title defined in the PDF reader is automatically collected from the map’s main title.

If you want to display the map name instead of the title, you can use one of the following rules in your customization CSS (on page 1161):

```css
/* Titles (maps). */
*[class =~ "front-page/front-page-title"] *[class =~ "topic/title"]:not([class =~ 'bookmap/booktitle']) { 
  -oxy-pdf-meta-title: unset;
}

/* Titles (bookmaps). */
*[class =~ "front-page/front-page"] *[class =~ "bookmap/booktitle"] > *[class =~ "bookmap/mainbooktitle"] { 
  -oxy-pdf-meta-title: unset;
}
```

### How to Change the PDF Publication Title Property

The `<title>` element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```xml
<booktitle>
  <booklibrary>Retro Tools</booklibrary>
  <mainbooktitle>Main Book Title</mainbooktitle>
  <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```

For the publication title, the built-in CSS uses only the content of the `<mainbooktitle>`. If you want to collect all of the text from the `<booktitle>`, you can add the following rule to your customization CSS (on page 1161):
An XPath expression is used to collect all the `<booktitlealt>` elements from the merged map, select the first one, then use its text.

The built-in CSS uses the `<booktitlealt>` as the PDF description. In the example above, this property is cleared since it was moved as a title.

**How to Use Data Elements from the Map to Create Custom PDF Metadata**

To use a key value in the CSS, the key must be referenced from the content (either a topic or map).

If you do not have it referenced, you may force a reference by using the `<topicmeta>` or `<bookmeta>` section of your map and a `<data>` element. This has no effect on the published content, but allows the CSS rules to use its content.

```xml
<bookmeta>
    ....
    <data keyref="my_key"/>
    ....
</bookmeta>
```

This is expanded in the merged HTML file to:

```html
<div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
    ...
    <div keyref="my_key" class="- topic/data data">
        <div class="- topic/keyword keyword">
            KEY VALUE
        </div>
    </div>
    ...
</div>
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this `<data>` element:

```xml
[[class =~ "topic/data"] [keyref="my_key"] { 
    string-set: key-string content (text);
}]
```

```css
@page {
    @bottom-left {
        content: "My key is: " string(key-string) !important;
    }
}
```
Or you can use the value from a :before pseudo-element, like the one for the title:

```css
*:topic/title]:before {
  content: oxy_xpath("//*[contains(@class, 'topic/data')][@keyref = 'my_key']//text()");
}
```

Another use-case is to use the key as a source for a custom PDF document property:

```css
*:topic/data][keyref="my_key"] {
  -oxy-pdf-meta-custom: attr(keyref) content(text);
}
```

### How to Control the PDF Viewer

The PDF document may contain settings for the PDF Viewer. This helps to make the viewing experience common for all of the readers. For example, you can specify the zoom level that the document is presented, or whether the outline view should be displayed.

There are several CSS properties you can use. These properties should be set on the root element. If they are set on multiple elements, the first one will be taken into account.

### Examples

- To hide the PDF Viewer toolbar and menu bar:

  ```css
  :root {
    -oxy-pdf-viewer-hide-menubar: true;
    -oxy-pdf-viewer-hide-toolbar: true;
  }
  ```

- To make the document be displayed with a different zoom level:

  ```css
  :root {
    -oxy-pdf-viewer-zoom: 50%;
  }
  ```

- To make the PDF Viewer just as large as the displayed document (e.g. if there is a zoom level that makes the document smaller, then the window of the viewer will be just as big as the page):

  ```css
  :root {
    -oxy-pdf-viewer-fit-window: true;
  }
  ```

- If you need the pages to be displayed as a single continuous column (to be able to scroll in a single view port), use:

  ```css
  :root {
    -oxy-pdf-viewer-page-layout: one-column;
  }
  ```
The supported include: single-page, two-columns-left, and more.

- To make the document outline view visible, use:

```xml
:root {
    -oxy-pdf-viewer-page-mode: use-outlines;
}
```

The supported values include: use-thumbs, use-none. For more details, see the list of Chemistry extension CSS properties.

Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file (*on page 1163*), the *frontmatter* topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true"`:

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"> ...
</bookmap>

<oxy:front-page class="- front-page/front-page">
...
</oxy:front-page>

<opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder" class="- toc/toc">
...
</opentopic:map>

<frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" class="- map/topicref bookmap/frontmatter">
...
</frontmatter>

<concept class="- topic/topic concept/concept">
    is-frontmatter="true"
    topicrefclass="- map/topicref bookmap/bookabstract" ...
</concept> ...
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Note:
The process also applies for the backmatter topic references inside a `<backmatter>` element with the `bookmap/backmatter` class and referenced content with the `@is-backmatter="true"` attribute both in the merged map and merged HTML files.

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in [PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

Related Information:
Page Headers and Footers (on page 1175)

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your customization CSS (on page 1161):

```css
*[class =~ "map/map"] > *[class =~ "topic/topic"][is-frontmatter] { page-break-before: auto; }
```

How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmark elements are formatted using the `matter-page` as defined in Default Page Definitions (on page 1168). In the merged file, the `<backmatter>` and
**Style the Topics Depending on Their Role**

There might be cases when you need to distinguish between certain types of topics that have different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```xml
<topic
    class="- topic/topic"
    id="unique_1"
    topicrefclass="- map/topicref bookmap/preface" .. >
   ...
</topic>
```

This can be used to match and apply various styling choices, or even a particular page layout:

```xml
@page preface-page {
    background-color:silver;
    @top-center{
        content: "Custom Preface Header";
    }
}
}`
```
Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- \([PLUGIN\_DIR]/css/print/p-numbering-shallow.css\)
- \([PLUGIN\_DIR]/css/print/p-numbering-deep.css\)
- \([PLUGIN\_DIR]/css/print/p-numbering-deep-chapter-scope.css\)
- \([PLUGIN\_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css\)

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see Numbering Types (on page 1230).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    class=" front-page/front-page ">
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc ">
    <title class="- topic/title ">Publication Title</title>
    <topicref is-chapter="true" class="- map/topicref " ...>
      <topicmeta class="- map/topicmeta " ...>
        <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
      ...
      </topicmeta>
    </topicref>
    <topicref class="- map/topicref " ...>
      <topicmeta class="- map/topicmeta " data-topic-id="dcpp_resources">
        <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
      ...
    </topicref>
  </opentopic:map>
</map>
```
Note:
The `<opentopic:map>` element contains the effective table of contents structure.

Note:
The TOC items are the elements with the class: `- map/topicref`.

Note:
The ones identified as chapters have the `@is-chapter` attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div class="- map/map map" ...>
  <div class=" front-page/front-page front-page">
      ...
  </div>
  <div class=" toc/toc toc">
      <div class="- topic/title title">Publication Title</div>
      <div is-chapter="true" class="- map/topicref topicref" ...> 
        <div class="- map/topicmeta topicmeta" ...>
          <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>
          ...
        </div>
      </div>
      <div class="- map/topicref " ...>
        <div class="- map/topicmeta " data-topic-id="dcpp_resources">
          <div href="#unique_2" class="- topic/navtitle ">Resources</div>
          ...
        </div>
      </div>
  </div>
</div>
```
The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in:
[INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

For the DITA Map PDF - based on HTML5 & CSS transformations:

The main content is organized as follows:
For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```xml
<opentopic:map>
...
</opentopic:map>
```

```xml
<div class="map/map"
...
</div>

```xml
<div is-chapter="true" oid="dcpp_overview"
...>
  <div class="topic/topic">
    <title class="topic/title">Overview</title>
    ...
  </div>
  <div class="topic/topic"
    id="unique_2"
    oid="dcpp_resources">
    <div class="topic/title">Resources</div>
    ...
  </div>
  <div class="topic/topic"
    id="unique_2"
    oid="dcpp_parameters">
    <div class="topic/title">Parameters</div>
    ...
  </div>
</div>
```

---

**Note:**
The topic content comes after the `<opentopic:map>` element.

**Note:**
The child topics are the elements that have the class `topic/topic` included in the parents.

**Note:**
The ones identified as chapters have the `@is-chapter` attribute set.

### The Titles of Chapters

The titles from the content are children of the topics:

```xml
<topic class="- topic/topic" id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title">Parameters</title>
  ...
</topic>
```
For the DITA Map PDF - based on HTML5 & CSS transformations:

```html
<div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
  <div class="- topic/title title ">
    Parameters
  </div>
  ...
</div>
```

**Note:**
The title elements have the class: `- topic/title`. The actual element name can be different.

**Numbering Types**

The type of numbering that appears in your publication is controlled by the `args.css.param.numbering` parameter.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (shallow numbering). The following values are accepted:

**Table 13. Types of Numbering**

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections/ Nested Topics</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>numbered</td>
<td>no</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep</td>
<td>numbered</td>
<td>numbered</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>restarted at the beginning of each chapter</td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>from the start of the publication</td>
</tr>
</tbody>
</table>
Note:
When using any of the deep numbering types, no distinction is made between sections and nested topics. For example, if a topic contains two sections, followed by another nested topic, the sections will be numbered with 1 and 2, and the nested topic with 3.

Notice:
The `deep-chapter-scope` and `deep-chapter-scope-no-page-reset` values are only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Examples

Shallow

Each chapter (or first-level topic) is numbered, but sections/nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

```
Chapter 1. First Chapter
  Page 1
  Topic
    Section
      Table 1
      Table 2
  Topic
    Section
  Page 2
  Table 3

Chapter 2. Second Chapter
  Page 3
  Topic
    Table 4
    Table 5
  Topic
  Page 4
```

It will result in the following content inside the PDF:

```
Chapter 1. Introduction..............................................................1
Chapter 2. Care and Preparation......................................................2
  Pruning............................................................................2
  Garden Preparation................................................................3
Chapter 3. Flowers by Season.........................................................4
  Spring Flowers.....................................................................4
  Iris.............................................................................4
```
Deep

All chapters (or first-level topics) and sections/nested topics are numbered (these are also prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1
   Topic 1.2
   Table 2
   Page 2
   Table 3
2. Second Chapter
   Page 3
   Topic 2.1
   Table 4
   Table 5
   Topic 2.2
   Page 4

It will result in the following content inside the PDF:

1. Introduction......................................................................1
2. Care and Preparation..............................................................2
   2.1. Pruning.......................................................................2
   2.2. Garden Preparation.........................................................3
3. Flowers by Season.................................................................4
   3.1. Spring Flowers.................................................................4
      3.1.1. Iris......................................................................4
      3.1.2. Snowdrop................................................................6
         ...
List of Figures
   Figure 1: Iris
Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, pages, figures, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

1. First Chapter
   Page 1.1
   Topic 1.1
   Table 1-1
   Link to page 2.2
   Topic 1.2
   Page 1.2
   Table 1-2
2. Second Chapter
   Page 2.1
   Topic 2.1
   Table 2-1
   Table 2-2
   Table 2-3
   Topic 2.2
   Table 2-4
   Page 2.2
   Link to page 1.1

It will result in the following content inside the PDF:

1. Introduction......................................................................1
2. Care and Preparation..............................................................1
   2.1. Pruning.......................................................................1
   2.2. Garden Preparation............................................................2
3. Flowers by Season..................................................................1
   3.1. Spring Flowers.................................................................1
      3.1.1. Iris......................................................................1
      3.1.2. Snowdrop.................................................................3
   ...

List of Figures
   Figure 3-1: Iris
### Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, figures, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

<table>
<thead>
<tr>
<th>1. First Chapter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page 1</td>
</tr>
<tr>
<td>Topic 1.1</td>
</tr>
<tr>
<td>Table 1-1</td>
</tr>
<tr>
<td>Link to page 4</td>
</tr>
<tr>
<td>Topic 1.2</td>
</tr>
<tr>
<td>Page 2</td>
</tr>
<tr>
<td>Table 1-2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

List of Figures
- Figure 3-1: Iris
Tip:
When using deep numbering, if you want to exclude sections from being numbered, see How to Include Topic Sections in TOC (on page 1237).

How to Reset Page Numbering at First Chapter

By default, pages are numbered from the start of the publication, but in some cases, you may need to restart the page number at a certain location in your content (for example, at the first part/chapter).

Note:
The following sections do not apply for args.css.param.numbering="deep-chapter-scope" and args.css.param.numbering="deep-chapter-scope-no-page-reset" parameter values because they already define a specific numbering scheme.

Reset Page Numbering in Shallow Context

To reset the page counter at the first part/chapter when the args.css.param.numbering="shallow" parameter value is set, use the following rules in your customization CSS (on page 1161):

```css
*[^map/map] > *[^toc/toc] + *[^topic/topic][is-chapter],
*[^map/map] > *[^topic/topic][is-frontmatter] + *[^topic/...)
    counter-reset: page 1;
}
*[^map/map] > *[^toc/toc] + *[^topic/topic][is-part],
*[^map/map] > *[^topic/topic][is-frontmatter] + *[^topic/...}
    counter-reset: page 1 chapter;
}
```

Reset Page Numbering in Deep Context

To reset the page counter at the first part/chapter when the args.css.param.numbering="deep" parameter value is set, use the following rules in your customization CSS (on page 1161):

```css
*[^map/map][numbering ^= 'deep'] > *[^toc/toc] + *[^topic/...}
    counter-reset: page 1 section1;
}`
How to Remove the 'Chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization CSS (on page 1161):

For the TOC:

```
*[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
  display:none !important;
}
```

For the titles in the content, change the content of the title :before (this example just uses the chapter number):

```
*[class ~= "topic/topic"]{is-chapter}:not([is-part]) > *[class ~= "topic/title"]:before {
  content: counter(chapter) ". " !important;
}
```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled deep numbering (on page 1230). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the target-counters CSS function to extract the entire context of the counters from the target. The chapter-and-sections built-in counter is already updated with both the chapter number and the nested topics:

```
*[class ~= "topic/xref"]:after {
  content: target-counters(attr(href), chapter-and-sections, ".") !important;
}
```

This counter does not include the part number, so be careful when linking between parts (consider adding the target part number explicitly):

```
*[class ~= "topic/xref"]:after {
  content: "[" target-counter(attr(href), part, upper-roman) "]" target-counters(attr(href), chapter-and-sections, ".") "]" !important;
  color:blue;
}
```
How to Include Topic Sections in TOC

To include topic sections in the table of contents, set the `args.css.param.numbering-sections` transformation parameter (on page 1120) to yes. In this case, they are numbered according the numbering scheme set by the `args.css.param.numbering` parameter (on page 1230).

If you want to prevent topic sections from being numbered in your output, set the value of the `args.css.param.numbering-sections` parameter to no.

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```xml
<bookmap>
  ...
  <frontmatter>
    <booklists>
      <toc/>
      <figurelist/>
      <tablelist/>
    </booklists>
  </frontmatter>
  ...
</bookmap>
```

Table of Contents - XML Fragment

In the merged map file (on page 1163), the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a metadata section that includes the topic title.
<oxy:front-page> ... </oxy:front-page>

<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc ">

<oxy:toc-title xmlns:oxygen="http://www.oxygenxml.com/extensions/author" empty="true" class="- toc/title ">
 ...
 </oxy:toc-title>

<booktitle class="- topic/title bookmap/booktitle ">
 <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
 <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
 <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product Tasks</booktitlealt>
 ...
</booktitle>

<chapter is-chapter="true" class="- map/topicref bookmap/chapter " href="#unique_5" type="topic">
 <topicmeta class="- map/topicmeta " data-topic-id="installing">
 <navtitle href="#unique_5" class="- topic/navtitle ">Installing</navtitle>
 ...
 </topicmeta>

<topicref class="- map/topicref " href="#unique_6" type="task">
 <topicmeta class="- map/topicmeta " data-topic-id="installstorage">
 <navtitle href="#unique_6" class="- topic/navtitle ">Installing</navtitle>
 ...
 </topicmeta>
 ...
</topicref>
 ...
</chapter>

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 <div> elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.

<div class="- bookmap/bookmap map/map map bookmap" ...>
 ...
</div>

<div class="- front-page/front-page front-page" ... </div>

<div class="- bookmap/frontmatter frontmatter" ... </div>

<div class=" toc/toc toc"
The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo-element, in the CSS.

**Table of Contents - Built-in CSS**

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-toc.css.

**Related Information:**

Page Headers and Footers (on page 1175)

**How to Increase TOC Depth**

By default, only the first three levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see Table of Contents - Built-in CSS (on page 1239)) that hides topics on higher levels is:
/* Hide sections below level 3. */
*{class ~="map/topicref"}[is-chapter] >
*{class ~="map/topicref"}[is-chapter]:not([is-chapter]) >
*{class ~="map/topicref"}
    display: none;
}

If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

*{class ~="map/topicref"}[is-chapter] >
*{class ~="map/topicref"}[is-chapter]:not([is-chapter]) >
*{class ~="map/topicref"}
    display:block;
}

If the args.css.param.numbering parameter is set to a value other than shallow, you also need to add the following rules in your customization CSS:

*{class ~="map/map"}[numbering =~ 'deep']
*{class ~="map/topicref"}[is-chapter]:not([is-part]) >
*{class ~="map/topicref"}
*{class ~="map/topicref"}
    counter-increment: toc-chapter-and-sections;
}

*{class ~="map/map"}[numbering =~ 'deep']
*{class ~="map/topicref"}[is-chapter]:not([is-part]) >
*{class ~="map/topicref"}
*{class ~="map/topicref"}
    counter-reset: toc-chapter-and-sections;
}

*{class ~="map/map"}[numbering =~ 'deep']
*{class ~="map/topicref"}[is-chapter]:not([is-part]) >
*{class ~="map/topicref"}
*{class ~="map/topicref"}
    counter-increment: toc-chapter-and-sections;
}

*{class ~="map/topicref"}[is-chapter]:not([is-part]) >
*{class ~="map/topicref"}
    counter-reset: toc-chapter-and-sections;
}

*{class ~="map/topicref"}[is-chapter]:not([is-part]) >
*{class ~="map/topicref"}
    counter-reset: toc-chapter-and-sections;
}
**How to Style the Table of Contents Entries**

**Note:**
Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS *(on page 1161)*, add the following two selectors:

```css
/* The toc item label - the topic title */
*[class ~="map/topicref"] *[class ~="topic/navtitle"] {
  font-style: italic;
  color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~="map/topicref"] *[class ~="topic/navtitle"]:after {
  content: leader('-') target-counter(attr(href), page);
  color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```css
*[class ~="map/topicref"] *[class ~="map/topicref"] {
  margin-left: 1em;
}
```

The numbers can be styled like this:

```css
*[class ~="map/topicref"] > *[class ~="map/topicmeta"]:before,
*[class ~="map/topicref"]
  > *[class ~="map/topicmeta"] > *[class ~="topic/navtitle"]:before{
    color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```css
*[class ~="map/topicref"][is-chapter = "true"] > *[class ~="map/topicmeta"] > *[class
  ~="topic/navtitle"]{
  font-size:2em;
}
```
How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named `table-of-contents`. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```css
@page table-of-contents:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
@page table-of-contents:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS (on page 1161):

```css
@page table-of-contents:left {
  @top-left {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
@page table-of-contents:right {
  @top-right {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
```

**Important:**

The first page from the table of contents does not have any content displayed in the header. The default CSS contains rules that disable the content. If you need to also display the numerals on the first page, use the following:

```css
@page table-of-contents:first:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```
How to Make the Table of Contents Start on an Odd Page

In your customization CSS (on page 1161), add the following snippet for the table-of-contents page:

```css
@page table-of-contents:
{oxy-initial-page-number: auto-odd;}
```

Related Information:
Double Side Pagination (on page 1251)

How to Display a Topic Before the Table of Contents

To display a topic before the table-of-contents page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the @outputclass to before-toc on the <topicref>.

```xml
<topicref href="pathToMyTopic" outputclass="before-toc"/>
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:
Controlling the Publication Content (on page 1324)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the shortdesc element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute @is-chapter.

In your customization CSS (on page 1161), add the following CSS selector:
How to Remove Entries from the TOC

To remove entries from the table of contents, set the \texttt{@toc=\textit{no}} attribute on the topicrefs from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Hide the TOC

To hide the TOC, you have multiple options:

- [Recommended] Use a DITA \texttt{<bookmap>} instead of a \texttt{<map>}, and omit the \texttt{<toc>} element from the \texttt{<booklists>}. An example bookmap can be found in the DITA 1.3 Spec.
- Use the transformation parameter: \texttt{hide.frontpage.toc.index.glossary} \textit{(on page 1124)}.
- Use a \texttt{display:none} property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

\begin{verbatim}
*{class ~='map/map'} > *{class ~='toc/toc'}
  display: none;
\end{verbatim}

\begin{verbatim}
*{class ~='map/map'} > *{class ~='toc/toc'} > *{class ~='toc/title'}
  bookmark-label: none;
  -ah-bookmark-label: none;
\end{verbatim}

Related Information:
Transformation Parameters \textit{(on page 1120)}

Table of Contents on a Page (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmaps instead of regular maps.
- Set the \texttt{args.chapter.layout} transformation parameter to either of the following values: MINITOC or MINITOC-BOTTOM-LINKS.
Note:

If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

Layout for MINITOC

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.

Chapter 1. Introduction

<table>
<thead>
<tr>
<th>Topics:</th>
</tr>
</thead>
<tbody>
<tr>
<td>About this framework.</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

Layout for MINITOC-BOTTOM-LINKS

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter `<topicref>` in the map.
Chapter 1. Introduction

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Topics:
- About this framework.
- Description

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```xml
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita"/>
  <topicref href="topics/introduction-description.dita"/>
</chapter>
```

The chapter-introduction.dita file provides the description content that is in the right side of the page. The children <topicref> elements generate the mini TOC links.

Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some <div> elements that wrap the entire mini TOC and the description area.

- **chapter/minitoc**
  
  Wraps the entire structure, including the content of the chapter <topicref>.

- **chapter/minitoc-links**
  
  Wraps the <related-links> element. Note that the label of the related links list is internationalized.
**chapter/minitoc-desc**

Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.

```
<div class="- topic/div chapter/minitoc ">
  <div class="- topic/div chapter/minitoc-links ">
    <related-links class="- topic/related-links ">
      <linklist class="- topic/linklist ">
        <desc class="- topic/desc ">
          <ph class="- topic/ph chapter/minitoc-label">Topics: </ph>
        </desc>
        <link class="- topic/link " href="#unique_2" type="topic" role="child">
          <linktext class="- topic/linktext ">About this framework.</linktext>
        </link>
        <link class="- topic/link " href="#unique_3" type="topic" role="child">
          <linktext class="- topic/linktext ">Description</linktext>
        </link>
      </linklist>
    </related-links>
  </div>
  <shortdesc class="- topic/shortdesc ">
    DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture</shortdesc>
  <body class="- topic/body ">
    <p class="- topic/p ">The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.</p>
  </body>
</div>
```

When using the `pdf-css-html5` transformation, this structure is converted to a set of HTML elements, preserving the class values:

```
<div class="- topic/div chapter/minitoc div minitoc">
  <div class="- topic/div chapter/minitoc-links div minitoc-links">
    <nav role="navigation" class="- topic/related-links related-links">
      <div class="- topic/linklist linklist linklistwithchild">
        <div class="- topic/desc desc">
          <span class="- topic/ph chapter/minitoc-label ph minitoc-label">Topics: </span>
        </div>
      </div>
    </nav>
  </div>
</div>
```
DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

### Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-chapters-minitoc.css`.

### How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links and put all the links in a colored rectangle with decimal numbers before them.

In your customization CSS *(on page 1161)*, add the following selectors:
/* Change from inline to blocks to stack them one over the other. */

/*
 *[class="chapter/minitoc-desc"],
 *[class="chapter/minitoc-links"] {
   display: block;
   width: 100%;
 }

/* No need for the 'Topics:' label. */

/* Add background for the links list. */

/* Remove the border and the padding from the description. We do not need that separator. */

/* Add a number before each of the links. */

Related Information:

How to Speed up CSS Development and Debugging (on page 1166)

List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the frontmatter or backmatter. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):
How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```xml
*[@class~="placeholder/tablelist"] { 
    page:tablelist; 
    color:green; 
} 
*[@class~="placeholder/figurelist"] { 
    page:figurelist; 
    color:green; 
}
```

**Note:**

The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```xml
@page figurelist { 
    @top-left { content: none; } 
    @top-center { content: "Figure List"; } 
    @top-right { content: none; } 
} 
@page figurelist:first { 
    @top-left { content: none; } 
    @top-center { content: none; } 
    @top-right { content: none; } 
} 
@page tablelist { 
```
How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```xml
<entry class="- listentry/entry " href="#unique_6_Connect_42_fig_rjy_spn_xgb">
  <prefix class="- listentry/prefix ">Figure</prefix>
  <number class="- listentry/number ">4</number>
  <title class="- topic/title ">This is another figure</title>
</entry>
```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```css
*[class~="listentry/prefix"],
*[class~="listentry/number"] {
  display:none;
}
```

This works for both a list of tables and list of figures since the structure of each entry is the same.

To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```css
*[class="placeholder/figurelist"] *[class="listentry/prefix"],
*[class="placeholder/figurelist"] *[class="listentry/number"] {
  display:none;
}
```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.
Note:
For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: `{INSTALLATIONDIRECTORY}/css/print/p-optional-double-side-pagination.css`. You may choose to import this file from your customization CSS (on page 1161).

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (on page 1161), add the following:

```css
@page chapter {
  -oxy-initial-page-number: auto-odd;
}

@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: `auto`, `auto-even`, `auto-odd`, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (on page 1161):

```css
@page chapter:blank, table-of-contents:blank {
  @top-left       { content: none; }
  @top-center     { content: none; }
  @top-right      { content: none; }
  @bottom-left    { content: none; }
  @bottom-center  { content: none; }
  @bottom-right   { content: none; }
}
```

Note:
This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.
How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (on page 1161), use the -oxy-force-page-count property with an even value:

```css
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for -oxy-force-page-count include: even, odd, end-on-even, end-on-odd, auto, no-force.

How to Style the First page of a Chapter

You can use the :first page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the maptitle string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (on page 1161), add the following:

```css
@page chapter:first {
  @top-right-corner { content: string(maptitle); }
  @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages.

First you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (on page 1168).

Next, add the column-count and column-gap properties to that page. For example:

```css
@page chapter{
  column-count:2;
}
```
If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```
*[class ~='topic/topic'][is-chapter] > *[class ~='topic/title*'] {
    column-span:all;
}
```

**Limitation:**

You cannot use multiple column configurations on the same page. Oxygen XML Author Eclipse plugin only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

**Change Layout for a Specific Topic.**

If you need to have a different column layout just for one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

   ```
   <topic outputclass="two_columns" ...
   ```

2. Define a CSS rule that changes the `page` property for the matching element.

   ```
   *[class ~='two_columns*],
   *[outputclass ~='two_columns*] {
       page: two_column_page !important;
   }
   ```

   **Tip:**

   In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

   **Note:**

   The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

   ```
   @page two_column_page {
       column-count: 2;
   }
   ```

   Note that the topic will be separated from other sibling topics with different page layouts by page breaks.
PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-bookmarks.css.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

   ```xml
   ...
   <topicref href="topics/my_topic.dita" locktitle="yes">
     <topicmeta>
       <navtitle>Introduction</navtitle>
     </topicmeta>
   </topicref>
   ...
   ```

   **Note:**
   As a best practice, a `@locktitle` attribute with the value ‘yes’ is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

   ```xml
   <topic id="other_topic" xml:lang="en-us">
     <title>Normal Title</title>
     <titlealts>
       <navtitle>Navigation Title</navtitle>
     </titlealts>
     <body>
   ...
   ```
How to Control Bookmarks Depth and Sections Display in PDF.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example, to 2 levels), you can use the following CSS rules in your customization CSS (on page 1161):

```css
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*class="topic/topic"]*class="topic/title"},

These rules clear the labels generated by the titles starting with the depth of 3 (the topic nesting level is given by the selectors *class="topic/topic"*).

By default, the PDF bookmarks also include the sections. If you need to remove them, you can use the following CSS rule in your customization CSS (on page 1161):

```css
*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],
*[class="topic/topic"]*[class="topic/section"] > *[class="topic/title"],

bookmark-label: none;
}
```

How to Specify the Open/Closed PDF Bookmark State

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your customization CSS (on page 1161).
For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```
*{class="topic/topic"} > *{class="topic/title"},
*{class="topic/topic"} *{class="topic/topic"} > *{class="topic/title"},
*{class="topic/topic"} *{class="topic/topic"} *{class="topic/topic"} > *{class="topic/title"} {
  bookmark-state:open;
}
```

**How to Remove the Numbering From the PDF Bookmarks**

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS *(on page 1161)*, add the following CSS rules:

```
*{class="topic/topic"} > *{class="topic/title"} {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

⚠️ **Important:**

This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```
*{class="topic/topic"]:has(*{class="topic/titlealts"}) > *{class="topic/title"} {...}
```

**Related Information:**

*Numbering *(on page 1226)*

**Index**

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```
<title>The topic title.</title>

<prolog>
  <metadata>
```

```
```
or in the content itself:

...  
<p>Open the lid then turn the body pump to the right.  
</p>  
...  

If you are using a bookmap, you need to specify where the index list should be presented (for instance in the <i>backmatter</i> of the book. Technically, it is possible to also add it to the <i>frontmatter</i>, but this is unusual). This is done using an <indexlist> element in the <booklists> element (inside the <backmatter>):

```xml
<bookmap>  
...  
<chapter href="tasks/troubleshooting.dita">  
...  
</chapter>  
<backmatter>  
  <booklists>  
    <indexlist/>  
  </booklists>  
</backmatter>  
</bookmap>
```

For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

**Index - XML Fragment**

In the merged map file (on page 1163), the structure that holds the index tree is the `<opentopic-index:index.groups>` element.

```xml
<map class="- map/map ">  
  <oxy:front-page>  
    ...  
  </oxy:front-page>  
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
```
Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.
Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>`/`<oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<map>
  <div class="- map map">
    <div class="front-page/front-page">...
  </div>
  <div class="toc/toc">...
  </div>
  <div class="- topic/topic">
    <div class="- topic/title">Request Support</div>...
  </div>
  <div class="index/groups groups">...
</map>
```

The index group content becomes:

```xml
<map>
  <div class="- index/group group">
    <div class="index/label label">T</div>
    <div class="index/entry entry">
      <div class="index/formatted-value">Table of contents</div>
      <div class="index/refid refid">
        <div class="index/link link" href="#d16e3988">[d16e3988]</div>
      </div>
    </div>
    <div class="index/entry entry">
      <div class="index/formatted-value">change header</div>
      <div class="index/refid refid">
        <div class="index/link link" href="#d16e3988">[d16e3988]</div>
      </div>
    </div>
  </div>
</map>
```
Index - Built-in CSS

All index styling is found in: [PLUGIN_DIR]css/print/p-index.css.

How to Style the Index Page Title and the Grouping Letters

In your customization CSS (on page 1161), add the following CSS rules:

```css
* [class =~ "index/groups"] * [class =~ "index/group"] * [class =~ "index/label"] {
  font-size: 1.5em;
  color: navy;
}

*[class =~ "index/groups"]:before {
  content: "- Index - ";
  color: navy;
  font-size: 4em;
}
```

The result is:
How to Style the Index Terms Labels

In your customization CSS (on page 1161), add the following CSS rule:

```css
* [class ~='index/groups'] * [class ~='index/formatted-value'] {
  font-style: oblique;
  color: gray;
}
```

The result is:

How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.
In your customization CSS (on page 1161), add the following CSS rule:

```css
*[class~="index/formatted-value"],
*[class~="index/refid"] {
    display:inline;
}

/* Hide the sequences of links that actually do not contain links. */
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]{
    display:none;
}
*[class~="index/group"] *[class ~="index/entry"] >
  *[class~="index/refid"]:has(*[class~="index/link"]){
    display:inline;
}

*[class~="index/group"] *[class="index/entry"] {
    text-align:justify;
}
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]:before{
    content:leader('.');
}
```

The output now contains the dots:

```
Index

F
  footer................................................................. 37

H
  header.................................................................. 37

T
  table of contents.................................................... 32
    change header....................................................... 32
    style.................................................................. 34
```
How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```css
*[^= "index/groups"] { 
    counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```css
*[^= "index/groups"] { 
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (on page 1161):

```css
@page index {
    @bottom-center { content: counter(page, decimal) }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:

```
Index

<table>
<thead>
<tr>
<th>C</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Close programs</td>
<td>8</td>
</tr>
<tr>
<td>Computer cover</td>
<td>7,8</td>
</tr>
<tr>
<td>configure</td>
<td>10, 10.10</td>
</tr>
<tr>
<td>D</td>
<td></td>
</tr>
<tr>
<td>database</td>
<td>8, 8, 8, 9, 10, 11,12</td>
</tr>
<tr>
<td>H</td>
<td></td>
</tr>
<tr>
<td>hard drive</td>
<td>7, 7, 7, 8, 10, 11,12</td>
</tr>
<tr>
<td>I</td>
<td></td>
</tr>
<tr>
<td>install</td>
<td>7, 8.9</td>
</tr>
<tr>
<td>M</td>
<td></td>
</tr>
<tr>
<td>maintain</td>
<td>11,11</td>
</tr>
<tr>
<td>hdd</td>
<td></td>
</tr>
<tr>
<td>drive</td>
<td>11</td>
</tr>
</tbody>
</table>
```
You need to place the elements that have the following class on the same line:

- **indexformatted-value**
  - This is the text of the index term.

- **index/refid**
  - This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your customization CSS *(on page 1161)*, add the following CSS rule:

```css
/* Hide the sequences of links that actually do not contain links. */
*[class~="index/groups"] *[class~-="index/entry"] > *[class~="index/refid"]{display:none;}

/* Move the nesting of indexterms from margin to padding */
*[class~="index/groups"] *[class~-="index/entry"] {margin-left: 0;}
*[class~="index/groups"]
*[class~-="index/entry"]
*[class~="index/formatted-value"]{padding-left: 0.2em;}
*[class~="index/groups"]
```
To avoid bleeding of the index term label, you may need to mark it as being hyphenated:

```xml
    <index/formatted-value>
        hyphens:auto;
    </index/formatted-value>
```

To activate hyphenation, see: How to Enable Hyphenation for Entire Map (on page 1273).

**Appendices**

The `<appendices>` element that is available in the DITA bookmap has a special behavior (based on its sibling nodes):

1. If the bookmap contains `<part>` elements, the `<appendices>` will behave as a part.
2. If the bookmap contains `<chapter>` (and no `<part>`) elements, the `<appendices>` will behave as a chapter.

**Note:**

The behavior includes page-break, numbering, and title rendering.

For example, if I define a bookmap with a `<part>` element, I will obtain:

```xml
<part>
    <chapter/>
    <topicref/>
    <chapter/>
```
For another example, if I define a bookmap with a `<chapter>` element only, I will obtain:

```xml
<chapter/>
<topicref/>
<chapter/>
<appendices> <!-- Appendices behaves like a Chapter -->
<appendix/> <!-- Appendix behaves like a TopicRef -->
<appendix/>
</appendices>
```

**Warning:**
If the `<appendices>` element is not defined and the `<appendix>` is used directly instead, then it will behave like a *Part* or *Chapter* using the same pattern as for `<appendices>`.

### How To Control Page Break Within Appendices

If you define a bookmap with `<appendices>` and some `<appendix>` elements, you may want the parent `<appendices>` to be on a separate page than its children. This is done automatically if the bookmap contains `<part>` elements. Otherwise, you may need to use the following in your CSS:

```css
*[topicrefclass ~*="bookmap/appendix"]:first-of-type {
    page-break-before: always;
}
```

### Footnotes

Footnotes are pieces of information placed at the bottom of the page. A footnote has a number that is left in the content (the footnote call) and the same value placed before the footnote text (the footnote marker).

#### Footnotes - Built-in CSS

Footnote properties are defined in `[PLUGIN_DIR]css/print/p-foot-notes.css`.

#### How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers and use some colors, add the following rules to your customization CSS *(on page 1161)*:

```css
*[class ~*="topic/fn"]:footnote-call {
    font-weight: bold;
}
```
How to Add a Separator Above the Footnotes

The `@footnote` part of a `@page` declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a `leader`. The leader uses a letter or a line style to fill the entire width of the page.

```plaintext
@page {
    margin: 0.5in;
    ...
    @footnote {
        content: leader(solid);
        color: silver;
    }
}
```

To create a dotted line, you can use the dot character: `leader('..')`. Other commonly used characters are: 
"-" (dash) and "_" (underscore).

How to Reset the Footnotes Counter

There are cases where you want to reset the footnote counter.

For example, if you need to reset it at the beginning of each chapter, add the following rules to your customization CSS (on page 1161):

```plaintext
*[class =~ "bookmap/chapter"],
*[class =~ "topic/topic"][is-chapter] {
    counter-reset: footnote 1;
}
```

Or you can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```plaintext
<p outputclass="reset-footnotes"/>
```
How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1138).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <!-- Match only top level tables (i.e tables that are not nested in other tables), that have footnotes. -->
    <xsl:template match="*[contains(@class, 'topic/table')]
        [not(ancestor::*[contains(@class, 'topic/table')])]
        [//*[contains(@class, 'topic/fn')]]">
        <xsl:next-match>
            <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
        </xsl:next-match>

    <!-- Create a list with all the footnotes from the current table. -->
    <ol class="- topic/ol " outputclass="table-fn-container">
        <xsl:for-each select="/*[contains(@class, 'topic/fn')]">
            <li class="- topic/li " id="{generate-id(.)}" outputclass="table-fn">
                <xsl:apply-templates select="node()"/>
            </li>
        </xsl:for-each>
    </ol>
</xsl:template>
```
<!-- Match the footnotes in table entries, replace them with a link. -->
<xsl:template match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')]">
  <xsl:param name="top-level-table" tunnel="yes"/>

  <!-- Determine the footnote number. -->
  <xsl:variable name="fn-number" select="index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>

  <xref type="fn" class="- topic/xref" href="#${generate-id(.)}" outputclass="table-fn-call">
    <xsl:value-of select="$fn-number"/>
  </xref>
</xsl:template>

5. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
  ...
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
/* Customize footnote calls, inside the table. */
*[outputclass ~= 'table-fn-call'] {
  color: black;
  text-decoration: none;
  font-size: smaller;
  vertical-align: super;
  line-height: none;
}

/* Hide the "on page .." text that follows xrefs. */
*[outputclass ~= 'table-fn-call']:after {
  display: none;
}
```
/* Customize the list containing all the table footnotes. */
/*[outputclass ~='table-fn-container'] { */
border-top: 1pt solid black;
/*}

/* Customize footnotes display, below the table. */
/*[outputclass ~='table-fn'] { */
font-size: 1em;
/*}
/*[outputclass ~='table-fn']::marker { */
font-size: 1em;
/*}

7. Open the template descriptor file (on page 1132) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

**Hyphenation**

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of the PDF Chemistry processor to perform hyphenation.

**Hyphenation Dictionaries**

The Oxygen XML Author Eclipse plugin provides built-in hyphenation patterns for the following languages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>de_CH</td>
<td>German (Switzerland)</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
</tbody>
</table>
The built-in hyphenation pattern license terms are listed in the XML files in the 
`[CHEMISTRY_INSTALL_DIR]/config/hyph` folder. Most of them comply with the LaTeX distribution policy.

### Installing New Hyphenation Dictionaries

Oxygen XML Author Eclipse plugin uses the TeX hyphenation dictionaries converted to XML by the OFFO project: [https://sourceforge.net/projects/offo/](https://sourceforge.net/projects/offo/).

The `.xml` files allow you to access the licensing terms and you can use them as a starting point to create customized dictionaries (see [How to Alter a Hyphenation Dictionary](#) on page 1272).

The `.hyp` files are the compiled dictionaries that the Oxygen XML Author Eclipse plugin actually uses.

One simple way to add more dictionaries:

1. **Download and extract the** `offo-hyphenation-compiled.zip` file. This file is a bundle of many dictionary files.
2. **Copy the** `fop-hyph.jar` file to the `[OXYGEN_INSTALL_DIR]/lib` directory.
3. **If you just need a single dictionary, place the** `.hyp` or `.xml` file in the `[OXYGEN_INSTALL_DIR]/config/hyph` directory (create that directory if it is missing).

### How to Alter a Hyphenation Dictionary

You can copy the dictionaries you need to change in another directory, then use the `-hyph-dir` parameter to refer them inside your transformation.
Each file is named with the language code and has the following structure:

```xml
<hyphenation-info>
  <hyphen-min before="2" after="3"/>
  <exceptions>
    o-mni-bus
    ...
  </exceptions>
  <patterns>
    préémi3nent.
    proémi3nent.
    surémi3nent.
    ....
  </patterns>
</hyphenation-info>
```

To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

**exceptions**

Contains the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-"), character. If a word does not contain this character, it will not be hyphenated.

For example, o-mni-bus will match the omnibus word and will indicate two possible hyphenation points.

**Note:**

Compound words (i.e. e-mail) cannot be controlled by exception words.

**patterns**

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, tran3s2act indicates that the possible hyphenation points are "tran-s-act" and the preferable point is the first one, having the higher score of "3".

**How to Enable Hyphenation for Entire Map**

To enable hyphenation for your entire map:
1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.

2. In your customization CSS (on page 1161), add:

   ```css
   :root {
       hyphens: auto;
   }```

3. To except certain elements from being hyphenated, use `hyphens: none`. The following example excludes the `<keyword>` elements from being hyphenated:

   ```css
   *[class ~= "topic/keyword"] {
       hyphens: none;
   }```

### How to Enable/Disable Hyphenation for an Element

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.

2. You have two options to control hyphenation inside an XML element:

   **CSS Approach**

   Use the `hyphens` property.

   For example, if you want to enable hyphenation in codeblocks:

   ```css
   *[class="pr-d/codeblock"] {
       hyphens: auto;
   }```

   If you want to disable hyphenation inside tables:

   ```css
   *[class="topic/table"] {
       hyphens: none;
   }```

   **Attribute Approach**

   Use the `@outputclass="hyphens"` or `@outputclass="no-hyphens"` attributes/values.

   For example, if you want to enable hyphenation in codeblocks:

   ```xml
   <codeblock outputclass="hyphens">
       ...
   </codeblock>```

   If you want to disable hyphenation inside tables:
<table outputclass="no-hyphens">
  ...
</table>

**Note:**
The default built-in CSS enables hyphenation for tables:

```css
*[class ~="topic/table"] {
  hyphens: auto;
}
```

**Related information**

- How to Disable Hyphenation for a Word

**Accessibility**

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

**Related Information:**

- Oxygen PDF Chemistry: Accessibility

**Accessibility - Built-in CSS**

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

**How to Create Fully Accessible Documents**

To make your documents fully accessible (PDF/UA1 compliant), do the following:

1. The accessibility standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your customization CSS *(on page 1161)*. For instance, you can use:

```css
body { font-family: Arial }

@page {
  @top-left {font-family: Arial }
  @top-right {font-family: Arial }
  @top-center {font-family: Arial }
  @top-left-corner {font-family: Arial }
  @top-right-corner {font-family: Arial }
```
2. Create a new transformation scenario, based on the DITA Map PDF - based on HTML5 & CSS built-in scenario.

3. In the Parameters tab, change the value of the `pdf.accessibility` parameter to `yes`.

4. Run the transformation.

## Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

To use them in the customization CSS *(on page 1161)*:

- You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: *Oxygen PDF Chemistry User Manual: Fonts*.

### How to Avoid Characters Being Rendered as #

When the processor renders text with a font that does not include certain characters, those characters are replaced with the `#` symbol. This can easily be seen from Oxygen's Results view. For example:

```
[CH] Glyph "?" (0x7ae0) not available in font "Roboto-Regular".
```

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```
<d1entry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</d1entry>
```

If the font does not include this character, the output will look something like this:

```
#
  This is the right arrow.
```
To fix this you can either:

1. Install Arial Unicode MS font on your system. This is one of the PDF processor fallback fonts. Starting with version 24 there are additional fonts used as fallback as SimSun, Malgun Gothic and more, so if one of these are found on the system they will be used directly.
2. Specify the fallback font in your customization.

For the second case, if you use *Times New Roman* for the entire publication, you could add *Symbol* as the fallback font. In your customization CSS *(on page 1161)*, add:

```css
*[^class =~ "topic/dlentry"] {  
  font-family: "Times New Roman", Symbol;
}
```

To change the font for the entire publication, not just an element, you can use:

```css
:root {font-family: "Times New Roman", Symbol !important; }
```

```css
@page {
  @top-left {font-family: "Times New Roman", Symbol !important; }
  @top-right {font-family: "Times New Roman", Symbol !important; }
  @top-center {font-family: "Times New Roman", Symbol !important; }
  @top-left-corner {font-family: "Times New Roman", Symbol !important; }
  @top-right-corner {font-family: "Times New Roman", Symbol !important; }
  @bottom-left {font-family: "Times New Roman", Symbol !important; }
  @bottom-right {font-family: "Times New Roman", Symbol !important; }
  @bottom-center {font-family: "Times New Roman", Symbol !important; }
  @bottom-left-corner {font-family: "Times New Roman", Symbol !important; }
  @bottom-right-corner {font-family: "Times New Roman", Symbol !important; }
}
```

**Tip:**

On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

**Note:**

It is also possible to use a generic family name as fallback, like serif, sans-serif or monospace, like this you will call upon the processor default fallback fonts system.
Warning:
Even if the message is a warning, sometimes it can lead to a failed transformation. This usually occurs for really special characters (different from letters or common characters).

How to Set Fonts in Titles and Content

Suppose that in your customization CSS (on page 1161), you have defined your font (for example, *Roboto*) using a Google web font:

```css
@import url('https://fonts.googleapis.com/css?family=Roboto');
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS (on page 1161), add an `!important` rule that associates a font to all the elements from the document:

```css
* {
    font-family: "Roboto" !important;
}
```

Note:
If you want to use the :root selector instead of the * sector, without the !important qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Important:
These settings do not apply to page margin boxes, only to the text inside the page. If you also want to change the font used in headers and footers, see: How to Change the Font of the Headers and Footers (on page 1178).

Next, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: Debugging the CSS (on page 1163).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above * selector, you need to use more specific CSS selectors:

```css
*[class="front-page/front-page-title"],
*[class="topic/title"] {
    font-family: Arial !important;
}
```

```css
*[class="pr-d/codeph"],
```
How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected, and so on until one is found that includes all the glyphs. A common font sequence for Asian languages is as follows:

```css
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (on page 1278).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the -oxy-simulate-style:yes CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry.

How to Use Asian Fonts in Linux

For Asian languages on Linux distributions, PDF Chemistry automatically uses DejaVu and Noto CJK as fallback fonts for Serif, Sans-Serif, and Monospace content.

**Warning:**

On some distributions, the Noto CJK fonts are not available. In this case, you need to install them using the system package manager:

- fonts-noto-cjk on Debian family distributions (e.g. Ubuntu).
- google-noto-cjk-fonts on Red Hat family distributions (e.g. CentOS).

How to Add a New Asian Font

If you want to add a specific font for Asian languages, you need to declare it inside your customization CSS (on page 1161). The following example uses the Noto Sans Tamil font-family:

```css
/* Font Declaration */
@font-face {
    font-family: "Noto Sans Tamil";
}
```
How to Set Fonts for Displaying Music

Music is rendered as normal text in most fonts, but some of them will render them as musical glyphs. For example, the *MusGlyphs* font converts the text to music and adjusts it to the surrounding text.

This font is divided in two sub-fonts that act for each of the following categories:

- **MusGlyphs** - Converts all characters that match a musical pattern into music glyphs. It should be used inside the elements that contain only music.
- **MusGlyphs-Text** - Converts only the text prefixed with the `@` symbol into music glyphs. The remaining text is displayed normally.

To use this font, you simply need to declare each sub-font then use them in appropriate elements:
Comments, Highlights, and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 248. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

Note:

Comments with the Mark as Done flag selected appear with a check mark in the Comments section and with a Completed label (John Doe Completed).
To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to `no`.

The comments and changes are included in the merged map file (on page 1163) either as XML elements (`<oxy-insert>`, `<oxy-delete>`, `<oxy-comment>`, `<oxy-attributes>`) in the case of the XML merged map, or as HTML elements with similar classes (`oxy-insert`, `oxy-delete`, `oxy-comment`, `oxy-attributes`) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

**Tip:**
These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

**Note:**
The inserted text, deleted text, and deleted markup are included in the sticky notes, you can change this behavior by using the `show.changed.text.in.pdf.sticky.notes.content` parameter (on page 1126).

**Related Information:**
Transformation Parameters (on page 1120)
Debugging the CSS (on page 1163)

**Comments and Tracked Changes - XML Fragment**

This section contains information about how each type of tracked change is structured in the merged map XML file (on page 1163).

**Insertions**

For an insertion type of tracked change, the structure that defines the insertion details is inside the `range` (`<oxy-range-start>` to `<oxy-range-ends>`), the inserted text is highlighted by an `<oxy-insert-hl>` element, and the details are stored in the `<oxy-insert>` element.

```xml
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-insert href="#sc_1" hr_id="1">
  <oxy:oxy-author>daniel</oxy:oxy-author>
  <oxy:oxy-content>insert</oxy:oxy-content>
  <oxy:oxy-date>2018/03/15</oxy:oxy-date>
  <oxy:oxy-hour>09:38:29</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-insert>

<n:oxy-insert-hl>This is an insert!!</n:oxy-insert-hl>
```
Comments

Similar to insertions, comments are defined in a range (to), the comment details is in the element, and the highlighted content is wrapped in the element.

Note:
Comments that are marked as done have a flag="done" attribute:

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element contains details about multiple attribute changes, each stored in the element.
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in the `<oxy-delete-hl>` element.

```xml
<oxy:oxy-range-start id="sc_2" hr_id="2"/>
<oxy:oxy-delete-hl> This is a deleted text. </oxy:oxy-delete-hl>
<oxy:oxy-range-end hr_id="2"/>
```

There is a structure that offers details about the deletion change, using the `<oxy-delete>` element. This is linked to the above deletion range by the same ID value:

```xml
<oxy:oxy-delete href="#sc_2" hr_id="2">
    <oxy:oxy-author>dan</oxy:oxy-author>
    <oxy:oxy-content><image href="../img/ex.gif"></oxy:oxy-content>
    <oxy:oxy-date>2018/03/14</oxy:oxy-date>
    <oxy:oxy-hour>11:38:06</oxy:oxy-hour>
    <oxy:oxy-tz>+02:00</oxy:tz>
</oxy:oxy-delete>
```

Colored Highlights

To show some text as highlighted with a background color:

```xml
<oxy:oxy-color-hl color="rgba(140,255,140,50)">Some colored text.</oxy:oxy-color-hl>
```

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the merged map HTML file (on page 1163).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a `range` (`oxy-range-start` to `oxy-range-end`), the inserted text is highlighted by a `span` element with the class `oxy-insert-hl`, and the details are stored in a `span` element with the `oxy-insert` class.
Comments

Similar to insertions, comments are defined in a range (oxy-range-start to oxy-range-end), the comment details in an element with the class oxy-comment, and the highlighted content is wrapped in the oxy-comment-hl element.

Note:
Comments that are marked as done have a flag="done" attribute:

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class oxy-attributes contains details about multiple attribute changes, each stored in an element with the class oxy-attribute-change.
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value:

Colored Highlights

To show some text as highlighted with a background color:
Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in:
[PLUGIN_DIR]css/print/p-side-notes.css.

How to Style Changed or Commented Text

To style the highlighted text from the document content, use the <oxy-comment-hl> element (or <oxy-delete-hl>, <oxy-insert-hl>, respectively, by local name or class name):

```
oxy-comment-hl,  
.oxy-comment-hl {  
  color:magenta;  
}
```

**Note:**

The class name selector is useful when using the DITA Map PDF - based on HTML5 & CSS or DITA PDF - based on HTML5 & CSS transformation scenarios.

If you want to change the small labels that define the affected start and end ranges (they are a number formatted like: "[n] .. [n]" where n is the number of the change), you can use the following selectors:

```
oxy-range-start:before,  
.oxy-range-start:before {  
  display:inline;  
  content:'[' attr(hr_id) ']';  
  color:red;  
}  
oxy-range-end:before,  
.oxy-range-end:before {  
  display:inline;  
  content:'[/' attr(hr_id) ']';  
  color:red;  
}
```

Use `display:none` if you want to hide them.

If you want to change the background color of the comment footnote (assuming you set the show.changes.and.comments.as.pdf.sticky.notes transformation to no), add the following snippet in your customization CSS *(on page 1161)*:

```
oxy-comment,  
.oxy-comment {  
  background-color:inherit;  
}
Similarly, you can style the other footnotes for `<oxy-attributes>`, `<oxy-delete>`, and `<oxy-insert>` elements.

### How to Hide Tracked Change Footnotes

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

In some cases, when your document contains a lot of tracked changes, you may need to hide the footnotes associated with the insertions, deletions, or attribute changes. Using the following example, the deletions and insertions are hidden, but the comments remain visible. In your customization CSS (on page 1161), add:

```css
.oxy-attributes,
oxy-delete,
oxy-insert{
  float:none;
  display:none;
}
```

### How to Show Only Change Bars Without Other Styling for Tracked Changes

It is possible to only display the change bars for tracked changes (inserted or deleted content) in the PDF document while hiding the other styling for the tracked changes. This is helpful if you want to see the document in a final version while still seeing change bars where content was inserted or deleted.

To achieve this, follow these steps:

1. Set the `show.changes.and.comments` parameter to `yes` and the `show.changes.and.comments.as.pdf.sticky.notes` parameter to `no`.

   **Step Result:** The first parameter causes tracked changes to be visible in your document and styled (e.g. insertions are blue and underlined, while deletions are red with a strike-through). Changing the second parameter to `no` causes the tracked changes to be displayed as a footnote instead of a PDF annotation.

2. Hide the footnotes by adding the following in your customization CSS (on page 1161):

   ```css
   .oxy-attributes,
   .oxy-comment,
   .oxy-delete,
   .oxy-insert {
     float: initial;
     display: none;
   }
   ```

3. Remove the change range markers (the { and } symbols):
4. Remove the styling for the insertions and deletions:

```css
.oxy-insert-hl{
  color:unset;
  text-decoration:none;
}
.oxy-delete-hl {
  content: "\200b";
  text-decoration:none;
}
.oxy-comment-hl{
  background-color: unset;
}
.oxy-color-hl[color]{
  background-color: unset;
}
```

5. **[Optional]** You can improve the visibility of the change bars with this construct:

```css
.oxy-range-start[is-changebar]:before(100) {
  -oxy-changebar-color: red;
  -oxy-changebar-width: 3pt;
}
```

## Troubleshooting

This section contains information about fixing various change tracking, highlights and comments publishing problems.

### Highlights are Spanning Unexpectedly to the End of the Page

**Problem**

Tracked changes and highlights span beyond what is expected.

**Cause**

If the change tracking insertions, comments, or highlights span over an area that is larger than expected, the markup that signals their end is missing.
Solution

To fix this, open the topic where the highlights start and check if the XML processing instructions that define the end of the highlighted interval are correct. The intervals are defined as follows:

For highlights:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="140,255,140"?>
<?oxy_custom_end?>
```

For comments:

```xml
<?oxy_comment_start author="dan" timestamp="20201102T092905+0200" comment="Test"?>
<?oxy_comment_end?>
```

For inserted text:

```xml
<?oxy_insert_start author="dan" timestamp="20201102T093034+0200"?>
<?oxy_insert_end?>
```

Make sure all the ending processing instructions are located before the root element end tag.

Draft Watermarks

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

How to Add a Draft Watermark on All Pages

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS *(on page 1161)*:

```css
@page {
    background-image: url("draft.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-color: inherit;
}
```

If you have already set a background image for other pages (for example, the *front-page* or *table-of-contents*), the above selector won’t change them, as they are more specific.

The best practice is to use a different *draft.css* CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish the content as a draft, use the *draft.css* in your transformation scenario, otherwise directly reference the customization CSS *(on page 1161)*.
How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a Draft watermark until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the `bookmeta/bookchangehistory` element).

```
<bookmeta>
  <author>John</author>
  <critdates>
    <created date="1/1/2015"/>
    <created date="3/4/2016"/>
    <approved/>
  </critdates>
  <bookchangehistory>
    <approved/>
  </bookchangehistory>
...  
```

Use `oxy_xpath` every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the Oxygen XPath Builder view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```
@page {
  background-image: url(oxy_xpath("if(/*[contains(@class, 'bookmap/approved')]]) then '' else 'draft-watermark.png'"));
  background-position: center;
  background-repeat: no-repeat;
}
```

or use an element selector that restricts the watermark image only to the page area covered by that element:

```
:root, body{
  ... /* same as properties above */
}
```

**Note:**
You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).
Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```
<val>
  ...
  <prop action="flag" att="product" val="YourProd" backcolor="purple"/>
  ...
</val>
```

How to Flag Content Using Change Bars

As an example, to add a change bar (revision mark) for particular content, you can use the following in the DITAVAL file:

```
<val>
  <revprop action="flag"
            changebar="color:blue;style:solid;width:2pt;offset:1.25mm;placement:start" val="new"/>
</val>
```

This would result in any content that is marked with `@rev="new"` having a blue change bar.

How to Flag Content Using Images

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```
<val>
  <prop action="flag"
         att="product" val="MyProd"
```
Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (on page 1161) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (on page 1163).

Reusing the Styling for WebHelp and PDF Output

If you are using the pdf-css-html5 transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```xml
<h1 class="title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ...</p>
</div>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```xml
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="- topic/body body">
  <p class="- topic/shortdesc shortdesc">When caring ...</p>
  <p class="- topic/p p">When caring for your flower garden you want ...</p>
</div>
```

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```css
.shortdesc {
  font-style: italic;
}
```
The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

**Titles**

Titles can be styled by matching the `topic/title` class attribute.

```css
*[class="topic/title"] {
    color:navy;
}
```

**How to Avoid Wrapping the Title Text Without Indentation**

By default, the chapter/section number is on the same line as the title text. If the title is too long, the text wraps to the next line without any indentation.

```
4.5.5 This is a long title
text that wraps.
```

If you want the wrapped text to include indentation, you need to set the value of the `args.css.param.title.layout` transformation parameter to `table`. This results in the chapter/section number being placed in one cell while the rest of the title content is in another cell with wrapped text and it is displayed with an indent:

```
4.5.5 This is a long title
text that wraps.
```

**Equations**

This processor supports MathML equations.

**How to Change the Font of MathML Equations**

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```css
*[class="equation-d/equation-block"],
*[class="equation-d/equation-inline"]{
    font-family:"courier new";
    font-size:1.5em;
    padding:1em;
}
```

**Note:**

An equation can be rendered using multiple classes of fonts (e.g. the `serif`, `sans serif`, `monospace`, `fraktur`, and `doublestruck` classes. Depending on each of the equation symbols, a class is selected.
for it. The font specified in the CSS rule (as in the preceding example), applies only to the serif class. However, if a symbol codepoint is not covered by the currently selected class fonts, it falls back to the font specified in the CSS.

⚠️ **Attention:**
Some of the fonts may not be supported. In that case, a default serif font is used.

## Lists

This is the default layout for lists (values are in px):

```
<ol>
  <li>Begin by cutting out all the dead branches.</li>
  <li>Remove all tangled or crossed over branches.</li>
  <li>Take your time! Work comfortably and do not make shortcuts.</li>
  <li>Clean up the area. Burn all pest infested branches.</li>
</ol>
```

Markers are displayed in the padding area, so they are not included in the principal block box.

The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists. To summarize:

- Setting the `padding-left` or `margin-left` properties on lists will move the whole list.
- Setting the `margin-left` property on list items will move the whole list.
- Setting the `padding-left` property on list items will only move the list item content (not the marker).

⚠️ **Note:**
If the `padding-left` property is set on lists and the `margin-left` property is set on list items, the result will move the whole list with a combination of both padding and margin values.

## How to Align Lists with Page Margins

It is possible to reposition the lists to align them with the rest of the text from the body.

The default CSS rules for the lists are as follows:

```css
ol {
  display: block;
  margin-top: 1.33em;
  margin-bottom: 1.33em;
  list-style-type: decimal;
  padding-left: 40px;
}
```
ul {
    display: block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type: disc;
    padding-left: 40px;
}

To align the lists, the following rules are sufficient in the customization CSS (on page 1161):

* [class~="topic/ol"],
* [class~="topic/ul"] {
    padding-left: 0;
    list-style-position: inside;
}

Note: By default, the list-style-position property is set to outside.

How to Style the List Markers

For the media print, the default CSS rules for the list items use the :marker pseudo-class.

@media print {
    *[class="topic/li"][class~="topic/li"]:marker {
        text-align: center;
        font-weight: bold;
    }
    *[class="topic/li"] {
        margin-left: 0.25in;
    }
}

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS (on page 1161):

* [class="topic/ol"] > *[class="topic/li"][class~="topic/li"]:marker {
    font-weight: normal;
}

For the unordered lists:

* [class="topic/ul"] > *[class="topic/li"][class~="topic/li"]:marker {
    font-weight: normal;
}
How to Continue List Numbering

It is possible to continue the numbering of an ordered list even when the content is split on multiple \texttt{<ol>} elements.

You just need to define an \texttt{@outputclass} attribute on the lists where numbering should continue:

\begin{verbatim}
<ol>
  <li>First Item</li>
  <li>Second Item</li>
</ol>
<p>A paragraph</p>
<ol outputclass="continue">
  <li>Third Item</li>
</ol>
\end{verbatim}

Then set the following content inside your CSS customization:

\begin{verbatim}
*[class~="topic/ol"] {
  counter-reset: list-counter;
}
*[class~="topic/ol"] [outputclass="continue"] {
  counter-reset: none;
}
*[class~="topic/ol"] > *[class~="topic/li"] {
  counter-increment: list-counter;
}
*[class~="topic/ol"] > *[class~="topic/li"]:marker {
  content: counter(list-counter) ". 00a0";
}
\end{verbatim}

How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the \texttt{list-style-type} CSS Property.

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

\begin{verbatim}
*{class = "topic/ol"} {
  list-style-type: lower-roman;
}
\end{verbatim}
Change the Content of the `:marker` CSS Pseudo-Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

```css
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:marker {
width:3em;
}
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(1):marker{ content: "а" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(2):marker{ content: "б" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(3):marker{ content: "в" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(4):marker{ content: "г" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(5):marker{ content: "д" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(6):marker{ content: "е" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(7):marker{ content: "ж" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(8):marker{ content: "з" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(9):marker{ content: "и" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(10):marker{ content: "к" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(11):marker{ content: "л" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(12):marker{ content: "м" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(13):marker{ content: "н" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(14):marker{ content: "о" }
*[^class ~='topic/ol'][^outputclass ~='cyrillic'] > *[^class ~='topic/li']:nth-of-type(15):marker{ content: "п" }
```

**Important:**

This example will work only for lists up to 28 items. You will have to extend it for longer lists!

Oxygen PDF Chemistry User Guide: Lists

Links

Links allow the users to navigate through the documentation.

How to Remove 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (on page 1161):

```css
* [class = "topic/xref"] [href]:after, 
* [class = "topic/link"] [href]:after { 
```
Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```xml
*[class =~ "topic/entry"] *[class =~ "topic/xref"][href]:after{
  content: none !important;
}
```

**How to Change Link Styles**

Suppose you want the links to be bold and with an underline. In your customization CSS (on page 1161), add this snippet:

```css
*[class =~ "topic/xref"][href]:after,
*[class =~ "topic/link"][href]:after {
  font-weight: bold;
  text-decoration: underline;
}
```

**How to Hide Descriptions in Related Links Sections**

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (on page 1163) like this:

```xml
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
        role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>
```

If you need to hide these descriptions, add the following code in your customization CSS (on page 1161):

```css
*[class =~ "topic/link"] > *[class =~ "topic/desc"] {
  display: none;
}
```
How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

<table>
<thead>
<tr>
<th>Related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Topic</td>
</tr>
<tr>
<td>Target Concept</td>
</tr>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>

It is possible to group the links by target type (topic type) by setting the `args.rellinks.group.mode=group-by-type` parameter. The output will look like this:

<table>
<thead>
<tr>
<th>Related concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Concept</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Topic</td>
</tr>
</tbody>
</table>

Images and Figures

Images are an important part of a publication.

**Note:**
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in `[PLUGIN_DIR]css/print/p-figures-images.css`.

```css
*[class ~="topic/image"] {  
    prince-image-resolution: 96dpi;  
    -ah-image-resolution: 96dpi;  
    image-resolution: 96dpi;  
    max-width: 100%;  
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.
In your customization CSS *(on page 1161)*, add the following snippet:

```css
*[class ~="topic/image"] {
  ...
  /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
  max-width: 6.5in;
}
```

Pay attention to images that have an image map *(on page 1306)* associated. The built-in rules set the `max-width: auto` for them to avoid scaling. Otherwise, it would cause a misalignment between the image and its clickable areas. These images are best to have a `@width` and `@height` attribute.

**How to Change Image Resolution**

**How to Change the Resolution for Raster Images**

This technique changes the size of all *raster* images from your documentation. It will not work for *vector* images, such as PDF or SVG.

The default resolution is 96 dpi (same as in web browsers). You can change it by adding the following in your customization CSS *(on page 1161)*:

```css
*[class ~="topic/image"] {
  prince-image-resolution: 300dpi;
  -ah-image-resolution: 300dpi;
  image-resolution: 300dpi;
}
```

**Important:**

The above selector does not apply to images from the `<imagemap>` element. You can use the following selector for that purpose:

```css
*[class ~="ut-d/imagemap"] > *[class ~="topic/image"] {
...
}
```

Make sure you verify the area shapes to match the new image boundaries. The pixels specified in the image map area coordinates are always 1/96 in. For more details, see: How to Use Image Maps *(on page 1306)*.

**How to Change the Resolution for Vector Images**

This technique will change the size of all *vector* images (such as PDF or SVG) and will not affect *raster* images.
Vector images are rendered with a default resolution of 96 dpi. You can change this default value by setting the `image.resolution` transformation parameter (on page 1120) to another value (from 72, 120, 300 and 600).

### How to Place Big Images on Rotated Pages

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1161), add:

```css
 *[class~="topic/image"] [outputclass='land'] {
   page: landscape-page;
}
```

Setting the attribute `@outputclass = 'land'` on the table element will force the table on a new landscape page.

Another solution is to set an `@outputclass` attribute on the image, then create a rule that matches it, and associate a landscape page for it.

### How to Place a Text and Image Side by Side

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a `<div>` element like this:

   ```xml
   ...  
   <div outputclass="side-by-side">
     <p>
       This will be in the left side, the next figure in the right.  
       </p>
     <fig>
       <image href="cactus.jpeg"/>
     </fig>
   </div>
   ...  
   ```

   **Note:**
   You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (on page 1161), add:

   ```css
   *[outputclass = "side-by-side"]  >  *[class = "topic/p"] {
     display:inline-block;
     width: 45%;
   }
   
   *[outputclass = "side-by-side"] > *[class = "topic/fig"] {
     display:inline-block;
     width: 45%;
   }
   ```
The image should fill the entire width of the parent `<fig>` element:

```css
* [outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] > *[class =~ "topic/image"] { width:100%; }
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```css
* [outputclass =~ "side-by-side"] > *[class =~ "topic/p"] { vertical-align:top; }

* [outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] { vertical-align:top; font-size:0pt; }
```

**Note:**
The `font-size:0pt` is needed to remove the font ascent and descent around the image rectangle.

### How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a `:before` or `:after` pseudo-element. For example, for notes you may have both artwork and text:

```css
*[class =~ "topic/note"]:before { content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- **Use the `image-resolution` CSS property:**

  ```css
  *[class =~ "topic/note"] { image-resolution:300dpi; }
  ```

- **Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple `:before` pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the `:before` with the highest number in the brackets:**

  ```css
  *[class =~ "topic/note"]:before(2) { content: url('note.png') ;
  ```
How to Center Images

DITA defines a `placement` attribute for the `<image>` elements. The implicit value is `inline`. Suppose that you need to center the images that have the placement set to `break` (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS (on page 1161), add:

```css
* [class ~= "topic/fig"] { text-align: center; }
/* Other images, with break placement. */
*[class ~= "topic/image"] [placement='break'] {
  display: block;
  text-align: center;
}
/* Scaled images are getting a computed width attribute, so we can use the auto margins. Auto margins function only if the block they apply to has a width. */
* [class ~= "topic/image"] [placement='break'] [width] {
  margin-left: auto;
  margin-right: auto;
  border: 2pt solid red;
}
```

How to Change/Reset the Figure Numbering

Note:
This topic is applicable for the DITA Map PDF - based on HTML5 & CSS DITA PDF - based on HTML5 & CSS transformation types.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:
NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and the second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<figcaption>`.

```html
/*[class ~~ "topic/topic"] [is-chapter] { 
  counter-reset: figcount;
}

.fig--title-label{
  display:none;
}

/*[class == "topic/fig"] > .figcap:before{
  /* Add more styling or change the content if needed */
  content: "Figure " counter(figcount) ". ";
  counter-increment: figcount;
}
```

### How to Fix Missing Images

If your images are not accessible, you may receive an error message in the transformation console like this:

```
Image not found. URI:file:/path/to/my/image
```

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`.

### How to Use Image Maps

To use the DITA `<imagemap>` element in a PDF transformation, follow this procedure:
1. Start by determining the width and height of your image in CSS pixels and specify it on the `<image>` element using the `@width` and `@height` attributes.

**Notes:**
- A CSS pixel is $\frac{1}{96}$ in, so if the image is created at a 96dpi resolution, one dot from the image is one pixel in the CSS space. If your image is displayed at another resolution (on page 1302), then it is adjusted accordingly (for example, 192dpi results in two dots from the image being equal to one pixel in the CSS space).
- You can use other CSS units, including percentages. The percentages are solved relative to the image size and represent a way of creating responsive image maps.

**Warning:**
If you publish the content for both PDF and HTML web output, make sure you only use pixels, as some browsers only support these units.

**Example:**
Suppose you have a very large image that is 6400x4800 dots, but you want to make it fit in a box of 640x480 CSS pixels. In the following snippet, this is done by specifying the width and height attributes.

```xml
<imagemap>
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded" width="640" height="480">
    <alt>Gear Pump</alt>
  </image>
</imagemap>
```

2. In the map element, add areas (each with a shape and a set of coordinates):

```xml
<imagemap>
  <image ... />
  <area shape="circle" coords="172, 265, 14">
    <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>

  <area shape="poly" coords="568, 81, 576, 103, 468, 152, 455, 130"/>
</imagemap>
```
<xref href="parts/drive-shaft.dita#drive_shaft_topic/drive_shaft" format="dita">Drive Shaft</xref>

The type of areas are the ones defined in the HTML standard: circle, poly, rect, default. For more details, see: [https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element](https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element).

3. Verify how the shapes look in the output. You can make the shapes visible by one of the following methods:
   - Using the `show.image.map.area.numbers` and `show.image.map.area.shapes` transformation parameters.
   - Adding a CSS snippet to your customization. The shapes have the `image-map-shape` class, the bullet around the image map number (`image-map-number`), and the text inside the bullet (`image-map-number-text`). To make them translucent yellow:

```css
.image-map-shape{
  fill: yellow;
  fill-opacity: 0.5;
  stroke-opacity: 0.5;
}
.image-map-number-text {
  visibility: visible;
}
.image-map-number {
  fill: yellow;
  fill-opacity: 0.4;
  stroke-opacity: 0.7;
}
```

**Tip:**
An SVG with links can be used as an alternative to the DITA `<imagemap>` element. Make sure that each link is a relative URI to an ID inside the publication content.

**How to Hide the Image Map Links List**

Below every image map, a list of links that point to the image map targets is displayed. This list can be hidden from the final output by using the following CSS selector:

```css
.imagemap--areas {
  display: none;
}
```
How to Use SVG Syntax Diagrams

The DITA `<syntaxdiagram>` element is supported by the PDF transformation. To use SVG syntax diagrams, follow this procedure:

1. Download the latest version of the `svg-syntaxdiagrams` plugin, unzip it, and copy all the folders into your `DITA-OT-DIR\plugins` folder (they all start with "com.").
2. Open a command prompt inside `DITA-OT-DIR\bin` and run the `dita install` command.
3. You can now add your custom `<syntaxdiagram>` element in your topic, as in the following example:

```
<syntaxdiagram id="syntaxdiagram_ok4_clk_xnb">
  <title>CopyFile</title>
  <groupseq><kwdf>COPIF</kwdf></groupseq>
  <groupcomp><var>input-filename</var><kwdf>*INFILE</kwdf></groupcomp>
  <groupseq><var>output-filename</var><kwdf>*OUTFILE</kwdf></groupseq>
  <groupchoice><var>input-filename</var><kwdf>*INFILE</kwdf></groupchoice>
  <groupchoice><var>output-filename</var><kwdf>*OUTFILE</kwdf></groupchoice>
</syntaxdiagram>
```

4. Run the DITA Map PDF - based on HTML5 & CSS (or DITA PDF - based on HTML5 & CSS) transformation.

⚠️ **Warning:**

If you are not publishing the content for the first time, you may need to delete the `out/` and `temp/` folders to see the syntax diagram correctly in the `.merged.html` file.

**Result:** The PDF is generated and the syntax diagram is displayed as a referenced SVG file like this:

![Sample Syntax Diagram]

**Tables**

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

**Tables - Built-in CSS**

There is a combination of CSS files that address tables:

- `[PLUGIN_DIR]/css/core/-table-html-cals.css`
- `[PLUGIN_DIR]/css/print/p-tables.css`
How to Handle Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `orient = 'land'` attribute on the table element will force the table to be on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```html
*{class~="topic/table"}[data-cols='5'],
*{class~="topic/table"}[data-cols='6'],
*{class~="topic/table"}[data-cols='7'],
*{class~="topic/table"}[data-cols='8'],
*{class~="topic/table"}[data-cols='9'],
*{class~="topic/table"}[data-cols='10'] {
  page: landscape-page;
  max-width: 100%;
  max-height: 100%;
  width: 100%;
  page-break-before: avoid;
}
```

**Note:**
The landscape-page page layout is defined in the `[PLUGIN_DIR]/css/print/p-pages-and-headers.css` file.

If you want to rotate the entire topic that contains the big table, use:

```html
*{class~="topic/table"}[data-cols='5'],
*{class~="topic/table"}[data-cols='6'],
*{class~="topic/table"}[data-cols='7'],
*{class~="topic/table"}[data-cols='8'],
*{class~="topic/table"}[data-cols='9'],
*{class~="topic/table"}[data-cols='10'] {
  max-width: 100%;
  table-layout: auto;
}
```

```html
*{class~="topic/topic":has(*:not([class~="topic/topic"])) >
  *{class~="topic/table"}[data-cols='5']},
*{class~="topic/topic":has(*:not([class~="topic/topic"])) >
  *{class~="topic/table"}[data-cols='6']},
*{class~="topic/topic":has(*:not([class~="topic/topic"])) >
  *{class~="topic/table"}[data-cols='7']},
```
How to Avoid a Table Exceeding the Page Width

The DITA specification indicates that tables should have a fixed layout. This can be done in two different ways:

Note:

It is also possible to import the `{PLUGIN_DIR}/css/print/p-optional-auto-rotate-wide-tables.css` stylesheet into your custom CSS.

---

```html
*[class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='8'],
*[class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='9'],
*[class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='10'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='5'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='6'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='7'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='8'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='9'],
*[^class~="topic/topic"] :has(*:not([class~="topic/topic"])) >
  *[class~="topic/table"] [data-cols='10'] } {
  page: landscape-page;
}
```
1. **Using proportional or relative measures** - It includes percent values and shares values (i.e. "3\*" or "12\*").

2. **Using fixed measures** - It includes all the values followed by units (i.e. \textit{in}, \textit{pt}, \textit{px}, and others).

![Important:](image)

Although the specification allows you to combine these values, it is **highly recommend** that you only use one method at a time. Combining both methods could lead to a table exceeding the page width and will make the content unreadable.

### How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the \texttt{overflow-wrap} property to force the word to break:

\[
*[^{class =~ "topic/table"}] (  
  overflow-wrap: break-word;  
)*

**Related Information:**

- Hyphenation \textit{(on page 1271)}
- How to Enable/Disable Hyphenation for an Element \textit{(on page 1274)}

### How to Fix Small Images in Table

Tables contained in the output of DITA Map PDF - based on HTML5 & CSS (and DITA PDF - based on HTML5 & CSS) transformations have an automatic layout by default. This means that DITA-OT defines a preferred size on them, optimizing their width/height inside the content to make them as small as possible.

If, for example, you have a two-column table \textit{without defined column widths} and one column contains images while the other column contains text, the table in the generated PDF will have its first column shrunk with smaller images and an enlarged second column (to occupy the least amount of space in the output).

To avoid this, you must \texttt{unset} the default image \texttt{max-width} so that the original size of the image will be used instead:

\[
*[^{class =~ "topic/image"}] (  
  max-width: unset;  
)*

```
How to Rotate Content from a Table Cell

In DITA CALS tables, you can rotate the content of a cell by setting the `@rotate` attribute to 1.

In the following example, the Sport, All terrain, and Family header cells are rotated.

```xml
<table frame="all" rowsep="1" colsep="1" id="table_dlp_fib_crb">
  <title>Car Features</title>
  <group cols="4">
    <colspec colname="c1" colnum="1" colwidth="14*"/>
    <colspec colname="c2" colnum="2" colwidth="1*" align="center"/>
    <colspec colname="c3" colnum="3" colwidth="1*" align="center"/>
    <colspec colname="c4" colnum="4" colwidth="1*" align="center"/>
  </group>
  <thead>
    <row>
      <entry morerows="1">Car Name</entry>
      <entry namest="c2" nameend="c4">Features</entry>
    </row>
    <row>
      <entry rotate="1">Sport</entry>
      <entry rotate="1">All terrain</entry>
      <entry rotate="1">Family</entry>
    </row>
  </thead>
  <tbody>
    <row>
      <entry>Tesla Model S</entry>
      <entry>X</entry>
      <entry>X</entry>
      <entry>X</entry>
    </row>
    ...  
  </tbody>
</table>
```

Table 14. Car Features

<table>
<thead>
<tr>
<th>Car Name</th>
<th>Sport</th>
<th>All terrain</th>
<th>Family</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tesla Model S</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

The resulting output will be:
The built-in CSS matches the cells with this attribute and applies the following properties:

```
* [class~="topic/entry"] [rotate='1'] {
  transform: rotate(270deg);

  /* Avoid wrapping, including hyphenation */
  white-space: pre;
  hyphens: manual;

  /* The rotated content will start from the lower side of the cell */
  vertical-align: bottom;
}
```

To change the vertical alignment of the content (for example, to move it to the middle of the cell), use the following in your CSS customization:

```
* [class~="topic/entry"] [rotate='1'] {
  vertical-align: middle;
}
```

The resulting output will be:

<table>
<thead>
<tr>
<th>Car Name</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sport</td>
</tr>
<tr>
<td>Tesla Model S</td>
<td>X</td>
</tr>
<tr>
<td>Nissan Leaf</td>
<td></td>
</tr>
<tr>
<td>Dacia Duster</td>
<td>X</td>
</tr>
</tbody>
</table>
To make the text wrap (for instance, the "All terrain" could be split on two lines), you need to inhibit the whitespace preservation from the built-in CSS. In this case, all spaces will create a line break in the rotated layout. Thus, you can add this in your customization:

```
*{class~="topic/entry"]}{
  vertical-align:middle;
  white-space:normal;
}
```

The resulting output will be:

<table>
<thead>
<tr>
<th></th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Car Name</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sport</td>
</tr>
<tr>
<td>Tesla Model S</td>
<td>X</td>
</tr>
<tr>
<td>Nissan Leaf</td>
<td></td>
</tr>
<tr>
<td>Dacia Duster</td>
<td>X</td>
</tr>
</tbody>
</table>

**Note:**

The padding and borders set on the table cells are not rotated (only the content of the cell is rotated). You can use `padding-left` (for instance) to move the labels to the horizontal axis.

```
*{class~="topic/entry"]}{
  padding-left:2em;
}
```

**How to Add Horizontal Lines to a Choice Table**

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```
*{class="task/choptionhd"},
*{class="task/choptionhd"},
*{class="task/chdeschd"},
*{class="task/choption"} {
  background-color: #EEEEEE;
  text-align: left;
}

*{class="task/choicetable"} {
```
Note:
Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

How to Remove the Table NN Label

For the DITA Map PDF - based on HTML5 & CSS transformation scenario, the label for a table’s title is wrapped in a span element with the class: table--title-label.

```
<table ... >
  ...
  <caption class="- topic/title title tablecap">
    <span class="table--title-label">Table
    <span class="table--title-label-number">1. </span></span>
    <span class="table--title">The title of the table</span>
  </caption>
  ...
```

To hide it, set its display to none:

```
.table--title-label {
  display: none;
}
```

For the direct transformation, use:

```
*[class =~ "topic/table"] > *[class =~ "topic/title"]:before {
  content: none;
}
```
How to Center Tables

You can center the tables by using margins `auto`, while the table caption (title) can be centered using the `text-align` property:

```css
*[class =~ "topic/table"] {
    margin-left: auto;
    margin-right: auto;
    width: 50%;
    border: 1pt solid blue;
}
*[class =~ "topic/table"] *[class =~ "topic/title"]{
    text-align: center;
}
```

How to Add Stripes to a Table

To create a striped look for your tables, you can use the following CSS rules:

```css
/* Header background and foreground */
*[class =~ "topic/table"][outputclass =~ "stripes"] > *[class =~ "topic/thead"] > *[class =~ "topic/row"] {
    background-color: blue;
    color: white;
}

/* A default background for the entire table body */
*[class =~ "topic/table"][outputclass =~ "stripes"] > *[class =~ "topic/tbody"] {
    background-color: #eeeeee;
}

/* Color for the stripes */
*[/topic/table]([outputclass =~ "stripes"] > *[class =~ "topic/tbody"] > *[class =~ "topic/row"])nth-child(odd) {
    background-color: cyan;
}

/* Border for the cells */
*[/topic/table]([outputclass =~ "stripes"] *[/class =~ "topic/entry"]) {
    border: blue;
}
```

The above rules assume that tables that are to be painted with stripes are marked with an `@outputclass` attribute:
If you want to make all tables look the same, you can ignore this attribute and remove the `outputclass ~="stripes"` simple selector from the above rules.

⚠️ **CAUTION:**
Applying stripes and thin cell borders can cause rendering issues in the PDF renderer on screen display devices. For more information, see How to Fix Disappearing Thin Lines or Cell Borders (on page 1333).

### How to Display Borders on a Split Cell

By default, if a cell extends onto a second page, its bottom and top borders are discarded. To display these borders, you need to add the following property in your CSS customization:

```css
*[class ~= "topic/entry"] {
  -oxy-borders-conditionality: retain;
}
```

### Code Blocks

Code blocks are used to render section of programming code.

### How to Enable Code Syntax Highlighting

This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
For example, for a java snippet:

```xml
<codeblock outputclass="language-java">
    for (int i=0; i <100; i++) {
        // do something
    }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```xml
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
xml:space="preserve">
    <strong class="hl-keyword" style="color:#7f0055">for</strong>
    (<strong class="hl-keyword" style="color:#7f0055">int</strong> i=<span class="hl-number">0</span>; i <span class="hl-number">100</span>; i++) {
        <em class="hl-comment" style="color:#006400">// do something</em>
    }
</pre>
```

And in the output, it will be rendered as:

```
for (int i=0; i <100; i++) {
    // do something
}
```

**Changing the Colors for the Syntax Highlighting**

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS *(on page 1161)*:

```css
.hl-keyword {
    color: red !important;
}
.hl-comment {
    color: blue !important;
}
```
How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (on page 1161):

```css
*.[class~="pr-d/codeblock"] {
    white-space: pre;
}
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations (on page 1141).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```bash
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```bash
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```bash
$gist = ls -l * | count -n \
| some more
```

Note:

For Linux/macOSX, the continuation character is the backslash \. For Windows, this is the shift character ^.

The command-line processor will now recognize that the first line is continuing on to the next one.
Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (tip, caution, danger, restriction, important, warning).

For information on how to add and manage mixed content before the note icons and labels, see How to Control the Image Size in Complex Static Content (on page 1304).

How to Change Note Icons

The recommended icon format is SVG.

To change the default icons for notes that do not have a `@type` attribute, add the following rule to your customization CSS (on page 1161):

```css
div.note {
  background-image: url("../img/note.svg");
}
```

For a note with a `@type` attribute set to `warning`, `caution`, or `trouble`, add the following corresponding CSS rule:

```css
div.warning {
  background-image: url("../img/warning.svg");
}
div.caution {
  background-image: url("../img/caution.svg");
}
div.trouble {
  background-image: url("../img/troubleshooting.svg");
}
```

Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (on page 1161):

```css
a:has(dfn[class ~="abbreviated-form"]){
  color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
  text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'none' else 'underline'");
}
```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.
Trademarks

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```xml
<tm tmtype="tm">My Product Name</tm>
```

Depending on the value of the `@tmtype` attribute, a different symbol is appended to the text: (®, ™, or ℠).

The structure of the merged HTML document the CSS will apply to is:

```html
<span class="- topic/tm tm" tmtype="tm">My Product Name</span><span class="- topic/tmmark tmmark ">™</span></span></span>
```

How to Style the Trademark Element Text

To change the style of the entire trademark text, you can match the `topic/tm` class like this:

```css
*:class ~="topic/tm" { 
  font-weight: bold; 
}
```

How to Style the Trademark Symbol

To change the aspect of the trademark symbol, you can use the `topic/tmmark` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```css
*:class ~="topic/tmmark" { 
  vertical-align: super; 
  font-size: smaller; 
}
```

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will become the attribute value. The namespace of these synthetic attributes is:

When using the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformations, the generated attribute will be in no namespace.
Notes:

• Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
• Use only Latin alphanumeric characters for parameter names.
• You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, notices, or the preface).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the `topicrefs` at level 2 or more:

```
:root[only-chapters-in-toc='yes'] *[class =~ "toc/toc"]
  > *[class =~ "map/topicref"] > *[class =~ "map/topicref"] { display:none; }
```

The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter

In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page {
  size: oxy_xpath('/'/*[@local-name()="page-size"])[1];
}
```

How to Change the Cover Page Using a Parameter

In the following example, a custom parameter is used to set the path of the cover page. The parameter points to an image by using its URL and is defined in the transformation scenario as:

```
args.css.param.cover-page="file:/path/to/cover-page.svg"
```

Then in the CSS, the attribute value is extracted and used as follows:
Controlling the Publication Content

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a *preface*, *frontmatter*, or *backmatter* with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA `<bookmap>` element.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```xml
<bookmap id="taskbook">
  <booktitle>
    <mainbooktitle>Publication Title</mainbooktitle>
    <booktitlealt>A very short description of the publication</booktitlealt>
  </booktitle>
  <frontmatter>
    <topicref href="topics/abstract.dita"/>
    <booklists>
      <toc/>
    </booklists>
    <topicref href="topics/foreword.dita"/>
  </frontmatter>
</bookmap>
```

Then you may define a *frontmatter*. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```xml
<frontmatter>
  <topicref href="topics/abstract.dita"/>
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita"/>
</frontmatter>
```

Note:
To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>` element.

Next, the topics are grouped into chapters:
At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes"/>
    </glossarylist>
    <figurelist/>
    <tablelist/>
  </booklists>
  <topicref href="topics/thanks.dita"/>
</backmatter>
```

As you can see, the bookmap offers much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (on page 1210) topic).

How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter hide.frontpage.toc.index.glossary. See: Transformation Parameters (on page 1120).

Related Information:

- How to Remove Entries from the TOC (on page 1244)
- How to Hide the TOC (on page 1244)

How to Make Chapters Look Like Individual Publications

Note:

This topic is only applicable for the DITA Map PDF - based on HTML5 & CSS transformation scenario.
Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the \texttt{args.css.param.numbering} (on page 1226) command-line parameter.

In addition to numbering, you can force the creation of a chapter TOC (on page 1244).

### Localization

DITA-OT supports more than 40 languages. The full list of supported languages (and their codes) is available here: https://www.dita-ot.org/3.6/topics/globalization-languages.html.

There are two ways to switch the labels to a specific language:

- Set the \texttt{@xml:lang} attribute on the DITA maps and/or topics root element with one of the supported values (e.g. de, fr-FR, ru, zh-CN).
- Set the \texttt{default.language} parameter in the transformation dialog box to the desired language code.

You can create language-dependent CSS rules in your customization CSS (on page 1161) by adding rules using the \texttt{:lang} pseudo-class (see https://developer.mozilla.org/en-US/docs/Web/CSS/:lang).

**Tip:**

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the Oxygen installation. Otherwise, you will lose the customization when upgrading Oxygen. You can contact the Oxygen support team to ask for the Oxygen Publishing Engine package.

### How to Customize CSS Strings

Some of the labels come from CSS files located in the \texttt{DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n} directory. These strings can be overridden directly from a custom CSS stylesheet. Simply identify (by debugging the CSS) and copy the rules that apply on your content and change their values. For example:

```css
/* Title of the TOC page */
*{class =~ "toc/title"}[empty]:lang(es):before {
    content: "Contenidos";
}
```

**Note:**

If you want to use a language without a corresponding \texttt{p-i18n-xx.css} stylesheet, follow these instructions:
1. Copy one of the available stylesheets (located in the $DITA-OT-DIR$/plugins/com.oxygenxml.pdf.css/css/print/i18n directory) into your CSS customization (other than the English one because it does not have the :lang pseudo-class since it is the default language).
   2. For each rules, replace the :lang(xx) pseudo-class with your expected language code, then replace each property value with the expected label.

Debugging the CSS (on page 1163)

How to Modify Existing Strings

If the label you want to modify is not available from the CSS, you need to modify the XML strings. The default XML strings are available at the following two locations:

- $DITA-OT-DIR$/plugins/org.dita.base/xsl/common
- $DITA-OT-DIR$/plugins/com.oxygenxml.pdf.css/resources/localization

To modify the generated text, you need to create a DITA-OT extension plugin that uses the $dita.xsl.strings$ extension point. The following example uses English, but you can adapt it for any language:

1. In the $DITA-OT-DIR$/plugins/ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.css.localization).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.css.localization">
     <require plugin="com.oxygenxml.pdf.css"/>
     <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
   </plugin>
   ```
3. Create a pdf-extension-strings.xml file with the following content:

   ```xml
   <langlist>
   <lang xml:lang="en" filename="strings-en-us.xml"/>
   <lang xml:lang="en-us" filename="strings-en-us.xml"/>
   </langlist>
   ```
4. Copy the strings you want to change from the default files to the strings-en-us.xml file, then replace their values:

   ```xml
   <strings xml:lang="en-US">
   <str name="Figure">Fig</str>
   ```
Some strings are not translated in all languages. In this case, they will appear in English. To add a new language for a given string, you need to create a DITA-OT extension plugin that uses the dita.xsl.strings extension point. The following example uses Polish, but you can adapt it for any language:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.css.localization).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css"/>
  
  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
</plugin>
```

3. Create a pdf-extension-strings.xml file with the following content:

```xml
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
  <lang xml:lang="pl-pl" filename="strings-pl-pl.xml"/>
</langlist>
```

4. Copy the strings you want to change from the default files to the strings-pl-pl.xml file, then replace their values:

```xml
<strings xml:lang="pl-PL">
  <str name="Continued">ciąg dalszy</str>
</strings>
```

**Warning:**

Make sure the string @name attribute remains the same, it is used by the process as a key to retrieve the strings text.
5. Use the Run DITA-OT Integrator transformation scenario (on page 808) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

**Security**

You can restrict the use of the PDF files by specifying a set of permissions. For example, you may want to set a password on the document, restrict the available actions inside the PDF reader, or encrypt the PDF content.

The pdf.security.* parameters listed in the Transformation Parameters (on page 1120) section can be used for this purpose.

**How to Protect PDF Files by Setting Security Permissions**

For example, to permit only the users that have a password to access the document and also to restrict their printing and copying capability, you can use the following parameter combination:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.security.owner.password</td>
<td>&lt;OWNER PASSWORD&gt;</td>
<td>People using this password will be able to open the document, with full permissions.</td>
</tr>
<tr>
<td>pdf.security.user.password</td>
<td>&lt;USER PASSWORD&gt;</td>
<td>People using this password will be able to open the document, but they will not be able to print.</td>
</tr>
<tr>
<td>pdf.security.restrict.print</td>
<td>yes</td>
<td>Restricts users from printing.</td>
</tr>
<tr>
<td>pdf.security.restrict.copy</td>
<td>yes</td>
<td>Restricts users from copying content.</td>
</tr>
</tbody>
</table>

**Important:**

If you specify just the user password (without an owner password), then the people using it will be considered owners, and no restrictions will apply to them.

**Troubleshooting**

This section contains information about fixing various change tracking, highlights and comments publishing problems.

**PDF file is damaged**

**Problem**

It is possible to get a PDF that cannot be opened in the PDF viewer. In this case, you might get an error similar to:
Error: PDF file is damaged - attempting to reconstruct xref table...
Error: Couldn't find trailer dictionary
Error: Couldn't read xref table

Cause

This usually means that your PDF viewer does not support a PDF version greater than 1.4. The main difference with newer PDF versions is that the xref table is compressed in a stream and is not available as a table.

Solution

You need to re-run the PDF transformation with the pdf.version parameter set to 1.4.

Failed to Run Pipeline: The Entity Cannot Be Resolved Through Catalogs

Problem

You can get a Failed to run pipeline error message that looks something like this:

Failed to run pipeline: The entity SOME_ENTITY cannot not be resolved through catalogs.
For security reasons files that are not listed in the DITA-OT catalogs and are not located in the DITA-OT directory are not read

Cause

This happens when the security checks that are implemented in the default transformation have blocked the reading of files that are not part of the DITA-OT (Oxygen Publishing Engine) installation directory and not part of the transformed DITA map.

Solution

If the origin of the transformed content is known and trusted, you can disable these checks by setting the args.disable.security.checks transformation parameter to yes.

The format-date() XPath Function Does not Respect the Specified Locale

Problem

Formatting a date using another language code, as in this example:

```xml
<title:before {
    content: oxy_xpath('format-date(current-date(), "[Mn] [Y]", "ru", (), ())');
}
```

results in an output like: [Language: en]september 2019, with the date being formatted in English.

Cause

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support languages other than English.
Solution

As a solution, you can either switch to a more language-neutral format that avoids the months names:

```xml
<title:before{
  content: oxy_xpath('format-date( current-date(), "[M] [Y]", "en", (), ())');
}
```

or you can use a more complex XPath expression like this:

```xml
<title:before{
  content: oxy_xpath("let $cm:= format-date(current-date(), '[MNN]') \
                   return concat( \n                   if ($cm= 'January') then  'JAN' else \n                   if ($cm= 'February') then  'FEB' else \n                   if ($cm= 'March') then  'MAR' else \n                   if ($cm= 'April') then  'APR' else \n                   if ($cm= 'May') then  'MAY' else \n                   if ($cm= 'June') then  'JUNE' else \n                   if ($cm= 'July') then  'JUL' else \n                   if ($cm= 'August') then  'AUG' else \n                   if ($cm= 'September') then  'SEPT' else \n                   if ($cm= 'October') then  'OCT' else \n                   if ($cm= 'November') then  'NOV' else '' \n                   , \n                   ', \n                   format-date(current-date(), '[Y0001]') \n                   ");
}
```
Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.

### Error Parsing CSS File - Caused by a Networking Problem

**Problem**

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception`, `Unknown host`, `Error parsing`.

**Cause**

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

**Note:**

If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

**Remedy**

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

**Note:**

If the problem is caused by a remote font, see [Using Local Fonts](#).

### Glossary Entries Referenced Using 'glossref' are not Displayed

**Problem**

I have a `<glossgroup>` that contains multiple `<glossentry>` elements and all the entries are referenced using `<glossref>` elements inside my map. When I add an `<abbreviated-form>` element linked to one of my `<glossentry>` elements (using a `@keyref`), the entry is not resolved in the PDF output.
Solution

Make sure every `<glossentry>` has an `@id`. Then, for each `<glossentry>`, declare a `<glossref>` element like this:

```xml
<glossref href="concepts/glossary.dita#flowers.genus" print="yes" keys="genus"/>
```

**Important:**
For bookmaps, the `<glossref>` elements should be declared in a separate ditamap.

How to Fix Disappearing Thin Lines or Cell Borders

Problem

There are cases where thin lines disappear from the PDF viewer at certain zoom levels.

Cause

This is caused by the limited resolution of the display, while a printer has a superior resolution and there should be no problem printing thin lines on paper.

Solution

If the primary PDF target is the display, then you have to use thicker lines in your CSS customization (for example, avoid using 1px and use 1pt or larger instead).

If you are using Adobe Acrobat Reader, then you can enhance the display of thin lines. This behavior can be changed by going to **Edit > Preferences > Page Display > Enhance Thin Lines**. Deselecting this option makes thin lines displayed as a row of gray pixels (through antialiasing) and they do not disappear. You can experiment by selecting and deselecting the option.

XSL FO-based DITA to PDF Customization

Oxygen XML Author Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting [DITA maps](on page 2079) to PDF output. Oxygen XML Author Eclipse plugin includes a built-in [DITA Map PDF - based on XSL-FO](on page 804) transformation scenario that converts DITA maps to PDF using an `xsl:fo` processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the `customization.dir` parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the [DITA Open Toolkit Documentation](on page 2079).

**Tip:**
Some sample plugins are available on GitHub that could help you to get started with creating a plugin:
Using a Customization Directory

One way to customize the PDF output generated by the DITA Map PDF - based on XSL-FO transformation scenario (on page 804) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the customization.dir parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire DITA-OT-DIR\plugins\org.dita.pdf2\Customization directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (on page 1334) for a specific example of how you can modify contents of the directory to embed a logo in the output.
3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 804), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Tip:
For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.

DITA-OT Documentation - PDF Customization Plugin

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book.

1. Create a customization directory (on page 1334) (if you have not already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, C:\Customization\common\artwork\logo.png).

Important:
Make sure that your logo image is named: logo.png.
3. Rename `Customization\catalog.xml.orig` to `Customization\catalog.xml`.

4. Open the `catalog.xml` in Oxygen XML Author Eclipse plugin and `uncomment` this line:

```xml
<!--uri name="cfg:fo/xsl/custom.xsl" url="fo/xsl/custom.xsl"/-->```

It now looks like this:

```xml
<uri name="cfg:fo/xsl/custom.xsl" url="fo/xsl/custom.xsl"/>
```

5. Rename the file `Customization\fo\xsl\custom.xsl.orig` to `C:\Customization\fo\xsl\custom.xsl`.

6. Open the `custom.xsl` file in Oxygen XML Author Eclipse plugin and create the template called `createFrontCoverContents` for DITA-OT 3.7.0.

**Tip:**
You can copy the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

**Example:**

For example, the `custom.xsl` could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

    <xsl:template name="createFrontCoverContents">
        <!-- set the title -->
        <fo:block xsl:use-attribute-sets="__frontmatter__title">
            <xsl:choose>
                <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
                    <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
                </xsl:when>
                <xsl:when test="$map/*[contains(@class,' bookmap/mainbooktitle ')][1]">
                    <xsl:apply-templates select="$map/*[contains(@class,' bookmap/mainbooktitle ')][1]"/>
                </xsl:when>
                <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
                    <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
                </xsl:when>
                <xsl:otherwise>
                    ...
                </xsl:otherwise>
            </xsl:choose>
        </fo:block>
    </xsl:template>
</xsl:stylesheet>
```
7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 804*), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

**Tip:** For other specific examples, see **DITA-OT 3.x Documentation - Customizing PDF Output**.

**Related Information:**
*Using a Customization Directory (on page 1334)*

---

**Customizing the Header and Footer in PDF Output**

The XSLT stylesheet **DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl** contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called **insertBodyOddFooter** or **insertBodyEvenFooter**.
These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common-vars/en.xml`. These resource files contain variables (such as `Body odd footer`) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. **Create a customization directory** *(on page 1334)* (if you have not already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

   **Tip:**
   For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.

3. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario *(on page 804)*, go to the **Parameters** tab, and set the *customization.dir* parameter to point to the location of your customization directory.

   **Related Information:**

   [Using a Customization Directory](on page 1334)

**Adding a Watermark to PDF Output**

To add a watermark to the PDF output of a **DITA Map PDF - based on XSL-FO** transformation scenario *(on page 804)*, follow this procedure:

1. **Create a customization directory** *(on page 1334)* (if you have not already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your watermark image to that directory (for example, `C:\Customization\cfg\common\artwork\watermark.png`).
3. Rename the `Customization\catalog.xml.orig` file to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Author Eclipse plugin and *uncomment* this line:

   ```xml
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"--> 
   ```

   The uncommented line should look like this:

   ```xml
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file: `Customization\fo\xsl\custom.xsl.orig` to: `Customization\fo\xsl\custom.xsl`.
6. Open the `Customization\fo\xsl\custom.xsl` file in Oxygen XML Author Eclipse plugin to overwrite two XSLT templates:

- The first template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

  ```xml
  <fo:static-content flow-name="odd-body-header">
    <fo:block-container absolute-position="absolute"
      top="-2cm" left="-3cm" width="21cm" height="29.7cm"
      background-image=""{concat($artworkPrefix,
     'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
      <fo:block/>
    </fo:block-container>
    <fo:block xsl:use-attribute-sets="__body_odd__header">
      <xsl:call-template name="insertVariable">
        <xsl:with-param name="theVariableID" select="'Body odd header'"/>
        <xsl:with-param name="theParameters">
          <prodname>
            <xsl:value-of select="$productName"/>
          </prodname>
          <heading>
            <fo:inline xsl:use-attribute-sets="__body_odd__header__heading">
              <fo:retrieve-marker retrieve-class-name="current-header"/>
            </fo:inline>
          </heading>
          <pagenum>
            <fo:inline xsl:use-attribute-sets="__body_odd__header__pagenum">
              <fo:page-number/>
            </fo:inline>
          </pagenum>
        </xsl:with-param>
        <xsl:call-template>
          <fo:block>
        </xsl:call-template>
      </xsl:with-param>
    </fo:block>
  </fo:static-content>
  
  - The second template to override is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xsl` and adding the `block-container` element that references the watermark image file:
<xsl:template name="createFrontMatter_1.0">
  <fo:page-sequence master-reference="front-matter"
xsl:use-attribute-sets="__force__page__count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
      <fo:block-container absolute-position="absolute"
top="-2cm" left="-3cm" width="21cm" height="29.7cm"
background-image="{concat($artworkPrefix, 'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
        <fo:block/>
      </fo:block-container>
      <fo:block xsl:use-attribute-sets="__frontmatter">
        <!-- set the title -->
        <fo:block xsl:use-attribute-sets="__frontmatter__title">
          <xsl:choose>
            <xsl:when test="$map/*[contains(@class,' topic/title ')]/[1]">
              <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')]/[1]"/>
            </xsl:when>
            <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')]/[1]">
              <xsl:apply-templates select="$map//*[contains(@class,' bookmap/mainbooktitle ')]/[1]"/>
            </xsl:when>
            <xsl:when test="//@*[contains(@class,' map/map ')]/@title">
              <xsl:value-of select="//@*[contains(@class,' map/map ')]/@title"/>
            </xsl:when>
            <xsl:otherwise>
              <xsl:value-of select="/descendant::*[contains(@class,' topic/topic ')]/[1]/*[contains(@class,' topic/title ')]"/>
            </xsl:otherwise>
          </xsl:choose>
        </fo:block>
        <!-- set the subtitle -->
        <xsl:apply-templates select="$map//*[contains(@class,' bookmap/booktitlealt ')]"/>
        <fo:block xsl:use-attribute-sets="__frontmatter__owner">
          <xsl:apply-templates select="$map//*[contains(@class,' bookmap/bookmeta ')]"/>
        </fo:block>
      </fo:block>
    </fo:flow>
  </fo:page-sequence>
</xsl:template>
7. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 804), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:
Adding a Watermark in DITA Map to XHTML Output (on page 1985)

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed Edit links in the DITA Map PDF output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an Edit link in the DITA Map PDF output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario (on page 804) and open the Parameters tab.
2. Set values for the following parameters:
   - editlink.ditamap.edit.url - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
   - editlink.additional.query.parameters - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. &tags-mode=no-tags).
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two block elements (on page 2077), such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```
and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (on page 2082) that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

   ```
   <p>First para</p>
   <?pagebreak?>
   <p>Second para</p>
   ```

2. Locate the DITA Open Toolkit distribution and in the plugins directory create a new plugin folder (for example, DITA-OT-DIR/plugins/pdf-page-break).

3. In this new folder, create a new plugin.xml file with the following content:

   ```xml
   <plugin id="com.yourpackage.pagebreak">
       <feature extension="package.support.name" value="Force Page Break Plugin"/>
       <feature extension="package.support.email" value="support@youremail.com"/>
       <feature extension="package.version" value="1.0.0"/>
       <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
   </plugin>
   ```

   The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

   ```xml
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:fo="http://www.w3.org/1999/XSL/Format"
                   version="1.0">
     <xsl:template match="processing-instruction('pagebreak')">
       <fo:block break-after="page"/>
     </xsl:template>
   </xsl:stylesheet>
   ```

5. Install your plugin in the DITA Open Toolkit. (on page 2026)

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the PDF output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario.
2. In the Parameters tab, set the value of the show.changes.and.comments parameter to yes. If you also want to display change bars for inserted or deleted content in the PDF, set the show.changebars parameter to yes. If you want to only show the changebars, without
other styling of the changes, you should set both the `show.changes.and.comments` and `show.changes.and.comments.as.changebars.only` parameters to `yes`.

3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - `ct.insert.color` - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
   - `ct.delete.color` - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
   - `ct.comment.bg.color` - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

### Set a Font for PDF Output Generated with FO Processor

When a **DITA map (on page 2079)** is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version (on page 878).

### DITA-OT PDF Font Mapping

The DITA-OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```xml
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be `monospace`, but `monospace` is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this `monospace` alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```xml
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the `monospace` has a `logical-font` definition and if so, it will use the `physical-font` specified there:
Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to Helvetica.

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Author Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Author Eclipse plugin, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR (on page 2080) from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the fop-hyph.jar library.

Adding Support for PDF Images

1. Download the fop-pdf-images JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the JCGM page and download the jcgm-image-0.1.1.jar and jcgm-core-0.2.0.jar libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug a DITA PDF transformation scenario, follow these steps:
1. Open the Preferences dialog box (on page 61), go to XML > XML Catalog, click Add, and select the file located at DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml.

2. Open the map in the DITA Maps Manager (on page 1762) and create a DITA Map PDF - based on XSL-FO transformation scenario.

3. Edit the scenario, go to the Parameters tab and change the value of the clean.temp parameter to no.

4. Run the transformation scenario.

5. Open the stage1.xml file located in the temporary directory and format and indent (on page 311) it.

6. Create a transformation scenario for this XML file by associating the topic2fo_shell_fop.xsl stylesheet located at DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets topic2fo_shell_xep.xsl or topic2fo_shell_axf.xsl located in the same folder.

7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).

8. Click the Parameters button and set the locale parameter with the value en_GB and the customizationDir.url parameter to point either to your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this: file://c:/path/to/DITA-OT-DIR/plugins/org.dita.pdf2/cfg.

9. If your XSLT stylesheet uses Java extensions, you need to reference the extra JAR libraries by clicking the Extensions button and add the libraries in the resulting dialog box. For example, if you have enabled the show.changes.and.comments parameter, you need to add the following JAR library for the parameter to have an effect: DITA-OT\plugins\com.oxygenxml.common\lib\oxygen-dita-publishing-xslt-extensions.jar.

10. Apply the transformation to continue the debugging process.

Related Information:
How to Enable Debugging for FO Processor Transformations (on page 880)

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   You could start from a copy of the file [DocBook XSL directory]/fo/titlepage.templates.xml (for example, [OXYGEN-INSTALL-DIR]/frameworks/
docbook/xsl/fo/titlepage.templates.xml) and customize it. More information about the spec file can be found here.

2. Generate a new XSLT stylesheets from the title spec file from the previous step.
   Apply [DocBook XSL directory]/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheets (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer.
   The customization layer is the stylesheets that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:
   ```xml
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.
   The path to the logo image must be inserted in the book/info/mediaobject structure of the XML document.

5. Apply the customization layer to the XML document.
   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Author Eclipse plugin and set the customization layer in the XSL URL property of the scenario (on page 817).

Related Information:

Video demonstration for creating a DocBook customization layer in Oxygen XML Author Eclipse plugin.
12. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note:
If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- `child::*` - Selects all children of the root node.
- `//name` - Selects all `<name>` elements and descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the `<cd>` elements that have a `<price>` element with a value larger than 10.80.
- `//prolog` - Finds all `<prolog>` elements.
- `//prolog[@platform='mac']` - Finds all `<prolog>` elements that have the `@platform` attribute value set to `mac`.
- `//child::prolog` - Selects all `<prolog>` elements and the child content.
- `/*[count(/accountNumber) > 5]` - Searches for instances where more than 5 `<accountNumber>` elements are found.
- `collection('file:/C:/path/to/folder/?select=*.xml')/*[not(/prolog)]` - Finds a list of all XML files that do not contain any `<prolog>` elements.

To find out more about XPath, see [http://www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

XPath Builder View

The XPath/XQuery Builder view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the XPath/XQuery Builder view and the current file is an XSLT document, Oxygen XML Author Eclipse plugin executes the expressions over the XML document in the associated scenario.
Note:
If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view contains the following actions:

**XPath version chooser drop-down menu**
A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note:
The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note:
Oxygen XML Author Eclipse plugin uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Author Eclipse plugin returns a compilation error.

**Execute XPath button**
Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the Results view (on page 308).

**Favorites button**
Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Author Eclipse plugin automatically groups favorites in folders named after the method of execution.

**History drop-down menu**
Keeps a list of the last 15 executed XPath expressions. Use the Clear history action from the bottom of the list to remove them.

**Settings drop-down menu**
Contains the following three options:

**Update on cursor move**

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

**Evaluate as you type**

When you select this option, the XPath expression you are composing is evaluated in real time.

**Note:**

This option and the automatic validation are disabled when the scope is other than **Current file**.

**Options**

Opens the Preferences page of the currently selected processing engine.

### XPath scope menu

Oxygen XML Author Eclipse plugin allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- **Current file** - Currently selected file only.
- **Enclosing project** - All the files of the project that encloses the currently edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (Project Explorer (on page 244) or Package Explorer).
- **All opened files** - All files that are opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map that is open in the DITA Maps Manager view (on page 1762).
- **Opened archive** - Files that are opened in the Archive Browser view (on page 1353).
- **Working sets** - The selected working sets (on page 2085).

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2085).
- **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.
When you hover your cursor over the version icon, a tooltip is displayed to let you know what engine Oxygen XML Author Eclipse plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Author Eclipse plugin assists you with the following features:

- **Content Completion Assistant (on page 2078)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (on page 61) and go to Editor > Syntax Highlight (on page 161).

- Automatic validation of the expression as you type.

**Note:**

When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.
XPath Expression Results View

When you run an XPath expression, Oxygen XML Author Eclipse plugin displays the results of its execution in the **XPath Results** view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Author Eclipse plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Author Eclipse plugin displays **Not available** in the **Location** column. Oxygen XML Author Eclipse plugin displays the results in a valid XPath expression format.

- `/*node[value]/node[value]/node[value]` -

**XPath Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

**Select All**

Extends the selection to all the messages from the view.

**Copy**

Copies information associated with the selected messages in case you want to paste it elsewhere.

**Save Results**

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy action** (on page 1350).

**Save Results as XML**

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy action** (on page 1350).

**Save Results as HTML**

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy action** (on page 1350).
Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press Enter. This action returns all the `chapter` nodes of the DocBook book in the Results View. Click a record in the Results View to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Author Eclipse plugin adds a result in the Results View for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```xml
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Figure 250. XPath Results Highlighted in Editor Panel with Character Precision

```
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
    </name>
    <given>Big</given>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker two.worker three five.worker"/>
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
    </name>
```

XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through XML Catalogs (on page 2085). These catalogs are configured in the XML Catalog preferences (on page 173) pages and the XML Parser preferences (on page 175).

Example:
As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an XML catalog, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```xml
let $docs := collection(iri-to-uri{
   "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
parser=ro.sync.xml.parser.CatalogEnabledXMLReader"})
```

**XPath Prefix Mapping**

To define default mappings between prefixes and namespace URIs go to the XPath preferences page (on page 184) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

⚠️ **Important:**

If you define a default namespace, Oxygen XML Author Eclipse plugin binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `<level>` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.
13. Working with Archives

Oxygen XML Author Eclipse plugin includes a useful Archive Browser view (on page 1353) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (on page 2080)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (on page 2080)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Author Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCI8

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the Project Explorer view (on page 244). This opens the archive in the main editing pane. The archive is unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the Project Explorer view and choosing Expand Zip Archive. This expands the archive. All the standard actions are available on the mounted archive. To close the archive, you can use the Collapse ZIP Archive action and any file opened from the expanded archive is closed when the archive in unmounted.

Tip:
If a file is not recognized by Oxygen XML Author Eclipse plugin as a supported archive type, you can add it in the Archive preferences page (on page 62).
Archive Contextual Menu Actions

The following additional actions are available from the contextual menu for archives:

- **Open**
  Opens a resource from the archive in the editor.

- **Extract**
  Extracts a resource from the archive in a specified folder.

- **New folder**
  Creates a folder as child of the selected folder in the browsed archive.

- **New file**
  Creates a file as child of the selected folder in the browsed archive.

- **Add files**
  Adds existing files as children of the selected folder in the browsed archive.

  **Note:**
  On macOS, the **Add file** action is also available and it allows you to add one file at a time.

- **Rename**
  Renames a resource in the archive.

- **Cut**
  Cuts the selected archive resource.

- **Copy**
Copying the selected archive resource.

Paste

Pastes a file or folder into the archive.

Delete

Removes a file or folder from archive.

Copy location

Copies the URL location of the selected resource.

Refresh

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

https://www.youtube.com/embed/OIGTNQwOCl8

Working with Archive Files

Oxygen XML Author Eclipse plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the Project Explorer view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.
When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes (on page 1357) back to the archive. You can also use the Open in System Application action to open the archive in the default system application that is associated with that type of file.

**EPUB-Specific Validation**

When working with EPUB archives, Eclipse includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Author Eclipse plugin uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

For more information about working with an EPUB archive in Oxygen XML Author Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8
Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New > New from Templates.
2. Choose your particular type of archive template. For example, select one of the ODF, OOXML, or EPUB templates.
3. Click Next and choose the name and location of the file.
4. Click Finish.
   A skeleton archive is saved on disk and open in Eclipse.

Tip:
Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Archive preferences page (on page 62).

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.
2. Open the document.xml file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. DOCX DITA to migrate to DITA.
   b. DOCX TEI P5 to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

**Tip:**
Oxygen XML Author Eclipse plugin also includes a built-in transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
Databases and SharePoint

Oxygen XML Author Eclipse plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Author Eclipse plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Author Eclipse plugin offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Author Eclipse plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Author Eclipse plugin include:

- IBM DB2 (on page 1365)
- Microsoft SQL Server (on page 1369)
- Oracle Database (on page 1373)
- PostgreSQL (on page 1378)
- eXist (on page 1389)
- MarkLogic (on page 1394)
- MySQL (on page 1399)
- Generic JDBC (on page 1401)
- JDBC-ODBC (on page 1402)
- BaseX (on page 1404)
- WebDAV (on page 1408)
- Microsoft SharePoint (on page 1413)
- Berkeley DB XML (Deprecated) (on page 1383)

Related information
Integration with Microsoft SharePoint (on page 1413)

Data Source Explorer View

The Data Source Explorer view displays your database connections. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Author Eclipse plugin supports multiple simultaneous database connections and the connection tree in the Data Source Explorer view provides an easy method for browsing them.

Figure 253. Data Source Explorer View

The objects (nodes) that are displayed in the Data Source Explorer view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the Project Explorer view (on page 244), a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

 Filters

Opens the Data Sources / Table Filters preferences page (on page 70), allowing you to decide which table types are displayed in the Data Source Explorer view.

 Configure Database Sources

Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.
Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the Data Source Explorer view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:
Data Sources Preferences (on page 65)

Table Explorer View

Relational databases tables in the Data Source Explorer view (on page 1359) can be displayed and edited in the Table Explorer view by selecting the Edit action from the contextual menu of a Table node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Author Eclipse plugin attempts to update the database with the new cell content.

Figure 254. Table Explorer View

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: ⚖.
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the Table Explorer view (using the Limit the number of cells option in the Data Sources Preferences page (on page 69)). If a
table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains `long` (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).

- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key `propID` column to 8, results in a duplicate entry error since that value has already been used in the first record:

![Figure 255. Duplicate Entry for Primary Key](image)

**Table Explorer Contextual Menu Actions**

Common editing actions (xf Cut,  Copy,  Paste, Select All, ⇐ Undo, ⇨ Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

- **Set NULL**
  
  Sets the content of the cell to `null`. This action is not available for columns that cannot have a value of `null`.

- **Insert row**
  
  Inserts an empty row in the table.

- **Duplicate row**
Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  Commits the selected row.

- **Delete row**
  Deletes the selected row.

- **Copy**
  Copies the content of the cell.

- **Paste**
  Pastes copied content into the selected cell.

**Table Explorer Toolbar Actions**

The toolbar of the **Table Explorer** view also includes the following actions:

- **Export to XML**
  Opens the **Export Criteria** dialog box.

- **Refresh**
  Performs a refresh for the sub-tree of the selected node.

- **Insert row**
  Inserts an empty row in the table.

- **Duplicate row**
  Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  Commits the selected row.

- **Delete row**
  Deletes the selected row.

**Related Information:**

- **Data Source Explorer View** ([on page 1359](#))

**Database Connection Support**

Oxygen XML Author Eclipse plugin offers support for a variety of **Relational** and **Native XML** database connections. The database drivers and connections for various types of database are configured in the **Data Sources preferences page** ([on page 65](#)) and once configured, the database connections can be viewed and
managed in the Data Source Explorer view (on page 1359). Oxygen XML Author Eclipse plugin also includes a Database perspective (on page 216) that helps you to manage databases.

The database support in Oxygen XML Author Eclipse plugin offers a variety of capabilities, including:

- Browsing the structure of databases in the Data Source Explorer view (on page 1359).
- Viewing relational tables in the Table Explorer view (on page 1361).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Author Eclipse plugin offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Author Eclipse plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, MariaDB).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Author Eclipse plugin offers support for the most commonly used native XML databases, including:

- eXist
- MarkLogic
- Oracle XML DB
- Base X
- Berkeley DB XML (Deprecated)

WebDAV Connections (on page 1408)
Integration with Microsoft SharePoint (on page 1413)
IBM DB2 Database Connections

Oxygen XML Author Eclipse plugin includes support for IBM DB2 database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of an IBM DB2 database in the Data Source Explorer view (on page 1359), open tables in the Table Explorer view (on page 1361), and perform various operations on the resources in the repository.

Figure 256. IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Author Eclipse plugin for configuring a DB2 data source (on page 1366).
2. Configure IBM DB2 Data Source drivers (on page 1366).
3. Configure an IBM DB2 Server Connection (on page 1367).
4. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).
How to Configure IBM DB2 Data Source Drivers

Note: Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the Preferences dialog box (on page 61) and go to Data Sources.
4. Click the New button in the Data Sources panel.

The dialog box for configuring a data source is opened.

5. Enter a unique name for the data source.
6. Select DB2 in the driver Type drop-down menu.
7. Click the Add Files button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.
The IBM DB2 driver files are:

- `db2jcc.jar`
- `db2jcc_license_cisuz.jar`
- `db2jcc_license_cu.jar`

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to **configure your IBM DB2 connection (on page 1367)**.

**How to Configure an IBM DB2 Connection**

**Note:**
The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. **Open the Preferences dialog box (on page 61)** and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

3. **Enter a unique name for the connection.**
4. Select an IBM DB2 data source in the Data Source drop-down menu.

5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1359), depending on the node where it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1361).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1359), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**
  
  - **Register**
    Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.
Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Author Eclipse plugin.

**Microsoft SQL Server Database Connections**

Oxygen XML Author Eclipse plugin includes support for Microsoft SQL Server database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1359), open tables in the Table Explorer view (on page 1361), and perform various operations on the resources in the repository.

**Configuring a Microsoft SQL Server Connection**

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (on page 1369).
3. Configure a MS SQL Server Connection (on page 1370).
4. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

**How to Configure Microsoft SQL Server Data Source Drivers**

**Note:**

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (on page 61) and go to Data Sources.
3. Click the New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select SQLServer in the driver Type drop-down menu.
6. Click the Add Files button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called sqljdbc.jar.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your Microsoft SQL Server connection (on page 1370).

How to Configure a Microsoft SQL Server Connection

**Note:**
The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
   The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.

4. Select the SQL Server data source in the Data Source drop-down menu.

5. Enter the connection details.
   
   a. Enter the URL of the SQL Server server.
      
      If you want to connect to the server using Windows integrated authentication, you must add ;integratedSecurity=true to the end of the URL. The URL will look like this:

      \[jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;\]

      **Note:**
      
      For integrated authentication, leave the User and Password fields empty.

   b. Enter the user name for the connection to the SQL Server.

   c. Enter the password for the connection to the SQL Server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).
Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1359), depending on the node where it is invoked:

- **Refresh**
  - Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  - Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  - Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  - Opens the selected table in the Table Explorer view (on page 1361).

- **Export to XML (available on Table nodes)**
  - Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1359), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

- **XML Schema Repository Level Nodes**
  - **Register**
    - Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

- **Schema Level Nodes**
  - **Add**
    - Adds a new schema to the XML Schema files.
  - **Unregister**
    - Removes the selected schema from the XML Schema Repository.
  - **View**
    - Opens the selected schema in Oxygen XML Author Eclipse plugin.
Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Author Eclipse plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Author Eclipse plugin allows you to browse Oracle repositories in the Data Source Explorer view (on page 1359), open tables in the Table Explorer view (on page 1361), and perform various operations on the resources in the repository.

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (on page 1373).
3. Configure an Oracle 11g Connection (on page 1374).
4. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

How to Configure Oracle 11g Data Source Drivers

Note: Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the Preferences dialog box (on page 61) and go to Data Sources.

3. Click the **New** button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   ![Data Source Drivers Configuration Dialog Box](image)

4. Enter a unique name for the data source.

5. Select Oracle in the driver Type drop-down menu.

6. Click the Add Files button and select the Oracle driver file that you downloaded.

   The Oracle driver file is called `ojdbc5.jar`.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your Oracle connection (on page 1374).

---

### How to Configure an Oracle 11g Connection

**Note:**

Available in the Enterprise edition only.
To configure a connection to an Oracle 11g server, follow these steps:

1. **Open the Preferences dialog box (on page 61)** and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

**Figure 263. Connection Configuration Dialog Box**

![Connection Configuration Dialog Box](image)

3. Enter a unique name for the connection.
4. Select the **Oracle 11g** data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view (on page 1359)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2082)**.
Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1359), depending on the node where it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1361).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1359), the various nodes in Oracle database connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**
  - **Register**
    Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. **Local** scope means that the schema is visible only to the user who registers it. **Global** scope means that the schema is public.

Note:

Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLElement tables that conform to the registered schemas. For XMLElement columns, the ALTER TABLE privilege is needed on corresponding tables. If there are...
schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

**XML Repository Level Nodes**

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

**Container Level Nodes**

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

**Resource Level Nodes**

Open

Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Rename**
Renames the current resource

**Move**
Moves the current resource to a new container (also available through drag and drop).

**Delete**
Deletes the current container.

**Copy location**
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Properties**
Shows various properties of the current container.

**Compare**
Compares two selected resources.

**PostgreSQL Database Connections**
Oxygen XML Author Eclipse plugin includes support for PostgreSQL database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (on page 1359), open tables in the Table Explorer view (on page 1361), and perform various operations on the resources in the repository.
How to Configure PostgreSQL Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to [http://jdbc.postgresql.org/download.html](http://jdbc.postgresql.org/download.html) and download the PostgreSQL JDBC3 driver specific for your server version.
2. Open the Preferences dialog box (on page 61) and go to Data Sources. 
3. Click the **New** button in the Data Sources panel.

   The dialog box for configuring a data source is opened.
Figure 265. Data Source Drivers Configuration Dialog Box
4. Enter a unique name for the data source.
5. Select PostgreSQL in the driver Type drop-down list.
6. Click the Add Files button and select the PostgreSQL driver file that you downloaded.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue to configure your PostgreSQL connection (on page 1381).

**How to Configure a PostgreSQL Connection**

To configure a connection to a PostgreSQL server, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the New button in the Connections panel.

The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the PostgreSQL data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the PostgreSQL server.
   b. Enter the user name for the connection to the PostgreSQL server.
   c. Enter the password for the connection to the PostgreSQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1359), depending on the node where it is invoked:

- Refresh
  Performs a refresh on the selected node.
- Disconnect (available on Connection nodes)
Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the Table Explorer view (on page 1361).

Export to XML (available on Table nodes)

Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1359), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

Resource Level Nodes

Compare

Compares two selected resources.

Berkeley DB XML Database Connections (Deprecated)

Oxygen XML Author Eclipse plugin includes support for Berkeley DB XML database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a Berkeley DB XML database in the Data Source Explorer view (on page 1359) and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: https://www.oracle.com/database/technologies/related/berkeleydb.html.
Configuring a Berkeley DB XML Database Connection (Deprecated)

Follow this procedure to configure the support for a Berkeley DB XML database:

1. Configure Berkeley DB XML Data Source drivers (on page 1384).
2. Configure a Berkeley DB XML Connection (on page 1385).
3. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

How to Configure Berkeley DB XML Data Source Drivers (Deprecated)

Prerequisite:
For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Author Eclipse plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Berkeley DB XML from the driver Type drop-down menu.
5. Click the Add Files button to add the Berkeley DB driver files.

The driver files for the Berkeley DB database (and their locations) are as follows:

- db.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
- dbxml.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
Where [DBXML_DIR] is the Berkeley DB XML database root directory. For example, in Windows it is: C:\Program Files\Oracle\Berkeley DB XML <version>.

6. Click the OK button to finish the data source configuration.
7. Continue on to configure your Berkeley DB XML connection (on page 1385).

How to Configure a Berkeley DB XML Connection (Deprecated)

Oxygen XML Author Eclipse plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured Berkeley data source from the Data Source drop-down menu.
5. Enter the connection details.
   a. Set the path to the Berkeley DB XML database directory in the Environment home directory field. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
   b. Select the Verosity level: DEBUG, INFO, WARNING, or ERROR.
   c. Optionally, you can select the Join existing environment checkbox. If selected, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

Berkeley DB XML Contextual Menu Actions (Deprecated)

While browsing Berkeley DB XML connections in the Data Source Explorer view (on page 1359), the various nodes include the following contextual menu actions:

- **Configure Database Sources**
  Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Disconnect (when connected)**
  Stops the connection.
New Collection

Opens a **Container configuration** dialog box that allows you to add a new container in the repository.

**Figure 269. Container Configuration Dialog Box**

This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  - **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If selected, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If selected, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

Refresh
Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Container Level Nodes**

**Import Files**

Allows you to add a new file on the connection, in the current folder.

**Export**

Allows you to export the folder on the remote connection to a local folder.

**Cut**

Removes the current selection and places it in the clipboard.

**Paste**

Pastes the copied selection.

**Rename**

Renames the current resource.

**Delete**

Deletes the current container.

**Edit indices**

Opens a Container Indices dialog box that allows you to configure indices properties for the selected Berkeley container.

**Figure 270. Container Indices Dialog Box**

![Container Indices Dialog Box](image-url)
This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database.
  You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  - **Path type** - Drop-down menu that allows you to select from the following:
    - **node** - Indicates that you want to index a single node in the path.
    - **edge** - Indicates that you want to index the portion of the path where two nodes meet.
  - **Node type** - Drop-down menu that allows you to select from the following:
    - **element** - An element node in the document content.
    - **attribute** - An attribute node in the document content.
    - **metadata** - A node found only in the metadata content of a document.
  - **Key type** - Drop-down menu that allows you to select from the following:
    - **equality** - Improves the performances of tests that look for nodes with a specific value.
    - **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
    - **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
  - **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is `string`.

**Refresh**
Performs a refresh on the selected node.

**Properties**
Shows various properties of the current container.

**Resource Level Nodes**
Open
Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

---

**eXist Database Connections**

⚠️ **Attention:**

Oxygen XML Author Eclipse plugin has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

Oxygen XML Author Eclipse plugin includes support for eXist database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a eXist database in the Data Source Explorer view (on page 1359) and perform various operations on the resources in the repository.
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (on page 61), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

**Important:**

To create an eXist connection using this wizard, Oxygen XML Author Eclipse plugin expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.

3. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).
Attention:
Oxygen XML Author Eclipse plugin has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

How to Configure an eXist Connection Manually

Attention:
For this manual procedure, you need to already have an eXist database server installed. Also, Oxygen XML Author Eclipse plugin has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

Tip:
There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (on page 1390).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Author Eclipse plugin supports eXist database server versions up to and including version 5.0. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Author Eclipse plugin.
   - The exist.jar file located in the base directory.
   - All JAR files in the lib/core/ directory.
6. Click the OK button to finish the data source configuration.

Step 2: Configure an eXist Connection

To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the **Data Source** drop-down menu.

5. Enter the connection details:
   a. Set the URI to the installed eXist engine in the **XML DB URI** field.
   b. Set the user name in the **User** field.
   c. Set the password in the **Password** field.
   d. Enter the start collection in the **Collection** field.

   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** (on page 1359) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2082).

For more information about running XQuery against an eXist XML database, watch our video demonstration:

https://www.youtube.com/embed/Yoc5h1zSddA

**eXist Contextual Menu Actions**

While browsing eXist database connections in the **Data Source Explorer view** (on page 1359), the various nodes include the following contextual menu actions:

**Connection Level Nodes**

- **Configure Database Sources**
  
  Opens the **Data Sources preferences page** (on page 65) where you can configure both data sources and connections.

  **Disconnect (when connected)**

  Stops the connection.

- **Refresh**

  Performs a refresh on the selected node.

**Container Level Nodes**

- **New File**

  Creates a new file on the connection, in the current folder.

- **New Collection**

  Creates a new collection on the connection.

- **Import Folders**

  Imports folders on the server.
Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename
Renames the current resource

*Delete*

Deletes the current container.

*Refresh*

Performs a refresh on the selected node.

*Properties*

Shows various properties of the current container.

*Compare*

Compared two selected resources.

---

**MarkLogic Database Connections**

Oxygen XML Author Eclipse plugin Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection (on page 1395), you can use the Data Source Explorer view (on page 1359) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the Data Source Explorer view (on page 1359) allows you to open and edit these modules.

---

**Note:**

To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the directory creation property of the database is set to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```xml
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

---

**MarkLogic and XQuery**

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

**Modules Container**

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this Modules container.
Note:
You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a Requests container. In this container, Oxygen XML Author Eclipse plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire Requests container at the end of your session, right-click it and use the Cancel all requests action (on page 1398).

Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Author Eclipse plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic Data Source drivers (on page 1396).
3. Configure a MarkLogic Connection (on page 1396).
4. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).
How to Configure MarkLogic Data Source Drivers

Notes:

• Available in the Enterprise edition only.
• Oxygen XML Author Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the Preferences dialog box (on page 61) and go to Data Sources.
4. Click the + New button in the Data Sources panel.
5. Enter a unique name for the data source.
6. Select MarkLogic from the driver Type drop-down list.
7. Click the Add Files button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is marklogic-xcc-{server_version}.jar, where {server_version} is the MarkLogic server version.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection (on page 1396).

How to Configure a MarkLogic Connection

Notes:

• Available in the Enterprise edition only.
• Oxygen XML Author Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the Data Source drop-down menu.
5. Enter the connection details.
   a. The host name or IP address of the installed MarkLogic engine in the XDBC Host field.
      Oxygen XML Author Eclipse plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the
default authentication method when you create an HTTP or WebDAV Server is digest, so make sure to change it to basic.

b. Set the port number of the MarkLogic engine in the Port field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the Use it to execute queries action (on page 1397) from Data Source Explorer.

c. Set the user name to access the MarkLogic engine in the User field.

d. Set the password to access the MarkLogic engine in the Password field.

e. Optionally, in the WebDAV URL field, set the URL used for browsing the MarkLogic database in the Data Source Explorer view (on page 1359). The Database field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

### MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the Data Source Explorer view (on page 1359), the various nodes include the following contextual menu actions:

#### Connection Level Nodes

- **Configure Database Sources**
  - Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Disconnect (when connected)**
  - Stops the connection.

- **Refresh**
  - Performs a refresh on the selected node.

#### Container Level Nodes

- **Enable Debug Mode**
  - Switches the server to a debugging mode.

- **Use it to Execute Queries**
The server will be used to process XQuery expressions against it.

- **Refresh**
  - Performs a refresh on the selected node.

### Module or Folder Level Nodes

- **Export**
  - Allows you to export the folder on the remote connection to a local folder.

- **Refresh**
  - Performs a refresh on the selected node.

### Requests Level Nodes

- **Refresh**
  - Performs a refresh on the selected node.

- **Cancel all requests**
  - Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire Requests container at the end of your sessions.

### Resource Level Nodes

- **Open**
  - Opens the selected resource in the editor.

- **Open in System Application**
  - When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

- **Copy location**
  - Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

- **Refresh**
  - Performs a refresh on the selected node.

- **Compare**
  - Compares two selected resources.

Configuring a MarkLogic Database Connection (on page 1395)

MySQL Database Connections

Oxygen XML Author Eclipse plugin includes support for MySQL database connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1359), open tables in the Table Explorer view (on page 1361), and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL Data Source drivers (on page 1399).
2. Configure a MySQL Connection (on page 1400).
3. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. Open the Preferences dialog box (on page 61) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select Generic JDBC in the driver Type drop-down list.
6. Click the Add Files button and select the MySQL driver file that you downloaded. The driver file for the MySQL server is called mysql-com.jar.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MySQL connection (on page 1400).

**How to Configure a MySQL Connection**

To configure a connection to a MySQL server, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.

The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the MySQL data source in the Data Source drop-down list.
5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

**Generic JDBC Database Connections**

Oxygen XML Author Eclipse plugin includes support for Generic JDBC database connections.

**Configuring a Generic JDBC Database Connection**

To configure the support for a generic JDBC database, follow this procedure:
1. Configure Generic JDBC Data Source drivers (on page 1402).
2. Configure a Generic JDBC Connection (on page 1402).
3. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Author Eclipse plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author Eclipse plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (on page 1402).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: jdbc: <subprotocol>:<subname>.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

JDBC-ODBC Database Connections

Oxygen XML Author Eclipse plugin includes support for JDBC-ODBC database connections.
How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Author Eclipse plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author Eclipse plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the New button in the Connections panel.

The dialog box for configuring a database connection is displayed.

3. Enter a unique name for the connection.
4. Select JDBC-ODBC Bridge in the Data Source drop-down list.
5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.
6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

BaseX Database Connections

Oxygen XML Author Eclipse plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Author Eclipse plugin allows you to browse the structure of a BaseX database in the Data Source Explorer view (on page 1359) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.

2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: http://localhost:8984/webdav/TEST/etc/factbook.xml.

3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Author Eclipse plugin as described in How to Configure a WebDAV Connection (on page 1408). The WebDAV URL should resemble this: http://{hostname}:{port}/webdav/. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: http://localhost:8984/webdav
   - User: admin
   - Password: admin

4. Once the WebDAV connection is created, to view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).

BaseX Contextual Menu Actions

While browsing BaseX connections in the Data Source Explorer view (on page 1359), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.
Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource.

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes
Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

Important:
The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.
**BaseX XQJ Data Source**

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (on page 1407). The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the JAR file may differ). These libraries can be downloaded from `xqj.net/basex/basex-xqj-1.2.3.zip`. As an alternative, you can also find the libraries in the BaseX installation directory, in the `lib` sub-directory.

**BaseX XQJ Connection**

The next step is to create an XQJ connection (on page 1408).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **serverName**: localhost
- **user**: admin
- **password**: admin

**XQuery Execution**

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Author Eclipse plugin and create an XQuery Transformation (on page 886). In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

**How to Configure an XQJ Data Source**

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to `PATH` - on Windows, to `LD_LIBRARY_PATH` - on Linux, or to `DYLD_LIBRARY_PATH` - on macOS. Restart Oxygen XML Author Eclipse plugin after configuring the environment variables.
2. Open the Preferences dialog box (on page 61) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
4. Enter a unique name for the data source.
5. Select XQuery API for Java (XQJ) in the Type combo box.
6. Click the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   Oxygen XML Author Eclipse plugin detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in Driver class field.
7. Select the most suited driver in the Driver class combo box.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure the XQJ connection (on page 1408).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources (on page 1407) in the Data Source combo box.
5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the OK button to finish the connection configuration.

WebDAV Connections

Oxygen XML Author Eclipse plugin includes support for WebDAV server connections. Oxygen XML Author Eclipse plugin allows you to browse the structure of a WebDAV connection in the Data Source Explorer view (on page 1359) and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Author Eclipse plugin contains built-in data source drivers for WebDAV connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the Data Source Explorer view (on page 1359).

To configure a WebDAV connection, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field WebDAV URL.
   b. Set the user name that is used to access the WebDAV repository in the User field.
   c. Set the password that is used to access the WebDAV repository in the Password field.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1359) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2082).
For more information about the WebDAV support in Oxygen XML Author Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/vDXO36CqbwM

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the Data Source Explorer view (on page 1359), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources
Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

Disconnect (when connected)
Stops the connection.

New Folder
Creates a new folder on the connection.

Import Files
Allows you to add a new file on the connection, in the current folder.

Refresh
Performs a refresh on the selected node.

Folder Level Nodes

New File
Creates a new file on the connection, in the current folder.

New Folder
Creates a new folder on the connection.

Import Folders
Imports folders on the server.

Import Files
Allows you to add a new file on the connection, in the current folder.

Export
Allows you to export the folder on the remote connection to a local folder.

Cut
Removes the current selection and places it in the clipboard.
**Copy**

Copies the current selection into the clipboard.

**Paste**

Pastes the copied selection.

**Rename**

 Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

 Renames the current resource

**Delete**

Deletes the current container.

**Refresh**
Perform a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

SQL Execution Support

The database support in Oxygen XML Author Eclipse plugin includes support for writing SQL statements, syntax highlighting, folding (on page 2080), and dragging and dropping from the Data Source Explorer view (on page 1359). It also includes transformation scenarios for executing the statements, and the results are displayed in the Table Explorer view (on page 1361).

Drag and Drop from Data Source Explorer View

Dragging operations from the Data Source Explorer view (on page 1359) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support (on page 1363) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- SELECT `field1`, `field2`, .... FROM `catalog` . `table` (for example: SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera` . `cameraDesc`)
- UPDATE `catalog` . `table` SET `field1` = , `field2` = ,.... (for example: UPDATE `camera` . `cameraDesc` SET `DEPT` = , `DEPTNAME` = , `LOCATION` = )
- INSERT INTO `catalog` . `table` ( `field1`, `field2`, ....) VALUES (, ) (for example: INSERT INTO `camera` . `cameraDesc` (`DEPT`, `DEPTNAME`, `LOCATION`) VALUES (, ))
- DELETE FROM `catalog` . `table` (for example: DELETE FROM `camera` . `cameraDesc`)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:
SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario (on page 785) using the Configure Transformation Scenario(s) action from the toolbar or the XML menu.
   
   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.
   
   The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.
   
   For example, in SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ? the two parameters can be configured for the place holders (?) in the transformation scenario.
   
   When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

   ![Restriction]

   When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the Parameters button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: call dbo.Test(22, ?).

3. Execute the SQL scenario by clicking the OK or Apply associated button.

   The result of a SQL transformation is displayed in a view (on page 308) at the bottom of the Oxygen XML Author Eclipse plugin window.
4. View more complex return values of the SQL transformation in a separate editor panel.
A more complex value returned by the SQL query (for example, an XMLTYPE or CLOB value) cannot be displayed entirely in the result table.

   a. Right-click the cell containing the complex value.
   
   b. Select the action **Copy cell** from the contextual menu.
      The action copies the value in the clipboard.
   
   c. Paste the value into an appropriate editor.
      For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Author Eclipse plugin.

**Integration with Microsoft SharePoint**

**Restriction:**
The SharePoint integration is only available in the Enterprise edition of Oxygen XML Author Eclipse plugin.

Oxygen XML Author Eclipse plugin provides support for browsing and managing SharePoint connections in the **Data Source Explorer view** (on page 1359). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

There are two types of integrations that are possible:

- **SharePoint Online** - A new implementation that uses the SharePoint REST API v.2 and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

**Figure 276. SharePoint Connection in Data Source Explorer View**
How to Configure a SharePoint Connection

By default, Oxygen XML Author Eclipse plugin contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view.

There are two types of possible SharePoint connections:

- **SharePoint Online** - A new implementation that uses the SharePoint REST API v.2 and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

**SharePoint Online Connection**

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (on page 61), go to Data Sources. Select SharePoint Online in the Data Sources pane and in the Connections pane, click the + New button.
2. Enter a unique name for the connection.
3. Make sure SharePoint Online is selected in the Data Source combo box.
4. Enter the Tenant URL for your SharePoint repository and click OK.

**Note:**

If you are still logged in when you close Oxygen XML Author Eclipse plugin, the authentication persists the next time the application is started. If, for some reason, the authentication fails to recover the access token, an error is displayed in the Results pane at the bottom of the application. If this happens, you need to re-authenticate Oxygen XML Author Eclipse plugin.

**SharePoint Connection (Older Version)**

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (on page 61), go to Data Sources. Select SharePoint Online in the Data Sources pane and in the Connections pane, click the + New button.
2. Enter a unique name for the connection.
3. Make sure SharePoint is selected in the Data Source combo box.
4. Fill-in the connection details:
a. Enter the **SharePoint URL** for your SharePoint repository.
b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
c. Set the user name to access the SharePoint repository in the **User** field.
d. Set the password to access the SharePoint repository in the **Password** field.

5. Click **OK**.

**SharePoint Contextual Menu Actions**

While browsing SharePoint connections in the Data Source Explorer view (on page 1359), the following contextual menu actions are available, depending on the type of node:

**Connection Nodes**

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 65) where you can configure both data sources and connections.

- **Log in with Microsoft Account (when not connected)**
  
  Opens the Microsoft login page in your default browser and authenticates Oxygen XML Author Eclipse plugin.

- **Disconnect (when connected)**
  
  Stops the connection.

- **Refresh**
  
  Performs a refresh on the selected node.

**Site Nodes / Sub-site Nodes**

- **Copy location**
  
  Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

- **Refresh**
  
  Performs a refresh on the selected node.

**Folder Level Nodes**

- **New File**
  
  Creates a new file on the connection, in the current folder.

- **New Folder**
  
  Creates a new folder on the connection.

- **Import Folders**
Imports folders on the server.

**Import Files**

Allows you to add a new file on the connection, in the current folder.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Author Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Check Out**

Checks out the selected document on the server.

**Check In**

Checks in the selected document on the server. This action opens the Check In dialog box. For SharePoint Online connections, you only have the option to enter a comment and click the Check In button to process it.

For SharePoint (older version), the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to add a comment for a file that you check in.
Discard Check Out

Discards the previous checkout operation, making the file available to other users.

⚠️ Important:
Due to some API restrictions, the Discard Checkout action may not work when SharePoint Online connections are made directly to a sub-site.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.
15. Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Author Eclipse plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (on page 785).

Import from Text Files

Oxygen XML Author Eclipse plugin includes the possibility of importing text files (txt or csv file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to File > Import/Convert > Oxygen XML Author Eclipse plugin > Text File to XML and click Next. A Select text file dialog box is displayed.
2. Select the URL of the text file (txt or csv file extensions).
3. Select the encoding of the text file.
4. Click the Next button.
   The Import from text file dialog box is displayed.
5. Configure the settings for the conversion.
   a. Select the Field delimiter for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.
   b. The Import settings section presents the input data in a tabular form. By default, all data items are converted to element content (\<\> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (\= symbol). Clicking a second time causes the column data to be ignored (\x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   c. First row contains field names - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the
first row is interpreted as containing the field names. The changes are also visible in the preview panel.

d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

e. **Import Settings** - Clicking this button opens the **Import preferences page (on page 166)** that allows you to configure more import options.

f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

g. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Finish** to generate the XML document.

### Import from MS Excel Files

Oxygen XML Author Eclipse plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Author Eclipse plugin **Smart Paste mechanism (on page 362)** by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Author Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

#### Smart Paste Method in Author Mode

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Author Eclipse plugin **Smart Paste mechanism (on page 362)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

#### Grid Mode Method

The **Grid** mode in Oxygen XML Author Eclipse plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.

2. Switch to **Grid** mode in Oxygen XML Author Eclipse plugin.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select \( \text{Insert row} \) or \( \text{Insert column} \), depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in Grid mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Author Eclipse plugin might ignore that cell.

**Import Wizard Method**

To use the Import wizard to import an Excel file into an XML file, follow these steps:

1. Go to File > Import/Convert > Oxygen XML Author Eclipse plugin > MS Excel file to XML.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the Available Sheets section of this dialog box.
3. Click the Next button to proceed to the next stage of the wizard.
4. Configure the settings for the conversion. This stage of the wizard offers the following options:

**Import settings section**

Presents the input data in a tabular form. By default, all data items are converted to element content (§ symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (¶ symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

**First row contains field names**
If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

**Customize**

This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

**Import Settings**

Clicking this button opens the **Import preferences page** *(on page 166)* that allows you to configure more import options.

**Import formatted data (as displayed in Excel)**

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

**XML Import Preview panel**

Contains an example of what the generated XML document will look like.

**Save in file**

If selected, the new XML document is saved in the specified path.

5. Click **Finish** to generate the XML document.

For more information about exchanging data between Oxygen XML Author Eclipse plugin and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Related information**

- Exporting XML Content to Excel *(on page 338)*

**Import Database Data as an XML Document**

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import/Convert > Oxygen / Database Data to XML** and click **Next** to start the **Import** wizard.

   This opens a **Select database table** dialog box that lists all the defined database connections:
2. Select the connection to the database that contains the appropriate data. Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.

   The **Preferences/Data Sources** option page is opened.

4. Click **Connect**.

5. In the list of sources, expand a schema and choose the required table.

6. Click the **Next** button.

   The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.
7. Configure the settings for the conversion.

   a. **SQL Preview** - If this button is pressed, the **Import settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

   b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can
be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

c. Import Settings - Clicking this button opens the Import preferences page (on page 166) that allows you to configure more import options.

d. The XML Import Preview panel contains an example of what the generated XML document looks like.

e. Save in file - If selected, the new XML document is saved in the specified path.

f. Generate XML Schema - Allows you to specify the path of the generated XML Schema file.

8. Click Finish to generate the XML document.

Import from HTML Files

Oxygen XML Author Eclipse plugin offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in Author mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Author Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in Author mode.

The Oxygen XML Author Eclipse plugin Smart Paste mechanism (on page 362) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Import Wizard Method

To use the Import wizard to import from HTML files, follow these steps:

1. Go to File > Import/Convert > Oxygen XML Author Eclipse plugin > HTML File to XHTML. The Import HTML to XHTML wizard is displayed.
2. Select a parent folder and file name for the resulting XHTML document.
3. Enter the URL of the HTML document.
4. Select the type of the resulting XHTML document:
   ◦ XHTML5
   ◦ XHTML 1.0 Transitional
   ◦ XHTML 1.0 Strict
5. Click the Finish button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.
Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Author Eclipse plugin also provides special support for a convert protocol that can be used to chain predefined processors to dynamically import content from various sources.

A dynamic conversion URL chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (excel) on a target identified by the identifier (urn:files:sample.xls) and converts the Excel™ resource to XML. The second applied processor (xslt) applies an XSLT stylesheet identified using the identifier (urn:processors:excel2d.xsl) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an XML catalog that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="/resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="/processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the !/ pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog (on page 2085) support in the application. In the example above, the urn:files:sample.xls target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map (on page 2079) with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
```

the resources/sample.xls path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a DITA map.

A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.
Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Author Eclipse plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.
  
  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=v1!/urn:files:sample.xml
  ```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.
  
  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;pl=v1!/urn:files:sample.xml
  ```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.
  
  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of JAR (on page 2080) libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```java
  public void convert(String systemID, String originalSourceSystemID,
  InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```

  ```
  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/urn:files:java/WSEditorBase.java
  ```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.
  
  ```
  convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
  ```

- **json Processor** - Converts a JSON input to XML. It has no parameters.
  
  ```
  convert:/processor=json!/urn:files:personal.json
  ```

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.
  
  ```
  convert:/processor=xhtml!/urn:files:test.html
  ```
• **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```convert:/processor=wrap!/urn:files:test.csv```

• **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading ([Reload (F5)] from the toolbar) the URL content that is opened in the editor.

```convert:/processor=cache/processor=xslt/...!/urn:files:test.csv```

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html```

**Important:**

If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Author Eclipse plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libraries** button in the **Advanced** tab of the transformation scenario.

16. Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Author Eclipse plugin includes built-in, configured frameworks (on page 2080) for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use-case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced users who are familiar with API development can also create custom Author mode operations (on page 1475) for a particular framework.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip:
A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating a Framework through the Configuration Dialog

The easiest way to create a custom framework (on page 2080) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (on page 1584) with your team.

To create a custom framework by extending an existing one, follow these steps:
1. In a location where you have full write access, create a folder structure similar to this:
   `custom_frameworks/dita-extension`.
2. Open the Preferences dialog box (on page 61) and go to Document Type Association > Locations (on page 80). Add the path to your `custom_frameworks` folder in the Additional frameworks directories list and click OK or Apply to save your changes.
3. Go to the Document Type Association preferences page (on page 79) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.
   
   **Step Result:** This opens the Document Type Configuration dialog box (on page 81) where you can define the set of rules and settings for your custom framework.
4. Give the extension an appropriate name, select External for the Storage option, click the browsing button (✓) to specify the location of the custom directory you created in step 1.
5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (on page 81) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (on page 1430) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.
6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.
   
   **Results:** You now have a fully functional framework that can be shared with others (on page 1584).

**Related Information:**

Sharing a Framework (on page 1584)

**Creating a Framework Using an Extension Script**

A custom framework (on page 2080) (document type) can be created using a special XML descriptor file, either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it. You can then easily share the custom framework (on page 1584) with your team.

The easiest way to create such a descriptor is to use the New document wizard (on page 221) and choose the Extend Framework Script or Create Framework Script template.

**Tip:**

To see a visual, detailed look at how to create frameworks with an extension script, watch our webinar: Creating Frameworks Using an Extension Script (some samples are also available on that events page).
Creating a Custom Framework Starting from an Existing Framework

To create a custom framework by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
   custom_frameworks/dita-extension.

2. Open the Preferences dialog box (on page 61) and go to Document Type Association > Locations (on page 80). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click the New button on the toolbar and select the Extend Framework Script template. Save it inside the previously configured framework path (e.g. custom_frameworks/dita-extension).

4. Set the @base attribute on the script element to the value of the name of the extended framework (e.g. DITA).

   Note:
   Removing the @base attribute will create a framework from scratch.

5. Edit the script as described in Framework Extension Script File (on page 1433).

To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the resulting framework structure.

   Note:
   If you want to use the framework in an older Oxygen XML Author Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the Compile Framework Extension script action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

Creating a Custom Framework Without a Base Framework

To create a custom framework without starting from an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
   custom_frameworks/dita-extension.

2. Open the Preferences dialog box (on page 61) and go to Document Type Association > Locations (on page 80). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click New button on the toolbar and select the Create Framework Script template. Save it inside the previously configured framework path, custom_frameworks/dita-extension.

4. Edit the script as described in Framework Extension Script File (on page 1433).
To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the newly generated framework structure.

**Note:**
If you want to use the framework in an older Oxygen XML Author Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the Compile Framework Extension script action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

**Related information**
Sharing a Framework (on page 1584)

**Framework Extension Script File**

The framework extension file is used to describe a new framework configuration. Optionally, you can extend an existing built-in framework configuration (such as DITA or DocBook) and then make additions and changes to it.

The easiest way to create such a file is to use the New document wizard (on page 221) and choose the Extend Framework Script or Create Framework Script template.

The following examples assume that the newly created framework extends a built-in one.

**Basic Information**

Once you have created a new script file, you need to:

- Specify the name of the framework using the `<name>` element. Optionally, you can also add a description using the `<description>` element.
- If you want to extend an existing framework (such as DITA or DocBook), specify the name of the extended framework using the `@base` attribute on the `<script>` element.
- The `<priority>` element might be needed to instruct Oxygen XML Author Eclipse plugin to use this new framework instead of the one being extended or another framework that matches the same document.

**Example: Extending the Built-in DITA Framework**

```xml
<script xmlns="http://www.oxygenxml.com/ns/framework/extend"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.oxygenxml.com/ns/framework/extend
base="DITA">
  <name>My custom DITA framework</name>
  <description>A custom framework based on the built-in DITA framework</description>
</script>
```
Changing the Association Rules

Oxygen XML Author Eclipse plugin identifies the type of a document when the document matches at least one of the association rules.

Example: Instructing the Built-in Associations to Inherit None to Add Your Own

```xml
<associationRules inherit="none">
  <addRule rootElementLocalName="concept"/>
  <addRule fileName="test.xml"/>
</associationRules>
```

Setting the Initial Editing Mode

You can set the default editing mode that is loaded when a document is opened for the first time. For example, if the files are usually edited in the Author mode, you can set it as the initial page. For more details on the possible values, see Document Type Configuration Dialog Box - Initial Edit Mode (on page 82).

Example: Setting the Initial Editing Mode to Author

```xml
<initialPage>Author</initialPage>
```

Changing the Classpath

The Classpath tab displays a list of folders and JAR (on page 2080) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework (on page 2080) translation files. Oxygen XML Author Eclipse plugin loads the resources looking in the folders in the order they appear in the list.

Example: Customizing and Extending the Classpath Inherited From the Base Framework

```xml
<classpath inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/resources_2x" position="before"/>

  <removeEntry path="${baseFramework}/refactoring/"/>

</classpath>
```

Note:

When removing entries with framework editor variables, take into consideration how they were added in the base framework.
- An entry present in the base framework with the path \${framework}/file can be removed using an identical path or by using the \${baseFramework} variable: \${baseFramework}/file.

- An entry present in the base framework with the path \${frameworkDir}/file can be removed using an identical path or by using the \${baseFrameworkDir} variable: \${baseFrameworkDir}/file.

Sharing a Plugin Class Loader

If your framework uses the same JAVA extensions/classes as a plugin (on page 2082), it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

```xml
<classpath parentClassLoaderID="com.oxygenxml.git.plugin"/>
```

Changing XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an internet connection may not be available, an XML Catalog (on page 2085) may be used to map the web location to a local file system entry.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```xml
<xmlCatalogs inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/catalog.xml" position="before"/>
  <removeEntry path="${baseFramework}/oldCatalog.xml"/>
</xmlCatalogs>
```

Changing the Document Templates

You can create your own custom document templates or remove templates inherited from the base framework.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```xml
<documentTemplates inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework to make them appear first in the list. -->
  <addEntry path="${framework}/newTemplates" position="before"/>
</documentTemplates>
```
Adding New Transformation Scenarios and Removing Existing Ones

You can create new transformation scenarios and export them in one of the following locations:

- The Transformation Scenarios View (on page 903).
- The Configure Transformation Scenario(s) Dialog Box (on page 898).
- The Transformation Tab (on page 106).

**Example: Importing New Transformation Scenarios**

The `@href` attribute from the `<addScenarios>` element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The `${framework}` editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<transformationScenarios>
  <addScenarios href="scenarioExport.scenarios"/>
  <removeScenario name="DITA HTML5"/>
  <defaultScenarios>
    <name>DITA</name>
    <name>XML</name>
  </defaultScenarios>
</transformationScenarios>
```

Adding New Validation Scenarios and Removing Existing Ones

You can create new validation scenarios and export them in one of the following locations:

- The Configure Validation Scenario Dialog Box (on page 531).
- The Validation Tab (on page 107).

**Example: Importing New Validation Scenarios**

The `@href` attribute from the `<addScenarios>` element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The `${framework}` editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<validationScenarios>
  <addScenarios href="validationScenarioExport.scenarios"/>
  <removeScenario name="DITA"/>
  <defaultScenarios>
    <name>DITA Validation</name>
  </defaultScenarios>
</validationScenarios>
```
Oxygen XML Author Eclipse Plugin 24.1 | 16 - Framework and Author Mode Customization | 1437

<name>XML Validation</name>
</defaultScenarios>
</validationScenarios>

Customizing the Author Mode Through New CSS Files
The Author mode layout is driven by CSS rules. To customize it, you need to create new CSS files and add
them in the new framework.
Example: Using Larger Fonts in Titles
<author>
<css>
<removeCss path="${framework}/base.css"/>
<!-Adding CSS after the ones in the base gives the opportunity to
override rules from previous CSSs.
-->
<addCss path="${framework}/titles.css" position="after"/>
</css>
</author>

The ${framework}/titles.css file contains a rule like this:
*[class~='topic/title'] {
font-size:larger;
}

Example: Creating an Alternate CSS That Activates When the User Selects it in the Styles Menu
<author>
<css>
<addCss path="${framework}/pink.css" title="Pink titles" alternate="true"/>
</css>
</author>

The ${framework}/pink.css file contains a rule like this:
*[class~='topic/title'] {
color:#FF1493;
}

Defining Author Actions for the New Framework
Create external author actions (on page 1446), save them in a specific subdirectory of your particular
framework directory (on page 1449), and they will be loaded automatically.


Removing Author Actions from the Base Framework

Suppose that the base framework configuration defines some author actions (on page 1445) that are added in the main menu (on page 98), contextual menu (on page 98), toolbar (on page 100), or content completion window (on page 101). If you do not want to inherit one of these actions in the new framework and you also want to remove it from all the GUI elements, you can use the `<removeAction>` element:

```xml
<author>
  <authorActions>
    <removeAction id="action.to.remove"/>
  </authorActions>
</author>
```

Note:
If the new framework has an external author action (on page 1446) with the same ID as one of the actions specified in a `<removeAction>` element, the action will not be removed from the GUI elements (menus, toolbars, content completion window).

Author Toolbar Configuration

The Author mode-specific toolbars for the new framework can be customized by:

- Adding or removing actions from toolbars.
- Changing toolbar groups by adding or removing actions.
- Creating new toolbars and action groups.

Example: Customizing the Toolbar

```xml
<author>
  <toolbars>
    <toolbar>
      <!-- Remove an action inherited from the base framework. -->
      <removeAction id="bold"/>

      <!-- Insert an action into an existing group -->
      <group name="${i18n(link)}">
        <addAction id="insert.note"/>
      </group>

      <!-- Add actions, separators and new groups-->
      <separator/>
      <addAction id="insert.note"/>
      <group name="New group">
        <!-- Add more actions here... -->
      </group>
    </toolbar>
  </toolbars>
</author>
```
<addAction id="insert.note"/>
<addAction id="insert.table"/>
</group>
</toolbar>
</toolbars>
</author>

**Note:**
If you create a toolbar or group configuration and a toolbar/group with the same name already exists in the base framework, you will change the one inherited instead of creating a new one. You can inspect the names of the existing toolbars/groups inherited from the base framework in the Toolbar Subtab (on page 100).

**Example: Creating a New Toolbar**

A new toolbar is created if the @name attribute does not match a toolbar inherited from the base.

```xml
<author>
  <toolbars>
    <toolbar name="Extra Toolbar">
      <!-- Add actions, separators and new groups-->
      <separator/>
      <addAction id="insert.note"/>
      <group name="New group">
        <addAction id="insert.note"/>
        <addAction id="insert.table"/>
      </group>
    </toolbar>
  </toolbars>
</author>
```

**Example: Adding an Action in the Toolbar at a Specific Location**

You can insert items (actions or groups) relative to other items already present in the toolbar because they were inherited from the base framework configuration. The @anchor attribute specifies either the ID of an action or the name of a group already present in the toolbar and the @position attribute specifies whether the new item should be added before or after it.

**Note:**
If the @anchor attribute is missing, the entries will be added either first or last, according to @position value.
Author Menu and Contextual Menu Configuration

The Author mode-specific menus for the new framework can be customized by:

• Adding or removing actions and submenus.
• Changing existing submenus by adding or removing actions.

Example: Customizing the Contextual Menu

```xml
<contextualMenu>
  <!-- Add new actions and submenu -->
  <separator/>
  <addAction id="insert.table"/>
  <submenu name="Other actions">
    <addAction id="insert.note"/>
  </submenu>
  <!-- Contribute to an existing submenu -->
  <submenu name="${i18n(section)}">
    <addAction id="paragraph"/>
  </submenu>
  <!-- Remove a submenu inherited from the base framework. -->
  <removeSubmenu name="${i18n(link)}"/>
</contextualMenu>
```

Note:
The framework main menu is configured similarly, inside a `<menu>` container.

Tip:
You can inspect the names of the submenus inherited from the base framework in the Contextual Menu Subtab (on page 98) and Menu Subtab (on page 98).

Example: Adding an Action in the Contextual Menu at a Specific Location
You can insert new actions and submenus relative to other actions and submenus already present in the menu because they were inherited from the base framework configuration. The `@anchor` attribute specifies the ID of an Author mode action or a name of a submenu already present in the menu and the `@position` attribute specifies whether the new action should be added before or after it.

**Note:**
If the `@anchor` attribute is missing, the entries will be added either first or last, according to `@position` value.

```xml
<contextualMenu>
    <addAction id="insert.note" anchor="edit.image.map" position="before"/>

    <submenu name="Table menu" anchor="${i18n(insert)}" position="after">
        <addAction id="insert.table"/>
    </submenu>
</contextualMenu>
```

### Configuring the Content Completion in Author Mode

You can replace content completion entries obtained from the associated schema with Author mode actions *(on page 1445).*

In the `<authorActions>` container, you can specify the Author mode actions to be contributed. Optionally, you can mark them as a replacement for an existing schema proposal with the `@replacedElement` attribute.

The `<schemaProposals>` element allows you to remove proposals detected from the associated schema through the `<removeProposal>` element. If some proposals were removed in the base framework configuration and you want them re-added, you can do so through the `<addProposal>` element.

#### Example: Customizing the Content Completion Assistant

```xml
<contentCompletion>
    <authorActions>
        <addAction id="insert.note" replacedElement="note" inCCWindow="true"/>
    </authorActions>

    <schemaProposals>
        <removeProposal renderName="table"/>

        <!-- The base framework removed the "list" element proposal. We want it back... -->
        <addProposal renderName="list"/>
    </schemaProposals>
</contentCompletion>
```
Using Framework Extension Points

The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type. Libraries that contain the implementations must be present in the classpath of your framework (on page 1434). The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Example: Setting a Custom Extensions Bundle

```xml
<extensionPoints>
    <extension
        name="extensionsBundleClassName"
        value="ro.sync.ecss.extensions.dita.map.DITAMapExtensionsBundle"/>
</extensionPoints>
```

Reusing Parts of the Script Using XInclude

Elements in the script can be specified in dedicated files that can then be referenced using XInclude in the script.

Example: Using XInclude to Reference Elements in the Script

```xml
<script xmlns="http://www.oxygenxml.com/ns/framework/extend">
    <name>New framework</name>
    <xi:include href="classpath.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</script>
```

Where the referenced classpath.xml has this content:

```xml
<classpath xmlns="http://www.oxygenxml.com/ns/framework/extend">
    <addEntry path="test.jar"/>
</classpath>
```

Customizing the Author Mode Editing Experience for a Framework

You can customize the editing experience in Author mode for you and any other user who shares the same framework. This includes the ability to configure actions, menus, toolbars, icons, structure insertion shortcuts, and content completion proposals specifically for a particular framework (on page 2080) (document type). Advanced users who are familiar with API development can also create custom Author mode operations (on page 1475) for a particular framework.

Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Author Eclipse plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2081) and multiple alternate CSS styles (on page 2077). This makes it easy to change the look of the document as it appears in Author mode.
An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Note:
When altering a CSS file configured as a stylesheet for the current document framework, you can quickly check its effects in the Author mode by using the Reload document action that is available on the toolbar.

Managing the CSS Styles

The main (on page 2081) and alternate (on page 2077) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (on page 81). To access it, follow these steps:

1. Open the Preferences dialog box (on page 61).
2. Go to Document Type Association.
3. Select the appropriate document type and click the Edit button.

Important:
If you do not have access rights to the folder where the framework (on page 2080) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (on page 1585).

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (on page 87) of the Author tab.
You can **Add**, **Edit**, or **Delete** styles from this dialog box to manage the *main* *(on page 2081)* and *alternate* *(on page 2077)* styles associated to the particular document type. You can also change the order of the styles by using the **Move Up** and **Move Down** buttons. This also changes the order that they appear in the *Styles* drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the *alternate* style that is listed last in this list takes precedence, since it is the last one to be combined (applied as a layer).

The *URI* column shows the path of each CSS file. The names listed in the *Styles* drop-down menu match the values in the *Title* column. The value in the *Alternate* column determines whether it is a *main* or *alternate* CSS. If the value is *no*, it is a *main* CSS. If the value is *yes*, it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the *Styles* drop-down menu.

**Note:**

To group alternate styles into categories (submenus), use a vertical bar character (|) in the *Title* column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the *Styles* drop-down menu, while the text after the final vertical bar is rendered as the name of the style inside the submenu.
**Example:** Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to *My Styles|User Assistance|Hints* and *My Styles|User Actions|Inline Actions*, respectively.

<table>
<thead>
<tr>
<th>URI</th>
<th>Title</th>
<th>Alternate</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(framework)/css/hints/hints.css</td>
<td>*My Styles</td>
<td>User Assistance</td>
</tr>
<tr>
<td>$(framework)/css/actions/actions.css</td>
<td>*My Styles</td>
<td>User Actions</td>
</tr>
</tbody>
</table>

Oxygen XML Author Eclipse plugin will add a *My Styles* submenu with two submenus (*User Assistance* that contains the *Hints* style, and *User Actions* that contains the *Inline Actions* style) in the *Styles* drop-down menu.

The *Enable multiple selection of alternate CSSs* checkbox *(on page 87)* at the bottom of the pane must be selected for the *alternate CSS styles* *(on page 2077)* to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the alternate styles are treated like *main CSS styles* *(on page 2081)* and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

- CSS Subtab *(on page 87)*

Creating and Customizing Author Mode Actions for a Framework

There are several possibilities for creating new Author mode actions:

- You can create new actions for a framework or edit existing ones using the *Actions* subtab of the Document Type configuration dialog box *(on page 81)*. In this case, the actions are stored internally in the *.framework* file.
- You can export existing actions from the Document Type configuration dialog box *(on page 81)* into individual XML files or use a built-in template to create a new XML file that defines a single action. In
this case, the actions are stored externally as separate XML files. The benefits of using this approach are explained in the Creating or Editing Actions Using an Individual XML File for Each Action (on page 1446) section below.

Creating or Editing Actions Using the Document Type Configuration Dialog Box

To add or configure Author mode actions for a framework (on page 2080) (document type) using the Document Type configuration dialog box (on page 81), follow this procedure:

1. Open the Preferences dialog box (on page 61), go to Document Types Association, and select the framework.
2. Select your framework and click the Edit button (or you can use the Duplicate or Extend button to create an extension of the framework (on page 1430)).
3. In the resulting Document Type configuration dialog box (on page 81), go to the Author tab, then the Actions subtab.
4. To create a new action, click the New button. To edit an existing action, select the action and click the Edit button.

   **Step Result:** In either case, this opens the Action configuration dialog box (on page 89) where you can configure numerous aspects of the action.
5. Once you are finished, click OK several times to exit the configuration dialog box.

**Result:** Your changes are stored in the *.framework file for your particular framework.

Creating or Editing Actions Using an Individual XML File for Each Action

It is possible to work with Author mode actions outside the Document Type configuration dialog box (on page 81) and store them externally from the *.framework file. You can either export existing actions or use a template to create a new action from scratch. The benefits of using this approach are:

- You can share, copy, or reuse each individual action across multiple projects or frameworks.
- It is easier to develop and test action configurations. After configuring the XML file that defines an action, you can test its functionality by opening a document from your particular framework and invoking the action to see if it works as expected. If you did not get the desired result, you can simply repeat the process until you are happy with the result without having to navigate through the framework configuration dialog box.

**Exporting Actions**

To export existing Author mode actions into individual XML files, follow this procedure:

1. Open the Preferences dialog box (on page 61), go to Document Types Association, and select the framework.
2. Select your framework and click the Edit button (or you can use the Duplicate or Extend button to create an extension of the framework (on page 1430)).
3. In the resulting **Document Type** configuration dialog box *(on page 81)*, go to the **Author** tab, then the **Actions** subtab.

4. **[Important]** Make sure the **Storage option (on page 82)** in the top part of the dialog box is set to **External** and the external location must be a subdirectory of your current framework directory (see the Notes About the Storage Path section *(on page 1449)*).

5. Select the action (or multiple actions) you want to export, right-click, and use the **Export** action (this action is also located at the bottom of the table of actions).

   **Step Result:** If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have **_externalAuthorActions** at the end of the folder name) inside your current framework directory.

6. **[Important]** Click **OK** several times to confirm your changes and exit the **Preferences** dialog box. The files will not be created until you exit this dialog box.

   **Step Result:** Each exported action is extracted from the framework configuration file and exported as an individual XML file.

7. To configure and test a particular action, you can open its corresponding XML file in Oxygen XML Author Eclipse plugin, make changes, save the file, then open a document from your framework, test the action and repeat until you get the desired result.

   **Note:**
   You can add or edit the action files outside of Oxygen XML Author Eclipse plugin, but you will need to restart the application each time to reload the changes.

**Creating New Actions**

To create a new **Author** mode action outside the framework configuration dialog box, follow these steps:

1. Open the **New from templates wizard (on page 228)**, search for a template called **Author Action**, and choose a storage path and file name. Remember that ultimately, it must be saved in a subdirectory of your particular framework directory (see the Notes About the Storage Path section *(on page 1449)*). Complete the creation process.

   **Step Result:** The resulting XML file contains some hints and it is an example of an action configuration that will insert a new paragraph.

2. Configure the action as needed and save your changes.

   **Note:**
   You can use XInclude to reuse different fragments (such as XPath expressions or configured operations between actions).
Example: Reusing and XPath Expression

```xml
<a:operations>
  <a:operation id="InsertFragmentOperation">
    <a:xpathCondition>
      <xi:include href="expression.txt" xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
    </a:xpathCondition>
    <a:arguments>
      <a:argument name="insertLocation">
        <xi:include href="expression.txt" xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
      </a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Where the content of the `expression.txt` file is `self::para`.

Example: Reusing an Entire Operation

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <xi:include href="operation.xml" xpointer="element(/1/1)" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</a:operations>
```

Where the content of `operation.xml` is:

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <a:operation id="ToggleSurroundWithElementOperation">
    <a:xpathCondition>ancestor-or-self::p</a:xpathCondition>
    <a:arguments>
      <a:argument name="element">i</a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Step Result: At this point, the action has been created but it needs to be added to the UI (in a toolbar or menu).

3. Add the new action to a UI component. For example, to add it in a toolbar, open the Document Type configuration dialog box (on page 81), go to the Author tab, then the Toolbar subtab (on page 100), and add the action.
4. To test the action, you can open a document from your framework and test the action. If you don't get the desired result, open the action file, make changes, then test them again. Repeat until you get the desired result.

**Note:**
You can add or edit the action files outside of Oxygen XML Author Eclipse plugin, but you will need to restart the application each time to reload the changes.

**Notes About the Storage Path**

As mentioned above, it is imperative that the action configuration files be stored in a specific subdirectory of your particular framework directory.

There are two possible naming conventions for this subdirectory:

- `{framework_directory}/externalAuthorActions` - If there are multiple framework subdirectories inside `{framework_directory}`, using this path structure will make the actions available to all of them.
- `{framework_directory}/{framework_file_name}_externalAuthorActions` - Using this path structure will make the actions only available in the framework stored inside the `{framework_file_name}.framework` file.

**Note:**
When exporting actions from the UI *(on page 1446)*, this is the directory structure that is used.

**Action Configuration Tips**

- If an action is configured to insert a fragment that contains entities, you need to wrap it in `CDATA` markup.
- For a list of default operation, see Built-in Author Mode Operations *(on page 1449)*.

**Resources**

For more information about customizing Author mode actions, see the following resources:

- Webinar: *Improving the Authoring Experience Through Custom Actions*.
- Webinar: *Working with DITA in Oxygen - Customizing the Editing Experience*.

Framework Configuration Dialog Box: Actions Subtab *(on page 88)*

**Built-in Author Mode Operations**

This topic lists the default operations for the Author mode.
ChangeAttributeOperation

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom Author mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name**
  The attribute local name.

- **namespace**
  The attribute namespace.

- **elementLocation**
  The XPath location that identifies the element.

- **value**
  The new value for the attribute. If empty or null the attribute will be removed.

- **editAttribute**
  If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

- **removeIfEmpty**
  The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

ChangeAttributesOperation

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom Author mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  The names of the attributes to add, modify, or remove, separated by the new-line character (`\n`). The values can be local names or Clark notations.

- **values**
  The new attributes values, each on a new line, separated by the new-line character (`\n`). An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

- **removeIfEmpty**
  The possible values are `true` (default) and `false`. True means that the attribute will be removed if an empty value is provided.
**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations**
  
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes set. If it is not defined, then the element at the cursor position will be used.

- **setPseudoClassNames**
  
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations**
  
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes removed. If it is not defined, then the element at the cursor position will be used.

- **removePseudoClassNames**
  
  A space-separated list of pseudo-class names that will be removed from the matched nodes.

- **includeAllNodes**
  
  The possible values are *yes* and *no*. If set to *yes*, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to *no*, they are ignored.

**DeleteElementOperation**

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

**DeleteElementsOperation**

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

**ExecuteCommandLineOperation**

This operation allows you to start a process executing a given command line. It has the following arguments:

- **name**
  
  The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

- **workingDirectory**
  
  The path to the directory where the command line is executed. The default value is "." (current directory).

- **cmdLine**
  
  The command line to be executed (accepts editor variables *(on page 1465)*).
showConsole

If set to `true`, the console panel will be displayed in Oxygen XML Author Eclipse plugin. The default value is `false`.

wait

If set to `true`, the command line will wait for the operation to finish. The default value is `false`.

**ExecuteMultipleActionsOperation**

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding `framework`, or one of the common actions for all `frameworks` supplied by Oxygen XML Author Eclipse plugin.

**actionIDs**

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

**ExecuteMultipleWebappCompatibleActionsOperation**

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

**ExecuteTransformationScenariosOperation**

This operation allows running one or more transformation scenarios defined in the current `document type association (on page 2079)`, in the project options, or in the global options. A use case would be to add a toolbar button that triggers publishing to various output formats. The argument of the operation is:

**scenarioNames**

The list of scenario names that will be executed, separated by new lines.

**ExecuteValidationScenariosOperation**

This operation allows running one or more validation scenarios defined in the current `document type association (on page 2079)`, in the project options, or in the global options. The single argument for the operation is:

**scenarioNames**

The list of scenario names that will be executed, separated by new lines.

**InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

**fragment**

The XML fragment containing the MathML content that should be inserted.
InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation (on page 1471).

InsertOrReplaceFragmentOperation

Similar to InsertFragmentOperation (on page 1453), except it removes the selected content before inserting the fragment. Also, the insertPosition parameter has another possible value: Replace. If this value is used, the operation deletes the node selected by the XPath expression denoted by the insertLocation parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation (on page 1471).

InsertOrReplaceTextOperation

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

\text

The text section to insert.

InsertXIncludeOperation

Insert an XInclude element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

JSOperation

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see https://github.com/oxygenxml/javascript-sample-operations.

Notice:

For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

\text{script}

The JavaScript content to execute. It must have a function called doOperation(), which can use the predefined authorAccess variable. The authorAccess variable has access to the entire ro.sync.ecss.extensions.api.AuthorAccess Java API.

The following example is a script that retrieves the current value of the type attribute on the current element, allows the end-user to edit its new value and sets the new value in the document:
function doOperation(){

  //The current node is either entirely selected...
  currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
  if(currentNode == null){
    //or the cursor is placed in it
    caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
  }

  //Get current value of the @type attribute
  currentTypeValue = "";
  currentTypeValueAttr = currentNode.getAttribute("type");
  if(currentTypeValueAttr != null){
    currentTypeValue = currentTypeValueAttr.getValue();
  }

  //Ask user for new value for attribute.
  newTypeValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentTypeValue);
  if(newTypeValue != null){
    //Create and set the new attribute value for the @type attribute.
    attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
    authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
  }
}

Tip:
You can call functions defined inside a script called commons.js from your custom script content so that you can use that external script file as a library of functions. Note that this commons.js file must be placed in the root of the framework directory (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita/commons.js) because that is the only location where Oxygen XML Author Eclipse plugin will look for it.

MoveCaretOperation

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

  xpathLocation

  An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
position

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

selection

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

**MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

**sourceLocation**

XPath expression that identifies the content to be moved.

**deleteLocation**

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the sourceLocation parameter will also identify the node to be deleted.

**surroundFragment**

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

**targetLocation**

XPath expression that identifies the location where the node must be moved to.

**insertPosition**

Argument that indicates the insert position.

**moveOnlySourceContentNodes**

When set to true, only the content of the source element is moved.

**processTrackedChangesForXpathLocations**

When nodes are located via an XPath expression and the nodes are deleted with Change Tracking enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).
alwaysPreserveTrackedChangesInMovedContent

When set to true, tracked changes are included when a copied fragment is inserted in a document, regardless of the current state of the Track Changes feature.

OpenInSystemAppOperation

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

resourcePath

An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (on page 199) are expanded in the value of this parameter, before the expression is executed.

isUnparsedEntity

Possible values are true or false. If the value is true, the value of the resourcePath argument is treated as the name of an unparsed entity.

ReloadContentOperation

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

markAsNotModified

The possible values are true and false. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to true to prevent the editor from showing the content as modified.

RemovePseudoClassOperation

An operation that removes a pseudo-class from an element. Accepts the following parameters:

name

Name of the pseudo-class to be removed.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation

The XPath location that identifies the element. If it is not defined, then the element at the cursor position is used. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

Example:
Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```css
paragraph:myClass{
  font-size:2em;
  color:red;
}
paragraph{
  color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName**
  The new element name.

- **elementLocation**
  The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**ReplaceElementContentOperation**

An operation that replaces the content of the element at the cursor location (or fully selected element). The operation accepts the following parameters:

- **fragment**
  Specifies the fragment that will be inserted as the element content.

- **elementLocation**
  An XPath expression that identifies the element. If it is not defined, then the element at the cursor position is used.

**SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation**
  An XPath expression that identifies the element that will have the pseudo-class set. If it is not defined, then the element at the cursor position is used.
name

The pseudo-class local name.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (on page 1473).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

header

The text that is placed before the selection.

footer

The text that is placed after the selection.

TogglePseudoClassOperation

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

name

Name of the pseudo-class to be toggled on/off.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation

The XPath location that identifies one or more elements that will have the pseudo class toggled. If it is not defined, then the element at the cursor position is used.
Example:

```xml
paragraph:myClass{
  color:red;
}
paragraph{
  color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered `paragraph` element.

**ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- **element**
  
  The element to wrap or unwrap content.

- **schemaAware**
  
  This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**ToggleCommentOperation**

This operation allows for commenting or un-commenting the selected content. It does not have any arguments. If the selection is text, the operation wraps the selection in a comment. If the selection is a comment, the operation removes the comment.

**UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

- **unwrapElementLocation**
  
  An XPath expression that identifies the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.
XQueryUpdateOperation

Allows you to execute an XQuery Update script directly over content in Author mode.

Notice:
This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

- **script**

  The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the `${framework}` (on page 205) or `${frameworkDir}` (on page 206) editor variables to refer the scripts from the framework directory.

  The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

  ```
  declare variable $oxyxq:selection external;
  ```

  In the example below (on page 1460), you can see how this argument is used.

- **externalParams**

  A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:

  ```
  declare variable $param1 external;
  declare variable $param2 external;
  ```

  You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

- **expandXincludeReferences**

  Makes all XInclude elements transparent to the XQuery transformer. When the XInclude references are transparent, the XQueryUpdateOperation can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the XInclude elements are not transparent.

An example of an XQuery Update Script that converts paragraphs to list items:

```xml
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(: This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
```
If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.

declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :) let $toProcess := if (empty($oxyxq:selection)) then
  (.)
else
  ($oxyxq:selection)

return if (not(empty($toProcess))) then
  {
    (: Create the list :) let $ul :=
      <ul>
        { for $sel in $toProcess
          return
            <li>{$sel}</li>
        }
      </ul>
    return
    (: Delete the processed nodes :) for $sel in $toProcess
      return
      delete node $sel,
    (: Inserts the constructed list :) insert node $ul
      before $toProcess[1]
  }
else

XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.
Notice:
For Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

**sourceLocation**
An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations where you want to look at an ancestor of the current element and make decisions in the script based on that. To do this, you can set the `sourceLocation` to point to an ancestor node then use the `oxy:current-element()` function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">
  <xsl:template match="/">
    <xsl:apply-templates select="oxy:current-element()"/>
  </xsl:template>

  <xsl:template match="para">
    <!-- And the context is again inside the current element, 
    but we can use information from the entire XML -->
    <xsl:variable name="keyImage" select="/imagedata[@fileref='images/lake.jpeg']/ancestor::inlinemediaobject/@xml:id/string()"/>
    <xref linkend="{$keyImage}" role="key_include" xmlns="http://docbook.org/ns/docbook"/>
  </xsl:template>
</xsl:stylesheet>
```

**targetLocation**
An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

**script**
The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported `xslt_operation.xsl` needs to be located in the current framework directory.
You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the **framework** directory.
- The \$\{framework\} editor variable (on page 205) can also be used to reference resources from the **framework** directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the **framework** directory to a resource from the **framework**.

### action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

### caretPosition

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the \$\{caret\} editor variable (on page 204) in the inserted content.

### expandEditorVariables

Parameter controlling the expansion of editor variables (on page 199) returned by the script processing. Expansion is enabled by default.

### suspendTrackChanges

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (on page 2084) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

### externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xml
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the externalParams to param1=value1,param2=value2.

**XSLTOperation Example:** Sort a list with respect to the language declared on the root element:
Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```xml
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The **XSLTOperation** needs to be configured as follows:

- **sourceLocation** is set to /* so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs oxy" version="2.0">

  <xsl:template match="/">
    <!-- sourceLocation parameter was set to /* to have a larger context. 
    We can pinpoint the element that contained the caret 
    using the oxy:current-element() function. -->
    <xsl:apply-templates select="oxy:current-element()"/>
  </xsl:template>

  <xsl:template match="ul">
    <!-- Because the sourceLocation parameter was set to /* we now have access to 
    the root element and its attributes. -->
    <xsl:variable name="lang" select="/*/@xml:lang"/>
    <xsl:variable name="collationURI">
      <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=', $lang)"/>
    </xsl:variable>
    <xsl:copy>
      <xsl:copy-of select="@*"/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```
Using Entities and Xincludes with the XSLTOperation

- **Entities** will be resolved in the result.
- **Xincludes** are also resolved in the result, and you can alter the XML obtained after the resolving using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.

Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following editor variables (on page 199):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection** plugin.

**Note:**

The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

**Note:**

The **${caret}** editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the **insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)** method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.
• **${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

• **${ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...),
'default_value', @id)}** - To prompt for values at runtime, use the ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...), 'default-value') editor variable. You can set the following parameters:
  ◦ 'message' - The displayed message. Note the quotes that enclose the message.
  ◦ 'default-value' - Optional parameter. Provides a default value.
  ◦ @id - Optional parameter. Used for identifying the variable to reuse the answer using the
    ${answer(@id)} editor variable.
  ◦ type - Optional parameter (defaults to generic), with one of the following values:

  ![Note]

  The title of the dialog box will be determined by the type of parameter and as follows:
  ▪ For url and relative_url parameters, the title will be the name of the parameter and the value of the 'message'.
  ▪ For the other parameters listed below, the title will be the name of that respective parameter.
  ▪ If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', type, 'default_value')}</th>
</tr>
</thead>
<tbody>
<tr>
<td>generic (default)</td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>▪ ${ask('Hello world!')} - The dialog box has a Hello world! message displayed.</td>
</tr>
<tr>
<td></td>
<td>▪ ${ask('Hello world!', generic, 'Hello again!')} - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again'.</td>
</tr>
<tr>
<td>url</td>
<td>Description: Input is considered a URL. Oxygen XML Author Eclipse plugin checks that the provided URL is valid.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td>Parameter</td>
<td>Format: ${\text{ask('message', parameter, 'default')}}</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------</td>
</tr>
<tr>
<td>relative_url</td>
<td>${\text{ask('message', relative_url, 'default')}}</td>
</tr>
</tbody>
</table>

**Note:**
If the $\text{ask}$ editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Author Eclipse plugin will transform it into an absolute URL.

**Example:**

$\{\text{ask('File location', relative_url, 'C:/example.txt')}\}$ - The dialog box has the name *File location*. The URL inserted in the input box is made relative to the currently edited document location.

| password | Format: $\{\text{ask('message', password, 'default')}\} | The input is hidden with bullet characters. |

**Example:**

- $\{\text{ask('Input password', password)}\}$ - The displayed dialog box has the name *Input password* and the input is hidden with bullet symbols.
- $\{\text{ask('Input password', password, 'abcd')}\}$ - The displayed dialog box has the name *Input password* and the input hidden with bullet symbols. The input field already contains the default *abcd* value.

<p>| combobox | Format: ${\text{ask('message', combobox, ('real_value1':'rendered_value1';..'real_valueN':'rendered_valueN'), 'default')}} | Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <em>rendered_value</em> values. Choosing such a value will return its associated value (<em>real_value</em>). |</p>
<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Note:</strong></th>
</tr>
</thead>
</table>
|  | The list of ‘real_value’:’rendered_value’ pairs can be computed using \$\{xpath\_eval()}.
|  | The ‘default’ parameter specifies the default-selected value and can match either a key or a value.

**Example:**

- `$\{ask('Operating System', combobox, (‘win’: ‘Microsoft Windows’; ‘macos’: ‘macOS’; ‘lnx’: ‘Linux/UNIX’), ‘macos’)\}` - The dialog box has the name ‘Operating System’. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

  - In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by macOS, as in the following example: `$\{ask('Operating System', combobox, (‘win’: ‘Microsoft Windows’; ‘macos’: ‘macOS’; ‘lnx’: ‘Linux/UNIX’), ‘macOS’)\}`

- `$\{ask('Mobile OS', combobox, (‘ios’: ‘iOS’; ‘and’: ‘Android’), ‘Android’)\}`

**editable_combobox**

**Format:** `$\{ask('message', editable_combobox, (‘real_value1’:’rendered\_value1’;...;’real\_value\_N’:’rendered\_value\_N’), ‘default’)\}`

**Description:** Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.

  - The list of ‘real_value’:’rendered_value’ pairs can be computed using \$\{xpath\_eval()\}. 

Parameter

| Note: | The ‘default’ parameter specifies the default-selected value and can match either a key or a value. |

Example:

- `${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

- `${ask('Operating System', editable_combobox, (${xpath_eval(for $pair in (["win", 'Microsoft Windows'], ["macos", 'macOS'], ["lnx", 'Linux/UNIX']) return "'" || $pair?1 || ":" || $pair?2 || "'"))}, 'ios')}`

Format: `${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}`

Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value.

Note: The list of ‘real_value’:‘rendered_value’ pairs can be computed using `${xpath_eval()}`.

Note: The ‘default’ parameter specifies the default-selected value and can match either a key or a value.

Example:

- `${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}` - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>In this example, macOS is the default-selected value and if selected, it would return macos for the output.</td>
</tr>
</tbody>
</table>

- `${ask('Operating System', radio, (${xpath_eval(for $pair in ['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" || $pair?1 || "":"" || $pair?2 || ":")), 'ios'})`  

  - `$({timeStamp})` - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
  - `$({uuid})` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
  - `$({id})` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
  - `$({cfn})` - Current file name without the extension and parent folder. The current file is the one currently open and selected.
  - `$({cfne})` - Current file name with extension. The current file is the one currently open and selected.
  - `$({cf})` - Current file as file path, that is the absolute file path of the currently edited document.
  - `$({cfd})` - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
  - `$({frameworksDir})` - The path (as file path) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the Document Type Association > Locations preferences page.
  - `$({pd})` - The file path to the folder that contains the current project file (.xpr).
  - `$({oxygenInstallDir})` - Oxygen XML Author Eclipse plugin installation folder as file path.
  - `$({homeDir})` - The path (as file path) of the user home folder.
  - `$({pn})` - Current project name.
  - `$({env(VAR_NAME)})` - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `$({system(var.name)})` editor variable.
  - `$({system(var.name)})` - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the `$({env(VAR_NAME)})` editor variable instead.
• ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

**Note:**
This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

### How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

- In the **API documentation** for the particular operation.
- By invoking the `getArguments()` method on the operation.
- In the source code of the operation.
- In Oxygen XML Author Eclipse plugin:
  1. Go to Options > Preferences > Document Type Association, select a document type and click the **New**, **Edit**, **Duplicate**, or **Extend** button *(on page 79).*
  2. Go to the **Author** tab and then the **Actions** subtab. At the bottom of this subtab, click **+ New** to open the **Action** dialog box *(on page 89).*
  3. Locate the **Operation** field and click the **Choose** button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click **OK**).

The arguments for the operation will now be displayed in the **Action** dialog box *(on page 89).*

### Arguments of InsertFragmentOperation

**fragment**

This argument has a textual value. This value is parsed by Oxygen XML Author Eclipse plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:
• **Prefixes that are not bound explicitly**

For instance, the fragment:

```xml
<x:item id="dty2"/>
&ent;
<x:item id="dty3"/>
```

Can be correctly inserted in the document: ('\)' marks the insertion point):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
  <!ENTITY ent "entity">
]>
<x:root xmlns:x="nsp">
  |
</x:root>
```

Result:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
  <!ENTITY ent "entity">
]>
<x:root xmlns:x="nsp">
  <x:item id="dty2"/>
  &ent;
  <x:item id="dty3"/>
</x:root>
```

• **Default namespaces**

If there is a default namespace declared in the document and the document fragment (on page 2078) does not declare a namespace, the elements from the fragment are considered to be in no namespace.

For instance, the fragment:

```xml
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  |
</root>
```
Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the insertLocation. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `${caret}` editor variable (on page 204). The possible values of this action are true and false.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**insertEvenIfInvalid**

The possible values of this argument are true and false. If true, the content that would make the document invalid is accepted. If false and the insertion is not valid, the operation will not be executed and an error message will be displayed.

**Arguments of SurroundWithFragmentOperation**

**fragment**
The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
 <A>
  <X/>
  <Y/>
 </A>
 <B>
  <C/>
 </B>
</F>
```

and the document:

```xml
<doc>
 <X/>
 <Y/>
 <Z/>
<doc>
```

Considering the selected content to be surrounded is the sequence of elements X and Y, then the result is:

```xml
<doc>
 <F>
  <A>
   <X/>
   <Y/>
  </A>
 <B>
  <C/>
 </B>
 </F>
 <Z/>
<doc>
```

Since the element X was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**Note:**

If the first leaf is not the desired location for the surrounded fragment, you can use `ro.sync.ecss.extensions.commons.operations.InsertOrReplaceFragmentOperation` and set the following arguments:

- **fragment**
  
  The XML fragment that will surround the selection. Use the `${selection}` editor variable in the location you want to place the surrounded fragment.

- **schemaAware**
Set it to `false` to avoid moving the fragment if it is not valid at the given location.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

### Adding a Custom Operation to an Existing Framework

This task explains how to add a custom Author mode operation to an existing framework (on page 2080) (document type).

1. Set up a sample project.
2. A variety of classes implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java JAR library.
4. Copy the JAR library to your framework directory (for example, `{OXYGEN_INSTALL_DIR}/frameworks/[FRAMEWORK_DIR]`).
5. Open the Preferences dialog box (on page 61), go to Document Type Association, and edit the document type (you need write access to the `{OXYGEN_INSTALL_DIR}`) to open the Document Type configuration dialog box (on page 81).
   a. In the Classpath tab, add a reference to your JAR library (for example, `${framework}/customAction.jar`).
   b. Go to the Author tab, then go to the Actions subtab.
   c. Click the + New button and use the Action dialog box (on page 89) to create a new action that uses your custom operation.
   d. Mount the action to the toolbars or menus. You can also define a shortcut key.
6. Share the modifications (on page 1584) with your colleagues. The files that should be shared are your customAction.jar library and the .framework configuration file from the `{OXYGEN_INSTALL_DIR}/frameworks/[FRAMEWORK_DIR]` directory.

**Related Information:**

- AuthorOperation API

**Example: Configuring the Insert Section Action for a Framework**

This topic describes the procedure for defining the Insert Section action for a custom framework (on page 2080). It is assumed that the icon files, § (Section16.gif) for the menu item and § (Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu
and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom framework directory ([OXYGEN_INSTALL_DIR]/frameworks [CUSTOM_FRAMEWORK_DIR]).

Figure 282. Action Dialog Box

1. Set the ID field to insert_section. This is a unique action identifier.
2. Set the Name field to Insert Section. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.
3. Set the Menu access key to i. On Windows, the menu items can be accessed using Alt+letter keys combination, when the menu is visible. The letter is visually represented by underlining the first letter from the menu item name having the same value.
4. Add a Description.
5. Set the Large icon (20x20) field to ${framework}/Section20.gif. A good practice is to store the image files inside the framework directory and use editor variable (on page 199) ${framework} to make the image relative to the framework location.
   If the images are bundled in a JAR (on page 2080) archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.
   
   If the image file Section20.gif is located in the images directory inside the JAR archive, you can reference it by using /images/Section20.gif. The JAR file must be added into the Classpath list.
6. Set the Small icon (16x16) field to ${framework}/Section16.gif.
7. Click the text field next to **Shortcut key** and set it to `Ctrl+Shift+S` (`Meta+Shift+S` on macOS). This will be the key combination to trigger the action using the keyboard only. The shortcut is enabled only by adding the action to the main menu of **Author mode** (on page 1479), which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a `<book>`, `<article>`, or another `<section>`.

   a. Set the XPath expression field to:

   ```xml
   local-name()='section' or local-name()='book' or 
   local-name()='article'
   ```

   b. Set the **invoke operation** field to **InsertFragmentOperation** built-in operation, designed to insert an XML fragment at the cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the **Author Default Operations** (on page 1449) section. This set can be expanded with your own Java operation implementations.

   c. Configure the arguments section as follows:

   ```xml
   <section xmlns="http://www.oxygenxml.com/sample/documentation">
   <title/>
   </section>
   ```

   *insertLocation* - leave it empty. This means the location will be at the cursor position.

   *insertPosition* - select "Inside".

**Example: Configuring the Insert Table Action for a Framework**

This topic describes the procedure for defining the **Insert Table** action for a custom **framework** (on page 2080). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action (on page 1475), you will use the **InsertFragmentOperation** built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom **framework** directory (`{OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}\`).

1. Set **ID** field to `insert_table`.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to `t`.
4. Set **Description** field to *>Adds a table element*.
5. Set **Toolbar icon** to `${framework} / toolbarIcon.png`.
6. Set **Menu icon** to `${framework} / menuIcon.png`.
7. Set **Shortcut key** to *Ctrl + Shift + T (Command + Shift + T on macOS)*.
8. Set up the action's functionality:

   a. Set **XPath expression** field to `true()`.
      *true() is equivalent with leaving this field empty.*

   b. Set **Invoke operation** to use *InsertFragmentOperation* built-in operation that inserts an XML fragment to the cursor position.

   c. Configure operation's arguments as follows:

      fragment - set it to:

      ```xml
      <table xmlns="http://www.oxygenxml.com/sample/documentation">
      <header>
      <td/> <td/> <td/>
      </header>
      <tr><td/> <td/> <td/></tr>
      <tr><td/> <td/> <td/></tr>
      </table>
      ```

      insertLocation - to add tables at the end of the section use the following code:

      ```xml
      ancestor::section/*[last()]
      ```

      insertPosition - Select *After*.

**Using Retina/HiDPI Icons for the Actions from a Framework**

Higher resolution icons can also be included in customized *frameworks (on page 2080)* for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the **Document Type Configuration** dialog box (on page 81) (from the **Action** dialog box (on page 89)) or from an API (*ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (on page 1566)*).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (`@2x` or `@3x`) in the **Action** dialog box (on page 89) or the **XMLNodeRendererCustomizer API (on page 1566)**. When using a Retina or HiDPI display, Oxygen XML Author Eclipse plugin automatically searches the folder of the *normal* icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used instead.
Customizing the Menu for a Framework

Defined actions can be grouped into customized menus in the Oxygen XML Author Eclipse plugin menu bar.

1. Open the Document Type configuration dialog box (on page 81), select your custom framework (on page 2080), and go to the Author tab.
2. Go to the Menu subtab. In the left side you have the list of actions and some special entries:
   - Submenu - Creates a submenu. You can nest an unlimited number of menus.
   - Separator - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then click the Edit button.
4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then click the Add as child button. Change the submenu name to Table, using the Edit button.
5. Select the Insert section action in the left panel section and the Table label in the right panel section, then click the Add as sibling button.
6. Now select the Insert table action in the left panel section and the Table in the right panel section. Click the Add as child button.

Figure 283. Configuring the Menu

When opening a test document for a custom framework in Author mode, the menu you created is displayed in between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).
Customizing the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the Author editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the Document Type configuration dialog box (on page 81) for the particular framework (on page 2080) and go to the Author tab. Next, go to the Contextual Menu subtab.
2. Follow the same steps as explained in the Configuring the Main Menu (on page 1479), except changing the menu name because the contextual menu does not have a name.

**Note:**
You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and framework-specific ones) are grouped together under the same submenu.

To test it, open the test file, and open the contextual menu. In the lower part there is shown the Table submenu and the Insert section action.

Customizing the Content Completion Assistant for Author Mode Only

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:
You can use the content completion customization support in a custom framework by following this procedure:

1. Open the Document type configuration dialog box for your custom framework and select the Author tab. Next, go to the Content Completion tab.

![Figure 286. Customize Content Completion](image)

The top side of the Content Completion section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.

2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and click the Add as child or Add as sibling button to include it in the Current actions list. A Content Completion Item dialog box appears, giving you the possibility to select where to provide the selected action.
3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

![Remove Item Dialog Box](image)

**Note:**

In the Item name drop-down menu, `<SPLIT>` refers to the action of splitting the element and creating a new one, while `<ENTER>` refers to the action of inserting a new line.

Related Information:

Customizing the Content Completion Assistant Using a Configuration File (on page 1488)
Customizing the Toolbars for a Framework

This procedure describes how to add defined actions to a toolbar for a custom framework (on page 2080). You can also create additional custom toolbars with existing or custom actions.

1. Open the Document Type configuration dialog box (on page 81) for your custom framework and select the Author tab.

2. Go to the Toolbar subtab.

![Figure 289. Configuring the Toolbar](image)

The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called Separator allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the **Add as child** or **Add as sibling** button.

**Result:** When opening a document for the particular framework in Author mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:**
If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the Author mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the Author Custom Actions toolbar) is selected.
Note:
A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Customizing Text-to-Markup Shortcut Patterns

Some built-in frameworks include a configuration file that defines shortcut patterns that can be used in Author mode to automatically insert a certain XML structure. More specifically, the XML structure (fragment) automatically replaces a specific prefix pattern. For example, if you are editing a DITA document using the built-in DITA framework, entering a hyphen (-) followed by a space at the beginning of a paragraph would automatically replace them with an unordered list element (\texttt{\textless ul\textgreater}) with a child list item element (\texttt{\textless li\textgreater}). This is made possible by the AutoCorrect mechanism in Oxygen XML Author Eclipse plugin.

It is possible to customize the particular configuration file (\texttt{structureAutocorrect.xml}) to define your own markup insertion shortcut patterns by following these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, \texttt{OXYGEN\_INSTALL\_DIR/frameworks/dita/resources}).
2. Open the Preferences dialog box (on page 61) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 85) add a link to that resources folder (if it does not already exist).
3. Create a new \texttt{structureAutocorrect.xml} file or edit an existing one (this file already exists in the resources folder of particular document types and you can use an existing file as a starting point for your customization).
4. Make the appropriate changes to your \texttt{structureAutocorrect.xml} file. The file should look like this:

```xml
<structure-autocorrect>
  <!-- Unordered lists -->
  <prefix-replacement prefix="-">
    <ul><li/></ul>
  </prefix-replacement>
  <!-- Ordered lists -->
  <prefix-replacement prefix="1.">
    <ol><li/></ol>
  </prefix-replacement>
  <!-- Code block -->
  <prefix-replacement prefix="```">
    <codeblock/>
  </prefix-replacement>
</structure-autocorrect>
```
Using this example, when a user enters one of the defined prefixes at the start of an element that allows the corresponding fragment, Oxygen XML Author Eclipse plugin will automatically replace the prefix with its corresponding fragment. For example, entering a hyphen (\-) at the beginning of a paragraph followed by a space would automatically replace them with an unordered list element (<ul>) with a child list item element (<li>). Any subsequently added content would be placed inside the first node/element that does not have a child node/element (in this example, the cursor would be placed in the first <li> element).

5. Save the file in the resources folder for the particular document type, using the fixed name:
   structureAutocorrect.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/structureAutocorrect.xml).

6. Restart the application and open a document for your particular framework to test your customization.

---

**Customizing Smart Paste Support**

The Smart Paste feature (on page 362) preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support Smart Paste (on page 363) in Oxygen XML Author Eclipse plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework (on page 2080)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

**How to Customize the Smart Paste Mapping**

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named resources in the following path structure:
   /frameworks/[Document Type]/resources

2. Create an XSLT file named xhtml2content.xsl and save it in the resources folder for the particular framework.
   For example: /frameworks/[Document Type]/resources/xhtml2content.xsl

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (on page 1487) section below.
Tip:
The built-in DITA framework includes an `xhtml2ditaDriver.xsl` file (in `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in `dita/resources` folder and customize the stylesheets according to your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Author Eclipse plugin.

Result: When you paste content from external applications (such as a web browser or an Office document) to a document that is open in Author mode, and that matches the particular framework, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

Customized Smart Paste Stylesheet Sample:

```xml
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xhtml="http://www.w3.org/1999/xhtml"
  xmlns="urn:hl7-org:v3"
  exclude-result-prefixes="xsl xhtml">

  <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

  <xsl:template match="xhtml:b | xhtml:strong">
    <content styleCode="bold">
      <xsl:apply-templates select="@* | node()"/>
    </content>
  </xsl:template>

  <xsl:template match="*">
    <xsl:apply-templates select="@* | node()"/>
  </xsl:template>

  <xsl:template match="@* | node()">
    <xsl:copy>
      <xsl:apply-templates select="@* | node()"/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

- **inTableContext**
  The custom XSLT stylesheet receives this parameter with a value of `true` if the end-user is pasting content inside a table.

- **folderOfPasteTargetXml**
  A URL pointing to the folder where the currently edited XML document is located. This is used to save images relative to the current XML document.

- **context.path.names**
  A sequence of element names showing the current context in the XML document where the paste occurred.

- **context.path.uris**
  A sequence of namespaces, one for each context path name.

- **context.path.separator**
  The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the resources folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste
(automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>
  <!--True to check if the entire sequence of words which get pasted are converted to the target vocabulary. If the check fails, the content will be inserted as a simple sequence of words without any formatting.-->
  <checkEntireContentIsFullyPreserved>true</checkEntireContentIsFullyPreserved>
</pasteOptions>
```

- Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 1581)

Customize the Content Completion Assistant

Oxygen XML Author Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 2078).
Oxygen XML Author Eclipse plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Author Eclipse plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the Content Completion subtab in the Document Type Association configuration dialog box. To access this subtab, open the Preferences dialog box, go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Content Completion subtab.

  **Note:**
  This works only for Author visual mode.

- You can use a cc_config.xml configuration file that is specific to each document type to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

**Resources**

To see more ideas for various advanced customization possibilities (including how to insert or reject proposals for the content completion assistant), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

**Related information**

Customizing the Content Completion Assistant for Author Mode Only (on page 1480)

**Customizing the Content Completion Assistant Using a Configuration File**

Oxygen XML Author Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant. Oxygen XML Author Eclipse plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Author Eclipse plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the Content Completion subtab in the Document Type Association configuration dialog box. To access this subtab, open the Preferences dialog box, go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Content Completion subtab.
You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Customizing the Content Completion Assistant for Author Mode Only (on page 1480)

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (li) accepts more than 60 child elements. Oxygen XML Author Eclipse plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (li) to only accept paragraph elements (p). In this case, the Content Completion Assistant (on page 2078) should not offer any element other than a paragraph (p) when a list item (li) is inserted into a document. It would also be helpful if the required child element (p) was automatically inserted whenever a list item (li) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be complicated in some cases. Fortunately, Oxygen XML Author Eclipse plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2078), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (on page 61) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 85) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 85) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 85), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc_config.xml) uses <elementProposals> elements. This element allows you to customize or filter the child elements and attributes for an element.

Warning:
Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

Elements:

To control the elements that are proposed for an element, you can use the following attributes for the <elementProposals> element:
• **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the `<title>` elements in the document, while "chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element.

You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`
- `//xs:documentation[@lang="en"]`

**Note:**

Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:

```xml
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
  path="db5:listitem" insertElements="db5:para"/>
```

**Other Important Notes:**

- If the `@path` attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleElements (on page 1492)` or `rejectElements (on page 1493)` to specify or restrict particular elements for a framework (on page 2080).
For example, suppose that in your DITA documents, you want to restrict your users from using `<image>` and `<fig>` elements because you do not want images to be included in your output. The configuration file should look like this:

```xml
<elementProposals rejectElements="image fig" />  
```

Since the `@path` attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- If the particular document type has name namespaces, the `@path` should contain the qualified name. For example, in TEI documents, if you want to set a list of possible attributes for the `<span>` element, you need to use a qualified name like this (notice the declaration of the namespace prefix "t" and its usage):

```xml
<config xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/ccfilter/config
  http://www.oxygenxml.com/ns/ccfilter/config/ccConfigSchemaFilter.xsd"
  xmlns="http://www.oxygenxml.com/ns/ccfilter/config"
  xmlns:t="http://www.tei-c.org/ns/1.0">

  <elementProposals path="t:span" possibleAttributes="type"/>

</config>
```

- **insertElements** - A space-separated sequence of child element names. Each time the element specified in the `@path` attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `<b>` element, followed by an `<i>` element. An empty value ("") means that no child elements should be inserted.

  **Note:**
  
  If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute. For example, "b i codeph ph" means that the Content Completion Assistant will contain these four elements when invoked on the element specified in the `@path` attribute. The following other possible values are also supported:

  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the `insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:
• **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the @path attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

**Note:**

This setting makes the application behave as if the rejected elements were not allowed by the schema in that location. Most of the toolbar actions take the schema into account when inserting content. If the inserted content is not allowed by the schema in that particular location, the application tries to find another location within close proximity where the content is allowed.

For example, suppose you reject the insertions of images in paragraphs. If a user has the cursor inside a paragraph and uses the toolbar action that inserts an image, the image will be inserted after the current paragraph rather than at the current location.

If you want to avoid having users insert an element directly from the content completion mechanism and want them to use a toolbar action instead, it is better to use the Document Type Configuration (on page 101) dialog box to remove the element.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals rejectElements="image fig imagemap foreign" />
```

**Attributes:**

To control the attributes that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

• **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `<title>` elements in the document, while "chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 154).

**Note:**

If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use possibleAttributes (on page 1494) or rejectAttributes (on page 1494) to specify or restrict attributes for an entire framework.
For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```xml
<elementProposals possibleAttributes=""
    id domains href scope format type conref
    props keyref class"/>
```

Since the `@path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```xml
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```xml
<elementProposals path="ol/li">
    <insertAttribute name="platform" value="test"/>
</elementProposals>
```

- **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type"/>
```

- **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals rejectAttributes="importance platform product"/>
```
Other Important Notes About the Configuration File

Important:

• By default, the element names that do not have a namespace prefix are considered from no-namespace. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the @elementPath and @model attributes.
• This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
• To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Reload (F5) action to test your customizations.
• When an XML element from the document is matched against a list of configured elementProposals, the first one in sequence takes precedence. Therefore, make sure you place the more specific elementProposals (those with a longer path) first in your configuration file.
• Simple wildcard patterns can be used in the following attributes: @possibleElements, @rejectElements, @possibleAttributes, and @rejectAttributes. For example, code*, *block, con*ref, _*.
• Editor variables (on page 199) can be used in the @value attribute of the <insertAttribute> element. For example:

```xml
<elementProposals path="prolog/critdates/created">
  <insertAttribute name="date" value="${date(yyyy-MM-dd)}"/>
</elementProposals>
```
• Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex elementProposals patterns are defined, you should avoid infinite recursions.

Examples: Configuring the Element Proposals

• Example 1: Automatically Insert Elements

Suppose that you want to automatically insert a paragraph element (<p>) whenever a DITA ordered list item element (<ol/li>) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```xml
<elementProposals path="ol/li" insertElements="p"
  possibleElements="_INSERTED_"/>
```
Tip:

This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the Content Completion Assistant, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Customizing the Author Mode Editing Experience for a Framework (on page 1442).

• Example 2: Insert Complex Element Structure

For a more complex example, suppose that you want to insert a complex structure whenever a DITA <prolog> element is inserted.

For instance, if you want to insert the following structure inside <prolog> elements:

```
<prolog>
  <author></author>
  <metadata>
    <keywords>
      <keyword></keyword>
      <keyword></keyword>
    </keywords>
  </metadata>
</prolog>
```

the configuration file should include the following:

```
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords" insertElements="keyword, keyword"/>
```

• Example 3: Limit Possible Elements

Suppose that you also want to limit the proposals for the <keywords> element to only allow the user to insert <audience> or <keyword> elements. The configuration file should include the following:

```
<elementProposals path="prolog/metadata" insertElements="keywords" possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting <image> elements inside DITA list item elements (<li>), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="li" rejectElements="image"/>
```
Examples: Configuring the Attributes Proposals

- **Example 1: Automatically Insert Attributes**

  Suppose that you want to insert an \texttt{@id} attribute (with an empty value) whenever a DITA list item element (\texttt{<li>}) is inserted. The configuration file should include the following:

  ```xml
  <elementProposals path="li" insertAttributes="id"/>
  ```

- **Example 2: Limit Possible Attributes**

  Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (\texttt{<li>}) is inserted. The configuration file should look like this:

  ```xml
  <elementProposals path="li" insertAttributes="id"
  possibleAttributes="id product platform audience"/>
  ```

  Suppose that you want to simply restrict your users from inserting \texttt{@conref} attributes inside DITA topics (\texttt{<topic>}) element, but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

  ```xml
  <elementProposals path="topic" rejectAttributes="conref"/>
  ```

- Customizing the Rendering of Elements (on page 1504)

Configuring the Proposals for Attribute and Element Values

Oxygen XML Author Eclipse plugin includes support for configuring the proposed values that appear in the Content Completion Assistant (on page 2078). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the Content Completion Assistant.

For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an \texttt{@xml:lang} attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2078), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, \texttt{OXYGEN_INSTALL_DIR/frameworks/dita/resources}).
2. Open the Preferences dialog box (on page 61) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 85) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.

b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 85) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 85), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (cc_config.xml) includes a series of valueProposals instructions that will match an element or attribute name and has the following attributes:
• path - A path within the document that matches the element or attribute that will have its content completion proposals changed. For example:
  ◦ path="title" matches all the <title> elements in the document.
  ◦ path="chapter/title" matches only the <title> elements that are direct children of the <chapter> element.
  ◦ path="@xml:lang" matches all the @xml:lang attributes in the document.
  ◦ path="title/@xml:lang" matches only the @xml:lang attributes that appear on <title> elements.

You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):
  ◦ element[@attr] - Matches all instances of the specified element that include the specified attribute.
  ◦ element[not(@attr)] - Matches all instances of the specified element that do not include the specified attribute.
  ◦ element[@attr = "value"] - Matches all instances of the specified element that include the specified attribute with the given value.
  ◦ element[@attr != "value"] - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]

The following are just examples of how simplified XPath expressions might look like:
  ◦ elementName
  ◦ /elementName
  ◦ /elementName1/elementName2/elementName3
  ◦ //xs:localName
  ◦ //xs:documentation[@lang="en"]

Note: Using a namespace prefix requires that you declare it on the <elementProposals> element or on an ancestor element. For example:

```xml
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
  path="db5:listitem" insertElements="db5:para" />
```
editable - Specifies the editable state of the attribute values, as reflected in the Attributes view (on page 377) and the In-place Attributes Editor (on page 379). The possible values for the @editable attribute are:

- **true** - The attribute values can be edited by choosing from a combo box or manually providing a value.
- **false** - The attribute values cannot be edited.
- onlyAllowedItems - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

The new value proposals are specified in the <valueProposals> element through:

- One or more <item> elements, which are grouped inside an <items> element.

**Tip:**

The <item> element can have a @listValue attribute, which can be set to true if you want those items to be part of a list attribute value (such as attr="item1 item2").

- An <xsit> element that references an XSLT script that gets executed and must return an <items> element.

The behavior of the <items> or <xsit> elements are specified with the help of the @action attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source. An <xsit> element must be used in this situation.

**Note:**

valueProposals offers more flexibility compared to the old match element that was marked as deprecated.

```
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```
Other Important Notes About the Configuration File

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should Refresh the source document (on page 499).

Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```xml
<!-- Replaces the values for an element with the local name "lg", from the given namespace -->
<valueProposals path="x:lg" xmlns:x="http://www.oxygenxml.com/ns/samples">
    <items action="replace">
        <item value="stanza"/>
        <item value="refrain"/>
    </items>
</valueProposals>

<!-- Adds two values for an attribute "type", from no namespace -->
<valueProposals path="@type" editable="onlyAllowedItems">
    <items>
        <item value="stanza"/>
        <item value="refrain"/>
    </items>
</valueProposals>
```

Example: Using Attribute Conditions

The possible values of an attribute depend on the value of another attribute from the same element:

```xml
<valueProposals path="property[@name='color']">
    <items>
        <item value="red"/>
        <item value="blue"/>
    </items>
</valueProposals>

<valueProposals path="property[@name='shape']">
    <items>
        <item value="rectangle"/>
        <item value="square"/>
    </items>
</valueProposals>
```
Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

**Tip:**
You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

**Note:**
A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New from templates wizard (on page 228)).

**Note:**
If `@useCache` is set to `false`, then the XSLT will be invoked any time the proposals are needed. If `@useCache` is set to `true`, then the XSLT is executed once and the obtained proposals are kept in a cache and returned every time the proposals are requested again. You can use the Validate (Alt + Shift + V, V) action to drop the cached values and recompute them.

Configuring Proposed Values in the Context Where the Content Completion was Invoked

**Web Author Customization Note:**
This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element where the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, `color`) and other values for another property (for example, `shape`). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
</sampleArticle>
```
<property name="color" value=""/>

<!-- The possible values for @value should be "square" and "rectangle" -->
<property name="shape" value=""/>
</sampleArticle>

The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <valueProposals path="property/@value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </valueProposals>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 exclude-result-prefixes="xs"
                 version="3.0">

  <xsl:param name="documentSystemID" as="xs:string"/>
  <xsl:param name="contextElementXPathExpression" as="xs:string"/>

  <xsl:template name="start">
    <xsl:apply-templates select="doc($documentSystemID)"/>
  </xsl:template>

  <xsl:template match="/">
    <xsl:variable name="propertyElement" as="element()">
      <xsl:evaluate xpath="$contextElementXPathExpression" context-item="./"/>
    </xsl:variable>

    <items>
      <xsl:if test="$propertyElement/@name = 'color'>
        <item value='red'/>
        <item value='blue'/>
      </xsl:if>
      <xsl:if test="$propertyElement/@name = 'shape'>
        <item value='rectangle'/>
        <item value='square'/>
      </xsl:if>
    </items>
  </xsl:template>
</xsl:stylesheet>
```
The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context where the content completion was invoked.

**Customizing the Rendering of Elements**

In addition to the support for configuring the proposals that appear in the [Content Completion Assistant](on page 2078), Oxygen XML Author Eclipse plugin also includes support for customizing how the elements are rendered. You can do this by using the [XMLNodeRendererCustomizer API extension](on page 1566), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`<p>`) to be rendered as "Paragraph" instead of "p" in the various components in Author mode (such as in the [Outline view](on page 299), [Elements view](on page 382), [Attributes view](on page 377), and the breadcrumb navigation bar). To achieve this, you can use the `<elementRenderings>` element in the configuration file.

**Setting up the Content Completion Configuration File**

To customize the configuration file for the [Content Completion Assistant](on page 2078), follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the Preferences dialog box (on page 61) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 85) add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it (e.g. create a `resources` folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the
cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 85) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 85), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the <render> element inside a <elementRenderings> element to specify how element names, their annotations, and their icons are rendered.

The <elementRenderings> element supports the @platform attribute, which can have one of the following values:

webapp
The element renderings are only applied to Oxygen XML Web Author.

standalone
The element renderings are only applied to standalone distributions of Oxygen.

eclipse
The element renderings are only applied to Eclipse plugin distributions of Oxygen.
You can use the following attributes for the `<render>` element:

- **element**
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from `noNamespace`.

- **as**
  Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 344), and the Outline (on page 299), Elements (on page 382), and Attributes (on page 377) views). This attribute is optional. If it is missing, the name of the element is used.

  If you want to translate this label into another language, use the `${i18n(key_name)}` editor variable (on page 206). The following code snippet shows how the DITA paragraph elements (`<p>`) can be translated:

  ```xml
  <elementRenderings>
  <render element="p" as="${i18n(cc_p)}"/>
  </elementRenderings>
  ```

- **iconPath**
  Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 299) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Author Eclipse plugin to load "frameworks/${framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Author Eclipse plugin classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Author Eclipse plugin JAR file resources.

- **xml:lang** (Deprecated)
  It is recommended to use the `${i18n(key_name)}` editor variable (on page 206) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `<render>` elements for the same `@element` attribute (element name) and the
The @xml:lang attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

**Note:**
The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (p) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `<render>` element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

```xml
annotation
```

This element can be used within the `<render>` element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (on page 344), and the Outline (on page 299), Elements (on page 382), Attributes (on page 377) views), as well as the tooltips that are displayed when you hover over elements in Text mode. You can use HTML content to style the annotations (see the example below (on page 1508)).

**Note:**
If this element is missing, the styling for the annotations for that element is collected from the associated schema (on page 368).

**Tip:**
The annotations can also be translated in the configuration file. For example:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}">
    <annotation>${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```
Other Important Notes About the Configuration File for Rendering Elements

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Reload (F5)** action to test your customizations.
- If the framework has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: ${oXygenInstallDir}frameworks/${framework}/styleguide/. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
- If an XMLNodeRendererCustomizer API extension has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

**Example: Changing the Rendering of an Element**

Suppose that you want to render the name of the DITA `<title>` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A `<i>`heading`</i>` or `<b>`label`</b>` for the main parts of a topic`</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```
Customizing Annotations in the Content Completion Assistant

Oxygen XML Author Eclipse plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (on page 2078) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 382). If you hover over attributes in the Attributes view (on page 377) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (on page 81) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name:

   contentCompletionElementsMap.xml

4. Open the Preferences dialog box (on page 61), go to Document Type Association, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Author Eclipse plugin will locate your mapping file by doing one of the following:

   - In the Classpath tab add a link to the newly created folder.

   - In the Catalogs tab add a new catalog file (on page 567). The selected file needs to contain the following:

```xml
<catalog

   xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog"
</catalog>
```
where \(\text{processed_dt_name}\) is the name of the document type in lower case and with spaces replaced by underscores.

**Note:**

If Oxygen XML Author Eclipse plugin finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

**Example:** You can look at how the DITA mapping file is configured:

\[ \text{OXYGEN_INSTALL_DIR}/\text{frameworks/dita/styleguide/contentCompletionElementsMap.xml} \]

The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

In the **Content Completion Assistant (on page 2078)**, you should see the additional annotations for each element.

**Translating Annotations**

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Author Eclipse plugin looks for several filename formats to determine the information to load for the content completion annotations. These files that begin with the name **contentCompletionElementsMap**, are located in the **styleguide** folder for each built-in framework (for example, \text{OXYGEN_INSTALL_DIR/frameworks/dita/styleguide}).

For example, for English, the files are loaded in the following order (from specific to more general):

- **contentCompletionElementsMap\_en\_US.xml** or **contentCompletionElementsMap\_en\_UK.xml**, and so on
- **contentCompletionElementsMap\_en.xml**
- **contentCompletionElementsMap.xml**

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the **styleguide** folder for your framework):

- **contentCompletionElementsMap\_de\_DE.xml**
- **contentCompletionElementsMap\_de.xml**
Customizing the Content Completion Assistant for Author Mode Only

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- **Content Completion Assistant (on page 2078)** window
- **Elements** view (on page 382)
- **Insert Element** menus (from the Outline view (on page 299) or breadcrumb (on page 351) contextual menus)

You can use the content completion customization support in a custom framework (on page 2080) by following this procedure:

1. Open the Document type configuration dialog box (on page 81) for your custom framework and select the Author tab. Next, go to the Content Completion tab (on page 101).

   ![Figure 290. Customize Content Completion](image)

   The top side of the **Content Completion** section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.

2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and click the Add as child or Add as sibling button to include it in the Current actions list. A Content Completion Item dialog box appears, giving you the possibility to select where to provide the selected action.
3. If you want to exclude a certain item from the Content Completion proposals, you can use the + Add button from the Filter - Remove content completion items list. The Remove item dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

**Note:**
In the Item name drop-down menu, `<SPLIT>` refers to the action of splitting the element and creating a new one, while `<ENTER>` refers to the action of inserting a new line.

**Related Information:**
Customizing the Content Completion Assistant Using a Configuration File (on page 1488)
Configuring Transformation Scenarios for a Framework

When distributing a framework (on page 2080) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an xsl folder inside your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).

   The folder structure for the documentation framework should be:
   
   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
     schema
     css
     templates
     xsl
   ```

2. Create an xsl file and save it in the xsl folder. To help you get started, you can use the sample sdf.xsl file found in the sample framework customization package.

3. Open the Preferences dialog box (on page 61) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type Configuration dialog box (on page 81), and choose the Transformation tab. Click the + New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

   In the New scenario dialog box, fill in the following fields:
   
   ◦ Fill in the Name field with the name of your transformation scenario.
   
   ◦ Set the XSL URL field to path of your custom stylesheet (for example, ${framework}/xsl/mycustom.xsl).
4. Change to the **Output** tab. Configure the fields as follows:
   - Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
   - Select the **Open in Browser/System Application** option.

   **Note:**
   To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

   - Select the **Saved file** option.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:
To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the sample framework customization package. Click the **Apply Transformation Scenario(s)** button to display the **Transform with** dialog box. The scenario list contains the scenario you defined earlier. Select the `SDF to HTML` scenario that you just defined and click the **Apply associated** button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

### Configuring Validation Scenarios for a Framework

You can distribute a **framework** (on page 2080) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:**

If a **main file** is associated with the current file, the validation scenarios defined in the **main file**, along with any Schematron schema defined in the default scenarios for that particular **framework**, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular **framework**. For more information on **main files**, see Contextual Project Operations Using 'Main Files' Support (on page 252) or Modular Contextual XML Editing Using 'Main Files' Support (on page 570).

To associate a validation scenario with a specific **framework**, follow these steps:

1. Open the **Preferences** dialog box (on page 61) and go to **Document Type Association**.
2. Select the document type and click the **Edit** button to open the **Document Type Configuration** dialog box (on page 81), then choose the **Validation** tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the **Default** box for that specific document type.
3. To edit an existing scenario, select the scenario and click the **Edit** button. To add a new scenario, click the **New** button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the 📦 **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the 📜 **Insert Editor Variable** button to insert an editor variable (on page 199) or a custom editor variable (on page 208).

**File type**

- `{start-dir}` - Start directory of custom validator
- `{standard-params}` - List of standard parameters
- `{cm}` - The current file name without extension
- `{currentFileURL}` - The path of the currently edited file (URL)
- `{cwd}` - The path of current file directory (URL)
- `{frameworks}` - Oxygen frameworks directory (URL)
- `{jdx}` - Project directory (URL)
- `{oxygenHome}` - Oxygen installation directory (URL)
- `{home}` - The path to user home directory (URL)
- `{proj}` - Project name
- `{env(VAR_NAME)}` - Value of environment variable VAR_NAME
- `{system(VAR_NAME)}` - Value of system variable var.name
The type of the document that is validated in the current validation unit. Oxygen XML Author Eclipse plugin automatically selects the file type depending on the value of the URL of the file to validate field.

**Validation engine**

You can select one of the engines available in Oxygen XML Author Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 188), XML Schema preferences page (on page 179)).

- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager, but for a local file rather than an entire DITA map (on page 2079)).

- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager).

- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option (on page 1811)).

**Automatic validation**

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 519). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 121), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

**Settings**

Depending on the selected validation engine, clicking the Settings button either opens the Specify Schema dialog box or the Configure validation engine dialog box.

- **Specify Schema Dialog Box**

  This dialog box allows you to specify a custom schema to be used for the validation process.
The **Specify Schema** dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (*on page 557*).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the ![Insert Editor Variables](on page 199) button, or the browsing actions in the ![Browse](drop-down list).

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify *Java extension JARs* (*on page 2080*) to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

• **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the Validate and Check for Completeness action (on page 1806) in the DITA Maps Manager).

**Note:**
The options presented in the Configure validation engine dialog box depends on type of validation engine. For example, when configuring the DITA-OT Project Validation and Completeness Check validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).
The **Configure Validation Engine** dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 530*).
Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 1762). Clicking the Details icon opens a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to create a profiling condition set.

- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.

- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.

- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2083) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.
Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```xml
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes **key scopes (on page 1923)** into account.

For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a **key scope (on page 1923)** on the second occurrence.

Report unreferenced key definitions
Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

### Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `processing-role` attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

### Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

### Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

### Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 134) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

### Additional Schematron checks
Allows you to select a Schematron file that Oxygen XML Author Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the 
\[ Insert Editor Variables (on page 199) \] button, or the browsing actions in the 
\[ Browse \] drop-down list.

**Move Up**

Moves the selected validation unit up one spot in the list.

**Move Down**

Moves the selected validation unit down one spot in the list.

**Add**

Adds a new validation unit to the list.

**Remove**

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Click Ok.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (on page 107). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

**Customizing New Document Templates for a Framework**

You can create your own custom document templates and attach them to a custom framework (on page 2080). You can then share the custom framework (on page 1584) so that all users will have access to the templates in the New from templates wizard (on page 228).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   **Tip:**
   
   You can use editor variables (on page 199) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 230) for other template customization tips (for example, you could add placeholders or hints (on page 233) to assist authors).

2. Save the new template in a directory (for example, called templates) within your custom framework directory.
3. Open the **Document Type configuration dialog box** (on page 81) for that specific framework, go to the **Templates tab** (on page 104), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). Binding to an absolute file (e.g., C:\some_dir\templates) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.

5. To test the template, open the new document wizard (New toolbar button or File > New > New from Templates) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

**Related Information:**

Customizing Document Templates (on page 230)

---

**Configuring XML Catalogs**

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an **XML Catalog** (on page 2085) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 2080) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

**Example:**

Create a new XML file called catalog.xml and save it in your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

```xml
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd" url="schema/abs.xsd"/>
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd"/>
</catalog>
```
2. Add catalog files to your custom framework using the Catalogs tab (on page 105) from the Document Type configuration dialog box (on page 81).

To test the catalog settings, restart Oxygen XML Author Eclipse plugin and try to validate a new sample document for your custom framework. There should be no errors.

**Example:**

The schema that validates the document refers the other file abs.xsd through an import element:

```xml
```

The @schemaLocation attribute references the abs.xsd file:

```xml
<xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
    http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the abs.xsd file located in the schema directory (note that the schema directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

**Localizing Frameworks**

Oxygen XML Author Eclipse plugin supports framework (on page 2080) localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework.

To localize the content of a framework, follow this procedure:

1. Create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list"/>
</translation>
```
Oxygen XML Author Eclipse plugin matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `<languageList>` tag for the corresponding framework is used.

2. The `translation.xml` file must be stored in a directory named `i18n` located in the framework folder. You also need to add a reference to the `i18n` directory in the `Classpath` list corresponding to the edited document type (on page 85).

3. After you create this file, you can use the keys defined in it to customize the name and description of the following:
   - Actions
   - Menu entries
   - Contextual menus
   - Toolbars
   - Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (on page 61) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 81), go to Author > Actions, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. `Translation_key` corresponds to the key from the `translation.xml` file.

4. Next, open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This is an example of an entry in the `translation.xml` file:

```xml
<key value="translation_key">
  <comment>Bold action name.</comment>
  <val lang="en_US">Bold</val>
  <val lang="de_DE">Bold</val>
  <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the `translation.xml` file in the Java code used by your custom framework, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:
Note:
You can enter any language you want in the `<languagelist>` tag and any number of keys.

DocBook Example:
The translation.xml file for the DocBook framework is located here: 
`[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type, the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (on page 61) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the oxygen-sample-framework module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Framework Java Extensibility Guide
You can add extensions (on page 2082) to your custom framework (on page 2080) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 81).

If you want to customize the Eclipse plugin, you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen APIs.

Configuring an Extensions Bundle
All extensions (on page 2082) that are provided by Oxygen XML Author Eclipse plugin are included in a single bundle.

Note:
The individual extensions can still be set (open the Preferences dialog box (on page 61), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the `ro.sync.ecss.extensions.api.ExtensionsBundle` class. The provided implementation of the `ExtensionsBundle` is instantiated when the Document Type Association (on page 2079) rules defined for the custom framework (on page 2080) matches a document opened in
the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the \(\text{OXYGEN_INSTALL_DIR}/\)lib folder.
2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   
   For example:
   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```

3. A Document Type ID and a short description should be defined by implementing the getDocumentTypeID and getDescription methods. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   
   For example:
   ```java
   public String getDocumentTypeID() {
   }

   public String getDescription() {
       return "A custom extensions bundle used for the Simple Document" +
             "Framework document type";
   }
   ```

4. [Optional] To be notified about the activation of the custom Author Extension in relation with an open document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener. The custom Author Extension state listener should be provided by implementing the createAuthorExtensionStateListener method.
   
   For example:
   ```java
   public AuthorExtensionStateListener createAuthorExtensionStateListener() {
       return new SDFAuthorExtensionStateListener();
   }
   ```

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description
and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in Implementing an Author Extension State Listener (on page 1542).

If Schema-Aware mode (on page 143) is active in Oxygen XML Author Eclipse plugin, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

For more details about this handler, see Handling Schema-Aware Editing Events (on page 1579).

5. **[Optional]** You can customize the content completion proposals by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration. For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemasManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 1535) section.

6. **[Optional]** The Author mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `@id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked. For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 1560) section.

7. **[Optional]** The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the Author editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available...
in Author mode for both Oxygen XML Author Eclipse plugin Eclipse plugin and standalone application. The Text mode corresponding listener is available only for Oxygen XML Author Eclipse plugin Eclipse plugin. The methods corresponding to each implementation are: createAuthorAWTDndListener, createTextSWTDndListener, and createAuthorSWTDndListener.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the Author mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 1537) section.

8. [Optional] Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the ref element and the attribute indicating the referenced resource is location. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements ro.sync.ecss.extensions.api.AuthorReferenceResolver. The method responsible for creating the custom references resolver is createAuthorReferenceResolver. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:

```java
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 1538) section.

9. [Optional] To be able to dynamically customize the default CSS styles for a certain ro.sync.ecss.extensions.api.node.AuthorNode, an implementation of ro.sync.ecss.extensions.api.StylesFilter can be provided. The extensions bundle method responsible for creating the StylesFilter is createAuthorStylesFilter. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 1559) section for more details about the styles filter extension.
10. [Optional] To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the `ExtensionsBundle` specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`. For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 1551) and Configuring a Table Column Width Provider (on page 1545) sections.

If the functionality related to one of the previous extension points does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return `null`.

11. [Optional] An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time the `oxy_link-text()` function (on page 1660) is encountered in the CSS styles associated with an element. For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a `JAR (on page 2080)` file.
13. Copy the `JAR` file into your custom `framework` directory (for example, `frameworks/sdf`).
14. Add the `JAR` file to the class path. To do this, open the Preferences dialog box (on page 61), go to Document Type Association, select the document type (for example, `SDF`), click the Edit button, select
the **Classpath** tab, and click the **Add** button. In the displayed dialog box, enter the location of the **JAR** file relative to the Oxygen XML Author Eclipse plugin **frameworks** folder.

15. Register the Java class by going to the **Extensions** tab. Click the **Choose** button and select the name of the class (for example, **SDFExtensionsBundle**).

**Note:**
The complete source code for **framework** customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

ExtensionsBundle.html

---

### Adding a Custom Image Decorator for Author Mode

The **AuthorImageDecorator** extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

**How to Implement an AuthorImageDecorator**

To implement your own **AuthorImageDecorator**, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1528), you can return the **AuthorImageDecorator** implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.
   b. Specify the **AuthorImageDecorator** in the **Author image decorator** individual extension in the **Extensions** tab (on page 108) of the Document Type configuration dialog box (on page 81) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {
```
Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (on page 2080) the following features:
Automatic ID generation - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 2080). The following methods can be implemented to accomplish this: assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()

Avoiding copying unique attributes when "Split" is called inside an element - You can split the current block element (on page 2077) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: boolean copyAttributeOnSplit(String attrQName, AuthorElement element)

Tip:
The ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework (on page 2080). You can also check out the DITA and DocBook implementations of ro.sync.ecss.extensions.api.UniqueAttributesRecognizer to see how they were implemented and connected to the extensions bundle.

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the ro.sync.contentcompletion.xml.SchemaManagerFilter interface.

```java
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {
```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Author Eclipse plugin or by contributing to the list of proposals. The filter can be applied on
elements, attributes or on their values. Attributes filtering can be implemented using the `filterAttributes` method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAtribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```java
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAtribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
    return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements,
WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
```
```java
if (elements != null) {
    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
        CIElement element = iterator.next();
        // Remove the 'td' element
        if ("td".equals(element.getQName())) {
            elements.remove(element);
            break;
        }
    }
} else {
    elements = new ArrayList<CIElement>();
}
// Insert the 'th' element in the list of content completion proposals
CIElement thElement = new SDFElement();
thElement.setName("th");
elements.add(thElement);
}
else {
    // If the given context is null then the given list of content completion
    // elements contains global elements.
}
return elements;
}
```

The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

---

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

#### Interfaces for the Drag and Drop Listener

`ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDLlistener`
Receives callbacks from the standalone application for Drag And Drop in Author mode.

*com.oxygenxml.editor.editors.author.AuthorDnDListener*

Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.

*com.oxygenxml.editor.editors.TextDnDListener*

Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 1581).

**Related Information:**
Customizing Smart Paste Support (on page 1485)

**Configuring a Reference Resolver**

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the referenced resource is `location`. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the ro.sync.ecss.extensions.api.AuthorReferenceResolver interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;
   import ro.sync.ecss.extensions.api.node.AuthorNode;

   public class ReferencesResolver
      implements AuthorReferenceResolver {

   2. The `hasReferences` method verifies if the handler considers the node to have references. It takes AuthorNode as an argument that represents the node that will be verified. The method will return true if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

   ```java
   public boolean hasReferences(AuthorNode node) {
      boolean hasReferences = false;
      if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
         // Add your reference resolver code here
      }
   ```
3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

```java
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node that needs the reference resolved, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog (on page 2085)`. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference(AuthorNode node, String systemID, AuthorAccess authorAccess, EntityResolver entityResolver) {
    SAXSource saxSource = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                saxSource = new SAXSource();
                saxSource.setSystemId(systemID);
                saxSource.setDtdSystemId("ref-fragment.dtd");
                saxSource.setPublicId("ref-fragment.dtd");
            }
        }
    }
    return saxSource;
}
```
AuthorElement element = (AuthorElement) node;

if ("ref".equals(element.getLocalName())) {
    AttrValue attrValue = element.getAttribute("location");
    if (attrValue != null) {
        String attrStringVal = attrValue.getValue();
        try {
            URL absoluteUrl = new URL(new URL(systemID),
                authorAccess.getUtilAccess().correctURL(attrStringVal));
            InputSource inputSource = entityResolver.resolveEntity(null,
                absoluteUrl.toString());
            if (inputSource == null) {
                inputSource = new InputSource(absoluteUrl.toString());
            }
            XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
            xmlReader.setEntityResolver(entityResolver);
            saxSource = new SAXSource(xmlReader, inputSource);
        } catch (MalformedURLException e) {
            logger.error(e, e);
        } catch (SAXException e) {
            logger.error(e, e);
        } catch (IOException e) {
            logger.error(e, e);
        }
    }
}

return saxSource;
}

5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
```
6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                }
            }
        }
    }
    return systemID;
}
```

In the listing below, the XML document contains the `ref` element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

**Figure 299. Reference with no specified reference resolver**

```xml
Reference without a reference resolver
<Referenced>
```
When the above implementation is configured, the reference has the expected layout:

![Reference with reference resolver](image)

**Figure 300. Reference with reference resolver**

<table>
<thead>
<tr>
<th>Reference with a reference resolver</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference</td>
</tr>
<tr>
<td>Edit referenced content</td>
</tr>
<tr>
<td>Referred paragraph</td>
</tr>
</tbody>
</table>

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

### Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
    private OptionListener sdfOptionListener;

    public void activated(AuthorAccess authorAccess) {
        // Get the value of the option.
        String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", "");
        // Use the option for some initializations...

        // Add an OptionListener.
        authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);
    }
}
```

When the association rules of the framework (on page 2080) (document type) configuration match that of a document open in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. 

```java
public void activated(AuthorAccess authorAccess) {
    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", "");
    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);
}
The `authorAccess` parameter received by the `activated` method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the `ro.sync.ecss.extensions.api.OptionsStorage` can be obtained by calling the `getOptionsStorage` method from the `authorAccess`. The same object can be used to register `ro.sync.ecss.extensions.api.OptionListener` listeners. An option listener is registered in relation with an option key and will be notified about the value changes of that option.

An AuthorListener can be used if events related to the Author mode document modifications are of interest. The listener can be added to the `ro.sync.ecss.extensions.api.AuthorDocumentController`. A reference to the document controller is returned by the `getDocumentController` method from the `authorAccess`. The document controller can also be used to perform operations involving document modifications.

To provide access to the Author mode component-related functionality and information, the `authorAccess` has a reference to the `ro.sync.ecss.extensions.api.access.AuthorEditorAccess` that can be obtained when calling the `getEditorAccess` method. At this level, AuthorMouseListener and AuthorCaretListener can be added to provide notification of mouse and cursor events that occur in the Author editor mode.

The deactivation event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The `deactivate` method is typically used to unregister the listeners previously added on the `activate` method and to perform other actions. For example, options related to the deactivated Author Extension can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
```
"sdf.custom.option.key", optionValue);

// Remove the OptionListener.
authorAccess/optionsStorage().removeOptionListener(sdfOptionListener);

// Remove DocumentListeners.
authorAccess/documentController().removeAuthorListener(
    sdfAuthorDocumentListener);

// Remove MouseListener.
authorAccess/editorAccess().removeAuthorMouseListener(sdfMouseListener);

// Remove CaretListener.
authorAccess/editorAccess().removeAuthorCaretListener(sdfCaretListener);

// Other actions...

}
Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Author Eclipse plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 1551).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Author Eclipse plugin. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 1545).

The table from the example does not make use of the attributes `@colsep` and `@rowsep` (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 1555).

### Configuring a Table Column Width Provider

In a custom framework (on page 2080), the `<table>` element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 1544), if you use the table element attribute `width` Oxygen XML Author Eclipse plugin can determine the table width automatically. In this example the table has `<col>` elements with `@width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.
1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider implements AuthorTableColumnWidthProvider {

}
```

2. Method `init` is taking as argument an `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element. In our case the column widths are specified in `<col>` elements from the `<table>` element. In such cases you must collect the span information by analyzing the `<table>` element.

```java
public void init(AuthorElement tableElement) {
    this.tableElement = tableElement;
    AuthorElement[] colChildren = tableElement.getElementsByTagName("customcol");
    if (colChildren != null && colChildren.length > 0) {
        for (int i = 0; i < colChildren.length; i++) {
            AuthorElement colChild = colChildren[i];
            if (i == 0) {
                colsStartOffset = colChild.getStartOffset();
            }
            if (i == colChildren.length - 1) {
                colsEndOffset = colChild.getEndOffset();
            }
            // Determine the 'width' for this col.
            AttrValue colWidthAttribute = colChild.getAttribute("width");
            String colWidth = null;
            if (colWidthAttribute != null) {
                colWidth = colWidthAttribute.getValue();
                // Add WidthRepresentation objects for the columns this 'customcol'
                // specification spans over.
                colWidthSpecs.add(new WidthRepresentation(colWidth, true));
            }
        }
    }
}
```

3. The method `isTableAcceptingWidth` should check if the table cells are a `<td>` element.

```java
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```
4. The method `isTableAndColumnsResizable` should check if the table cells are a `<td>` element. This method determines if the table and its columns can be resized by dragging the edge of a column.

```java
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

5. Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```java
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}
```

```java
public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}
```

6. Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.
public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
   int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);

                authorDocumentController.setAttribute("width",
                    new AttrValue(newWidth),
                    tableElement);
            } else {
                throw new AuthorOperationException("Cannot find the table element.");
            }
        }
    }
}

public void commitColumnWidthModifications
(AuthorDocumentController authorDocumentController,
   WidthRepresentation[] colWidths, String tableCellsTagName)
throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (colWidths != null && tableElement != null) {
            if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
                authorDocumentController.delete(colsStartOffset, colsEndOffset);
            }

            String xmlFragment = createXMLFragment(colWidths);
            int offset = -1;
            AuthorElement[] header = tableElement.getElementsByLocalName("header");
            if (header != null && header.length > 0) {
                // Insert the cols elements before the 'header' element
                offset = header[0].getStartOffset();
            }
            if (offset == -1) {
                throw new AuthorOperationException("No valid offset to insert column width");
            }
            authorDocumentController.insertXMLFragment(xmlFragment, offset);
        }
    }
}
private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol");
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=" + width.getWidthRepresentation() + """);
        }
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=" + ns + """);
        }
        fragment.append("/>");
    }
    return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

In the listing below, the XML document contains the table element:
When no table column width provider is specified, the table has the following layout:

**Figure 301. Table layout when no column width provider is specified**

![Table layout](image)

When the above implementation is configured, the table has the correct layout:
Figure 302. Columns with custom widths

<table>
<thead>
<tr>
<th>C1</th>
<th>C2</th>
<th>C3</th>
<th>C4</th>
</tr>
</thead>
<tbody>
<tr>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td>cs=1, rs=2</td>
<td>cs=1, rs=3</td>
</tr>
<tr>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>cs=3, rs=1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

Configuring a Table Cell Span Provider

In a custom framework (on page 2080), the `table` element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 1544), you need to indicate Oxygen XML Author Eclipse plugin a method to determine the cell spanning. If you use the `@rowspan` and `@colspan` attributes, Oxygen XML Author Eclipse plugin can determine the cell spanning automatically. In the following example, the `td` element uses the `@row_span` and `@column_span` attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider implements AuthorTableCellSpanProvider {

    // Implementation...
}
```

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `table` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `table` element. In such cases, you must collect the span information by analyzing the `table` element.
public void init(AuthorElement table) {
}

3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

```java
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if(attrValue != null) {
        // The attribute was found.
        String cs = attrValue.getValue();
        if(cs != null) {
            try {
                colSpan = new Integer(cs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```java
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if(attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if(rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}
```
5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td cs=1, rs=1</td>
        <td column_span="2" row_span="2">cs=2, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td cs=1, rs=1</td>
    </tr>
    <tr>
        <td column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```

When no table cell span provider is specified, the table has the following layout:
Figure 303. Table layout when no cell span provider is specified

When the above implementation is configured, the table has the correct layout:

Figure 304. Cells spanning multiple rows and columns.
Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 2080), the `<table>` element has separators between rows. As explained in Configuring Tables (on page 1544), you need to indicate a method to determine the way rows and columns are separated. If you use the `@rowsep` and `@colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Author Eclipse plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
   import ro.sync.ecss.extensions.api.node.AuthorElement;

   public class TableCellSepProvider implements AuthorTableCellSepProvider {
   }
   ```

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `<table>` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

   ```java
   public void init(AuthorElement table) {
   }
   ```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

   ```java
   /**
    * @return false - No column separator at the right of the cell.
    */
   @Override
   public boolean getColSep(AuthorElement cellElement, int columnIndex) {
       return false;
   }
   ```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

5. In the example below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>H1</td>
        <td>H2</td>
        <td>H3</td>
        <td>H4</td>
    </header>
    <tr>
        <td>C11</td>
        <td>C12</td>
        <td>C13</td>
        <td>C14</td>
    </tr>
    <tr>
        <td>C21</td>
        <td>C22</td>
        <td>C23</td>
        <td>C24</td>
    </tr>
    <tr>
        <td>C31</td>
        <td>C32</td>
        <td>C33</td>
        <td>C34</td>
    </tr>
</table>
```

When the borders for the `<td>` element are removed from the CSS, the row separators become visible:
Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you customize the attribute value editing mechanisms in Oxygen XML Author Eclipse plugin. It changes the `Browse` button found in the attribute editors to an `Edit` button. When a user clicks that `Edit` button, your custom attribute value editor will be presented.

The `Edit` button can be accessed in the following attribute editors:

- The `Attributes` view in **Author mode (on page 377)** (when the `Expand` button is used to reveal an expanded panel).
- The `Attributes` view in **Text mode (on page 302)** (when the `Expand` button is used to reveal an expanded panel).
- The `In-place Attributes Editor (on page 379)` when invoked in **Author mode**.
- The `In-place Attributes Editor` invoked in the **Outline view (on page 299)**.

How to Implement a `CustomAttributeValueEditor`

To implement your own `CustomAttributeValueEditor`, follow this procedure:

1. Extend the `ro.sync.ecss.extensions.api.CustomAttributeValueEditor` abstract class.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 1528), you can return the `CustomAttributesValueEditor` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()` method.

b. Specify the `CustomAttributesValueEditor` in the **Author** custom attribute value editor individual extension in the **Extensions** tab (on page 108) of the **Document Type** configuration dialog box (on page 81) for your particular document type.

**Example**

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
    return "My custom attribute value editor";
  }

  /**
   * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
   * (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
   */
  @Override
  public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
      throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog
      ("Set a new value for " + attribute.getAttributeQName() + ":");
  }

  /**
   * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
   */
  @Override
  public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
  }
```
Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

![Dialog box example](image)

### Customizing the CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the Author mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Author Eclipse plugin or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `<table>` element:

```java
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }

```
Customizing Elements that Wrap Profiled Content

For each framework (on page 2080) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 1561) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.

Note:
The complete source code of framework customization examples can be found in the oxygen-sample-framework project.
Default Link Target Reference Finder

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values *(on page 1561).*
- XPointer element() scheme *(on page 1562).*

The method getElementLocator determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null IDTypeVerifier will always be provided if a schema is associated with the document type.

The link string argument is the anchor *(on page 2077)* part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: ":
            + link + ". Cause: " + e, e);
    }
    return elementLocator;
}
```

ID Element Locator

The IDElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.

The constructor only assigns field values and the method endElement is empty for this implementation.

The method startElement checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is xml:id.
- The attribute type is ID.
The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```java
public boolean startElement(String uri, String localName,
                             String name, Attr[] atts) {
    String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
    return elementFound;
}
```

**XPointer Element Locator**

`XPointerElementLocator` is an implementation of the abstract class `ro.sync.ecss.extensions.api.link.ElementLocator` for links that have one of the following XPointer element() scheme patterns:

**element (elementID)**

Locate the element with the specified ID.

**element (/1/2/3)**

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

**element (elementID/3/4)**

A child sequence appearing after a `NCName` identifies an element by means of stepwise navigation, starting from the element located by the given name.
The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element ".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;

    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }
        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            } catch (NumberFormatException e) {
                invalidFormat = true;
            }
        }
        if(invalidFormat){
            throw new ElementLocatorException(
                "Only the element() scheme is supported when locating XPointer links."
                + "Supported formats: element(elementID), element(/1/2/3),
                element(elemID/2/3/4).";
            }
            i++;
        }
    }
    if(Character.isDigit(xpointerPath[0].charAt(0))){
        // This is the case when xpointer have the following pattern /1/5/7
        xpointerPathDepth = xpointerPath.length;
    }
```
The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are:

- **uri**
  - The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- **localName**
  - Local name of the element.

- **qName**
  - Qualified name of the element.

- **atts**
  - Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName,
                            String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
```
currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
}

if (startIndexWithElementID) {
   // This the case when xpath path starts with an element ID.
   String xpathElement = xpathPath[0];
   for (int i = 0; i < atts.length; i++) {
      if (xpathElement.equals(atts[i].getValue())){
         if (idVerifier.hasIDType(
               localName, uri, atts[i].getQName(), atts[i].getNamespace())){
            xpathPathDepth = startElementDepth + xpathPath.length - 1;
            break;
         }
      }
   }

   if (xpathPathDepth == startElementDepth){
      // check if xpath path matches with the current element path
      linkLocated = true;
      try {
         int xpathIdx = xpathPath.length - 1;
         int stackIdx = currentElementIndexStack.size() - 1;
         int stopIdx = startIndexWithElementID ? 1 : 0;
         while (xpathIdx >= stopIdx && stackIdx >= 0) {
            int xpathIndex = Integer.parseInt(xpathPath[xpathIdx]);
            int currentElementIndex =
               ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
            if (xpathIndex != currentElementIndex) {
               linkLocated = false;
               break;
            }
            xpathIdx--;
            stackIdx--;
         }
      } catch (NumberFormatException e) {
         logger.warn(e,e);
      }
   } catch (NumberFormatException e) {
      logger.warn(e,e);
   }
}
The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (on page 299) in Author mode, breadcrumb navigation bar (on page 351) in Author mode, Outline view (on page 299) in Text mode, Content Completion Assistant (on page 2078) window, or DITA Maps Manager view (on page 1762).

Note:

There are two methods to provide an implementation of `ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer`:

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the Document type configuration dialog box (on page 81) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration dialog box (on page 81) (XML node renderer customizer field in the Individual extensions section of the Extensions tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the `XMLNodeRendererCustomizer` should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 469).

For example, for the `<title>` element, if the `XMLNodeRendererCustomizer` returns the path `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file (`myImg@2x.png`) should be added to the same images directory (`${framework}/images/`
myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (on page 468) section.

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

Related Information:
Customizing the Rendering of Elements (on page 1504)
Using Retina/HiDPI Icons for the Actions from a Framework (on page 1478)

Customizing Author Operations

Oxygen XML Author Eclipse plugin Author mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (on page 1449)) and the execution of XPath expressions on the current document edited in Author mode. However, there are situations where you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a+ server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Author Eclipse plugin Author mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Author Eclipse plugin website. It includes the source code of the Author mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Author Eclipse plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

Attention:
Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Author Eclipse plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Author Eclipse plugin with a Java 1.8 virtual
Important:
From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Author Eclipse plugin and ONLY if such extensions are used from inside Oxygen XML Author Eclipse plugin. To use such extensions outside of Oxygen XML Author Eclipse plugin (for example, a 3rd-party application that has Oxygen XML Author Eclipse plugin built in to it), an additional license must be purchased to use the SDK according the Oxygen XML SDK Licensing Policy.

Example 1 - Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom framework (on page 2080). The images are represented by the `<image>` element. The location of the image file is represented by the value of the @href attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.
2. Modify the simple.documentation.framework.InsertImageOperation class that implements the ro.sync.ecss.extensions.api.AuthorOperation interface. This interface defines three methods: doOperation, getArguments and getDescription

A short description of these methods follows:

- The doOperation method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type ro.sync.ecss.extensions.api.AuthorAccess and a map.
  - Argument names and values.
- The getArguments method is used by Oxygen XML Author Eclipse plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The getDescription method is used by Oxygen XML Author Eclipse plugin when the operation is configured. It returns a description of the operation.

Example:

Here is the implementation of these three methods:
/**
 * Performs the operation.
 */

public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
    AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='"
            + href + "'/">";

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment
        (imageFragment, caretPosition);
    }
}

/**
 * Has no arguments.
 *
 * @return null.
 */

public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */

public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}
Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

Important:
Make sure you always specify the namespace of the inserted fragments.

3. Package the compiled class into a JAR (on page 2080) file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
  <target name="dist">
    <jar destfile="sdf.jar" basedir="classes">
      <fileset dir="classes">
        <include name="**/*"/>
      </fileset>
    </jar>
  </target>
</project>
```

4. Copy the sdf.jar file into your custom framework directory
   
   \( \text{\texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks\{CUSTOM\_FRAMEWORK\_DIR\}}} \).

5. Add the sdf.jar to the class path. To do this, open the Preferences dialog box (on page 61), go to Document Type Association, select SDF, and click the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 81) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author Eclipse plugin frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory
   
   \( \text{\texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks\{CUSTOM\_FRAMEWORK\_DIR\}}} \).

8. Define the action’s properties:
   
   - Set ID to insert_image.
   - Set Name to Insert image.
   - Set Menu access key to letter i.
   - Set Toolbar action to \$\{framework\}/toolbarImage.png.
   - Set Menu icon to \$\{framework\}/menuImage.png.
   - Set Shortcut key to Ctrl (Meta on macOS)+Shift+i.
9. Next, set up the operation. You want to add images only if the current element is a `<section>`, `<book>` or `<article>`.

   ◦ Set the value of **XPath expression** to

   ```
   local-name()='section' or local-name()='book'
   or local-name()='article'
   ```

   ◦ Set the **Invoke operation** field to `simple.documentation.framework.InsertImageOperation`.

**Figure 306. Selecting the Operation**

![Operation interface](image)

10. Add the action to the toolbar, using the **Toolbar** panel.

   To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

**Example 2 - Operations with Arguments - Report from Database Operation**

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the **database connection string**, the **user name**, the **password** and the **SQL expression**.
1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Create the class simple.documentation.framework.QueryDatabaseOperation. This class must implement the ro.sync.ecss.extensions.api.AuthorOperation interface.

```java
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{

3. Now define the operation's arguments. For each of them, you will use a String constant representing the argument name:

```java
private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";
```

4. You must describe the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

```java
public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
            ARG_CONNECTION,
            ArgumentDescriptor.TYPE_STRING,
            "The database URL connection string."),
        new ArgumentDescriptor(
            ARG_USER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the database user."),
        new ArgumentDescriptor(
            ARG_PASSWORD,
            ArgumentDescriptor.TYPE_STRING,
            "The database password.")
    };
    return args;
}
```
ARG_SQL,
ArgumentDescriptor.TYPE_STRING,
"The SQL statement to be executed."
);
return args;
}

These names, types and descriptions will be listed in the Arguments table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map) throws IllegalArgumentException, AuthorOperationException {

    // Collects the arguments.
    String jdbcDriver = (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection = (String)map.getArgumentValue(ARG_CONNECTION);
    String user = (String)map.getArgumentValue(ARG_USER);
    String password = (String)map.getArgumentValue(ARG_PASSWORD);
    String sql = (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();
    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql),
            caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: 
            + e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load ' 
            + jdbcDriver + "', e);
    }
}
```
The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the `<` and `&` characters are replaced with the `&lt;` and `&amp;` character entities to ensure that the fragment is well-formed.

```java
private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql)
    throws SQLException,
    ClassNotFoundException {

    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);
    pr.put("password", password);

    // Loads the database driver.
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection =
        DriverManager.getConnection(connectionURL, pr);
    java.sql.Statement statement =
        connection.createStatement();
    ResultSet resultSet =
        statement.executeQuery(sql);

    StringBuffer fragmentBuffer = new StringBuffer();
    fragmentBuffer.append("<table xmlns=" +
    "http://www.oxygenxml.com/sample/documentation'">");

    // Creates the table header.
    // fragmentBuffer.append("<header>");
    ResultSetMetaData metaData = resultSet.getMetaData();
    int columnCount = metaData.getColumnCount();
    for (int i = 1; i <= columnCount; i++) {
        // ...
    }
```
fragmentBuffer.append("<td>");
fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author Eclipse plugin website.

7. Package the compiled class into a JAR (on page 2080) file.
8. Copy the JAR file and the JDBC driver files into your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).
9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (on page 79), select SDF and click the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 81) and click the + Add button. In the
displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author Eclipse plugin frameworks folder.

10. Go to the Actions subtab. The action properties are:
   ◦ Set **ID** to clients_report.
   ◦ Set **Name** to Clients Report.
   ◦ Set **Menu access key** to letter r.
   ◦ Set **Description** to Connects to the database and collects the list of clients.
   ◦ Set **Toolbar icon** to $\{\text{framework}/TableDB20.png\} (the TableDB20.png icon is stored in the frameworks/sdf folder).
   ◦ Leave empty the **Menu icon**.
   ◦ Set **shortcut key** to **Ctrl + Shift + C** (Command + Shift + C on macOS).

11. The action will work only if the current element is a **section**. Set up the operation as follows:
   ◦ Set **XPath expression** to:
     \[
     \text{local-name()} = 'section'
     \]
   ◦ Use the Java operation defined earlier to set the **Invoke operation** field. Click the **Choose** button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>`.

   The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:
   \[
   \text{SELECT userID, email FROM users}
   \]

12. Add the action to the toolbar, using the **Toolbar** panel.

**Figure 307. Java Operation Arguments Setup**
To test the action, open or create an XML file and place the cursor at a valid location. Then click the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

**Figure 308. Table Content Extracted from the Database**

Handling Author Mode Action Events

The **AuthorActionEventHandler** extension point allows you to handle certain **Author** mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press **Enter** instead of it opening the **Content Completion Assistant (on page 2078)**.

**How to Implement an AuthorActionEventHandler**

To implement your own **AuthorActionEventHandler**, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1528), you can return the **AuthorActionEventHandler** implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the **AuthorActionEventHandler** in the **Author action event handler** individual extension in the **Extensions** tab (on page 108) of the **Document Type** configuration dialog box (on page 81) for your particular document type.
Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the `new-line` character. Then the `handleEvent` method inserts the new line at the current cursor position.

```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {
    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent(AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");

                if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                    canHandle = true;
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }

            return canHandle;
        }
    }

    /**
     * public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
     *         boolean canHandle = false;
     *     
     *     if (type == AuthorActionEventType.ENTER) {
     *         AuthorDocumentController documentController = authorAccess.getDocumentController();
     *         int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
     *         try {
     *             AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
     *             AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
     *             AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
     *             if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
     *                 canHandle = true;
     *             }
     *         } catch (BadLocationException ex) {
     *             if (logger.isDebugEnabled()) {
     *                 logger.error(ex.getMessage(), ex);
     *             }
     *         }
     *         return canHandle;
     *     }
     * 
     *     /**
     *     * public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
     *     *         boolean canHandle = false;
     *     *     
     *     *     if (type == AuthorActionEventType.ENTER) {
     *     *         AuthorDocumentController documentController = authorAccess.getDocumentController();
     *     *         int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
     *     *         try {
     *     *             AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
     *     *             AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
     *     *             AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
     *     *             if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
     *     *                 canHandle = true;
     *     *             }
     *     *         } catch (BadLocationException ex) {
     *     *             if (logger.isDebugEnabled()) {
     *     *                 logger.error(ex.getMessage(), ex);
     *     *             }
     *     *         }
     *     *         return canHandle;
     *     *     }
     *     * 
     *     */
     */
```
Handling Schema-Aware Editing Events

The AuthorSchemaAwareEditingHandlerAdapter extension point allows you to handle certain Author mode actions in various ways. For example, implementing the AuthorSchemaAwareEditingHandlerAdapter makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Author Eclipse plugin when pasting content (through the use of some specific methods (on page 1581)).

How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema-Aware Editing option (on page 143) must be set to On or Custom in the Schema-Aware preferences page (on page 143). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, configure an extensions bundle (on page 1528) and return
the `AuthorSchemaAwareEditingHandlerAdapter` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()` method.

**Example**

Typing events can be handled using the `handleTyping` method. For example, the `AuthorSchemaAwareEditingHandlerAdapter` checks if the schema is not a learned one, was loaded successfully, and if the Smart paste and drag and drop option *(on page 144)* is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter
    extends AuthorSchemaAwareEditingHandler {

    /*
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
        throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager =
            authorAccess.getDocumentController().getAuthorSchemaManager();
        if (!authorSchemaManager.isLearnSchema() &&
            !authorSchemaManager.hasLoadingErrors() &&
            authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment =
                    authorAccess.getDocumentController().createNewDocumentTextFragment
                        (String.valueOf(ch));
                handleTyping = handleInsertionEvent
                    (offset, new AuthorDocumentFragment[]{characterFragment}, authorAccess);
            } catch (AuthorOperationException e) {
                throw new InvalidEditException
                    (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
            }
        }
        return handleTyping;
    }
```
Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in Author mode, if the result causes the document to become invalid, Oxygen XML Author Eclipse plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Author Eclipse plugin might surround the pasted content in a sequence of ancestor elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Author Eclipse plugin. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Author Eclipse plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

AuthorDocumentFragment Class

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The `AuthorExternalObjectInsertionHandler` extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own `AuthorExternalObjectInsertionHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler` interface.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the `AuthorExternalObjectInsertionHandler` in the Author extern object Insertion handler individual extension in the Extensions tab (on page 108) of the Document Type configuration dialog box (on page 81) for your particular document type.
b. Otherwise, you can configure an extensions bundle (on page 1528), then return the AuthorExternalObjectInsertionHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler() method.

3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)

and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 85) in the Document Type configuration dialog box (on page 81) for your particular document type.

Example

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
 createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
 getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}
```

Tip:

For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 1485).
Presenting an Edit Properties Dialog Box for Actions in Author Mode

The `EditPropertiesHandler` extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an `EditPropertiesHandler`

To implement your own `EditPropertiesHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.EditPropertiesHandler` interface.
2. To instruct Oxygen XML Author Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1528), you can return the `EditPropertiesHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.
   b. Specify the `EditPropertiesHandler` in the `Editor edit properties handler` individual extension in the `Extensions` tab (on page 108) of the Document Type configuration dialog box (on page 81) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

   /**
    * @see ro.sync.ecss.extensions.api.Extension#getDescription()
    */
   @Override
   public String getDescription() {
      return "Sample implementation that handles properties for a table element.";
   }

   /**
    * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
    */
   @Override
   public boolean canEditProperties(AuthorNode authorNode) {
      // If this node is an image element we can edit its properties.
      return "image".equals(authorNode.getDisplayName());
   }
}
```
```java
/**
 * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
 * (ro.sync.ecss.extensions.api.node.AuthorNode,
 * ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {

    // If we receive this call then it surely an image.
    AuthorElement imageElement = (AuthorElement) authorNode;
    String currentValue = "";
    AttrValue altValue = imageElement.getAttribute("alt");
    if (altValue != null) {
        currentValue = altValue.getValue();
    }
    String newValue = JOptionPane.showInputDialog(
            (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
            "Alternate text",
            currentValue);
    if (newValue != null) {
        authorAccess.getDocumentController().setAttribute("alt",
                new AttrValue(newValue), imageElement);
    }
}
}
```

Example result: If a user were to double-click an `<image>` tag icon (image) in Author mode, the following dialog box would be displayed that allows the user to edit the alternate text property for the image:

![Dialog box](image)

Sharing a Framework

You can create a custom framework by extending a built-in document type (on page 1430) (such as DITA or DocBook) using the Document Type Association preferences page (on page 79), make modifications to it, and then share the extension with your team.
Sharing the Extended Framework

There are several ways that you can share the extended custom framework (on page 1430) with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project Explorer view (on page 244) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 1430), if you have not already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
  4. Go to Options > Preferences > Document Type Association > Locations (on page 80).
  5. In the Additional frameworks directories list, add an entry using the \$pd editor variable (on page 206) like this: \$pd/custom_frameworks.
  6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their Project Explorer view (on page 244), the new framework becomes available in the list of document types.

- Distribute the directory of the extended framework (on page 1430) to the other members of your team. They will simply copy that directory to their /frameworks directory. The new framework will be available in their list of document types when Oxygen XML Author Eclipse plugin starts.

To test the extended framework, the other members of your team can check the list of document types in the Document Type Association preferences page (on page 79) to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

Basic Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a framework (on page 2080). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip:

A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.
XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Author Eclipse plugin needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Author Eclipse plugin detects the schema, see Associating a Schema to XML Documents (on page 557).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, test_report.xsd defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
    </xs:complexType>
  </xs:element>
</xs:schema>
```
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The table element must have children that have a table-row style. Similarly, the row elements must contain elements with a table-cell style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

**report**

The root of a report document. It should be rendered as a box that contains all other elements. To achieve this, the display type is set to block. Additionally, some margins are set for it. The CSS rule that matches this element is:

```css
report {
    display: block;
}
```
margin:1em;
}

title

The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

title {
    display:block;
    font-size:2em;
}

description

Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it standout.

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

line {
    display:block;
}

important

Defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

important {
    display:inline;
    font-weight:bold;
}

results

Displays the list of test_names and the results for each one. To make it easier to read, it is displayed as a table, with a green border and margins.

results{
    display:table;
The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```
entry {
    display:table-row;
}
```

test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```
report {
    display:block;
    margin:2em;
}

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line {
    display:block;
}
```
important {
    display:inline;
    font-weight:bold;
}

title {
    display:block;
    font-size:2em;
}

results{
    display:table;
    margin:2em;
    border:1px solid green;
}

entry {
    display:table-row;
}

test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
**XML Instance Template**

Based on the XML Schema and CSS file Oxygen XML Author Eclipse plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      Database connection test true
    </entry>
    <entry>
      XSLT Transformation test true
    </entry>
    <entry>
      DTD validation test false
    </entry>
  </results>
</report>
```
The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    .......
</report>
```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

### Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type ([framework](on page 2080)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action.

#### Step 1: Organize Framework Files

First, create a new folder for your customized [framework](on page 2080). This folder will be used to store all files related to the documentation [framework]. The folder structure will look something like this:
The frameworks directory is the container where all the Oxygen XML Author Eclipse plugin framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Author Eclipse plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Author Eclipse plugin by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the main schema, to the schema directory and the CSS file sdf.css to the css directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom framework (on page 2080) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (on page 61) and go to Document Type Association > Locations (on page 80). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page (on page 79) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 81) where you can define the set of rules and settings for your custom framework.

3. Give the extension an appropriate name, select External for the Storage option, click the browsing button (を選ぶ) to specify the location of your custom framework directory.

4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 2080), suppose the documents are either articles or books, and composed of sections. The sections may contain
The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">
    <xs:import
        namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
        schemaLocation="abs.xsd"/>
</xs:schema>
```

Next, the structure of the sections is defined. They all start with a `<title>`, then have the optional `<def>` element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.
The paragraph contains text and other custom styling markup, such as bold (<b>) and italic (<i>) elements.

```
<xs:element name="para" type="doc:paragraphType"/>
```

The `<image>` element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The `<table>` element contains a header row and then a sequence of rows (<tr> elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
      <xs:element name="tr" maxOccurs="unbounded">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" type="doc:tdType" maxOccurs="unbounded"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
    <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

### Step 4: Associate the Schema to the Framework

In the bottom section of the **Document Type** configuration dialog box *(on page 81)*, there are a series of tabs. The **Schema** tab refers to the schema that is used for validation of the documents that match the defined association rules.

**Important:**

If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this **Schema** tab is not used for validation or content completion.

**Schema Type**

Select from the combo box the value **XML Schema**.

**Schema URI**

Enter the value of the schema location (for example, `${framework}/schema/sdf.xsd`). Use the **${frameworks}** editor variable *(on page 206)* in the schema URI path instead of a full path to be valid for multiple Oxygen XML Author Eclipse plugin installations.

**Important:**

The **${frameworks}** variable is expanded at the time of validation into the absolute location of the directory containing the **framework (on page 208)**.
Step 5: Create a Custom CSS

If you read the Framework Customization Overview (on page 1585) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```css
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

Important:

Having block display children in an inline display parent results in Oxygen XML Author Eclipse plugin changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight:bold;
}
* * title{
```
It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo-elements will be used, plus the CSS counters.

First declare a counter named `sect` for each `book` or `article`. The counter is set to zero at the beginning of each such element:

```css
book,
article{
  counter-reset: sect;
}
```

The `sect` counter is incremented with each `section`, that is a direct child of a `book` or an `article` element.

```css
book > section,
article > section{
  counter-increment: sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```css
book > section > title:before,
article > section > title:before{
  content: "Section " counter(sect) ". " ;
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```css
section{
  margin-left: 1em;
  margin-top: 1em;
}
```
In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

### Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```css
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

### Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Author Eclipse plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Author Eclipse plugin.

```css
image{
    display:block;
}
```
The `image` element has the required `href` attribute of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```
content: attr(href, url);
margin-left:2em;
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Author Eclipse plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Author Eclipse plugin handles both absolute and relative specified URLs. If the image has an `absolute` URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is `relative` specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the `Author` mode:

```
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
  width:attr(width, length);
}
```
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file (on page 87).

Step 7: Testing the Framework Customization

To test the new framework (on page 2080) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Author Eclipse plugin will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
     xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be as error.
CSS Support in Author Mode

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, Oxygen XML Author Eclipse plugin has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 1430).

Resources

To see a visual demonstration of various advanced customization possibilities (including ideas for tailoring the editing experience using CSS), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

Associating a CSS with an XML Document

Associating a Stylesheet with an XML Document

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:
• Insert the `xml-stylesheet` processing instruction with the `@type` attribute at the beginning of the XML document. The easiest way to do this is by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the XML menu.

CSS example:

```xml
<?xml-stylesheet type="text/css" href="test.css"?>
```

• Add a new CSS file to a framework (on page 2080) (document type). To do so, open the Preferences dialog box (on page 61) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Click the New button to add a new CSS file.

> Note:
The built-in frameworks are read-only, so you need to Extend (on page 80) or Duplicate (on page 79) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 313. Document with no CSS association default rendering

For information about associating a CSS to a framework (document type), see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 2085) URI mappings to determine an indirect CSS referenced location.
Example: CSS Import

For example, if you can have a CSS import, such as:

```css
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 2085) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 173):

```xml
<uri name="http://host/path/to/location/custom.css"
     uri="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 2085) file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
     uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual Author editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables (on page 199) in CSS imports. When editing an XML document with an associated CSS in Author mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```css
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework (on page 2080) folder where the custom.css is placed. In the Document Type Association preferences page (on page 79), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the framework() function.

**Note:**

If you use editor variables like ${cfdu} (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

Displaying Processing Instructions from Other XML Editors

By default, some external processing instructions are hidden (for example, certain processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS (on page 1602) like this:
Specifying Media Types in the CSS

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Author Eclipse plugin Author mode and ignored in other media types. This can be accomplished by using the oxygen media type.

**Example: oxygen Media Type**

```css
b{
  font-weight:bold;
  display:inline;
}

@media oxygen{
  b{
    text-decoration:underline;
  }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Author Eclipse plugin Author mode.

You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Author Eclipse plugin in Windows, and another set of style rules for macOS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

**Example: os and platform Properties**
Oxygen XML Author Eclipse plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also includes support for some style rules that are specific to Oxygen XML Author Eclipse plugin.

**@font-face At-Rule**

Oxygen XML Author Eclipse plugin allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.

**Example: @font-face Rule**

```css
@font-face {
    font-family: "Baroque Script";
    /* The location of the loaded TTF font must be relative to the CSS*/
    src: url("BaroqueScript.ttf");
}
```

The specified `font-family` must match the name of the font declared in the `.ttf` file.

**@media Rule**

The `@media` rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Author Eclipse plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.).

**Supported Media Types**

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
• **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Eclipse plugin **Author** mode. For more information, see Specifying Media Types in the CSS *(on page 1605).*

• **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Eclipse plugin **Author** mode when a dark theme is used (for example, *Graphite*).

• **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Eclipse plugin **Author** mode on a Windows High Contrast Theme with a black background.

• **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Eclipse plugin **Author** mode on a Windows High Contrast Theme with a white background.

**Example: @media Rule**

```
@media oxygen{
  b{
    text-decoration:underline;
  }
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}
```

**Supported Properties**

Oxygen XML Author Eclipse plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

• **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.

• **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```
@media (min-width:500px) {
  p{
    content:'XXX';
  }
}
@media (max-width:700px) {
  p:after{
    content:'YYY';
  }
}
```
Standard W3C CSS Supported Features

Oxygen XML Author Eclipse plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

Tip:
CSS rules that match attributes are always more specific than element selectors. For more information, see https://drafts.csswg.org/selectors-3/#specificity.

The following table lists the CSS selectors that are supported in Oxygen XML Author Eclipse plugin:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any E element (i.e. an element with the local name E)</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a descendant of an E element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a child of an element E.</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type E if it is in (human) language E (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any F element immediately preceded by a sibling element E.</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any F element preceded by a sibling element E.</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>E[foo=&quot;warning&quot;]</code></td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any <code>E</code> element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td><code>E[foo~=&quot;warning&quot;]</code></td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any <code>E</code> element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td><code>E[lang=&quot;en&quot;]</code></td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
<td>Matches any <code>E</code> element whose &quot;lang&quot; attribute has a hyphen-separated list of values beginning (from the left) with &quot;en&quot;.</td>
</tr>
<tr>
<td><code>E:before</code> and <code>E:after</code></td>
<td>Pseudo-elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td><code>E:first-child</code></td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element <code>E</code> when <code>E</code> is the first child of its parent.</td>
</tr>
<tr>
<td><code>E:not(s)</code></td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An <code>E</code> element that does not match simple selector <code>s</code>.</td>
</tr>
<tr>
<td><code>E:has</code></td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (on page 1614).</td>
</tr>
<tr>
<td><code>E:hover</code></td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td><code>E:focus</code></td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td><code>E:focus-within</code></td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements that will have the</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------</td>
<td>-----------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>:focus</td>
<td>:focus pseudo-class</td>
<td></td>
<td>:focus pseudo-class applied. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E:marker</td>
<td>The marker pseudo-class</td>
<td>CSS Level 4</td>
<td>The ::marker pseudo-element represents the automatically generated marker box of a list item.</td>
</tr>
</tbody>
</table>
| E#myid     | The ID selector             | CSS Level 2 | Matches any E element with ID equal to "myid".

**Important:**
Limitation: In Oxygen XML Author Eclipse plugin the match is performed only taking into account the attributes with the exact name: "id".

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>E[att^=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value begins exactly with the string val.</td>
</tr>
<tr>
<td>E[att$=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value ends exactly with the string val.</td>
</tr>
<tr>
<td>E[att=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value contains the substring val.</td>
</tr>
<tr>
<td>E:root</td>
<td>Root pseudo-class</td>
<td>CSS Level 3</td>
<td>Matches the root element of the document. In HTML, the root element is always the HTML element.</td>
</tr>
<tr>
<td>E:empty</td>
<td>Empty pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element that has no text or child elements.</td>
</tr>
<tr>
<td>E:nth-child(n)</td>
<td>The nth-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent.</td>
</tr>
<tr>
<td>E:nth-last-child(n)</td>
<td>The nth-last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent, counting from the last one.</td>
</tr>
<tr>
<td>E:nth-of-type(n)</td>
<td>The nth-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type.</td>
</tr>
<tr>
<td>E:nth-last-of-type(n)</td>
<td>The nth-last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type, counting from the last one.</td>
</tr>
</tbody>
</table>
### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Author Eclipse plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```xml
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```css```
.b {font-weight:bold}
```css```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";

Then:

sync\A

Represents the name A in the http://sync.example.org namespace.

*\B

Represents the name B in ANY namespace, including NO NAMESPACE.

C

Represents the name C in ANY namespace, including NO NAMESPACE.

Example: Defining prefixed namespaces combined with pseudo-elements

To match the <def> element its namespace declares, bind it to the abs prefix and then write a CSS rule:

@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";

Then:

abs\def

Represents the name "def" in the http://www.oxygenxml.com/sample/documentation/abstracts namespace.

abs\def:before

Represents the :before pseudo-element of the "def" element from the http://www.oxygenxml.com/sample/documentation/abstracts namespace.

Subject Selector

Oxygen XML Author Eclipse plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C http://www.w3.org/TR/selectors4/). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

Example:
A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

⚠️ **Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```
Oxygen XML Author Eclipse plugin supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]), as described in Subject Selector (on page 1612). Oxygen XML Author Eclipse plugin also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```css
table:has(tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `<thead>` element in the `<tbody>` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```javascript
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```
Descendant Selectors Limitation

Important:
The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

- \( a:has(b \ c) \)
- \( a:has(b>c) \)

Supported CSS Properties

Oxygen XML Author Eclipse plugin validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in Author mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Author Eclipse plugin-specific (extension) CSS properties, see CSS Extensions (on page 1628).

<table>
<thead>
<tr>

<td>none</td>
<td>[ underline</td>
</tr>
</tbody>
</table>

**Notes:**
- `<length>` refers to measurement units such as pixels (px), inches (in), points (pt), and ems (em).
- `<percentage>` refers to percentages of the parent element.
- `inherit` sets the value to inherit from the parent element.
- `initial` sets the value to the default value.
- `unset` indicates the value is not set.
- `blink` indicates the text decoration is blink.

### Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**
attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
  content: "[Audience Level: " attr(audience) "]";
}
```

If the `<title>` element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Author Eclipse plugin, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: [http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional](http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional). The arguments of the function are:

```attr (attribute_name, attribute_type, default_value)```

**attribute_name**

The attribute name. This argument is required.

**attribute_type**

The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Author Eclipse plugin accepts one of the following types:

`color`
The value represents a color. The attribute may specify a color in various formats. Oxygen XML Author Eclipse plugin supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFEEFF.

url

The value is a URL pointing to a media object. Oxygen XML Author Eclipse plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

integer

The value must be interpreted as an integer.

number

The value must be interpreted as a float number.

length

The value must be interpreted as an integer.

percentage

The value must be interpreted relative to another value (length, size) expressed in percents.

em

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

ex

The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

px

The value must be interpreted as a size expressed in pixels relative to the viewing device.

mm

The value must be interpreted as a size expressed in millimeters.

cm

The value must be interpreted as a size expressed in centimeters.

in

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.
pt

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

pc

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

default_value

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

Example: attr Function

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The `<para>` elements have `@bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);
```

The `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);
```

The complete CSS rule is:

```css
para{
  display:block;
  background-color: attr(bg_color, color);
  font-size: attr(font_size, em);
  margin:attr(space, em);
}
```

The document is rendered as:
CSS Level 3 target-counter() and target-counters() Functions

The CSS Level 3 functions target-counter and target-counters can be used as values for the content property to retrieve counter values and display information obtained from a target at the end of a link.

The target-counter Function

This function retrieves the value of the innermost counter with a given name.

```
target-counter (<fragment>, <counter-name> [, <counter-style>] ?)
```

**fragment**

The URI fragment pointing to the ID of the target element.

**counter-name**

The name of the counter. This argument is required.

**counter-style**

This optional argument can be used to format the result.

Example:

HTML:

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
  </ol>
</nav>
```
CSS:

```
.frontmatter a::after { content: leader('.') target-counter(attr(href), page, lower-roman) }

.bodymatter a::after { content: leader('.') target-counter(attr(href), page, decimal) }
```

Result:

```
Preface.........vii  
Introduction.......xi  
Chapter One.........1
```

### The `target-counters` Function

This function fetches the value of all counters of a given name from the end of a link and formats them by inserting a given string between the value of each nested counter.

```
target-counter (<fragment>, <counter-name>, <delimiter> [, <counter-style>] ?)
```

- **fragment**
  
  The URI fragment pointing to the ID of the target element.

- **counter-name**
  
  The name of the counter. This argument is required.

- **delimiter**
  
  The string to be inserted between the value of each nested counter. This argument is required.

- **counter-style**
  
  This optional argument can be used to format the result.

calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```css
elem {
  width: calc(100% - 1em);
}
```

For more information, see: [https://drafts.csswg.org/css-values-3/#calc-notation](https://drafts.csswg.org/css-values-3/#calc-notation)

Custom CSS Properties (CSS Variables)

Custom properties (also referred to as CSS variables) are properties defined by CSS authors that contain specific values to be reused throughout a document.

Complex websites have many CSS rules, often with a lot of repeated values. For example, the same color might be used in dozens of different places, requiring a global search-and-replace operation if that color needs to be changed. Custom properties allow a value to be stored in one place, then referenced in multiple other places. An additional benefit is semantic identifiers. For example, `--main-text-color` is easier to understand than `#00ff00`, especially if this same color is also used in other contexts.

Custom properties follow the same rules as other CSS properties, so you are able to define and use them at multiple levels, following standard CSS cascading and specificity rules.

Usage

A custom property name begins with a double hyphen (`--`) and its value that can be any valid CSS value. You use the custom property value by specifying your custom property name inside the `var()` function, in place of a regular property value:

**Defining a Custom Property**

```css
element {
  --main-bg-color: brown;
  background-color: var(--main-bg-color);
}
```

**Note:**

Custom property names are case sensitive: `--my-color` will be treated as a separate custom property from `--My-color`.

Inheritance of Custom Properties

If you define a custom property on an element, you will be able to access it on all of its descendents.
Inheritance

```xml
<one>
  <two>
    <three/>
    <four/>
  </two>
</one>
```

```css
one {
  --color:green;
}

three {
  --color:red;
}

* {
  color: var(--color);
}
```

Result:

- `<one>` has the color green.
- `<two>` has the color green.
- `<three>` has the color red.
- `<four>` has the color green.

Custom Properties Fallback Values

The `var()` function has two arguments. The first argument is the name of the custom property to be substituted. The second argument (optional) is a fallback value, which is used as the substitution value when the referenced custom property is invalid or undefined.

Specifying a Fallback Value

```css
one {
  color: var(--color, blue);
}

one {
  color: var(--color, var(--fallback-color, red));
}
```
Dependencies

A custom property can reference the value of another custom property through the `var()` function.

A Custom Property Safely Using a Variable

```css
:root {
  --border-color: red;
  --main-border: 1px solid var(--border-color, green);
}

p {
  border: var(--main-border);
}
```

Combining Custom Variables with `calc()`

```css
:root {
  --foo: 10px;
  --bar: calc(var(--foo) + 10px);
}

p {
  font-size: var(--bar);
}
```

⚠️ CAUTION:

This can create cyclic dependencies where two or more custom properties each attempt to reference each other.

An Invalid Situation of Variables Depending on Each Other

```css
:root {
  --color: var(--bg-color);
  --bg-color: var(--color);
}
```

CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Author Eclipse plugin CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements (on page 2080) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
• Constructing a URL from a relative path location.
• String processing functions.

**Built-in CSS Selectors**

When Oxygen XML Author Eclipse plugin renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

**List of CSS Selector Contributed by Oxygen XML Author Eclipse plugin**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
    display:-oxy-morph !important;
    white-space:pre-wrap !important;

/*
 * EXM-40349
 *
 * In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of styling.
 *
 */
oxo|processing-instruction{oxy-placeholder} {
Example:

To show all entities in the Author mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:
Additional CSS Selectors

Oxygen XML Author Eclipse plugin provides support for selecting additional types of nodes. These custom selectors apply to: `document`, `doctype`, `processing-instruction`, `comment`, `CDATA sections`, `entities`, and `reference sections`. `Processing-instructions` are not displayed by default. To display them, open the Preferences dialog box (on page 61), go to Editor > Author, and select Show processing instructions.

Note:
The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with the `!important` flag. For this reason, you have to set the `!important` flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```xml
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

  ```css
  oxy|document {
    display:block !important;
  }
  ```

- **oxy|doctype** - The following example changes the rendering of `doctype` sections:

  ```css
  oxy|doctype {
    display:block !important;
    color:blue !important;
    background-color:transparent !important;
  }
  ```

- **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

  ```css
  oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
  }
  ```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```
You can match a processing instruction with a particular target from the CSS using the following construct:

```
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```
oxy|processing-instruction[target_name][data="b"]
```

- **oxy|comment** - The XML comments displayed in Author mode can be changed using the `oxy|comment` selector:

```
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

- **oxy|cdata** - The `oxy|cdata` selector matches CDATA sections:

```
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

- **oxy|entity** - The `oxy|entity` selector matches the entity content:

```
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```
oxy|entity[name='amp'],
ox|entity[name='lt'],
ox|entity[name='gt'],
ox|entity[name='quot'],
ox|entity[name='apos'],
ox|entity[name='#']{
    -oxy-display-tags: none;
}
```
• **oxy|reference** - The references to entities, XInclude, and DITA `@conref` and `@conkeyref` attributes are expanded by default in Author mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

You can use the `reference` property to customize the way these references are rendered in Author mode:

```xml
oxy|reference {
    border:1px solid gray !important;
}
```

In the Author mode, content is highlighted when text contains comments (on page 388) and changes (if Track Changes (on page 388) was active when the content was modified).

If this content is referenced, the Author mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

**Note:**

Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

• The following example represents the customization of the reference fragments that contain comments:

```xml
oxy|reference[comments]:before {
    content: "Comments: " attr(comments) !important;
}
```

• To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector:

```xml
oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
}
```

• Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

```xml
oxy|reference[changeTracking][comments]:before {
    content: "Change tracking: " attr(changeTracking) " and comments: " attr(comments) !important;
}
```
Additional CSS Properties

Oxygen XML Author Eclipse plugin provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

-oxy-append-content Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-append-content property adds content to that generated by the lesser specificity rules into a new compound content.

Example:
The content shown before the `element` will be `Hello World!`.

**-oxy-prepend-content Property**

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.

Oxygen XML Author Eclipse plugin allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:

```css
title{
    content: oxy_textfield(edit, '#text', columns, 40);
}
Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Author Eclipse plugin allows you to set the value of the `list-style-type` property to Cyrillic counters. For example, `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

**Example: Cyrillic Counters**

Counting list items with Cyrillic symbols:

```css
li{
    display:list-item;
    list-style-type:-oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: -oxy-display-tags Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Author Eclipse plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with `:before` and `:after` pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode (on page 344).
- **default** - The tag markers will be created depending on the current display mode (on page 344).
- **inherit** - The value of the property is inherited from an ancestor element.

```
-oxy-display-tags
Value: none | default | inherit
Initial: default
Applies to: all nodes(comments, elements, CDATA, etc.)
Inherited: false
Media: all
```

**Example: -oxy-display-tags Property**

In this example, the `para` element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.
Editable: -oxy-editable Property

Used to inhibit editing the content of a particular element.

If you want to inhibit the editing of the content of a certain element, you can set the -oxy-editable CSS property to false (the deprecated editable property is also supported).

Floating Toolbar: -oxy-floating-toolbar Property

Used to display a configured floating toolbar in Author mode.

The -oxy-floating-toolbar property is used to configure and display a floating toolbar in Author mode. It accepts a space-separated list of the following functions:

- oxy_button
- oxy_combobox
- oxy_label

Note:
The "|" text value can be used to add a separator between elements of the toolbar.

It must be used in conjunction with the -oxy-selected and -oxy-selection-inside pseudo-classes. The -oxy-selected pseudo-class is automatically set on an element that is fully selected and the -oxy-selection-inside pseudo-class is automatically set on an element that has a selection inside.

Example 1:

p:-oxy-selection-inside {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'bold')
    oxy_button(actionID, 'italic')
oxy_button(actionID, 'underline')
}

This results in a floating toolbar that contains bold, italic, and underline actions presented in Author mode every time text inside a paragraph element is selected.

**Example 2:**

```html
p:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_label(text, "Platform: ")
    oxy_combobox{
      edit, '@platform',
      editable, false,
      values, 'windows, mac, linux',
      labels, 'Windows, MacOS, Linux'
    }
}
```

This results in a floating toolbar that contains a Platform: label and a drop-down menu used to change the value of the @platform profiling attribute. This is presented in Author mode every time a paragraph element is fully selected.

**Example 3:**

```html
[conref]:-oxy-selected, [conkeyref]:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'add_edit_content_reference')
    oxy_button(actionID, 'remove_content_reference')
    "| |
    oxy_button(actionID, 'conref.replace')
}
```

This results in a floating toolbar that contains Edit Content Reference, Remove Content Reference, and Replace Reference with Content actions presented in Author mode every time an element with a @conref or @conkeyref attribute is fully selected.

**Folding Elements: -oxy-foldable Property**

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Author Eclipse plugin allows you to declare some elements to be foldable (on page 2080). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Author Eclipse plugin marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:
To define the element whose content can be *folded* by the user, you must use the property: `{oxy-foldable:true;}. To define the elements that are *folded* by default, use the `{oxy-folded:true}` property.

**Note:**
The `{oxy-folded}` property works in conjunction with the `{oxy-foldable}` property. Thus, the `{folded}` property is ignored if the `{oxy-foldable}` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The `{oxy-not-foldable-child}` property is used to identify the child element that is kept visible. As its value, it accepts an element name or a list of comma-separated element names. The first occurrence of each child element specified in the list of element names will be identified as the *not-foldable* child and displayed. If the element is marked as *foldable* (`{oxy-foldable:true;}`) but it doesn't have the `{oxy-not-foldable-child}` property or none of the specified *non-foldable* children exists, then the element is still *foldable*. In this case the element kept visible when *folded* will be the *before* pseudo-element.

**Note:**
Deprecated properties `{foldable}`, `{not-foldable-child}`, and `{folded}` are also supported.

**Example: Folding DocBook Elements**

All the elements below can have a `<title>` child element and are considered to be logical sections. You mark them as being *foldable* leaving the `<title>` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
```
Links: -oxy-link Property

Used to specify that a particular element should be considered a link.

Oxygen XML Author Eclipse plugin allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the -oxy-link property on the :before or :after pseudo-element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to \texttt{attr(href)}

**Example: DocBook Link Elements**

The following elements are defined to be links on the :before pseudo-element and their values are defined by the value of an attribute.

```xml
*[href]:before{
  -oxy-link:attr(href);
  content: "Click \texttt{attr(href)} for opening";
}
ulink[url]:before{
  -oxy-link:attr(url);
  content: "Click to open: \texttt{attr(url)}";
}
olink[targetdoc]:before{
  -oxy-link: attr(targetdoc);
  content: "Click to open: \texttt{attr(targetdoc)}";
}
```
Link Navigation: -oxy-link-activation-trigger Property

Used to specify how hyperlinks are handled in Author mode.

The -oxy-link-activation-trigger property is used to specify when hyperlinks are clickable in Author mode. This is helpful for those who are used to the hyperlink activation procedure in other applications (for example, apps that use Ctrl+Click (Command+Click on macOS) to activate hyperlinks.

The possible values are:

- **click** - Hyperlinks are opened when a user mouse-clicks the link icon or text.
- **modifier-click** - Hyperlinks are opened when a user holds down Ctrl (Command on macOS) and mouse-clicks the link icon or text.
- **auto** - The hyperlink strategy is determined automatically, depending on the context.
- **inherit** - The value is inherited from the parent element.

Morph Elements: -oxy-morph Property Value

Used to specify that an element should be displayed inline.

Oxygen XML Author Eclipse plugin allows you to specify that an element has an -oxy-morph display type (deprecated morph property is also supported), meaning that the element is inline if all its children are inline.

**Example: -oxy-morph Property Value**

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline or block behavior, depending on the behavior of its child elements:

```xml
wrapper{
    display:-oxy-morph;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content Property

Used to configure placeholders for empty elements.

Oxygen XML Author Eclipse plugin displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (oxy-placeholder-content and -oxy-show-placeholder).

**-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the -oxy-placeholder-content CSS property.

The following example would change the element to be displayed as key:
---

**Note:**

This CSS property accepts the $\{i18n(key)\} (on page 206) localization editor variable, as in the following example:

```
-oxy-placeholder-content: "$\{i18n(id)\}"
```

---

**-oxy-show-placeholder CSS Property**

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if `before` or `after` content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the Show placeholders for empty elements option (on page 126) (if `before` and `after` content is not declared).
- **no** - Never display placeholders.

---

**Note:**

Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

---

**Related information**

- Using Placeholders in Document Templates (on page 230)

---

**Style Elements: -oxy-style Property**

Used to configure the style of particular elements.

Oxygen XML Author Eclipse plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```
* {
  -oxy-style: attr(style);
}
```
Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

Tip:
The `@style` attribute is supported by default in HTML5 documents.

**Tags Color: -oxy-tags-color Property**

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Author Eclipse plugin does not display element tags. You can use the Partial Tags button from the Author toolbar to control the amount of displayed markup (on page 344).

To configure the default background and foreground colors of the tags, open the Preferences dialog box (on page 61), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (on page 128) and Tags foreground color (on page 128) options.

If you want to be more specific and configure the colors using a CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

**Example:**

```css
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}

title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

**Custom CSS Functions**

Oxygen XML Author Eclipse plugin provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

**Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:
### Syntax

<table>
<thead>
<tr>
<th>Function</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_add(param1, ..., paramN, 'returnType')</code></td>
<td>Adds the values of all parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_subtract(param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply(param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_divide(param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
<tr>
<td><code>oxy_modulo(param1, param2, 'returnType')</code></td>
<td>Returns the remainder of the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>

### Note:

The `returnType` can be `'integer'`, `'number'`, or any of the supported CSS measuring types.

### Example: `oxy_multiply` Function

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:

```css
image:before{
    content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: `oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function (on page 1674) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (`framework` configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the `framework` configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author Eclipse plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an `editor variable` (on page 199).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of `predefined operations` (on page 1449) that can be used.
Note:
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author Eclipse plugin operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

• **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
• **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

Example: *oxy_action function inside an oxy_button form control (on page 1674):*

```java
oxy_button(
    action, oxy_action{
        name, 'Insert',
        description, 'Insert an element after the current one',
        icon, url('insert.png'),
        operation,
            'InsertFragmentOperation',
        arg-fragment, '<element>${caret}</element>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'),
    showIcon, true)
```

Example: *oxy_action Function*

You can also create a button form control directly from an `oxy_action` function:

```java
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After')
```

Tip:
A code template is available to make it easy to add the `oxy_action` function with the *Content Completion Assistant (on page 2078)* by pressing **Ctrl + Space (Command + Space on macOS)** and select the `oxy_action` code template.
Action Lists: oxy_action_list() Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from the oxy_buttonGroup() function (on page 1676) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the oxy_action_list() function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action_list() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (on page 1649). The following properties are supported in the oxy_action() function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author Eclipse plugin (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (on page 199).
- **operation** - The name of the Java class implementing the ro.sync.ecss.extensions.api.AuthorOperation interface. There is also a variety of predefined operations (on page 1449) that can be used.

Note:

If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author Eclipse plugin operations from ro.sync.ecss.extensions.commons.operations package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-string** - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed).
- **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

Example: oxy_action_list Function

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
```
Tip:
A code template is available to make it easy to add the `oxy_action_list` function with the Content Completion Assistant (on page 2078) by pressing `Ctrl + Space (Command + Space on macOS)` and select the `oxy_action_list` code template.

Related information
Actions: oxy_action() Function (on page 1649)
Button Group Form Control (on page 1676)

Attributes Concatenation: oxy_attributes() Function

This function concatenates the attributes for an element and returns the serialization.

Syntax:

```
oxy_attributes()
```

Example: oxy_attributes Function

```
element{
    content: oxy_attributes();
}
```
For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="" />`, the CSS function will display:

```xml
att1="x" xmlns:a="2" x=""
```

**Base URL: oxy_base-uri() Function**

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the XML Base specification for more details.

**Example: oxy_base-uri Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```xml
image[href] {
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
  '.jpeg', 'Thumbnail.jpeg'));
}
```

**Capitalization: oxy_capitalize() Function**

This function capitalizes the first letter of the text received as argument.

**Syntax:**

```xml
oxy_capitalize (text)
```

- **text**
  - The text in which the first letter will be capitalized.

**Example: oxy_capitalize Function**

```xml
*:before{
  content: oxy_capitalize(oxy_name()) "": ";
}
```

This would insert the capitalized qualified name as static text content before the element.

**Compound Actions: oxy_compound_action() Function**

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 1674) or the `oxy_buttonGroup()` form control function (on page 1676).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 1649).
You can use three optional properties (name, description, icon) in the oxy_compound_action() function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first oxy_action function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the oxy_getActionName function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the oxy_getActionDescription function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author Eclipse plugin (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as an editor variable (on page 199). If you want to reuse the icon of an action already defined in your framework, you can use the oxy_getActionIcon function.

The oxy_getActionName, oxy_getActionDescription, and oxy_getActionIcon functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- **fallback** (optional) - A fallback value in case the ID value provided in the framework.defined.action.id parameter is not found.

**Example:** oxy_compound_action Function

```xml
oxy_button(
    action,
    oxy_compound_action(
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url(http://www.oxygenxml.com/img/icn_oxy20.png),
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, '<p audience='''></p>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Activate edit mode',
            description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
        )
    )
)
```
Tip:
A code template is available to make it easy to add the `oxy_compound_action` function with the *Content Completion Assistant* (on page 2078) by pressing **Ctrl + Space (Command + Space on macOS)** and select the `oxy_action_list` code template.

Related information

*Actions: oxy_action() Function (on page 1649)*
*Button Form Control (on page 1674)*

**Concatenation: oxy_concat() Function**

This function concatenates the received string arguments.

**Syntax:**

```
oxym_concat (str_1, str_2)
```

`str_1 ... str_n`

The string arguments to be concatenated.

**Example: oxy_concat Function**

If an XML element has a `@padding-left` attribute:

```
<p padding-left="20">...</p>
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
* [padding-left]{
  padding-left:oxy_concat(attr(padding-left), "px");
}
```

**Get Text: oxy_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

**Syntax:**

```
```
oxy_getSomeText (text, length, endsWithPoints)

text
Displays the actual text.

length
Sets the maximum number of characters that are displayed.

endsWithPoints
Specifies if the truncated text ends with ellipsis.

Example: oxy_getSomeText Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

```xml
*{longdesc}:before{
    content: oxy_getSomeText(attr(longdesc), 200);
}
```

Indexing: oxy_indexof() Function

This function is used to define searches.

The oxy_indexof() function has two signatures:

Syntax 1:

```
oxyl_indexof (text, toFind)
```

Returns the index within text string of the first occurrence of the toFind substring.

| text  | Text to search in. |
| toFind | The searched substring. |

Syntax 2:

```
oxyl_indexof (text, toFind, fromOffset)
```

Returns the index within text string of the first occurrence of the toFind substring. The search starts from fromOffset index.

| text  | Text to search in. |
| toFind | |

The searched substring.

**fromOffset**

The index to start the search from.

**Example: oxy_indexof Function**

```plaintext
oxy_indexof('abcd', 'bc') returns 1.

oxy_indexof('abcdabc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```plaintext
image[longdesc] {
    content: oxy_substring(attr(longdesc), 0,
                        oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Label: oxy_label() Function**

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are `property name - property value` pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - `font-weight`, `font-size`, `font-style`, `font`
  - `text-align`, `text-decoration`
  - `width`
  - `color`, `background-color`
  - `link` - For more information about this property, see the link property section (on page 1645).

```plaintext
element{
    content: oxy_label(text, "Label Text", styles,
                        "font-size:2em;color:red;link:attr(href);"));
}
```
Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```css
* {
    width: 40%;
    text-align: center;
}
```

Then refer that file with an `@import` directive, as follows:

```css
elem {
    content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
}
```

⚠️ **CAUTION:**

Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

>Note:
The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control (on page 1668) function to create a form control based layouts.

**Example: `oxy_label` Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
person:before {
    content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the *Name* label to be set to `bold`, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```css
person:before {
    content: oxy_label(text, "Name:", styles, "font-weight:bold;width:200px")
    oxy_textfield(edit, '@name', columns, 20) "\A *
    oxy_label(text, "Address:", styles, "width:200px")
```
Tip:
A code template is available to make it easy to add the oxy_label function with the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_label code template.

Last Occurrence: oxy_lastindexof() Function

This function is used to define last occurrence searches.

The oxy_lastindexof() function has two signatures:

Syntax 1:

oxy_lastindexof (text, toFind)

Returns the index within text string of the rightmost occurrence of the toFind substring.

text
Text to search in.

toFind
The searched substring.

Syntax 2:

oxy_lastindexof (text, toFind, fromOffset)

The search starts from fromOffset index. Returns the index within text string of the last occurrence of the toFind substring, searching backwards starting from the fromOffset index.

text
Text to search in.

toFind
The searched substring.

fromOffset
The index to start the search backwards from.

Example: oxy_lastindexof Function

oxy_lastindexof('abcdbc', 'bc') returns 4.

oxy_lastindexof('abcdbccdbc', 'bc', 2) returns 1.
If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```javascript
image[longdesc] {
    content: oxy_substring(attr(longdesc), 0,
                        oxy_lastindexOf(attr(longdesc), "Appendix"));
}
```

### Link Text: oxy_link-text() Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 2080), go to Configuring an Extensions Bundle (on page 1528).

#### DITA Support

For DITA, the `oxy_link-text()` function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

#### DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: oxy_link-text Function**

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `@xreflabel` attribute.

```xml
<para>
  <code id="para.id" xreflabel="The reference label">my code</code>
</para>
<para>
  <xref xrefend="para.id"/></para>

xref {
    content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `@href` is not valid), you can use an optional argument to display fallback text.

```javascript
*[class="map/topicref"]:before{
    content: oxy_link-text("Cannot find the topic reference");
    link:attr(href);
}
```
Local Name: oxy_local-name() Function

This function evaluates the local name of the current node.

It does not have any arguments.

**Example: oxy_local-name Function**

To insert the local name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_local-name() "": ";
}
```

Lowercase: oxy_lowercase() Function

This function transforms the text received as argument to lower case.

**Syntax:**

```jsx
oxy_lowercase(text)
```

- **text**
  - The text to be lower cased.

**Example: oxy_lowercase Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_lowercase(oxy_name()) "": ";
}
```

Name: oxy_name() Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

**Example: oxy_name Function**

To insert a qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_name() "": ";
}
```

Parent URL: oxy_parent-url() Function

This function evaluates the parent URL of a URL received as string.
Syntax:

```java
oxy_parent-url ( URL )
```

**URL**

The URL as string.

**Replace: oxy_replace() Function**

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

**Syntax 1:**

```java
oxy_replace ( text, target, replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- **text**
  - The text in which the replace will occur.

- **target**
  - The target string to be replaced.

- **replacement**
  - The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:

```java
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

**Syntax 2:**

```java
oxy_replace ( text, target, replacement, isRegExp )
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

- **text**
  - The text in which the replace will occur.

- **target**
The target string to be replaced.

**replacement**

The string replacement.

**isRegExp**

If *true* the target and replacement arguments are considered regular expressions, if *false* they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```xml
image[title] {
  content: oxy_replace(attr(title), "\s+", ",", true)
}
```

### Substring of Text: `oxy_substring()` Function

This function is used to return a string of text.

The `oxy_substring()` function has two signatures:

**Syntax 1:**

```xml
oxy_substring ( text, startOffset )
```

Returns a new string that is a substring of the original `text` string. It begins with the character at the specified index and extends to the end of `text` string.

- **text**
  
  The original string.

- **startOffset**
  
  The beginning index, inclusive

**Syntax 2:**

```xml
substring ( text, startOffset, endOffset )
```

Returns a new string that is a substring of the original `text` string. The substring begins at the specified `startOffset` and extends to the character at index `endOffset` - 1.

- **text**
  
  The original string.

- **startOffset**
  
  The beginning index, inclusive.

- **endOffset**
The ending index, exclusive.

**Example: oxy_substring Function**

`oxy_substring('abcd', 1)` returns the string 'bcd'.

`oxy_substring('abcd', 4)` returns an empty string.

`oxy_substring('abcd', 1, 3)` returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value: oxy_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

`oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html")` returns the following value:

```
http://www.example.com/a simple example.html
```

**Unparsed Entity URI: oxy_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.

**Syntax:**

```
oxy_unparsed-entity-uri ( unparsedEntityName )
```

`unparsedEntityName`

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an imagedata with `entityref` to an unparsed entity:

```xml
imagedata[entityref]{
  content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```
Uppercase: oxy_uppercase() Function

This function transforms the text received as argument to upper case.

Syntax:

```
oxy_uppercase (text)
```

text

The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
    content: oxy_uppercase(oxy_name()) "": ";
}
```

URL: oxy_url() Function

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Author Eclipse plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 199) (built-in or custom).

Syntax:

```
oxym_url (base_location, loc_1, loc_2)
```

**base_location**

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

**loc_1 ... loc_n (optional)**

Strings representing relative location path components.

Examples: oxy_url Function

The following function receives String objects as input parameters:

```
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```
The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```html
image[href]{
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href),
        '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 199) as the first parameter to point to the Oxygen XML Author Eclipse plugin installation location:

```html
image[href] {
    content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related information
Editor Variables (on page 199)

**XPath: oxy_xpath() Function**

This function is used to evaluate XPath expressions.

**Syntax:**

```html
oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ])
```

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced `xi:include` section or inside artificially referenced content (for example, DITA `@conref` or `@topicref` references).

The parameters of the function are as follows:

- A required **expression** parameter, which is the XPath expression to be evaluated.
- An optional **processChangeMarkers** parameter, followed by its value, which can be either **true** or **false** (default value). When you set the parameter to **true**, the function returns the resulting text with all the change markers accepted (**delete** changes are removed and **insert** changes are preserved).
- An optional **evaluate** parameter, followed by its value, which can be one of the following:
  - **dynamic** - Evaluates the XPath each time there are changes in the document.
  - **dynamic-once** - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other
nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.

- **static** - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

---

**Note:**

When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

---

**Example: oxy_xpath Function**

The following example counts the number of words from a paragraph (including tracked changes) and displays the result in front of it:

```xml
para:before{
  content:
  concat("|Number of words:|",
    oxy_xpath{
      "count(tokenize(normalize-space(string-join(text(), ' ')), ' '))",
      processChangeMarkers,
      true),
    "| "");
}
```

---

**Note:**

The `oxy_xpath()` function supports editor variables, as in the following example:
Form Controls

Oxygen XML Author Eclipse plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Author Eclipse plugin also supports custom form controls in Java (on page 1699).

How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 1684), its dedicated function is oxy_datePicker.
3. Associate the CSS file with the XML document in one of the following ways:
   ◦ If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 1442). This approach is recommended if you intend on sharing the customization with others.
   ◦ If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 1602).

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.
The `oxy_audio` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_audio Form Control**

```
object {
    content:
    oxy_audio(
        href, 'resources/audio.mp3',
        width, 200px),
    }
```

Tip:

To insert a sample of the `oxy_audio` form control in a CSS file, invoke the *Content Completion Assistant (on page 2078)* by pressing **Ctrl + Space (Command + Space on macOS)** and select the `oxy_audio` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

```
{OXYGEN_INSTALL_DIR}/samples/form-controls.
```

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related information**

- Custom CSS Functions *(on page 1648)*
- URL: `oxy_url()` Function *(on page 1665)*

---

**Browser Form Control**

The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Author Eclipse plugin workspace.

The `oxy_browser` form control supports the following properties:
**href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg')), width, 50%, height, 50%)
```

**width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```javascript
object {
  content:
  oxy_browser{
    href, 'http://example.page',
    width, 600px,
    height, 400px,
  }
}
```

**Tip:**
To insert a sample of the oxy_browser form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_browser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

```
[OXYGEN_INSTALL_DIR]/samples/form-controls
```

**Interacting with the Oxygen XML Author Eclipse plugin Workspace**

The oxy_browser form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the oxy_browser form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Author Eclipse plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

**Important:**
This will only work if the loaded HTML is located inside a framework or plugin directory (on page 80), such as: [OXYGEN_INSTALL_DIR]/frameworks/ or [OXYGEN_INSTALL_DIR]/plugins/.

The following global variables can be used:
• **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.

• **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.

• **pluginWorkspace** - An instance of `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace`.

• **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.

• **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", boolean],
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.

**Warning:**

On macOS, you need to use asynchronous calls to the API, due to the following JDK bug: [https://bugs.openjdk.java.net/browse/JDK-8087465](https://bugs.openjdk.java.net/browse/JDK-8087465). By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
```
Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

   ```javascript
   function bridgeReady () {
     // We declare a member function for each method of the
     // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
     var handler = {
       attributeChanged : function(event) {
         var node = event.getOwnerAuthorNode();
         var attrName = event.getAttributeName();

         if (node.equals(contextElement) && attrName === "counter") {
           init();
         }
       },
       contentDeleted : function(event) {},
       contentInserted : function(event) {}
     };

     // We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
     // delegate its methods to the JS object's functions.
     // We assign the listener to a global variable so that we can remove it later on,
     // on the dispose() method.
     authorDocumentListener = apiHelper.createProxyListener("ro.sync.ecss.extensions.api.AuthorListener", handler);

     var ctrl = authorAccess.getDocumentController();

     // Add the proxy listener.
     ctrl.addAuthorListener(authorDocumentListener);
   }
   
2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, the `dispose()` JavaScript function is invoked, so if
you have any cleanup to do, make sure you define a function with this name and remove any previously created listeners in it.

```javascript
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}
```

### Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above (on page 1670), you can debug the script by using the following guidelines:

- **Calls to** `alert("message.to.present")` or `console.log("message.to.present")` **will be presented in the Results panel (on page 308).**
- **You can install the Firebug extension** by executing the following script:

```javascript
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document.createElement('NS') && document.documentElement.namespaceURI;
        E = E ? document.createElementNS(E, 'script')
            : document.createElement('script');
        E.setAttribute('id', 'FirebugLite');
        E.setAttribute('src',
            'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
        E.setAttribute('FirebugLite', '4');
        (document.getElementsByTagName('head')[0]
            || document.getElementsByTagName('body')[0]).appendChild(E);
        E = new Image;
        E.setAttribute('src', 'https://getfirebug.com/' + '#startOpened');
    }
}
```

**Note:** To force the **Browser Form Control** to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:
Button Form Control

The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be true or false (default value).

- **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
  element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
  }
```

- **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
  element {
    content: oxy_button(actionID, 'remove.attribute', showIcon, true);
  }
```

- **enableInReadOnlyContext** - To enable button form controls (on page 1674) or groups of buttons form controls (on page 1676) this property needs to be set to true. This property can be used to specify areas as read-only (by setting the oxy-editable property to false). This is useful when you want to use an action that does not modify the context.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}

• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are *element* (default value) and *caret*. If you select the *element* value, the context is the element that holds the form control. If you select the *caret* value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the *element* value is selected automatically.

• **actionID** - The ID of the action, specified in the *document type association* (on page 89), that is invoked when you click the button.

Note: The element that contains the form control represents the context where the action is invoked.

• **action** - Defines an action directly, rather than using the *actionID* parameter to reference an action from the *document type association* (on page 89). This property is defined using the *oxy_action* function (on page 1649).

Tip: You can also create a button form control directly from an *oxy_action* function (on page 1650).

```xml
oxy_button(action, oxy_action{
  name, 'Insert',
  description, 'Insert an element after the current one',
  icon, url('insert.png'),
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After'
})
```

Tip: To execute multiple actions sequentially, you can use the *oxy_compound_action* function (on page 1653).

Example: **oxy_button** Form Control

```xml
button:before {
  content: "Label:"
}
```
oxy_button(
    /* This action is declared in the document type
       associated with the XML document. */
    actionID, "insert.popupWithMultipleSelection");
}

Tip:
To insert a sample of the oxy_button form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_button code template. Also, an oxy_button_in_place_action code template is available that inserts an oxy_button function that includes an action parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:
[OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:
https://www.youtube.com/embed/-WY3wzkMSLM

Related information
Custom CSS Functions (on page 1648)
Actions: oxy_action() Function (on page 1649)

Button Group Form Control
The oxy_buttonGroup built-in form control is used for a graphical user interface group of buttons that invokes one of several custom Author mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_buttonGroup form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the $\{i18n()\} editor variable (on page 206).
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be true or false.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
• **enableInReadOnlyContext** - To enable button form controls (on page 1674) or groups of buttons form controls (on page 1676) this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

• **actionIDs** - The IDs of the actions that will be presented in the group of buttons.

• **actionID** - The ID of the action, specified in the [document type association](on page 89), that is invoked when you click the button.

**Note:**
The element that contains the form control represents the context where the action is invoked.

• **actions** - Defines a sequential list of actions directly, rather than using the `actionID` parameter to reference actions from the [document type association](on page 89). This property is defined using the `oxy_action_list` function (on page 1651).

```xml
oxy_buttonGroup(
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  actions,
  oxy_action_list(
    oxy_action(
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<element></element>',
      arg-insertLocation, '.',
      arg-insertPosition, 'After'
    ),
    oxy_action(
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    )
  )
)
```
To execute multiple actions sequentially, you can use the `oxy_compound_action` function (on page 1653) in the `oxy_action_list` function (on page 1651).

```xml
<p:before {
  content:
    oxy_buttonGroup{
      label, 'A group of actions',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      actions,
      oxy_action_list{
        oxy_compound_action{
          name, oxy_getActionName('framework.id', 'Fallback'),
          description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
          icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
          oxy_action{
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, "<p audience=''></p>",
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
          },
          oxy_action{
            name, 'Activate edit mode',
            description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
            operation, 'SetPseudoClassOperation',
            arg-name, 'edit-mode-on',
            arg-elementLocation, '.'
          }
        },
        oxy_action{
          name, 'Delete',
          description, 'Deletes the current element',
          operation, 'DeleteElementOperation'
        }
      }
    }
}
```
• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or both.

**Example: oxy_buttonGroup Form Control**

```css
buttongroup:before {
  content:
  oxy_label(text, "Button Group:", width, 150px, text-align, left)
  oxy_buttonGroup(
    label, 'A group of actions',
    /* The action IDs are declared in the document type associated with the XML document. */
    actionIDs,
    "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both")
}
```

**Tip:**
To insert a sample of the `oxy_buttonGroup` form control in a CSS file, invoke the **Content Completion Assistant** by pressing Ctrl + Space (Command + Space on macOS) and select the `oxy_buttonGroup` code template. Also, an `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

`{OXYGEN_INSTALL_DIR}/samples/form-controls`

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Actions: `oxy_action()` Function *(on page 1649)*
Checkbox Form Control

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a **QName** (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility property to oxy-collapse-text` (on page 1640) to render the text only in the form control that the `oxy_editor` function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$\{comma\}` variable (on page 205).

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.\
• **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

• **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$\{i18n()\}` editor variable (on page 206). If this property is not specified, the `values` property is used as the label.

• **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```plaintext
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: Single oxy_checkbox Form Control**

```plaintext
checkBox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)
          The values are specified in the CSS:"
  oxy_checkbox(
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
    labels, "On/Off")
}
```

**Example: Multiple oxy_checkbox Form Controls**

```plaintext
multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value.
          Depending whether the check-box is selected,
          a different value is committed:"
  oxy_checkbox(
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started")
}
```
Tip:

To insert a sample of the oxy_checkbox form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_checkbox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

[OXYGEN_INSTALL_DIR]/samples/form-controls.

Collapse Text: -oxy-collapse-text Property Value (on page 1640)

Combo Box Form Control

The oxy_combobox built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The oxy_combobox form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  Note:
  You can set the value of the visibility property to -oxy-collapse-text (on page 1640) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
• **editable** - This property accepts the **true** and **false** values. In addition to a drop-down menu, the **true** value also generates an editable text field box that allows you to insert other values than the proposed ones. The **false** value generates a drop-down menu that only accepts the proposed values.

• **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the **${comma}** variable (on page 205).

• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

```
Note:
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.
```

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.

• **labels** - This property must have the same number of items as the **values** property. Each item provides a literal description of the items listed in the **values** property. These labels can be translated using the **${i18n()}** editor variable (on page 206).

```
Note:
This property is only available for read-only combo boxes (the **editable** property is set to **false**).
```

• **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element that was used to insert it.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

• **canRemoveValue** - If the value is set to **true** and the combo box is not editable, then a new **<Empty>** value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.
• **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function *(on page 1649)* or referenced from the framework *(on page 2080)* by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

**Example: oxy_combobox Form Control**

```css
comboBox:before {
  content: "A combo box that edits an attribute value. The possible values are provided from CSS:"

  oxy_combobox{
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action{
      name, 'Insert',
      operation, 'XQueryUpdateOperation',
      arg-script, 'insert node <product>{xs:string(@attribute)}</product>
        as last into .');
  }
}
```

**Tip:**

To insert a sample of the `oxy_combobox` form control in a CSS file, invoke the Content Completion Assistant *(on page 2078)* by pressing Ctrl + Space (Command + Space on macOS) and select the `oxy_combobox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

```
{OXYGEN_INSTALL_DIR}/samples/form-controls
```

- Collapse Text: `-oxy-collapse-text Property Value *(on page 1640)*

**Date Picker Form Control**

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.
The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility property to oxy-collapse-text (on page 1640)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **format** - This property specifies the format of the inserted date, if a specific format is not detected from the associated document schema. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example:** `oxy_datePicker Form Control`
Tip:
To insert a sample of the oxy_datePicker form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_datePicker Code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Custom CSS Functions (on page 1648)
Label: oxy_label() Function (on page 1657)

HTML Content Form Control
The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

• href - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
• id - The unique identifier of an item. This is a <div> element that has a unique @id and is a child of the <body> element. The <div> element is the container of the HTML content to be rendered by the form control.
• content - An alternative to the @href and @id pair of elements. It provides the HTML content that will be displayed in the form control.
• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `p_description <div>` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```css
p#intro_id:before {
    content: oxy_htmlContent(
        href, "descriptions.html",
        id, "p_description",
        width, 400px);
}
```

An alternative example, using the `content` property:

```css
p#intro_id:before {
    content: oxy_htmlContent{
        content, "<div style='font-weight:bold;'>My content</div>",
        width, 400px);
    }
```

**Note:**

Anchor HTML elements are displayed but the links are inactive.
Tip:
To insert a sample of the oxy_htmlContent form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_htmlContent code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

\[OXYGEN_INSTALL_DIR\]/samples/form-controls.

https://www.youtube.com/embed/-WY3wzkMSLM

Related information
Custom CSS Functions (on page 1648)

Pop-up Form Control

The oxy_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy_popup form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the visibility property to oxy-collapse-text (on page 1640) to render the text only in the form control that the oxy_editor function specifies.

- **rows** - This property specifies the number of rows that the form control presents.

  **Note:**
  If the value of the rows property is not specified, the default value of 12 is used.

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.
Note:
This property is used for rendering in the Author mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$\{comma\}$ variable (on page 205).

Example:

```css
link:before{
  content: oxy_popup(
    edit, 'Href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris$\{comma\}Snowdrop, Gardenia$\{comma\}Liliac,
           Chrysanthemum$\{comma\}Salvia, Gerbera",
    selectionMode, single);
}
```

- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note:
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.

Note:
The value of the `resultSeparator` property cannot exceed one character.

- **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.

- **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character. This property is used for the visual representation of the form control.
• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are *ascending* and *descending*.

• **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are *ascending* and *descending*.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the resultSeparator property is used.

• **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the editorSort and rendererSort properties have a higher priority. The possible values of this property are *ascending* and *descending*.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_popup Form Control**

```css
popupWithMultipleSelection:before {
  content: "This editor edits an attribute value. The possible values are specified inside the CSS:

oxy_popup(
    edit, "$attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);

  font-size: 30px;
}
```
Tip:
To insert a sample of the oxy_popup form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_popup code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

Custom CSS Functions (on page 1648)
Collapse Text: -oxy-collapse-text Property Value (on page 1640)

Text Area Form Control

The oxy_textArea built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The oxy_textArea form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - *@attribute_name* - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - *#text* - Specifies that the presented/edited value is the simple text value of an element.
  - *#content* - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:
then the text area form control will edit the following fragment:

```
<START_TEXT><ph>phase</ph><apiname><text>API</text></apiname></START_TEXT>
```

**Note:**
When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
  content:
  oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
<START_TEXT><ph>phase</ph><apiname><text>API</text></apiname></START_TEXT>
```

**Note:**
When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.

• **contentType** - Specifies the type of content that the form control will format with syntax highlighting. The following values are supported: `text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text/xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/text/batch; text/rnc; text/dtd; text/nvdl; text/plain`.

• **indentOnTab** - Specifies the behavior of the Tab key. If the value of this property is set to `true` (default value), the Tab key inserts characters. If it is set to `false`, Tab is used for navigation, jumping to the next editable position in the document.

• **white-space** - CSS property that influences the value that you edit, as well as the form control size:
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specifies, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.
  - **normal** - The white spaces and new lines are normalized.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Note:**
The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
  visibility: -oxy-collapse-text;
}
```
white-space: pre;
}

textarea[language="CSS"]:before {
  content: oxy_textArea(
    edit, '#text',
    contentType, 'text/css');
}

textarea[language="XML"]:before {
  content: oxy_textArea(
    edit, '#text',
    contentType, 'text/xml',
    rows, 10,
    columns, 30);
}

Tip:
To insert a sample of the oxy_textArea form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_textArea code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

[OXYGEN_INSTALL_DIR]/samples/form-controls.

Text Field Form Control

The oxy_textfield built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The oxy_textfield form control supports the following properties:
• **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  ◦ **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a [QName](on page 2083) and the CSS must have a namespace declaration for the prefix.
  ◦ **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**

  You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 1640) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$[comma]` variable (on page 205).
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

  **Note:**

  If the value is `false`, the [Content Completion Assistant](on page 2078) considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

  For example, suppose the possible values for your text field are: `value a`, `value b`, and `other values`. If the `hasMultipleValues` property is set to `true` and the user enters `*value ` (notice the space character after `value`) in the text field, the [Content Completion Assistant](on page 2078) will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the `hasMultipleValues` property was set to `false`, the
Content Completion Assistant would only suggest `value a` and `value b` because the space is considered part of the prefix.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textfield Form Control**

```xml
<element {
  content: "Label: ">
    oxy_textfield{
      edit, "@my_attr",
      values, "value1, value2",
      color, "red",
      columns, 40};
  }
```

**Tip:**
To insert a sample of the `oxy_textfield` form control in a CSS file, invoke the **Content Completion Assistant (on page 2078)** by pressing **Ctrl + Space (Command + Space on macOS)** and select the `oxy_textfield` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls`

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Custom CSS Functions (on page 1648)
- Collapse Text: -oxy-collapse-text Property Value (on page 1640)
URL Chooser Form Control

The oxy_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently open editor.

The oxy_urlChooser editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2083) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the visibility property to oxy-collapse-text (on page 1640) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "jpg,png,gif" is mapped to three filters that will display all jpg, png, and gif files respectively.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example:** oxy_urlChooser Form Control
urlChooser[file]:before {
  content: "A URL chooser editor that allows browsing for a URL. The selected URL is made relative to the currently edited file:"
  oxy_urlChooser(
    edit, "@file",
    columns 25);
}

Tip:
To insert a sample of the oxy_urlChooser form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_urlChooser Code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

{OXYGEN_INSTALL_DIR}/samples/form-controls.

Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4'), width, 400px, height, 300px)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_video Form Control

```object {
  content:
```
Tip:
To insert a sample of the oxy_video form control in a CSS file, invoke the Content Completion Assistant (on page 2078) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory:

{OXYGEN_INSTALL_DIR}/samples/form-controls.

Implementing Custom Form Controls
If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation
You can specify custom form controls using the following properties:

• rendererClassName - The name of the class that draws the edited value. It must be an implementation of ro.sync.ecss.extensions.api.editor.InplaceRenderer. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.

• swingEditorClassName - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of ro.sync.ecss.extensions.api.editor.InplaceEditor.

• swtEditorClassName - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the ro.sync.ecss.extensions.api.editor.InplaceEditor.

Note:
If the custom form control is intended to work in the Oxygen XML Author Eclipse plugin standalone distribution, the declaration of swtEditorClassName is not required. The renderer
(the class that draws the value) has different properties from the editor (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.

- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Author Eclipse plugin will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

- **ecHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

  The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 2080) that contains this implementation can either be added in the **Classpath** tab in the **Document Type Configuration** dialog box (on page 85) for your particular **framework** (on page 2080) or specified with the **classpath** property (on page 1700).

**Example: Java Code**

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {

    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */

    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                        context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the **built-in form controls** (on page 1668), as well as specified custom properties.
Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
  content: oxy_editor(
    rendererClassName, "com.custom.editors.CustomRenderer",
    swingEditorClassName, "com.custom.editors.SwingCustomEditor",
    swtEditorClassName, "com.custom.editors.SwtCustomEditor",
    edit, "@my_attr",
    customProperty1, "customValue1",
    customProperty2, "customValue2"
  )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Author Eclipse plugin SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 2080) library.
4. Copy the JAR library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Author Eclipse plugin, open the Preferences dialog box (on page 61), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.

Tip:

To see more detailed examples and more information about how form controls work in Oxygen XML Author Eclipse plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Editing Processing Instructions Using a Form Control

Oxygen XML Author Eclipse plugin allows you to edit processing instructions, comments, and CDATA by using CSS extensions.
Note:
You can edit both the content and the attribute value from a *processing instruction*.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**
```xml
<?pi_target attr="val"/>
```

**CSS:**
```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content:
        "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}

oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

**Related information**
- Text Field Form Control *(on page 1694)*
- Collapse Text: `-oxy-collapse-text` Property Value *(on page 1640)*
- Displaying Processing Instructions from Other XML Editors *(on page 1604)*

**Custom CSS Pseudo-classes**

You can set your custom CSS pseudo-classes on the nodes from the `AuthorDocument` model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Author Eclipse plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. `OXYGEN_INSTALL_DIR/frameworks/docbook/css/cals_table.css` *(Search for `-oxy-visible-colspecs`)*
2. The definition of action `table.toggle.colspec` from the DocBook `framework (on page 2080)` makes use of the pre-defined `TogglePseudoClassOperation` Author mode operation.

Here are some examples:
Example: Controlling the visibility of a section using a pseudo-class

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```css
section {
  display:none;
}
section:access-control-user {
  display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

Example: Coloring the elements at the current cursor location

You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
  color:red;
}
```

The API that you can use from the `CaretListener`:

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)

ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)
```

Predefined Pseudo-Class Author Mode Operations

Pre-defined `Author` mode operations can be used directly in your `framework` to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. `RemovePseudoClassOperation`

Using the :before(n) and :after(n) CSS Pseudo-Elements

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a `:before` or `:after` pseudo-element.
This example adds static text before the title ("Chapter 1", "Chapter 2", etc.):

```
h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```

All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple `before(n)` or `after(n)` pseudo-elements:

```
h1:before(3) {
  content: "Chapter ";
  color: blue;
}
h1:before(2) {
  content: counter(chapter);
  color: red;
  font-size: large;
}
h1:before(1) {
  content: ".";
  color: blue;
}
```

**Notes:**

- The bigger the level, the more distant the pseudo-element is.
- Level 1 corresponds to normal `:before` or `:after` pseudo-elements.

### Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a CSS **Inspector view** (on page 386) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The CSS **Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.
There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

Related Information:

**CSS Inspector View (on page 386)**
17. Extension Points for the Oxygen Eclipse Plugin

The Oxygen XML Author Eclipse plugin includes a number of extension points, which can be implemented by other Eclipse plugins that depend on it. All of them are listed in the plugin.xml file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Extension point: ditaKeyDefinitionManager

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd.

Extension point: actionBarContributorCustomizer

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Author Eclipse plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd.

Extension point: customEditorInputCreator

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Author Eclipse plugin when clicking links. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd.

Extension point: editorAdapterContributor

When an adapter is requested to the open XML editor you can provide your custom adapter from your external plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd.

Extension point: extensionsBundleContributor

Use this extension point to provide your own ExtensionsBundle implementation for a certain open XML resource. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd.

Extension point: stylesFilterContributor

Use this extension point to provide your own StylesFilter implementation for special visual rendering when an XML resource is opened in the Author editing mode. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd.
Extension point: **XMLRefactoringContributor**

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd.

Extension point: **workspaceAccessPlugin**

Use this extension point to be notified when Oxygen XML Author Eclipse plugin has started. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/exsd-schema/workspaceAccessExtension.exsd.

Extension point: **AuthorStylesheet**

Use this extension point to provide a stylesheet layer that will be used when rendering any XML document in Author mode. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd.

How to Use a Custom View with the Oxygen XML Author Eclipse plugin Distribution

**Question**

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Author Eclipse plugin?

**Answer**

Here you can find more information about the Eclipse part of the Oxygen SDK:

https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin

Use the provided Oxygen XML Author Eclipse plugin sample project as a starting point. From any custom view/component you can have singleton access to the using the ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace() API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the Text or Author editing modes) would look like this:

```java
WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);
if (currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
    //Editor opened in Text page
    WSXMLTextEditorPage tp = (WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();
    //You can access an API to insert text in the XNL content
    //    tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);
```
//This is the internal StyledText implementation
//
// tp.getTextComponent()
//
// You can use this XPath API to find the range of an XML element.
//
// tp.findElementsByXPath(xpathExpression)
} else if(currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
   // Editor opened in Author page
   //
   // try {
   WSAuthorEditorPage authPage = (WSAuthorEditorPage) currentEditorAccess.getCurrentPage();
   //
   // Then you can do stuff like this to insert XML at the cursor position
   //
   // authPage.getDocumentController().insertXMLFragment("<testTag/>", authPage.getCaretOffset());
   //
   // } catch (AuthorOperationException e) {
   //   // TODO Auto-generated catch block
   //   // e.printStackTrace();
   //   // }
   //
   //
}
Tools

Oxygen XML Author Eclipse plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author Eclipse plugin includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The XML menu.
- The Refactoring submenu from the contextual menu in the Project Explorer view (on page 244).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 1762).

Note:
The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 1712) or previewed (on page 1712) also appear in the Refactoring submenu of the contextual menu in the DITA Maps Manager.
XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

*Figure 316. XML Refactoring Wizard*

![XML Refactoring Wizard](image)

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Figure 317. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 318. XML Refactoring - Scope and Filters Wizard Page

Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2079) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 2085).

Filters
The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.

- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the Finish button, the operation will be processed and Oxygen XML Author Eclipse plugin provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

**Troubleshooting:**

If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

**Tip:**

If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

**Restriction:**

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author Eclipse plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Tip:
Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**Value**

The value for the affected attribute.

**Options section**

You can choose between one of the following options for the **Operation mode**:

**Add the attribute in the parent elements where it is missing**

Adds the attribute to all instances of the specified parent element.

**Change the value in the parent elements where the attribute already exists**

Replaces the value of the already existing attribute in all instance of the specified parent element.

**Both**

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**
Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be deleted.

**Rename attribute**

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be renamed.
New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

Refactoring Operations for Comments

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:

Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

Refactoring Operations for DITA Topics

Change topic ID to file name
Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert DITA 1.3 Maps and Topics to DITA 2.0**

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
  - Removes the `@lockmeta` attribute.
  - Removes the `<topicset>` and `<topicsetref>` elements.
  - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
  - Migrates the `@navtitle` attribute as a `<navtitle>` element.
  - Migrates the `@title` attribute as a `<title>` element.
  - Converts the `@copy-to` attribute to a `<resourceid>` element.
  - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
  - Convert topicmeta `<linktext>` to `<linktitle>`.
  - Removed `<hasInstance>, <hasKind>, <hasNarrower>, <hasPart>, <hasRelated>, and <relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>, <subjectRelHeader>, <subjectRel>, and <subjectRole>`.
- DITA task changes:
  - Converts the `<substep>` element to a `<step>` element.
  - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
  - Removes the `@type` attribute with the value `fastpath`.
  - Converts the `@alt` attribute to an `<alt>` element.
  - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
  - Removes the `<itemgroup>` element.
  - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
  - Removes the `@domains` attribute.
  - Renames `<sectiondiv>` to `<div>`.
  - Remove `@query` attribute from `<link>` element.
  - Remove `@spectentry` attribute from `<stentry>` element.
  - Remove the `@spectitle` attribute.

**Convert conrefs to conkeyrefs**

Use this operation to convert `@conref` attributes to `@conkeyref` attributes. For more information and instructions for using this operation, see **Converting Conrefs to Conkeyrefs (on page 1906)**.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))**
Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see **Converting DITA Topics to Another Type (on page 1835)**.

**Rename Key**

Use this operation to rename a key. It also updates all references to it.
Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for DITA Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for platform="windows redhat", you can change the current redhat value to linux). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA
topics, whenever there is a link element (\texttt{<xref>} or \texttt{<link>}) with a direct reference to another DITA topic or an element with a \texttt{@conref}, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the \textbf{Validate and check for completeness} action from the \textbf{DITA Maps Manager} toolbar to manually fix those problems. You can enable the \textbf{Report duplicate keys} checkbox to also report any keys that are defined more than once.

\textbf{Scope and Filters:}

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

\textbf{Scope}

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

\textbf{Filters section}

\textbf{Include files}

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

\textbf{Restrict to known XML file types only}

Excludes non-XML file types from the operation.

\textbf{Refactoring Operations for Elements}

\textbf{Delete element}

Use this operation to delete elements. This operation requires you to specify the following parameter:

\textbf{Element}

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

\textbf{Delete element content}

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

\textbf{Element}

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

\textbf{Insert element}
Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**
Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

- **Local name**
  
  The local name of the *Wrapper element*.

- **Namespace**
  
  The namespace of the *Wrapper element*.

**Wrap element content**

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

- **Local name**
  
  The local name of the *Wrapper element* that will surround the content of the target.

- **Namespace**
  
  The namespace of the *Wrapper element* that will surround the content of the target.

**Refactoring Operations for Fragments**

**Insert XML fragment**

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment**
  
  The XML fragment to be inserted.

- **Location section**
  
  **XPath**
An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Replace element content with XML fragment**

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the content of the target element.

**Replace element with XML fragment**

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.

**Refactoring Operations for JATSKit**

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:
Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for Processing Instructions

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

Note:

Processing instructions that are outside the root element are not deleted because the serializer preserves the content before and after the root.
Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

**Migrate HTML Page Layout Files to v21**

Use this operation to convert custom HTML page layout files *(on page 969)* that are included in a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Author Eclipse plugin version 21.0.

**Migrate HTML Page Layout Files to v22**

Use this operation to convert custom HTML page layout files *(on page 969)* that are included in a custom Publishing Template that was created in Oxygen XML Author Eclipse plugin versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Author Eclipse plugin version 22.0.

**Update HTML Pages**

⚠️ **Attention:**

This operation is only used by Oxygen XML Author Eclipse plugin and should not be used manually.

**Additional Notes:**

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options > Preferences > XML > XSLT-XQUERY > XPath** *(on page 184)* page. This preferences page can be easily opened by clicking the link in the note *(Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section)* at the bottom of the **Configure Operation Parameters** wizard page.

**Storing and Sharing Refactoring Operations**

Oxygen XML Author Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:
• A refactoring folder, created inside a directory that is associated to a framework you are customizing. To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (on page 85).

• A folder that you specify in the Load additional refactoring operations from text box (on page 180) in the XML Refactoring preferences page (on page 180).

• The refactoring folder from the Oxygen XML Author Eclipse plugin installation directory

(OXYGEN_INSTALL_DIR)/refactoring/.

Sharing Refactoring Operations

The purpose of Oxygen XML Author Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as framework (on page 2080) or projects.

After storing operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Author Eclipse plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in

(OXYGEN_INSTALL_DIR)/refactoring/i18n/translation.xml.

Canonicalizing Files

You can select the canonicalization (on page 2078) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode.

The Canonicalize dialog box allows you to set the following options:

• Exclusive - If selected, the exclusive (uncommented) canonicalization (on page 2078) method is used.

  Note:

  Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

• Exclusive with comments - If selected, the exclusive with comments canonicalization (on page 2078) method is used.
• **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2078) method is used.

   **Note:**

   *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

• **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2078) method is used.

• **XPath** - The XPath expression provides the fragments of the XML document to be signed.

**Related Information:**

Digital Signatures Overview (on page 597)

### Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode.

The following options are available:

• **Transformation Options** - See the Digital Signature Overview (on page 597) section for more information about these options.
  
  ◦ **None** - If selected, no canonicalization (on page 2078) algorithm is used.
  
  ◦ **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2078) method is used.

   **Note:**

   If Oxygen XML Author Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 180) where you can configure a valid certificate.
Note:

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2078) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2078) method is used.

Note:

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2078) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (on page 597) for more information.
- **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 597) for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.

Related Information:

- Digital Signatures Overview (on page 597)
- Verifying Signature (on page 603)
- Example of How to Digitally Sign XML Files or Content (on page 603)
Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

---

File Comparison Tool

Oxygen XML Author Eclipse plugin includes a file comparison tool that provides a mechanism for comparing two XML-related resources, as well as the possibility for a three-way comparison. You can compare files in a visual comparison mode or in a text-based comparison mode. The supported XML file types include XSL, XSD, DTD, XProc, WSDL, RNG, and XSpec, as well as HTML documents.

**How to Start a File Comparison**

There are various ways to automatically start the file comparison, but the most common ways are:

- You can select two files (or three file if one of them is a common ancestor) in the **Project Explorer** view, right-click, and select one of the options in the **Compare With** menu (e.g. **Compare With > Each Other** to compare the selected files).
- If you use a versioning system, you can compare files directly from the **Synchronize** view (e.g. double-click a file or right-click selected files and choose **Open In Compare Editor**) or the **History** view.

**Visual Author Comparison Mode**

The visual **Author** file comparison mode makes it easier to see how the compared changes will look in the final output. It includes unique features such as actions to control the tags display mode, the ability to do second-level comparisons, and it presents differences made with **Change Tracking** enabled.

If there is a CSS associated with the documents (either directly in the document or in the framework definition), the visual comparison tool is presented automatically when you compare XML files in Oxygen XML Author Eclipse plugin. If the comparison is automatically started in the text-based mode, you can switch to the visual comparison mode by clicking the ![Switch to Author Mode](https://example.com/switch_to_author_mode.png) toolbar button.
Attention:
If the documents do not have an associated CSS, the visual comparison mode cannot render the document properly, so the text-based mode is used in this situation.

You can compare versions in the Workbench with versions in the repository, or with the local edit history. You can also compare three files if a common ancestor exists. The two editors are constantly synchronized and the differences are refreshed when you save the modified document.

Figure 319. Visual File Comparison Tool

Text-based Comparison Mode

Oxygen XML Author Eclipse plugin also includes a text-based comparison mode. When in the Author comparison mode, you can switch to the text-based mode by clicking the Switch to Text Mode toolbar button.

Most of the options, features, and actions that are available for the visual-based comparison mode are also available in the Text comparison mode, although more algorithms (on page 1732) are available in Text mode.

Highlight Colors

The differences are also highlighted in several colors, depending on the type of change. The highlighting colors can be customized in the Diff > Appearance preferences page (on page 72). The default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side. For 3-way comparisons, it identifies blocks of changes that include conflicts.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes). For 3-way comparisons, it identifies your outgoing changes that do not include conflicts.
• **Blue** - Identifies an addition of a node in the right side (incoming changes). For 3-way comparisons, it identifies incoming changes that do not include conflicts.
• **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
• **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Navigating Differences**

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar.
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.

**Toolbar Actions**

A variety of actions are available on the toolbar:

- **Switch to Text Mode** (Not available in Author comparison mode)
  Switches to the text-based file comparison mode.
- **Switch to Author Mode** (Only available in Text mode)
  Switches to the visual Author file comparison mode.
- **Tags Display Mode** (Only available in Author comparison mode)
  Allows you to select the amount of markup to be displayed in the editors. You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Block Tags without Element Names, Inline Tags, Partial Tags, or No Tags.
- **Diff Options**
  Opens the Diff preferences page (on page 71) where you can configure various options.
- **Algorithm Drop-down menu** (Only available in Text mode)
  This drop-down menu allows you to select a diff algorithm (on page 1732) to use for the comparison (depending on whether it is a two-way or three-way comparison).
- **Swap Left and Right View**
  Swaps the file in the left pane with the one in the right pane.
- **Copy All Non-Conflicting Changes from Left to Right**
  Copies all non-conflicting changes from the file in the left pane to the file in the right pane.
- **Copy All Non-Conflicting Changes from Right to Left**
  Copies all non-conflicting changes from the file in the right pane to the file in the left pane.
- **Copy Current Change from Left to Right**
Copies the current change from the file in the left pane to the file in the right pane.

**Copy Current Change from Right to Left**

Copies the current change from the file in the right pane to the file in the left pane.

**Next Difference**

Navigates to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:**
A change block groups one or more consecutive lines that contain at least one change.

**Previous Difference**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Contextual Menu Actions**

The following contextual menu actions are available in each editor pane:

- **Undo**
  Undo changes in the currently focused editor pane.

- **Redo**
  Redo changes in the currently focused editor pane.

- **Cut**
  Cut the selection from the currently focused editor pane to the clipboard.

- **Copy**
  Copy the selection from the currently focused editor pane to the clipboard.

- **Paste**
  Paste content from the clipboard into the currently focused editor pane.

**Select all**
Selects all content in the currently focused editor pane.

**Find/Replace**

Performs a *find/replace* operation in the currently focused editor pane.

**Algorithms**

In **Text** mode, you can select the diff algorithm to use for the comparison using the Algorithm Drop-down menu that is available on the toolbar. The following diff algorithms are available (depending on whether it is a two-way or three-way comparison):

- **Auto (only available for two-way comparisons)** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters (only available for two-way comparisons)** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words (only available for two-way comparisons)** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware (only available for two-way comparisons)** - Computes differences for the file types or fragments known by Oxygen XML Author Eclipse plugin, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

In **Author** mode, only the **Auto**, **XML Fast**, and **XML Accurate** algorithms are available and you can select them from the Diff preferences page (on page 71) (easily accessible by clicking the Diff Options toolbar button).

**Second-Level Comparisons**

The comparison tool automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

For more information about the visual editing support for JSON, watch our video demonstration:

Troubleshooting

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Author Eclipse plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Author Eclipse plugin.

Out of Memory on External Processes

Problem

Oxygen XML Author Eclipse plugin throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the Preferences dialog box *(on page 61)*, go to XML > PDF Output > FO Processors, and increase the value of the Memory available to the Apache FOP option *(on page 169).*
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the `-Xmx` parameter set to the Java virtual machine.

Related Information:

- FO Processors Preferences *(on page 168)*
- Custom Engines Preferences *(on page 183)*
- How to Enable Debugging for FO Processor Transformations *(on page 880)*

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.
Cause

A possible cause is that the application needs more memory to run properly.

Solutions

• You can increase the maximum amount of memory available to Oxygen XML Author Eclipse plugin by setting the `-vmargs` and `-Xmx` parameters in the command used to launch the Eclipse platform.

  **Attention:**
  The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

• **Note:**

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

Address Family Not Supported by Protocol Family

Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Author Eclipse plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to true (`java.net.preferIPv4Stack=true`), by following this procedure:
1. Create a file named `custom_commons.vmoptions` and on a single line, add 
   `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Author Eclipse plugin installation folder (may need admin access).
2. Restart Oxygen XML Author Eclipse plugin.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is `true`.

### Application Takes Several Minutes to Start

**Problem**

Oxygen XML Author Eclipse plugin seems to take an abnormally long amount of time to start.

**Cause**

Some anti-virus software can cause Java applications, such as Oxygen XML Author Eclipse plugin, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

**Solution**

A possible solution is to add the Oxygen XML Author Eclipse plugin folder to the list of exceptions in the anti-virus software settings.

### Compatibility Issue Between Java and Certain Graphics Card Drivers

**Problem**

Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

**Solution**

If you encounter this problem, update your graphics card driver.

### Damaged File Associations on macOS

**Problem**

After upgrading macOS and Oxygen XML Author Eclipse plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

**Cause**

The upgrade damaged the file associations in the LaunchService Database on your macOS machine.
Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Author Eclipse plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Author Eclipse plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:

```
/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
```
7. Restart Finder with the following command:

```
killall Finder
```
8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Author Eclipse plugin icon.
10. Accept the confirmation.

Result: When you start Oxygen XML Author Eclipse plugin, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate log files and attach them to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 35) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate the Oxygen XML Author Eclipse plugin log files, follow these steps:
1. Create a text file called `logback.xml` in the `lib` folder of the installed `plugin` folder, with the following content:

```xml
<configuration>
  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
      <minIndex>1</minIndex>
      <maxIndex>20</maxIndex>
    </rollingPolicy>
    <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
      <maxFileSize>12MB</maxFileSize>
    </triggeringPolicy>
    <encoder>
      <pattern>%r %marker %p [%t] %c - %m%n</pattern>
    </encoder>
  </appender>
  <root level="debug">
    <appender-ref ref="R2" />
  </root>
</configuration>
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `logback.xml` file because it might cause performance issues if you leave it in the `lib` folder.

**Important:**
The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the `logback.xml` file when you are done with the procedure.

**Result:** The resulting log files are named `oxygen.log` and `oxygen#.log.gz` (for example, `oxygen.log`, `oxygen1.log.gz`, `oxygen2.log.gz`, etc.) and are located in the `Desktop\oxygenLog` folder.

### Dialog Boxes Cannot Be Resized on Mac

**Problem**

When using Oxygen XML Author Eclipse plugin on *macOS Big Sur*, dialog boxes (for example the **Find/Replace** or **Preferences** dialog box) cannot be resized.

**Cause**

This is caused by an issue with resizing dialog boxes in Oxygen XML Author Eclipse plugin on macOS Big Sur (and possibly later versions) causing crashes if the main application is in full screen mode.

**Solution**

Until this limitation is resolved in a future Oxygen XML Author Eclipse plugin version, dialog boxes cannot be maximized or resized on macOS Big Sur.

**DITA Map Transformation Fails (Cannot Connect to External Location)**

**Problem**

_DITA map (on page 2079)_ transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

**DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)**

**Problem**

_DITA Map WebHelp_ transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the force-unique parameter set to true to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique @copy-to attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```
DITA-OT Transformation Takes a Long Time to Process

Problem
A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause
Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution
There are several things you can try to troubleshoot this problem:

• If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
• If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
• Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
• You can increase the memory available to Oxygen XML Author Eclipse plugin (on page 1733). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem
The DITA to PDF transformation fails.
Cause

To generate the PDF output, Oxygen XML Author Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 1991).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 1806). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2079), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
How to Enable Debugging for FO Processor Transformations (on page 880)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
  <Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```
Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined inColspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]  at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]  at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined inColspec

To resolve this issue, correct the `<colspec>` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Author Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1762)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated `XSL-FO` file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[Fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```
**Solution: Broken Link**

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 1762) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Author Eclipse plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1762)) to find the original DITA topic where the table was generated.

---

**DITA to CHM Transformation Fails - Cannot Open File**

**Problem**

The DITA to CHM transformation fails with the following error:

```
```

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.

**Tip:**

It is a good practice to validate the DITA map (on page 2079) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1806). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

**Related Information:**
- DITA Map CHM (Compiled HTML Help) Transformation (on page 1963)
DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error:

[code]
[exec] HHC5003: Error: Compilation failed while compiling fileName.
[/code]

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip:

It is a good practice to validate the [DITA map](on page 2079) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1806). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

DITA Map CHM (Compiled HTML Help) Transformation (on page 1963)

Error After Switching Oxygen Products in Eclipse

Problem

On an Eclipse deployment, after installing and using the Editor product, I later decided to uninstall it and use Author or Developer instead. After installing the new product, I received an error that looked like this:

[code]
java.lang.Exception
        at org.eclipse.ui.internal.viewReference.createErrorPart(ViewReference.java:112)
        at org.eclipse.ui.internal.viewReference.createPart(ViewReference.java:98)
        at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
            {CompatibilityPart.java:279}
        at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
            {CompatibilityPart.java:317}
[/code]
Solution

You need to manually delete the perspective for the product you uninstalled by following this procedure:

1. Go to **Window > Preferences > General > Perspectives**.
2. Select the perspective for the product you uninstalled (for example, `<oXygen/> XML`) and click **Delete**.
3. Restart Eclipse.
4. Go to **Window > Open Perspective** and select the perspective for the new product (for example, `<oXygen/> XML Author`).

Hunspell Spell Checker is Unusable on Your Platform Error

**Problem**

When trying to use the **Check Spelling** option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session**.

**Cause**

There are instances where Oxygen XML Author Eclipse plugin determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

**Solution**

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Author Eclipse plugin.
2. Open the `%APPDATA%/com.oxygenxml` folder and look for a file called something like `HunspellCrashGuard*.txt`. Delete that file.
3. Restart Oxygen XML Author Eclipse plugin.

High Resolution Scaling Issues

**Problem**

I encounter scaling detection issues in a high resolution display (for example, some GUI components are too small).
Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

Windows with Java 8 - You can use the `com.oxygenxml.hidpi.scaling` custom system property (on page 212) to force a specific scaling setting. For example: `-Dcom.oxygenxml.hidpi.scaling=1.5` for 150% scaling.

Windows/Linux/MacOS with OpenJDK 11 or later - You can use the `sun.java2d.uiScale` Java system property to instruct Java to use a particular scaling factor:

```
-Dsun.java2d.uiScale=1.5
```

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf]`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).
The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip:
It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution. This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem
The Ant build process runs out of memory.

Solution
For details about setting custom JVM arguments to the Ant build process, see JVM Arguments (on page 1980).

JPEG CMYK Color Space Issues

Problem
JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

Solution
If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the {OXYGEN_INSTALL_DIR}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.

Mac Touch Bar Function Keys Do Not Work

Problem
I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Author Eclipse plugin.
Causes

By default, the Touch Bar function keys are not enabled for Oxygen XML Author Eclipse plugin.

Solution

To enable the Touch Bar function keys for Oxygen XML Author Eclipse plugin, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.

Keyboard no Longer Works After Inserting Accented Characters on Mac

Problem

The macOS has a method for inserting accented characters that is triggered by holding a key and then selecting the desired character from a contextual menu. When using this method in macOS 10.14 (Mojave) to insert accented characters in Oxygen XML Author Eclipse plugin, the keyboard can no longer be used unless I restart the application.

Causes

This problem is caused by some sort of incompatibility issue with Java 8 and macOS 10.14 (Mojave).

Solution

To prevent this problem, you should use an Oxygen XML Author Eclipse plugin distribution that includes OpenJDK 17:

1. Uninstall Oxygen XML Author Eclipse plugin:
   a. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Therefore, you should make a backup of any data you want to keep.
   b. Remove the application by manually deleting the installation folder and all its contents.
2. Reinstall Oxygen XML Author Eclipse plugin using the distribution that includes OpenJDK:
   a. Go to the Oxygen Download page.
   b. In the macOS tab, click on the macOS 10.11 and later (Includes OpenJDK 17) link to download this particular distribution.
   c. Follow the instructions to install the downloaded installation package.
Server Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Server Signature) is sent to the Oxygen XML Author Eclipse plugin servers, which in turn will sign the license key. The Server Signature is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your Server Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.
MSXML 4.0 Transformation Issues

**Problem**

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```plaintext
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

**Cause**

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

**Solution**

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

**Problem**

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: `Navigation to the web page was canceled`.

**Cause**

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

**Solution**

As a workaround, copy the CHM file on your local system and view it there.

References Outside the Main DITA Map Folder

**Problem**

A reference to a DITA topic, `map`, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 2079) is located leads to problems when publishing the content using the DITA Open Toolkit.

**Cause**

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

**Solution**

To solve this, try one of the following solutions:
• Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.

• Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

Important:
The fix.external.refs.com.oxygenxml parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Author Eclipse plugin or using the transform script.

• For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

Important:
This method is recommended for transformation scenarios that use an external DITA-OT.

Syntax Highlights Not Available in Eclipse Plugin

Problem
I associated the .ext extension with Oxygen XML Author Eclipse plugin in Eclipse but an .ext file opened with the Oxygen XML Author Eclipse plugin plugin does not have syntax highlights.

Solution
Associate an extension with Oxygen XML Author Eclipse plugin in Eclipse versions 4.4-4.22 by following these steps:

1. Associate the .ext extension with the Oxygen XML Author Eclipse plugin plugin:
   a. Open the Preferences dialog box (on page 61) and go to General > Editors > File Associations.
   b. Add *.ext to the list of file types.
   c. Select *.ext in the list by clicking it.
   d. Add Oxygen XML Author Eclipse plugin to the list of Associated editors and make it the default editor.

2. Associate the .ext extension with the Oxygen XML content type:
   a. Open the Preferences dialog box (on page 61) and go to General > Content Types.
   b. Add *.ext to the File associations list for the Text > XML > Oxygen XML Author Eclipse plugin content type.

3. Click the OK button in the Eclipse preferences dialog box.
Result: Now when an *.ext file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Author Eclipse plugin.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The TocJS transformation of a DITA map (on page 2079) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element <frame name="contentwin" src="concepts/about.html">.
6. Replace "concepts/about.html" with "index.html".

Text Rendering Issues on macOS

Problem

On macOS, I sometimes encounter issues there text is not rendered properly. For example, when tags are displayed in Author mode, sometimes the tag icon is rendered over the top of text (hiding the text) and sometimes text flows outside of code blocks.

Cause

This is an uncommon error that cannot be fixed in current versions.

Solution

Open the Preferences dialog box (on page 61), go to Editor > Edit modes > Author, and deselect the Fast text layout option (on page 126).
20. DITA Authoring

*DITA* is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework (on page 2080) for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Author Eclipse plugin features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.
- The DITA Style Guide Best Practices for Authors.
- Various sample DITA topics and maps can be found in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.
- Webinar: Getting Started with DITA Using Oxygen
Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Author Eclipse plugin. Oxygen XML Author Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Author Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Author Eclipse plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Author Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Author Eclipse plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Author Eclipse plugin

To create a DITA topic (on page 1826):

1. Select File > New > Other > Oxygen XML Author Eclipse plugin, or click the New button on the toolbar, and select New from Templates.

   Step Result: The New from Templates Wizard (on page 221) is displayed:
2. Go to Framework templates > DITA > topic and select the type of topic that you want to create, then click Next.

![New DITA Document from Templates Wizard](image)

**Note:**
If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click Finish.

**Result:** Your document is opened in the editor. Eventually, you will need to add a reference to it in your DITA map (on page 1756).
Your DITA topic is an XML document, thus all the editing features that Oxygen XML Author Eclipse plugin provides for editing XML documents (on page 20) also apply to DITA topics. Oxygen XML Author Eclipse plugin also provides additional specific DITA-related support for working with DITA topics (on page 1824), their associated DITA maps (on page 1760), and for creating DITA output (on page 1943).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2079). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Author Eclipse plugin

To create a map (on page 1777):

1. Select File > New > Other > Oxygen XML Author Eclipse plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 1762). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Figure 321. DITA Maps Manager View
Adding Existing Topics to a Map in Oxygen XML Author Eclipse plugin

There are several ways to add a topic reference to a map (on page 1781). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.

2. Right-click the DITA map in the DITA Maps Manager view (on page 1762) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

   **Step Result:** This opens the Insert Reference dialog box (on page 1786) with all of the required fields already filled in for you.

   ![Insert Reference Dialog Box](image)

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

4. Select Insert and close to add a reference to your topic in the map.

5. Save the DITA map.

Adding New Topics to a Map in Oxygen XML Author Eclipse plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map (on page 1781), follow these steps:
1. In the DITA Maps Manager (on page 1762), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   **Note:**
   The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 77) into account. When the option is deselected, a unique ID is generated.

   **Step Result:** The new topic is now referenced (as a `<topicref>`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.
Adding Submaps in Oxygen XML Author Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 1778). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 1778):

1. Right-click the parent DITA map in the DITA Maps Manager view (on page 1762) and choose Append child > Map reference.
   
   **Step Result:** This opens the Insert Reference dialog box (on page 1786) with all of the required fields already filled in for you.
2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select Insert and close to add a reference to your submap in the main map.
4. Save the main DITA map.

Validating a Map in Oxygen XML Author Eclipse plugin

Just as it is with your individual topics, it is important to validate your maps (on page 1806). Oxygen XML Author Eclipse plugin provides a validation function for DITA maps that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 1762).
   
   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 1807).
2. Select any of the various options you want to check.
3. Click Check to run the validation process.

Publishing Your Topics in Oxygen XML Author Eclipse plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 1943) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default,
Oxygen XML Author Eclipse plugin uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Author Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view (on page 1762).

   **Step Result:** This opens the **Configure Transformation Scenario(s)** dialog box (on page 898).

   ![Configure Transformation Scenarios Dialog Box](image)

2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

Webinars: Working with DITA in Oxygen

Working with Projects in DITA

Oxygen XML Author Eclipse plugin provides the ability to organize your DITA resources in projects, the same as with other XML-related files. This helps you manage and organize your files and projects allow you to perform batch operations (such as validation and transformation) over multiple files or to use Main Files support to rename or move DITA resources (on page 2043) while updating the references to them.

To learn how to create a new project and how add resources and manage it, see Creating a New Project (on page 243).

To help you get more familiar with how to use projects in DITA, there are two DITA-specific sample project templates available when using the New Project action (available, for example, from the Project menu):

- **DITA Project With Editing Customizations** - This sample DITA project imposes custom general settings and an editing behavior using a DITA framework extension. More details can be found in the project’s Readme.html file.
- **Sample DITA Project** - This sample DITA project is a best practice example that shows how DITA content can be organized to provide a scalable and flexible project structure. More details can be found in the project’s Readme.html file.

Using Projects to Group Documents (on page 242)

Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.
DITA Maps

A DITA map (on page 2079) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Author Eclipse plugin provides support for creating (on page 1777) and managing DITA maps (on page 1780) through the DITA Maps Manager (on page 1762). There are also specialized types of DITA maps, such as a bookmap (on page 2077), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 1778) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 1762) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 1762) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
- To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the DITA Maps Manager, you can right-click a map file in the Project Explorer view (on page 244) and select Open in DITA Maps Manager.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 1806). To support this, Oxygen XML Author Eclipse plugin provides an Edit Properties dialog box (on page 1797) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 1806) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Author Eclipse plugin provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.
Resources

Related information

DITA Map Document Type (Framework) (on page 715)
DITA Map Author Mode Actions (on page 1812)

DITA Maps Manager

Oxygen XML Author Eclipse plugin provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a tree or table of contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Each node is displayed with an icon representing the type of DITA resource. For example, a DITA Map is displayed with an icon, a DITA Topic is displayed with , a DITA Task is displayed with , etc. Any node that has processing-role="resource-only" set in its properties is displayed with a gray dot in the bottom-right corner of the icon ( ).
Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

• To open a submap in its own tab, simply double-click it (or right-click it and select Open).
• Right-click a map file in the Project Explorer view (on page 244) and select Open in DITA Maps Manager.

Submap Nodes

If your root map (on page 2083) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Tip: If you want to be able to edit submaps when the main (root/parent) map is open in the DITA Maps Manager, go to Options > Preferences > DITA > Maps and select the Allow referenced submaps to be edited option (on page 75).

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.
DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

**Note:**
If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

- **New DITA Map**
  Opens the New Document wizard (on page 221) that you can use to create a new DITA map document.

- **Open Drop-down Menu**
  You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:

  - **List of recently viewed DITA maps** that can be selected to reopen them.
  - **Clear history** - Clears the history list of the recently viewed DITA maps.
  - **Open** - Allows you to open the map in the DITA Maps Manager view (on page 1762).

  You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 1762).

  - **Browse workspace** - Opens a file browser dialog box allowing you to select a file from the local workspace.
  - **Open URL** - Displays the Choose DITA Map dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.

- **Save (Ctrl + S (Meta + S on macOS))**
  Saves the current DITA map.

- **Validate and Check for Completeness**
  Opens the DITA Map Completeness Check dialog box where you can configure options for checking the validity and integrity (on page 1806) of the map.

- **Apply Transformation Scenario(s)**
  Applies the DITA Map transformation scenario (on page 786) that is associated with the current map.

- **Configure Transformation Scenario(s)**
  Opens the Configure Transformation Scenarios dialog box (on page 898) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 843) with the current map.

- **Open Map in Editor with Resolved Topics**
Opens the DITA map in the main editor area with content from all topic references expanded in-place. Referenced content is presented as read-only by default. To edit it, you must use the Edit Reference contextual menu action to open the source topic that contains the referenced content.

If you want to edit the referenced topics directly without having to open the source document, go to Options > Preferences > Editor > Edit Modes > Author and select the Allow referenced content to be edited option (on page 128). Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.

Tip:
If you want to print the expanded content, you should consider changing selecting + Print ready from the Styles drop-down menu on the toolbar.

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note:
You can also use this action to open referenced DITA maps in the Editor.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.
- If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
- If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.
- If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

Settings

Show extended toolbar
Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

Show context toolbar

Toggles whether or not the Context option (on page 1766) will be displayed in the DITA Maps Manager toolbar.

Show topic titles

Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the @href attribute) for each topic is shown.

Show key reference values

Toggles how key references are presented in the DITA Maps Manager. If selected, the value of the @keyref attribute for each key reference is shown.

Root Map Drop-down menu

The drop-down menu displayed after Context can be used to specify the DITA root map (on page 2083) that Oxygen XML Author Eclipse plugin uses to define a hierarchical structure of submaps and to establish a key space (on page 2080) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (on page 1778).

Choose Root Map Drop-down menu

You can use this drop-down menu to browse for root maps with the following choices:

- **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
- **Browse workspace** - Allows you to select a root map from the local workspace.
- **Browse for remote file** - Displays the Open using FTP/SFTP dialog box (on page 236) that allows you to select a remotely stored root map.
- **Browse for archived file** - Displays the Archive Browser (on page 1353) that allows you to browse the content of an archive and choose a root map.
- **Browse Data Source Explorer** - Opens the Data Source Explorer (on page 1359) that allows you to browse the data sources defined in the Data Sources preferences page (on page 65).

Tip:

You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box to search for a root map.

Profiling/Conditional Text Drop-down Menu
You can use this drop-down menu to select and apply a defined profiling condition set (on page 2004) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.

- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 299) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 420) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

**Insert Topic Reference**

Opens the Insert Reference dialog box (on page 1786) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Author Eclipse plugin, the DITA map is updated automatically.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1797).

**Edit Attributes**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 377) topic.

**Delete**

Deletes the selected node.

**Move Up**

Moves the selected node up within the DITA map tree.
Move Down

Moves the selected node down within the DITA map tree.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map

The following actions can be invoked from the contextual menu on the root map (on page 2083) of an opened DITA map (many of them are also available in the DITA Maps menu):

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Export DITA Map

Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes an Export as Zip archive option that allows you to package the DITA map as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the DITA maps.

Show Feedback Comments Manager

Opens the Feedback Comments Manager view. This view is for those who use Oxygen Feedback to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in Oxygen XML Author Eclipse plugin.

Edit Properties
Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1797).

**Fast Create Topics**

Opens the **Fast Create Topics** dialog box (on page 1829) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2079).

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 1826).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 1786) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 1786) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 1796) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 1796).
- A set of actions that open the Insert Reference dialog box (on page 1786) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Search References**

Searches all references to the current topic in the entire DITA map (on page 2079). It also reports references that are defined as related links in relationship tables. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder.

**Refactoring submenu**

The following actions are available from this submenu when invokes from a root map:

- **Rename resource**
Allows you to change the name of a resource linked in the edited DITA map (on page 1783) and you have the option of updating all the references to the renamed DITA resource. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 1783) and you have the option of updating all the references to the moved DITA resources. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).
Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 581) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 581) that presents refactoring operations to assist you with managing the structure of your XML documents.

ABC Check Spelling in Files

Allows you to spell check multiple files (on page 269).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a DITA map (submaps need to be opened in the DITA Maps Manager to access these actions since they are in a read-only state in the parent map):

Note:

If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.
Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box (on page 1797)*.

Fast Create Topics

Opens the **Fast Create Topics** dialog box *(on page 1829)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map (on page 2079)**.

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 1826)*.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 1786)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 1786)* topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a targeted key definition *(on page 1796)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to define a key and a value inside a **keyword (on page 1796)**.
- A set of actions that open the **Insert Reference** dialog box *(on page 1786)* that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 1826)*.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 1786)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 1786)* topic.
• **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to [insert a targeted key definition](on page 1796) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to [define a key and a value inside a keyword](on page 1796).

• A set of actions that open the **Insert Reference** dialog box ([on page 1786]) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for [inserting a new topic](on page 1826).

• ![Reference](on page 1786) - Inserts a reference to a topic file. You can find more details about this action in the **Inserting References** ([on page 1786]) topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the **Inserting References** ([on page 1786]) topic.

• **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to [insert a targeted key definition](on page 1796) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to [define a key and a value inside a keyword](on page 1796).

• A set of actions that open the **Insert Reference** dialog box ([on page 1786]) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

**Search References**

Searches all references to the current topic in the entire [DITA map](on page 2079). It also reports references that are defined as related links in relationship tables. If you have enabled Main Files support ([on page 2043]), it also searches for references in the DITA maps added to the Main Files folder.

**Refactoring submenu**

The following actions are available from this submenu:

**Convert Markdown to DITA Topic (Available for Markdown documents)**
Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (on page 1889).

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map (on page 1783) and you have the option of updating all the references to the renamed DITA resource. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 1783) and you have the option of updating all the references to the moved DITA resources. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Extract to New DITA Map**

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.
**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Generate IDs**

Use this operation to automatically generate unique IDs for elements.

**Other XML Refactoring Actions**

For your convenience, the last 5 XML Refactoring tool operations *(on page 581)* that were finished or previewed will also appear in this submenu.

**XML Refactoring**

Opens the XML Refactoring tool wizard *(on page 581)* that presents refactoring operations to assist you with managing the structure of your XML documents.

**Check Spelling in Files**

Allows you to spell check multiple files *(on page 269).*

**Cut**

Deletes the currently selected node and copies it to the clipboard.

**Copy**
Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.

Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have enabled Main Files support (on page 2043), it also searches for references in the DITA maps added to the Main Files folder.

Organize

Allows you to organize the DITA map with the several submenu actions:

- Move Up - Moves the selected node up within the DITA map tree.
- Move Down - Moves the selected node down within the DITA map tree.
- Promote - Moves the selected node up one level to the level of its parent node.
- Demote - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Other Nodes
The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

**Open Map in Editor (available when invoking on a submap)**

Opens the currently selected DITA map in the editor.

**Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)**

Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

**Edit Attributes (only available for relationship table nodes)**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 377) topic.

**Edit Profiling Attributes (only available for relationship table nodes)**

Allows you to change the profiling attributes (on page 414) defined on the selected node.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

### Related information

- DITA Map Validation and Completeness Check (on page 1806)

### Creating a Map

To create a DITA map (on page 2079), subject scheme map (on page 2084), bookmap (on page 2077), or other types of DITA maps, follow these steps:

1. Use the New Document wizard (on page 221) to start creating your map.

   **Tip:**

   If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 1762)) and selecting New from the Append Child, Insert Before, or Insert After submenu.

2. Select one of the DITA Map templates from the Framework templates folder.
3. Click the Next button.
4. Select a parent folder and the file name and click Finish.
5. Save the map after opening it in the DITA Maps Manager (on page 1762) or the Editor.
Selecting a Root Map

Oxygen XML Author Eclipse plugin allows you to select a root map (on page 2083) (a main DITA map (on page 2079)) that defines a hierarchical structure of submaps and establishes a key space (on page 2080) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:

- The easiest method is to use the Context drop-down menu (on page 1766) in the DITA Maps Manager (on page 1762) toolbar to select the appropriate root map.
- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.
- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

Creating DITA Submaps

You can break up a large DITA map (on page 2079) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 1781), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a mapref element or a topicref element with the @format attribute set to ditamap. In most cases, Oxygen XML Author Eclipse plugin takes care of this for you.
Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.

2. To insert the submap as a child of the selected node, select Append Child > New. To insert the submap as a sibling to the current node, select Insert After > New or Insert Before > New.

   **Step Result:** This opens a New DITA file dialog box (on page 1826) that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the DITA Map folder and give it a name (the file should have a .ditamap file extension).

4. Click Create to insert the submap.

You can manage and move submaps the same as you would with topics. They can also be expanded and you can navigate their content in the DITA Maps Manager when the root (main) DITA map is open, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab.

**Tip:**
If you want to be able to edit submaps when the main (root/parent) map is open in the DITA Maps Manager, go to Options > Preferences > DITA > Maps and select the Allow referenced submaps to be edited option (on page 75).

Related Information:
Managing DITA Maps (on page 1780)

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a bookmap (on page 2077) to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as <frontmatter>, <part>, <chapter>, <appendix>, and <backmatter> to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Author Eclipse plugin.

To create a book in DITA using a bookmap, follow these steps:
1. Create a new bookmap (on page 1779) (File > New > Framework templates > DITA Map > map > Bookmap). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 1762)) and selecting New from the Append Child, Insert Before, or Insert After submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the Append child menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA bookmap and where to create each element.

3. Create special elements such as an index (on page 1804) and table of contents (on page 1803). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. Add topics (on page 1781) to your chapters to add content to your book. You may find it easier to manage if you use submaps (on page 1778) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.

Managing DITA Maps

You may want to manage your DITA maps (on page 2079) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the DITA Maps Manager (on page 1762).
- By showing the extended DITA Maps Manager (on page 1762) toolbar (click the Settings icon on the DITA Maps Manager (on page 1762) toolbar and select the extended toolbar) and then using the node moving buttons (↑↓←→) on the toolbar to move topics around in the map.
To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 1762), you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Author Eclipse plugin supports both approaches.

A DITA map (on page 2079) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the <topicref> element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Author Eclipse plugin provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The Insert Reference dialog box (on page 1786) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
- Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (on page 1762) toolbar.
- Select Insert Reference from the DITA Maps menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 1762). You can drag and drop files from any of the following:
• Your OS file system explorer.
• The Project Explorer view (on page 244).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 1762), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   ◦ Append Child > New - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   ◦ Insert Before > New - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   ◦ Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   ◦ Duplicate - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

Note:
The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 77) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a <topicref>) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

Adding Multiple Skeleton Topics at Once

Oxygen XML Author Eclipse plugin includes a feature in the DITA Maps Manager (on page 1762) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2079).
To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 1829).

### Adding Multiple References to the Same Topic in a Map

Oxygen XML Author Eclipse plugin allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 1762), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press the Delete key on your keyboard.
- Highlight the topic and click the Delete button on the DITA Maps Manager (on page 1762) extended toolbar.

Moving and Renaming Resources

You can move or rename resources referenced in your DITA project on disk directly from Oxygen XML Author Eclipse plugin and you have the option of updating all the references to the moved or renamed resources. If the resources are referenced in the DITA map, you can do this from the DITA Maps Manager view (on page 1762). You can also move and rename resources (DITA topics, maps, or other resources such as folders, images, HTML files, audio, video, text files, Markdown documents) from the Project Explorer view (on page 244). If you have enabled Main Files support (on page 2043), you will also have the option to update all the references to the moved or renamed resource.

### Moving or Renaming DITA Resources (Topics or Maps)

To move or rename resources (such as topics, maps, or other referenced non-DITA resources) referenced directly in the DITA map, use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 1762):

- **Refactoring > Move resource**
This action allows you to change the location of a resource linked in the edited DITA map using the Move resource dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map (preserving its completeness).
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author Eclipse plugin is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

Refactoring > Rename resource

This action allows you to change the name of a resource linked in the edited DITA map (on page 2079) using the Rename resource dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map (preserving its completeness).
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author Eclipse plugin is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

Note:
If a root DITA map (on page 2083) is not defined, the move and rename actions are executed in the context of the current DITA map.

Moving or Renaming Resources and Updating the References to Them Using the Project View

To move or rename DITA (topics, maps) or non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Project Explorer View (on page 251). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on resources while also updating all the references to them, use the following sets of procedures:

1. Enable Main Files support and add your root DITA map (on page 2083) to the Main Files folder by following the procedure found here: How to Enable Main Files Support in DITA (on page 2043).
2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 2044).
Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps (on page 2079). To assist you with organizing project resources, Oxygen XML Author Eclipse plugin includes the Find Unreferenced Resources action, that searches for such resources.

To perform this search, open the DITA map in the DITA Maps Manager (on page 1762), invoke the contextual menu on the map, and select the Find Unreferenced Resources action. This action opens the Find Unreferenced Resources dialog box, shown below.

Figure 325. Find Unreferenced Resources Dialog Box

The Find Unreferenced Resources dialog box includes the following options:
DITA Maps - Provides a list of DITA maps to be included in the search and allows you to Add maps to the list or Remove them.

Folders - Provides a list of folders to be included in the search and allows you to Add or Remove specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.

Filters - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:

- **Include files** - Allows you to filter specific files to include in the search.
- **Exclude files** - Allows you to filter specific files to exclude from the search.
- **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the Find button, if the search operation finds unreferenced resources, they are displayed in the Results panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select Remove from Disk. If you want to see the resource before deciding what to do with it, you can right-click its result and select Show in Explorer.

### Inserting References in DITA Maps

A DITA map (on page 2079) may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the Insert Reference dialog box (on page 1786).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

### Insert Reference Dialog Box

The Insert Reference dialog box allows you to insert and configure references in DITA maps (on page 2079). There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the Insert Reference dialog box, use one of the following methods:
• Select **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child, Insert Before, and Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager (on page 1762)**.
  ◦ To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  ◦ To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
  ◦ To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.

**Note:**
The content of these submenus depends on the node that is selected in the **DITA map tree** when the contextual menu is invoked. For example, if the selected node is a topic reference (**<topicref>**), its possible child nodes include the following elements: **<anchorref>, <chapter>, <keydef>, <mapref>, <topicgroup>, <topichead>, <topicref>, <topicset>, and <topicsetref>**.

• Click the **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).

• Select **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the **Reference or Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Author Eclipse plugin will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child, Insert Before, and Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target, Keys, Attributes, Metadata, and Profiling**.

**Target Tab**
The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.
Note:

If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a `<navref>` element requires a `@mapref` attribute instead.

**Keys Tab**

**Figure 327. Insert Reference Dialog Box - Keys Tab**

The **Keys** tab allows you to use and define keys *(on page 1795)* for indirect referencing. For more information, see *Working with Keys in DITA*(on page 1891). This tab includes the following:

**Define keys**

Use this text field to define the `@keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `@keyscope` attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current *root map*(on page 2083).

**Attributes Tab**
The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

### Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 75)*. For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

### Collection type

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a **DITA map** *(for example, unordered, sequence, choice, family, -dita-use-conref-target)*.

### Type

Allows you to select a `@type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 75)*.

### Scope

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a
detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the DITA preferences page *(on page 75)*.

**Format**

This property corresponds to the [@format attribute](https://www.dita.org/dita-conventions.html#format) of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the DITA preferences page *(on page 75)*.

**Processing Role**

This drop-down list allows you to set the [@processing-role attribute](https://www.dita.org/dita-conventions.html#processingrole) to one of the allowed values for DITA reference elements (for example, *resource-only*, *normal*, *-dita-use-conref-target*).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 329. Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**
Figure 330. Insert Reference Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your *root map (on page 2083)* references a DITA *subject scheme map (on page 2084)* that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see *DITA Profiling / Conditional Text (on page 1996)*.

**Finalizing Your Insert Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:**
You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

**Related Information:**
- DITA Profiling / Conditional Text (on page 1996)
- Working with Keys in DITA (on page 1891)

**Inserting Topic Headings**

The `<topichead>` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `<topicref>` element.

You can insert a topic heading by doing the following:
• Select **Topic Head** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view (on page 1762)**.

• Open the **DITA map** in the XML editor (on page 1761) and select the [ ] **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 1786) that allows you to easily insert a `<topichead>` element. A **Navigation title** (@navtitle attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

**Figure 331. Insert Topic Heading Using the Insert Reference Dialog Box**

![Insert Topic Head dialog box](image)

**Related Information:**
**Insert Reference Dialog Box (on page 1786)**

**Inserting Topic Groups**

The `<topicgroup>` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `<topicgroup>` can contain other `<topicgroup>` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `<topicgroup>` and its children. You can set the collection-type of a container `<topicgroup>` to determine how its children are related to each
other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 1762).

- Open the **DITA map** in the XML editor (on page 1761) and select the [Insert Topic Group] action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box (on page 1786) that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

![Insert Topic Group Using the Insert Reference Dialog Box](image)

**Figure 332. Insert Topic Group Using the Insert Reference Dialog Box**

**Related Information:**
- Insert Reference Dialog Box (on page 1786)
Defining Keys in DITA Maps

DITA uses keys (on page 1891) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2083). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (on page 2079) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="url_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
  <keydef keys="url_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>
```
**Note:**
The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

### Key Definition with a Keyword Value

To define a key with a value inside a `keyword`, follow these steps:

1. **[Optional but Recommended]** Create a submap *(on page 1778)* that will contain all of your key definitions and reference the submap in your `main (root)` map (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** *(on page 1762)*.
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition with Keyword** from the `Append Child, Insert Before, or Insert After` submenu (depending on where you want to insert the `key definition`). This opens an **Insert Key Definition** dialog box.
4. Enter the name of the key in the **Key** field.
5. Enter the key's value in the **Keyword** field.
6. Click **Insert and close**.

**Tip:**
If you need to profile the key or add other attributes, you can right-click the key definition in the **DITA Maps Manager**, select **Edit properties**, and configure them in the **Profiling** tab or **Attributes** tab, respectively.

### Key Definition with a Target

To insert a targeted `key definition` (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap *(on page 1778)* that will contain all of your key definitions and reference the submap in your `main (root)` map (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** *(on page 1762)*.
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the `Append Child, Insert Before, or Insert After` submenu (depending on where you want to insert the `key definition` in the **DITA map**). This opens an **Insert Key Definition** dialog box.
4. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
5. Go to the **Target** tab and select a target resource (such as an image or external link).

**Tip:**
You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

6. Once you are done configuring the targeted `key definition`, click **Insert and close**.
Edit Properties Dialog Box

The DITA Maps Manager view (on page 1762) includes a feature that allows you to view and edit the properties of a selected node. The Edit properties action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map (on page 2079) document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.

**Note:**

If you select multiple sibling nodes and invoke the Edit properties action, only the Profiling tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps (on page 2083).

At the top of the Edit Properties dialog box, the Reference type drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map (on page 2083), only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.

**Target Tab**
The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

### Choose a file location section

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

### URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

### ID

The drop-down list displays all of the target elements that are available for the selected target URL.

### Href

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

![Figure 333. Edit Properties Dialog Box - Target Tab](image)
**Note:**
If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a `<navref>` element requires a @mapref attribute instead.

**Keys Tab**

*Figure 334. Edit Properties Dialog Box - Keys Tab*

<table>
<thead>
<tr>
<th>Target</th>
<th>Keys</th>
<th>Attributes</th>
<th>Metadata</th>
<th>Profiling</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Keys are used for indirect referencing.

**Define keys:**
Use space as separator for multiple values.

**Key scopes:**
Use space as separator for multiple values.

**Key reference:**
Choose target for defined key(s)
Edit metadata information for defined key(s)

The **Keys** tab allows you to use and define keys (on page 1795) for indirect referencing. For more information, see *Working with Keys in DITA (on page 1891)*. This tab includes the following:

**Define keys**
Use this text field to define the @keys attribute for the target.

**Key scopes**
Use this text field to define or edit the value of a @keyscope attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**
Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map (on page 2083).

**Attributes Tab**
The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a **root map (on page 2083)**, the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**. However, if the title of the map contains elements other than plain text, the title is not editable and cannot be changed using this dialog box (you would need to open the DITA map in the main editor to edit the title).

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page (on page 75)**. For references to DITA resources, you can enforce
the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

**Tip:**

You can also select the **Prefer navigation title for topicref rendering** option in the **DITA preferences page** (on page 75) to always enforce the use of the `@navtitle` value rather than selecting this **Lock** option on individual topics.

**Collection type**

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a **DITA map** (for example, unordered, sequence, choice, family, -dita-use-conref-target).

**Type**

Allows you to select a `@type` attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 75).

**Scope**

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 75).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 75).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.
Metadata Tab

The Metadata tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

The Profiling tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2083) references a DITA subject scheme map (on page 2084) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.
If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 1996).

**Note:**
If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

Figure 339. Profiling Conflict Panel

**Finalizing Your Modifications**

Once you click OK, all your changes are applied to the target node.

**Related Information:**
DITA Profiling / Conditional Text (on page 1996)
Working with Keys in DITA (on page 1891)

**Generating a Table of Contents in DITA**

In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (on page 1760). In most cases, the processor generates a table of contents (TOC)
based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a `bookmap (on page 1779)` (as in the example below). For more information about the `<toc>` element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```xml
<bookmap>
   ....
   <frontmatter>
      <booklists>
         <toc href="chapter1.dita"/>
      </booklists>
   </frontmatter>
   ....
</bookmap>
```

Creating an Index in DITA

In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic**: In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.
- **In the `<topicref>` element in a map that references the topic**: This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.
- **In the body of a topic**: In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic of the topic header, create the elements as you normally would in Oxygen XML Author Eclipse plugin (on page 1831). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a `bookmap (on page 2077)`, you need to add an `<indexlist>` element to the `<backmatter>` of the book.

1. Open your `bookmap (on page 1779)` in the DITA Maps Manager (on page 1762).
2. Right-click the `bookmap` and select Append Child > Backmatter.
   The Insert Reference dialog box (on page 1786) appears.
3. Click Insert and Close to insert the `<backmatter>` element.
4. Right-click the `<backmatter>` element and create a `<booklists>` element using **Append Child > Book Lists**.

5. Use the same steps to create an `<indexlist>` element.

---

**CAUTION:**

Adding *index* entries and an `<indexlist>` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

---

### Resolving Topic References Through an XML Catalog

There are situations where you want to resolve references with an *XML Catalog*:

- You customized your DITA map (on page 2079) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Author Eclipse plugin. The **DITA Maps Manager view (on page 1762)** will solve the displayed topic refs through the added *XML catalog* URI mappings. The resolution through the XML catalog URI mappings are done only for reference values starting with the `urn:` prefix.

To add an *XML catalog* to the DITA framework (on page 2080), follow these steps:

1. Create an *XML catalog* using the guidelines described in Working with XML Catalogs (on page 567).
2. Open the Preferences dialog box (on page 61) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (on page 81).
4. Go to the Catalogs tab (on page 105).
5. Click on the + Add button to open a dialog box that allows you to add your created *XML Catalog* to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action (on page 520) for the changes to take effect.

---

**Note:**

You could also add your created catalog to the list of global catalogs in the XML Catalog preferences (on page 173) page.

---

### Adding a Custom URI Resolver to Oxygen XML Author Eclipse plugin

You can use the `XMLUtilAccess.addPriorityURIResolver(URIResolver)` API to add your own priority URI resolver from a Workspace Access plugin extension, allowing you to take control over how topic references in a DITA map are located or how references in DITA topics are resolved.
Publishing a DITA Map with References Resolved Through the XML Catalog

If you are publishing a DITA map that contains references to topics that need to be resolved through the XML catalog support in Oxygen XML Author Eclipse plugin, you must enable the fix.external.refs.com.oxygenxml parameter in the Parameters tab of the transformation scenario configuration dialog box.

Chunking DITA Topics

By default, when a DITA map (on page 2079) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the <topicref> that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the @toc and @collection-type attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the @collection-type attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 1762). To set the @toc and @chunk attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the DITA Maps Manager to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 2079) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the DITA Maps Manager view (on page 1762), make sure that the tab that holds your root map (on page 2083) is selected and that the Context selection is set either to the name of your root map or to <current map>.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click File > Refresh (F5).
3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 1807).
4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.
5. Select any other options you want to check.
6. Click **Check** to run the validation process.

**Result:** The progress of the operation is shown as a task in the **Progress** view and the operation can be stopped from there.

**Validation Process**

The validation process of a **DITA map** includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `@href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another **DITA map** is referenced in the main one, the referenced **DITA map** is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

**DITA Map Completeness Check Dialog Box**

The **DITA Map Completeness Check** dialog box allows you to configure the **DITA map** validation.
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 530)*.
Note:
If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set (on page 1996) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 1762). Clicking the Details icon opens a topic in the Oxygen XML Author Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2083) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.
For example, it will not report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

>Note: This option takes key scopes (on page 1923) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 1923) on the second occurrence.

**Report unreferenced key definitions**

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:
• Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
• Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

• If a row has fewer cells than the number of columns detected.
• For a `CALS` table, if a cell has a vertical span greater than the available rows count.
• For a `CALS` table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
• For a `CALS` table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
• For a `CALS` table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
• For a `CALS` table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the `Profiling / Conditional Text preferences page (on page 134)` (you can click the ³ Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Author Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the ➕ Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

**Export settings**

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

**Import settings**

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.
Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

**Tip:**
This function can be executed from an automated command-line script, for more details, see **Scripting Oxygen (on page 2057)**.

---

**DITA Map Author Mode Actions**

A variety of actions are available for DITA map documents that can be found in **DITA** menu, toolbar, contextual menu, and the **Content Completion Assistant (on page 2078)**.

**DITA Map Toolbar and Menu Actions**

When a **DITA map** is opened in **Author** mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  Opens a **New DITA file dialog box (on page 1826)** where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the **Insert Reference dialog box (on page 1786)** where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the **Reuse Content dialog box (on page 1907)** that allows you to insert and configure a content reference (\@conref), or a content key reference (\@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the **Insert Reference dialog box (on page 1786)** that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the **Insert Reference dialog box (on page 1786)** that allows you to insert a topic group at the cursor position.
Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column

Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.

Move Down

Moves the selected node down one position on its same level.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

DITA Map Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1797).

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.
Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2079). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:
1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.

2. In the DITA Maps Manager view, make sure that the **Context combo box** *(on page 1766)* points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select **Edit Properties**, and enter a value in the **Keys** field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA Map framework:

- **Insert New DITA Resource**
  
  Opens a **New DITA file dialog box** *(on page 1826)* where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  
  Opens the **Insert Reference dialog box** *(on page 1786)* where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  
  Opens the **Reuse Content dialog box** *(on page 1907)* that allows you to insert and configure a content reference (**@conref**), or a content key reference (**@conkeyref**) at the cursor position.

- **Insert Topic Heading**
  
  Opens the **Insert Reference dialog box** *(on page 1786)* that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  
  Opens the **Insert Reference dialog box** *(on page 1786)* that allows you to insert a topic group at the cursor position.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:
• \#<decimal value>- e.g. #65
• \&#<decimal value>- e.g. &#65
• \#x<hexadecimal value>- e.g. #x41
• \&#x<hexadecimal value>- e.g. &#x41

Relationship Table > Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Generate IDs

Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

Note:
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Search References

Finds the references to the @href or @keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 1762)). The current topic/map reference element must have an @href or @keys attribute defined to complete the search.

Show Key Definition

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2079) that contains the definition of the key with the element that defines that key selected.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \0x0045 will be converted to \0x0045 will be converted to E
- \0x0125 to ĥ
- 265 to ŭ
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the Position cursor between tags option is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
Surround with `[tag]` (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- Add/Change attribute
  
  Allows you to change the value of an attribute or insert a new one.

- Convert attribute to element
  
  Allows you to change an attribute into an element.

- Delete attribute
  
  Allows you to remove one or more attributes.

- Rename attribute
  
  Allows you to rename an attribute.

- Replace in attribute value
  
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- Delete comments
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  Allows you to delete elements.

- **Delete element content**
  Allows you to delete the content of elements.

- **Insert element**
  Allows you to insert new elements.

- **Rename element**
  Allows you to rename elements.

- **Unwrap element**
  Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

- **Wrap element**
  Allows you to surround elements with element tags.

- **Wrap element content**
  Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

- **Insert XML fragment**
  Allows you to insert an XML fragment.

- **Replace element content with XML fragment**
  Allows you to replace the content of elements with an XML fragment.

- **Replace element with XML fragment**
  Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
Enables or disables the Track Changes (on page 2084) support for the current document.

✔ **Accept Change(s) and Move to Next**

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ **Accept All Changes**

Accepts all Tracked Changes (on page 2084) in the current document.

✗ **Reject Change(s) and Move to Next**

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✗ **Reject All Changes**

Rejects all Tracked Changes (on page 2084) in the current document.

✍ **Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

✍ **Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

✍ **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

✍ **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**
  Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The floating contextual toolbar is automatically displayed when editing DITA map documents when a <topicref> element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).
DITA Map Drag/Drop Actions

Dragging a file from the Project Explorer view (on page 244) or DITA Maps Manager view (on page 1762) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a <topicref> element, <chapter>, <part>, etc.) at the drop location.

Opening a Topic from a DITA Map in Author Mode

If a DITA map is open in the Author visual editing mode, you can open a referenced topic by clicking the icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

Tip:
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

Opening a DITA Map With Topic Content Resolved

It is possible to open a DITA map in the main editor with all the content from the referenced topics resolved and presented in one document. To do this, select the DITA map in the DITA Maps Manager view and click the Open Map in Editor with Resolved Topics toolbar button. This opens the DITA map in the main editor area with content from all topic references expanded in-place.

Content from the resolved topics that is referenced using a @conref or @conkeyref attribute is presented as read-only by default. To edit it, you must use the Edit Reference contextual menu action to open the source topic that contains the referenced content.

Editing Referenced Content Directly

If you want to edit the referenced content directly without having to open the source document, go to Options > Preferences > Editor > Edit Modes > Author and select the Allow referenced content to be edited option (on page 128). The referenced content becomes editable in-place and saving the document will save all other modified topics.
Things to be Aware of When Enabling This Option:

- The references become editable only if the referenced topics are the root elements. If, for example, in the DITA map, there are references directly to subtopics embedded in a larger topic, those references will not be editable.
- If the content is stored in a CMS, you need to deselect the Local files only option (on page 128) to edit such remote referenced topics directly but this feature might not function properly with remote resources (it depends on the capabilities of the CMS connector).
- Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.
- When modified topics are saved, the Only modified content option in the Preferences > Editor > Edit Modes > Author > Serialization page (on page 146) is ignored.
- The toolbar has two DITA map-specific actions for inserting topic references and all DITA topic-specific actions that can be used to make changes in the referenced DITA topics.
- The content completion and schema-aware insertion strategies work in each referenced topic according to their respective schema.
- The contextual menu presents the relevant actions in each referenced topic.
- Validation works for each individual referenced topic but only if it contains modifications.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `<p>`, `<ol>`, and `<simpletable>`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.
Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

• A `<task>` element specifies that a block of content contains the description of a task.
• A `<codeblock>` element specifies that a block of text consists of programming code.
• A `<uicontrol>` element specifies that a word is the name of a control in a computer GUI.
• The `@platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`<wintitle>`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `<audience>` element to capture audience metadata.

Creating Topic Structures

Oxygen XML Author Eclipse plugin provides a number of tools to help you create topic structures:

• **Content Completion Assistant (on page 2078)** - Shows you which elements can be created at the current position.
• **Model view (on page 304)** - Shows you the complete structure supported by the current element.
Outline view (on page 299) - Shows you the current structure of your document.

DITA toolbar - Helps you to easily insert many common structures.

Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Author Eclipse plugin, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.

Related information

- Getting Started with DITA (on page 1753)
- DITA Topics Document Type (Framework) (on page 691)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- **Topic** - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- **Task** - For procedural information such as how to use a dialog box.
- **Concept** - For general, conceptual information such as a description of a product or feature.
- **Reference** - For reference information.

Oxygen XML Author Eclipse plugin also supports numerous other specialized topic types that you will find templates for in the various folders in the New DITA file dialog box (on page 1827). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and DITA map (on page 2079) types such as Glossentry, Troubleshooting, Bookmap (on page 2077), and Subject Scheme Map (on page 2084).

To create a new DITA topic and add a reference to it in your DITA map (on page 2079), follow these steps:

1. In the DITA Maps Manager (on page 1762), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 1827) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

Duplicate - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

Note: The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 77) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a <topicref>) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

New DITA File Dialog Box

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.
Figure 341. New DITA File Dialog Box

The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 228).

The New DITA file dialog box includes the following features and options:

**Choose a file template**

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

**Tip:**

You can use the text filter field at the top of the dialog box to search for a specific template.

**Title**

Depending on the selected file template, the value of the Title field is set in:
• The `<title>` element of a DITA topic file. The `<title>` element needs to be the first child of the root element.
• The `<glossterm>` element of a Glossentry file.

**New Topics Preferences**

Pressing this button opens the DITA New Topics preference page (on page 77).

**Save as**

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the `Browse` drop-down menu.

**Create**

When you click this button, a reference ( `<topicref>` ) to the new topic is added to the current DITA map and the new topic is opened in the editor.

**Related Information:**

- Getting Started with DITA (on page 1753)
- Adding Topics to a DITA Map (on page 1781)
- Working with Markdown Documents in DITA (on page 1888)
- Fast Create Multiple DITA Topics (on page 1829)

**Fast Create Multiple DITA Topics**

The DITA Maps Manager (on page 1762) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2079). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

**Note:**

The Fast Create Topics feature works for the following types of local and remote resource protocols: `file`, `http`, `https`, `ftp`, `ftps`.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.
The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (**Tab** or **Space**). Topic references will be created in the *DITA map* according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules *(on page 77)* for how those file names will be generated.

**Tip:**

If you have added a *file name prefix or suffix to the properties file*(on page 231) for DITA document templates, the generated file name will include that prefix or suffix.
File name prefix

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 231) for DITA document templates, the prefix you enter here will override the one from the properties file.

File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 231) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

Tip:
You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 1835).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

Create

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip:
You can easily change the order of the topics in the DITA map (on page 1780) at a later time,

Adding Topics to a DITA Map (on page 1781)
Converting DITA Topics to Another Type (on page 1835)

Editing DITA Topics

Oxygen XML Author Eclipse plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Author Eclipse plugin provides for editing
XML documents also apply to DITA topics. Oxygen XML Author Eclipse plugin also provides extensive additional support specifically for DITA.

**Opening a DITA Topic**

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** *(on page 1762)* (or right-click the topic and select **Open**).
- Double-click the file in the **Project Explorer view** *(on page 244)* (or right-click the file and select **Open**).
- If you have a **DITA map** *(on page 2079)* opened in the XML editor, you can click the **icon to the left of the topic.**
- Drag a DITA file from your system browser and drop it in the XML editor.

**Visual Editing in Author Mode**

DITA is an **XML format** *(on page 20)*, although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Author Eclipse plugin provides a graphical view of your topics in **Author mode** *(on page 220)*. Your topics will likely open in **Author mode** by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author mode**, just click **Author** at the bottom left of the editor window to switch to this mode.

**Author mode** presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author mode** is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Author Eclipse plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author mode** as a friendly visual editing environment, not a faithful preview of your output.

- Your document is still an XML document. **Author mode** creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to **Text mode** *(on page 219)*. You, or someone in your organization, can change how the **Author view** looks by changing the CSS stylesheet or providing an alternate stylesheet.

- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author mode** keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.

- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author view** (though there are some exceptions) and cannot be edited directly in the **Author view** (though in some
cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 377) to edit attributes.

**Tip:**
You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1442) section.

### Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Author Eclipse plugin has a number of Content Completion Assistant (on page 2078) features.

- **The Enter key:** In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element `<p>` in DITA) and tools insert the line breaks in the output and on-screen.

  ![Figure 343. Content Completion Assistant](image)

  The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (on page 2077) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

  A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).

  As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

  To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.
The Model view: You can see the entire model of the current element by opening the Model view (on page 304) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip:
You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1442) section.

DITA Editing Actions

A variety of actions are available in the DITA framework (on page 2080) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

Note:
The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 1866), the contextual menu also includes various general Author mode contextual menu actions (on page 504).

Related Information:
Getting Started with DITA (on page 1753)
DITA Topic Author Mode Actions (on page 1866)
Converting DITA Topics to Another Type

Oxygen XML Author Eclipse plugin includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for DITA

The following conversion operations are available:

- **Convert Nested Topics to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))
  
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1762))
  
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

- **Convert to Reference**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

- **Convert to Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

- **Convert to Topic**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

- **Convert to Troubleshooting**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).
Methods for Accessing the DITA Conversion Refactoring Operations

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 1762)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select XML Refactoring from the XML menu (or from the Refactoring submenu when you right-click one or more documents in the Project Explorer view (on page 244) or the DITA Maps Manager view (on page 1762)). Then select whichever operation is appropriate for your needs.

XML Refactoring Wizard Dialog Box

When you select any of the operations, Oxygen XML Author Eclipse plugin proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 1836), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.
- **Filters** section
  - Include files - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - Restrict to known XML file types only - Excludes non-XML file types from the operation.

If you used the Single Document Method (on page 1836), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

- **Preview**
  
  You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

  **Warning:**
  
  It is always recommended to use the Preview button to make sure the operation is not going to do something unexpected and after you click the Finish button, any Undo action will only revert changes on the current document.

- **Finish**
  
  When you use the Finish button, behind the scenes Oxygen XML Author Eclipse plugin maps the structure of the previous DITA document type to a structure that fits the new type. In some
cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Å is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

```
/OXYGEN_INSTALL_DIR/frameworks/dita/refactoring/utils/character-map.xsl
```

**Converting To and From DITA Specialization Document Types**

If you use your own [DITA specialization document type](on page 2038), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):
   
   ```
   /OXYGEN_INSTALL_DIR/ frameworks/dita/refactoring/
   ```

   **Note:**
   The stylesheets for converting entire files (from one type to another) are located in the `dita-files-conversion-stylesheets` folder. Each of these conversion operations has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*entrypoint.xsl` file (for example, to modify the Convert to Task operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.
   b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

3. For the Convert Nested Topics to New Topics and Convert Sections to New Topics operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the `/OXYGEN_INSTALL_DIR/ frameworks/dita/refactoring/utils/dita-formats.xsl` stylesheet with your own values for the `DOCTYPE` or `xml-model`.

4. If you want to change the name of the operation that will be displayed in Oxygen XML Author Eclipse plugin, follow these substeps:
a. Locate the resource XML file for the same conversion operation in the following directory:
   
   `[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/` (for example, for the **Convert to Task** operation, it is `convertResource2Task.xml`).

b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).

5. Save your changes to all modified files.
6. Restart Oxygen XML Author Eclipse plugin

**Result:** You should now see your changes when accessing the conversion operations *(on page 1836).*

---

---

**Working with Images in DITA Topics**

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

**Adding an Image Inline with the Insert Image Dialog Box**

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.

2. Select the ✖️ Insert Image action. The Insert Image dialog box appears.
3. Configure the options in this dialog box and click **Insert**.

The **Insert Image** dialog box includes the following options and features for inserting images into a DITA document:

**Location**

Use this option to specify a URL for the image as the value of an `@href` attribute inside the `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the *Browse* drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a `@keyref` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2083) of the current DITA map. You can use the **Choose Key Reference** button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

**Note:**

If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.
Figure title

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>`.

Alternate text

Use this text box to insert an `<alt>` element inside the `<image>`.

Size

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

Layout

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

Preview

The **Preview** box shows a thumbnail of the selected image so that you can see a preview of the image before clicking **Insert**.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the **Project Explorer** view (on page 244) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```xml
<image href="../images/image_file.png"/>
```

**Tip:**

To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author Eclipse plugin will automatically update the reference to the new image.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 1838) to the `<fig>` element.

**Note:**

The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`.
Oxygen XML Author Eclipse plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p>
  <image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
</p>

<b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

Figure 345. Image Floated to the Right

Searching for References to Images

You can search for all references to an image by selecting `Search References` from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified `ID` are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified `ID` are also reported.
Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project Explorer view and drop them into your documents (or copy and paste them).

### Table 15. Supported Media Types

<table>
<thead>
<tr>
<th>Media</th>
<th>Description</th>
<th>Type</th>

<td>Width &amp; Height</td>
</tr>
</tbody>
</table>

### Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:
1. Place the cursor at the location where you want the media resource.

2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.

![Insert Media Dialog Box](image)

Note:
You can also drag media files from your system explorer or the Project Explorer view (on page 244) and drop them into your documents (or copy and paste them). Note that this method will bypass the Insert Media dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

3. Configure the options in this dialog box and click Insert.

The Insert Media dialog box includes the following options:

**Location**

Use this option to specify a URL for the media resource as the value of a @data attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a @datakeyref attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2083) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.
Note:
If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.

Type
Oxygen XML Author Eclipse plugin detects and automatically selects the media type based upon the specified resource in the URL field (on page 1843). You can manually change the type, but keep in mind that in the publishing stage the object element is converted to an HTML5 element (on page 1844) based upon the type selected here. You can choose between: audio, video, or iframe.

Size
Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a @width and @height attribute, respectively. For audio clips, only the Width can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

Attention:
• On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

Result in Output: In the publishing stage, the object element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

• Videos - The object element is converted to an HTML5 video element.
• Audio Clips - The object element is converted to an HTML5 audio element.
• Embedded HTML Frames - The object element is converted to an HTML5 iframe element.

Tip:
There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select Copy embed code), you can then paste the contents of the clipboard in the URL field (on page 1843) and the Type (on page 1844) will automatically be set on iframe, while the Width and Height (on page 1844) will be populated according to the detected size, and an allowfullscreen parameter will
Inserting Media in HTML Outputs That Do Not Support Embedded Media

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Author Eclipse plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. **Edit the DITA transformation scenario** (on page 1969) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the **Parameters tab** (on page 1975) and click the **New** button to add a new parameter.
3. For the **Name**, enter: **com.oxygenxml.xhtml.linkToMediaResources**.
4. For the **Value**, enter: **true**.
5. Click **OK** and continue on to run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Image Maps in DITA

Oxygen XML Author Eclipse plugin includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.
Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape.
Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 ![Duplicate](image)

 **Duplicate**

 Use this button to create a duplicate of the currently selected shape.

 ![Delete](image)

 **Delete**

 Use this button to delete the currently selected shape.

 ![Undo](image)

 **Undo**

 Use this button to undo the last action.

 ![Redo](image)

 **Redo**

 Use this button to redo the last action that was undone.

 ![Show/Hide Numbers](image)

 **Show/Hide Numbers**

 Use this button to toggle between showing or hiding the numbers for the shapes.

 ![Bring Shape to Front](image)

 **Bring Shape to Front**

 Use this button to bring the currently selected shape forward to the top layer.

 ![Bring Shape Forward](image)

 **Bring Shape Forward**

 Use this button to bring the currently selected shape forward one layer.

 ![Send Shape Backward](image)

 **Send Shape Backward**

 Use this button to send the currently selected shape back one layer.

 ![Send Shape to Back](image)

 **Send Shape to Back**

 Use this button to send the currently selected shape back to the bottom layer.

 ![Color Chooser](image)

 **Color Chooser**

 Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 ![Zoom Slider](image)

 **Zoom Slider**

 Use this slider to zoom the image in or out in the main image pane.

 **Image Pane**

 This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:
Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to Polygon or Free Form shapes.

- **Remove Point**
  Removes the current point from Polygon or Free Form shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (on page 1935) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an `<xref>` element will be inserted with either an @href attribute or a @keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Author Eclipse plugin (on page 1935).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 1850) in Author mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:
1. Right-click the image and select **Image Map Editor**.

   **Step Result:** This action will apply an image map to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( [New Rectangle], [New Circle], or [New Polygon]).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1846) to adjust its layer and color, or to perform other editing actions.

   **Tip:**

   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1848). For example, the easiest way to remove a point is to right-click the point and select ✗ **Remove Point**.

4. With the shape selected, use one of the linking options (on page 1849) in the 📏 **Link** drop-down menu to select a target resource (or enter its path in the **Target** (on page 1849) text field).

5. (Optional) Enter a **Description** (on page 1849) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 348. Image Map Details**
How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the ![Show/Hide Numbers](on page 1846)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 1846) (↑, ↓, →, ←).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Related Information:

- [DITA 'imagemap' Element Specifications](#)
- [Working with Images in DITA Topics (on page 1838)](#)

**Adding Tables in DITA Topics**

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (on page 1852)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (on page 1853)** - This is used for more advanced functionality.
• **DITA Choice table model (on page 1856)** - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.

• **DITA Properties table model (on page 1858)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a **Simple** DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table Model.

![Insert Table Dialog Box - Simple Model](image)

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

### Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **@dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

![Note]

The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @colwidth attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (@colwidth attribute). Entering content into a cell changes the rendered width dynamically.
If you change the width by dragging a column in author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the **pt** unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in text mode. The following units are allowed: **pt** (points), **cm** (centimeters), **mm** (millimeters), **pi** (picas), **in** (inches).

### Frame

Allows you to specify a value for the **@frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a **@conref**, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the **@conref** target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Row separator

Specifies whether or not to include row separators (**@rowsep** attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (**@colsep** attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (**@align** attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**

The **justify** value cannot be rendered in author mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

• **ditauseconreftarget** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:**
The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (on page 220), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Sample CALS Table with Fixed Width](image)

**Inserting a Choice Table Model**

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the DITA menu), or select `choicetable` from the **Content Completion Assistant** (on page 2078). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.
The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3***" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

- `-dita-use-conref-target` - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

### Inserting a Properties Table Model

To insert a Properties table within a `<refbody>` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the DITA menu), or select **Properties(wizard)** from the Content Completion Assistant *(on page 2078)*. The **Insert Table** dialog box appears. Select **Properties** for the table Model.

**Figure 353. Insert Table Dialog Box - Properties Model**

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

- Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a **Properties** table is inserted into your DITA Reference document at the current cursor position (within a <refbody> element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on macOS))** action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 1862).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 219).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Author Eclipse plugin includes a **Smart Paste feature (on page 362)** that preserves certain style and structure information when pasting content.

**Tip:**

When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

**Related Information:**

**Editing Tables in Author Mode (on page 428)**
DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model (on page 1860)**
- **Simple table model (on page 1860)**
- **Choice table model (on page 1861)**
- **Properties table model (on page 1861)**

**CALS Table Model Layout**

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**@colwidth** attribute) or the text alignment (**@align** attribute). Although they appear as part of the **Author mode (on page 220)**, the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Figure 354. CALS Table in DITA](image)

**Simple Table Model Layout**

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

![Figure 355. DITA Simple Table](image)
### Choice Table Model Layout

A **Choice** table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetables>` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting `choicetable` from the *Content Completion Assistant* *(on page 2078)* (within a `<step>` element) or by using the [Insert Table] action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

![Figure 356. DITA Choice Table](image)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

### Properties Table Model Layout

A **Properties** table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting `properties(wizard)` from the *Content Completion Assistant* *(on page 2078)* (within a `<refbody>` element) or by using the [Insert Table] action on the toolbar (or from the contextual menu) and selecting *Properties* for the *Model*. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

![Figure 357. DITA Properties Table](image)

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

### Table Validation in DITA

Oxygen XML Author Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map* *(on page 2079)* with the [Validate and Check for Completeness] action, if the **Report table layout problems** option *(on page 1811)* is selected in the *DITA Map Completeness Check* dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
• The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
• The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
• The value of the `@cols`, `rowsep`, or `@colsep` attributes are not numeric.
• The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Table Properties` action from the toolbar or the `Table` submenu of the contextual menu (or `DITA` menu). This opens the `Table properties` dialog box.

The `Table properties` dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:

Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the `Table properties` dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a `Preview` pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (@align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**

The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**
Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (\texttt{@valign} attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a \texttt{@conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{@conref} target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

### Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the \texttt{@colsep} attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the \texttt{@rowsep} attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Frame (Available only in the Table tab)

Allows you to specify a value for the \texttt{@frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \texttt{@conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{@conref} target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

### Edit Table Properties for a Simple, Choice, or Properties Table Model

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

#### Table tab

##### Frame

Allows you to specify a value for the \texttt{@frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Row tab (not available for Properties tables)**

**Row type**

Allows you to change the row to a body or header type of row.

**Related Information:**

- Adding Tables in DITA Topics *(on page 1851)*
- Editing Tables in Author Mode *(on page 428)*

**Adding MathML Equations in DITA Topics**

You can add MathML equations in a DITA document using one of the following methods:

• Embed MathML directly into a DITA topic. You can use **Insert** > **Σ** **Insert Equation** from the contextual menu to insert a MathML equation. Clicking on the equation will open a **MathML Editor** where you can edit the code.

• Reference an external MathML file as an image, using the **-insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).

**Publishing Notes:**

• MathML equations contained in DITA topics can be published out-of-the-box in PDF using the **DITA PDF** transformation scenario.

• The **DITA Map PDF - based on HTML5 & CSS** transformation scenario *(on page 1115)* support MathML equations *(on page 1294)*.

• For details about HTML output, see **How to View MathML Equations in HTML Output** *(on page 1056)*.

• For other publishing formats, you might need to employ additional customizations for handling MathML content.
Oxygen XML Author Eclipse Plugin 24.1 | 20 - DITA Authoring | 1866

Adding LaTeX Equations in DITA Topics
LaTeX is a high-quality typesetting system that includes features designed for the production of technical
and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format.
By default, web browsers and PDF readers do not have support to show mathematical equations written in
LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.
Adding support for writing LaTeX equations in a DITA topic implies three stages:
1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD
specialization and add a new element (for example, called <latex> and it extends the DITA <foreign>
element). Alternatively, you can directly use the DITA <foreign> element with a specific @outputclass
attribute value:
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
<title>Test equation</title>
<body>
<p><foreign outputclass="embed-latex">L' = {L}{\sqrt{1-\frac{v^2}{c^2}}}</foreign></p>
</body>
</topic>

2. If you want Oxygen XML Author Eclipse plugin to properly present the LaTeX equation when editing in
the Author visual mode, you need a plugin that converts the equation content to an image. There is a
sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/
tree/master/latex-images-support. You can download and copy the plugin folder latex-images-support
to the Oxygen XML Author Eclipse plugin plugins folder, then restart Oxygen XML Author Eclipse plugin.
3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA
Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/
oxygenxml/dita-latex.

DITA Topic Author Mode Actions
A variety of actions are available for DITA documents that can be found in DITA menu, toolbar, contextual
menu, and the Content Completion Assistant (on page 2078).

DITA Toolbar Actions
The following default actions are available on the DITA toolbar when editing in Author mode (by default, most
of them are also available in the DITA menu and in various submenus of the contextual menu):
Bold
Surrounds the selected text with a <b> tag. You can use this action on multiple non-contiguous
selections.
Italic


Surrounds the selected text with an  tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with a  tag. You can use this action on multiple non-contiguous selections.

**Link Actions Drop-Down Menu**

The following link actions are available from this menu:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 1935) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2079) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 1935).

**File Reference**

Opens the File Reference dialog box (on page 1936) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

**Web Link**

Opens the Web Link dialog box (on page 1936) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (on page 1936) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

**Tip:**

You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search
Related Link to File

Opens the **File Reference** dialog box ([on page 1937](#)) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see **Linking in DITA Topics** ([on page 1935](#)).

Related Link to Web Page

Opens the **Web Link** dialog box ([on page 1937](#)) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see **Linking in DITA Topics** ([on page 1935](#)).

![Insert Image]

Opens the **Insert Image** dialog box ([on page 1838](#)) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

![Insert Media Resource]

Opens the **Insert Media** dialog box ([on page 1842](#)) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an **<object>** element and it is rendered in **Author** mode so that it can be played directly from there.

§ **Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

§ **Insert Section**

Inserts a new **<section>** element in the document, depending on the current context.

**Insert Concept**

Inserts a new **<concept>** element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

**Insert Task**

Inserts a new **<task>** element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.
Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 1907) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 1908), content key references (@conkeyref) (on page 1911), or key references to metadata (@keyref) (on page 1914).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).
**Note:**
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **only lists, paragraphs, or inline content can be converted to tables**.

- **Insert Row**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Delete Row(s)**
  Deletes the table row located at the cursor position or multiple rows in a selection.

- **Insert Column**
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Delete Column(s)**
  Deletes the table column located at the cursor position or multiple columns in a selection.

- **Table Properties**
  Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### DITA Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

- **Edit Attributes**
  Displays an **in-place attributes editor (on page 379)** that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  Allows you to change the **profiling attributes (on page 414)** defined on all selected elements.

- **Cut (Ctrl + X (Command + X on macOS))**
  Removes the currently selected content from the document and places it in the clipboard.
Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2079). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an <xref> that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:
1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.

2. In the DITA Maps Manager view, make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2077)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:**
  
  If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Image**
  
  Inserts an image reference (on page 464) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**
  
  Opens a Choose Media dialog box (on page 492) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Insert Equation**
  
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 494).

- **Insert Note**
  
  Inserts a new <note> element at the current cursor position.
Insert Code Block

Inserts a new `<codeblock>` element at current cursor position.

Insert Menu Cascade

Inserts a new `<menucascade>` element at current cursor position.

Insert Paragraph

Inserts a new `<p>` (paragraph) element at current cursor position.

Insert Section

Inserts a new `<section>` element in the document, depending on the current context.

Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e.g. #65
- `&<decimal value>` - e.g. &#65
- `<hexadecimal value>` - e.g. #x41
- `&<hexadecimal value>` - e.g. &#x41

Style submenu

This submenu includes the following text styling actions:

Bold

Emphasizes the selected text by surrounding it with a `<b>` (bold) tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with an `<i>` (italic) tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with a `<u>` (underline) tag. You can use this action on multiple non-contiguous selections.

Subscript

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Code**

Surrounds the selected text with a `<codeph>` tag.

**UI Control**

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

**Filepath**

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the **Other Actions** submenu provides access to the other actions):

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (*Above* or *Below* the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (*Above* or *Below* the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).
Split Cell

Splits the cell at the cursor location. If Oxygen XML Author Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the Cross Reference (xref) dialog box (on page 1935) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2079) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 1935).

File Reference

Opens the File Reference dialog box (on page 1936) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

Web Link

Opens the Web Link dialog box (on page 1936) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 1935).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 1936) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related
links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Tip:
You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Related Link to File
Opens the File Reference dialog box (on page 1937) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Related Link to Web Page
Opens the Web Link dialog box (on page 1937) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 1935).

Sort
Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs
Oxygen XML Author Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

Note:
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.
This submenu includes the following actions regarding reusing content in DITA:

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 1907) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 1908), content key references (@conkeyref) (on page 1911), or key references to metadata (@keyref) (on page 1914).

**Push Current Element**

Opens the Push current element dialog box (on page 1917) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 1907).

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `:dita-use-conref-target` value.

2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

For `keyrefs` inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrels`), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (`@conref` or `@conkeyref`) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the Replace selection with content reference option is selected in the dialog box, the selection will be replaced with a content reference (`@conref`). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (`@conref` and `@conrefend`). For more information, see Creating a Reusable Content Component (on page 1920).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 1921).

**Search References (Ctrl + Shift + G (Command + Shift + G on macOS))**

Finds the references to the `@id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2079) (opened in the DITA Maps Manager view (on page 1762)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

**Figure 359. Search References to Ancestors Dialog Box**

![Search References to Ancestors Dialog Box](image-url)
Tip:
If you are invoking the action on an image, see Searching for References to Images (on page 1841) for details about what will be reported.

Find Similar Topics

Opens the Open/Find Resource view and performs a search using text content from the \texttt{<title>}, \texttt{<shortdesc>}, \texttt{<keyword>}, and \texttt{<indexterm>} elements. It is helpful for quickly finding related topics that can be added as related links.

Show Key Definition

Available for elements that have a \texttt{@conkeyref} or \texttt{@keyref} attribute set (or elements with an ancestor element that has a \texttt{@conkeyref} or \texttt{@keyref} attribute). It computes the key name and opens the DITA map (on page 2079) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2078).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.
Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with change tracking (on page 2084) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 272). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to ĥ
- 265 to ɥ
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent *block elements (on page 2077)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the *Delete* or *Backspace* keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the *Position cursor between tags option (on page 111)* is selected in the *Content Completion* preferences page, the cursor is placed between the start and end tag.
  - If the *Position cursor between tags option (on page 111)* is not selected in the *Content Completion* preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
Surround with ['tag'] (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert @conref attributes to @conkeyref attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.
Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.
**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.
Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✔ Track Changes

Enables or disables the Track Changes (on page 2084) support for the current document.

✔ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes

Accepts all Tracked Changes (on page 2084) in the current document.

✗ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2084) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✗ Reject All Changes

Rejects all Tracked Changes (on page 2084) in the current document.

✍ Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2084). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

✍ Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.
Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 410).

Manage IDs submenu

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 572) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 572).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))
Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on macOS))
Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))
Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))
Unfolds all elements in the current document.

Inspect Styles
Opens the CSS Inspector view (on page 386) that allows you to examine the CSS rules that match the currently selected element.

Options
Opens the Author mode preferences page (on page 125) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DITA
Oxygen XML Author Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 360. DITA Floating Contextual Toolbar

The floating contextual toolbar is automatically displayed when editing DITA documents in various situations, including:

- When a \texttt{<p>}, \texttt{<li>}, or \texttt{<shortdesc>} element has a selection inside, the floating toolbar includes actions such as \texttt{Bold}, \texttt{Italic}, \texttt{Underline}, a \texttt{Link} submenu, and more.
- When an \texttt{<image>} or \texttt{<xref>} element is selected:
  - If the element has an \texttt{@href} attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  - If the element has a \texttt{@keyref} attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an \texttt{<object>} element is selected:
  - If the element has a \texttt{@data} attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  - If the element has a \texttt{@datakeyref} attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
• When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.
• When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.
• When a `<ul>` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.
• When an `<ol>` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.
• When an `<li>` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
• When a `<rows>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
• When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
• When an `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the Project Explorer view (on page 244) or DITA Maps Manager view (on page 1762) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 244) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).

**Tip:**
For information about customizing Author mode actions for a particular framework (on page 2080) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1442) section.

**Related Information:**
Customizing the Author Mode Editing Experience for a Framework (on page 1442)

**Working with Markdown Documents in DITA**

Oxygen XML Author Eclipse plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics.
and the **DITA** tab in the *Preview* pane provides a visualization of how the DITA topic will look after conversion. Likewise, the **XDITA** tab in the *Preview* pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the *Preview* pane.

### Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

### Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Author Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager** *(on page 1762)*. The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (**topicref** element) with the **format** attribute set to **markdown**.

- **Validate Markdown Documents in DITA Maps** - When you use the **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a **DITA map**, Markdown documents that are referenced in the **DITA map** will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming **DITA maps** that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.
Figure 361. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Author Eclipse plugin is about to make.

**Convert**

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

**Tip:**

Oxygen XML Author Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Project Explorer view (on page 244), open the sample.xpr project, and navigate to the dita/markdown-dita folder.
**DITA-Related Markdown Syntax**

For a list of Markdown rules and syntax examples that are specific to DITA, see the [Markdown DITA Syntax Reference](#).

**Working with Keys in DITA**

DITA uses keys to insert content that may have different values in particular circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a various ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

**Defining Keys in DITA Maps**

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2083). This makes it easier to manage since they’re all in one location.

There are two types of key definitions that can be created in a map:

- **Key with a value inside a `<keyword>`**. To define this type of key, follow these instructions: [Key Definition with a Keyword Value](#).
- **Key with a target (for example, to target a resource such as an image or external link)**. To define this type of key, follow these instructions: [Key Definition with a Target](#).
Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA (on page 1921).

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the <topicref> element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the <topicref> element in its DITA map (on page 2079)) is to use the Keys tab in the Edit Properties dialog box (on page 1799). In the DITA Maps Manager (on page 1762), invoke the contextual menu on the topic that will have the key assigned and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (on page 1935) to it using <xref keyref="feature.quick-heat">. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (on page 1781) by key: <topicref keyref="feature.quick-heat">. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (on page 1903). In this case, the content reference uses the key to locate the topic to pull content from. It uses a @conkeyref attribute: <procedure conkeyref="feature.quick-heat/preheat-procedure">. In this example, feature.quick-heat is the key, and preheat-procedure is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file (on page 1796)) and then insert the image using the key (on page 1838).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="imagel" href="/img/imagel.png" format="png"/>
</map>
```
Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 2083). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 1894) in the output and you can even define abbreviated forms (on page 1894) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Author Eclipse plugin

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 1779) for your glossary and embed it in your main map.

2. Create a glossary entry topic (<glossentry>) for each glossary term. The <glossentry> element may contain numerous optional glossentry elements, but every glossentry topic must contain a <glossterm> and <glossdef> element. The <glossterm> is the name of the term while the <glossdef> is its definition. Here is an simple example:

   `<glossentry id="ddl">`  
   `<glossterm>Data Definition Language</glossterm>`  
   `<glossdef>A language used for defining database schemas.</glossdef>`  
   `</glossentry>`

   The easiest way to create a glossentry topic in Oxygen XML Author Eclipse plugin:  
   a. Click the New file wizard button on the toolbar.  
   b. Type glossentry in the search field at the top of the dialog box.  
   c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the <glossref> element. This element requires a @keys attribute. Please make sure the @print attribute is set to yes to show the glossary also in the PDF output.

   `<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>`
The easiest way to reference a glossentry in Oxygen XML Author Eclipse plugin:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

Step Result: This opens the Insert Reference dialog box (on page 1786).

b. Go to the Keys tab and enter a name in the Define keys field.
c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.
d. Click Insert and Close.

Tip:
You could also group multiple glossentry topics into a single collection by using the <glossgroup> element.

How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the <term> element (or <abbreviated-form> element as described in the next section (on page 1894)) with a @keyref attribute that references the corresponding key specified in the <glossref>. Of course, the <glossref> points to the <glossentry> topic where the glossary term is defined.

<term keyref="gloss_ddl"/>

In the output, the text specified in the <glossterm> element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a <term> element and reference the glossary term in Oxygen XML Author Eclipse plugin:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the DITA Reusable Components view (on page 1926), go to the Keys tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select Insert as Keyref > More > Term.

Using Abbreviated Forms (Acronyms) with Glossary Terms

The <abbreviated-form> element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the <glossentry> and then reference it with the <abbreviated-form> element (instead of the <term> element).
The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```xml
<glossentry id="ddl">
    <glossterm>Data Definition Language</glossterm>
    <glossBody>
        <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
        <glossAlt>
            <glossAcronym>DDL</glossAcronym>
        </glossAlt>
    </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```xml
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc.

Reusing DITA Content

Reusing content is one of the key features of DITA and DITA provides several methods for reusing content. Oxygen XML Author Eclipse plugin provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 1898).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 1900) (conref, conkeyref, coderef). A conref (content reference) (on page 1901) creates a direct reference to a specific element of another topic. A conkeyref (content key reference) (on page 1903) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the
key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A `coderef` references an external file that contains literal code.

Oxygen XML Author Eclipse plugin provides support for all of these mechanisms.

While the `conref` and `conkeyref` mechanisms can be used to reference any content element, it is considered best practice to only use `conref` or `conkeyref` content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Author Eclipse plugin can help you create a reusable component from your current content.

**Reusing Content with Reusable Components**

DITA allows you to select content in a topic, create a reusable component (on page 1919) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

**Reusing Content with Variables**

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 1921), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

**Reusing Content with DITA 1.3 Concepts**

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. Key Scopes (or scoped keys) (on page 1923) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. Branch Filtering (on page 1925) allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the DITA Reusable Components view (on page 1926) can be quite helpful. It collects all of the keys and reusable components that are defined in the root map (on page 2083) and presents them in a dynamic table where you can easily locate and insert references to them.

**Reuse Actions in Oxygen XML Author Eclipse plugin**

Oxygen XML Author Eclipse plugin includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the DITA menu, and some are available on the toolbar.
**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 1907) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 1908), content key references (@conkeyref) (on page 1911), or key references to metadata (@keyref) (on page 1914).

**Push Current Element**

Opens the Push current element dialog box (on page 1917) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 1907).

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.
If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the Replace selection with content reference option is selected in the dialog box, the selection will be replaced with a content reference (@conref). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (@conref and @conrefend). For more information, see Creating a Reusable Content Component (on page 1920).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 1921).

**Resources**

For more information about reusing strategies in DITA, see the following resources:

- Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies
- Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies

**Related information**

Working with Keys in DITA (on page 1891)

**Reusing DITA Topics in Multiple Maps**

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (on page 1783)) using one of the following procedures:

**Reuse Topics Using the DITA Maps Manager**

1. Make sure the DITA map (on page 2079) is opened in the DITA Maps Manager (on page 1762).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on macOS) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 1762)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
b. If the topic already exists in another DITA map, do one of the following:

- Open the other map in the DITA Maps Manager (on page 1762), right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
- If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 1762)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.

c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:

- Right-click the topic in the Project Explorer view (on page 244) (or the file system), select Copy, switch to the DITA Maps Manager (on page 1762) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
- If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 1762)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.

3. If your topic uses a key reference (on page 1891), set up the appropriate key definition in your map (on page 1795).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 1941).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 1806) on the toolbar in the DITA Maps Manager.

## Reuse Topics Using Author Mode Editor

1. Open the DITA map (on page 1761) in the Author mode editor.

2. Add a reference to an existing topic by dragging it from the Project Explorer view (on page 244) (or the file system) and dropping it in the desired location in the DITA map opened in Author mode. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.

3. If your topic uses a key reference (on page 1891), set up the appropriate key definition in your map (on page 1795).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 1941).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 1806) on the toolbar in the DITA Maps Manager.
Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 1762), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.

Working with Content References

The DITA content reference feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA `@conref` or `@conkeyref` attributes.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a `@conref` or `@conkeyref` attribute to an element in the local document. The `@conref` or `@conkeyref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Author Eclipse plugin displays it in Author mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (on page 61), go to Editor > Edit modes > Author, and deselect the Display referenced content option (on page 128).
Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main content reuse features of DITA. It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an ID to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select `Edit Attributes` from the contextual menu to open the in-place attribute editor. Enter `id` as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view to enter a value in the `id` attribute.

Creating a Content Reference

To create a content reference (`conref`), follow these steps:
1. Make sure the element you want to reference has an ID assigned to it (on page 1901).

2. In Author mode (on page 220), place the cursor at the location where you want the reused content to be inserted.

3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 1907) is displayed.

4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.

5. Select the Target ID of the element (or elements) to have their content inserted, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conref) field.

6. Make any other selections you need in the Reuse Content dialog box (on page 1907). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.

7. Click Insert or Insert and close to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Author Eclipse plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 144) is selected in the Schema-Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Author Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (conref) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.

2. Place the cursor at a location where the copied element will be valid.

3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 1930) to easily insert content references.

- An alternate way to reuse content is to use the Oxygen XML Author Eclipse plugin Create Reusable Component (on page 1920) and Insert Reusable Component (on page 1921) actions (available in the DITA menu and the Reuse submenu of the contextual menu). They handle the details of creating an ID and conref and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
• You can also insert reusable content using content key references (on page 1903). This may also make reusable content easier to manage, depending on your particular situation and needs.
• Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 1916), the conref push mechanism (on page 1917), variable text (on page 1921), key scopes (on page 1923), and branch filtering (on page 1925).

DITA Reusable Components View (on page 1926)
Creating a DITA Content Key Reference (on page 1903)
Editing DITA Content References (on page 1905)
Working with Reusable Components (on page 1919)
Working with Content References (on page 1900)

Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or `@conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism (on page 1901) that uses keys (on page 1891) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a conref, a conkeyref requires that the element to be reused has an `@id` attribute. It also requires the topic that contains the reusable content to be assigned a key (on page 1891) in a map. As with all uses of keys, you can substitute multiple maps or use profiling (on page 1996) to create multiple definitions of keys in a single map. This allows the same `@conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

Creating a Content Key Reference

To create a content key reference (`@conkeyref`), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an ID assigned to it.
2. In Author mode (on page 220), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 1907) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.
5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The @id value of the element that you select is automatically added to the Reference to (conkeyref) field.

6. Make any other selections you need in the Reuse Content dialog box (on page 1911). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the @id value of the last element in your selection.

7. Click Insert or Insert and close to create the content reference.

**Note:**
If you are using Text mode (on page 219), when you insert a @conkeyref attribute, after you enter the first quote (conkeyref=“), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

**Using Copy/Paste Actions to Create a Content Key Reference**

Oxygen XML Author Eclipse plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 144) is selected in the Schema-Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Author Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (@conkeyref) using copy/paste actions, follow these steps:

1. In the DITA Maps Manager view (on page 1762), make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 1762), select Edit Properties, and enter a value in the Keys field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the Paste as Content Key Reference action from the Paste Special submenu from the contextual menu.
Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 1930) to easily insert content key references.
- You can also insert reusable content using content references (conref) (on page 1901).
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 1916), the conref push mechanism (on page 1917), variable text (on page 1921), key scopes (on page 1923), and branch filtering (on page 1925).

Related Information:
- Reuse Content Dialog Box (on page 1907)
- DITA Reusable Components View (on page 1926)
- Creating a DITA Content Reference (on page 1901)
- Editing DITA Content References (on page 1905)
- Working with Reusable Components (on page 1919)
- Working with Content References (on page 1900)

Editing DITA Content References

When you reference reusable content using a @conref or @conkeyref attribute, by default, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.

Oxygen XML Author Eclipse plugin also includes some actions that allow you to quickly edit existing content references. When the element that contains a content reference (@conref or @conkeyref) is selected, the following actions are available in the DITA menu and the Reuse submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 1907).

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For keyrefs inside `<xref>` or `<link>` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Converting Conrefs to Conkeyrefs**

Oxygen XML Author Eclipse plugin includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 1762)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**

Select XML Refactoring from the XML menu (or from the Refactoring submenu when you right-click a document in the Project Explorer view (on page 244) or the DITA Maps Manager view (on page 1762)). Then select Convert conrefs to conkeyrefs from the DITA section and click Next.
Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method (on page 1906)**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method (on page 1906)**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:**

It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, the operation will be processed and all **content references** will be converted to **content key references** (either all **content references** in the current document or all **content references** in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the **DITA Map (on page 2079)**, so you still need to manually **define each key in your DITA map (on page 1795)**.

**Related Information:**

- Creating a DITA Content Reference (on page 1901)
- Creating a DITA Content Key Reference (on page 1903)
- Defining Keys in DITA Maps (on page 1795)

**Reuse Content Dialog Box**

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `@conref`, `@conkeyref`, and `@keyref` attributes can be used to insert references to reusable content. The `@conref` attribute stores
a reference to another element and is processed to replace the referencing element with the referenced
element. The \texttt{@conkeyref} attribute uses \textit{keys (on page 1891)} to locate the content to reuse rather than
direct references to the topic that contains the reusable content. The \texttt{@keyref} attribute also uses \textit{keys (on
page 1891)} and can be used to indirectly reference metadata that may have different values in various
circumstances.

\textbf{Note:}
For a \texttt{conref} or \texttt{conkeyref}, to reference the content inside a DITA element, the source element
must have an \texttt{id} attribute assigned to it. The element containing the content reference acts as a
placeholder for the referenced element. For more details about DITA \texttt{@conref} and \texttt{@conkeyref} attributes,
go to \url{https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html}.

\textbf{Note:}
For the purposes of using a \texttt{@keyref}, keys are defined at map level and referenced afterward. For more
information about the DITA \texttt{@keyref} attribute, go to \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekkeyrefattributte.html}.

Oxygen XML Author Eclipse plugin \textit{displays the referenced content (on page 345)} of a DITA content reference
if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and
your DITA-OT transformation needs an \textit{XML Catalog (on page 2085)} to map the URIs to local paths, you
need to \textit{add the catalog in Oxygen XML Author Eclipse plugin (on page 567)}. If the URIs can be resolved, the
referenced content is displayed in \textbf{Author} mode and in the transformation output.

In \textbf{Author} mode, a reference to reusable content (\texttt{@conref}, \texttt{@conkeyref}, or \texttt{@keyref}) can easily be inserted at the
cursor position by using the \textbf{Reuse Content} dialog box. It can be opened with any of the following methods:

\begin{itemize}
\item Click the \textbf{Reuse Content} action on the main toolbar.
\item In the contextual menu of the editing area, go to \textbf{Reuse} > \textbf{Reuse Content}.
\item Go to \textbf{DITA} > \textbf{Reuse Content}.
\end{itemize}

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML
Author Eclipse plugin will insert a \texttt{@conref}, \texttt{@conkeyref}, or \texttt{@keyref}.

If you select \texttt{Location} for the content source, a \textit{content reference (\texttt{@conref})} will be inserted. If you select \texttt{Key}
for the content source, keys will be used to insert a \textit{content key reference (\texttt{@conkeyref})} or a \textit{key reference
(\texttt{@keyref})}.

\textbf{Content Reference (\texttt{@conref}) Options Using the Reuse Content Dialog Box}
Choose the content source Section

When Location is selected for the content source, a content reference (@conref) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**

Displays the source code of the element to be referenced.

**Reference details Section**

**Reference to (conref)**

Oxygen XML Author Eclipse plugin automatically fills this text field with the value of the `@conref` attribute to be inserted. However, you can edit this value if need be.

**Reference to range end (conrefend)**

If you select multiple elements (of the same type) in the element table, Oxygen XML Author Eclipse plugin automatically fills this text field with the `@id` value of the last element in your selection. This value will be inserted as a `@conrefend` attribute, defining the end of the `conref` range.
Content Key Reference (@conkeyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2083) (you can also select one from the drop-down list in the Key field).

Note:
If the current DITA map is not selected as the root map, no keys will be listed.

Tip:
You can also use the DITA Reusable Components view (on page 1926) for similar purposes.
The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 1778).

- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.

- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:

  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2079) where the key is defined.

- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a **content key reference** (@conkeyref), select the key that contains the content you want to reference. Notice that the file path is shown in the Href column. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @conkeyref, you need to select a key that does have a value (file path) in the Href column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a **content key reference** has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a @conkeyref:
Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that conkeyref value is automatically selected.

Reference to

Oxygen XML Author Eclipse plugin automatically fills this text field with the value of the @conkeyref attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)

You can select this option to define a @conref attribute to be used as a fallback to determine the content reference relationship if the specified conkeyref cannot be resolved.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Author Eclipse plugin automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conkeyref range.
Key Reference to Metadata (@keyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2083) (you can also select one from the drop-down list in the **Key** field).

**Note:**
If the current DITA map is not selected as the root map, no keys will be listed.

**Tip:**
You can also use the DITA Reusable Components view (on page 1926) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to **select a root map (on page 1778)**.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `@keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that `href` value listed in this column.
  - **Definition Location** - The name of the **DITA map (on page 2079)** where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a **key reference** to metadata (`@keyref`), select the key you want to reference. Keys that do not have a value in the **Href** column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@keyref`, you need to select a key that does not have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@keyref`:
Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

Reference to

Oxygen XML Author Eclipse plugin automatically fills this text field with the value of the @keyref attribute to be inserted.

Element name

Oxygen XML Author Eclipse plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click Insert or Insert and close, the configured content reference is inserted into your document.

Tip:

You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

DITA Reusable Components View (on page 1926)

Working with Content References (on page 1900)

Working with Code References

Code References

The DITA `<coderef>` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `<coderef>` is processed, the referenced code file is imported and delimiting characters (such as `<` or `&`) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.
Example of using a Coderef

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 2079), the conref push will be processed during the publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario where a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Author Eclipse plugin includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.
This dialog box allows you to configure the following options for the conref push action:

**Choose the target resource**

Allows you to select a Location URL or a Key for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that can be replaced by, or pushed before/after, the current element, according to the push action.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

- **replace the target element**
  
  The target element will be replaced with the current element content.

  On the technical side, the value of the @conaction attribute in the current element will be set to `push replace` and the @conref or @conkeyref attribute will be set to the specified reference.

- **push before**
The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the `conref push` mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the **DITA map**.

**Resources**

For more information about the `conref push` mechanism and other advanced DITA profiling concepts, watch our Webinar: **Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies**.

**Related information**

The DITA Style Guide Best Practices for Authors: The Conref Push Technique

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Author Eclipse plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component (on page 1920) and Insert Reusable Component (on page 1921) actions.

Related Information:
DITA Reusable Components View (on page 1926)

Creating a Reusable Content Component

Oxygen XML Author Eclipse plugin makes it easy to create a reusable component from existing topic content.

Note:
To ensure that the topic file that contains the reusable component is a valid container for the reusable content component, Oxygen XML Author Eclipse plugin attempts to use the same schema information in the current topic for the file that contains the reused component. If it cannot create a valid instance of the reused content file with this approach, the application creates a specialized topic type automatically. This specialization is designed to make sure that the content is compatible with the topic type that it is created from. You can make changes to the configuration file (OXYGEN_INSTALL_DIR\frameworks\dita\reuse\reuse_configuration.properties) or override it from a framework extension to control if the created reusable component file should be based on the currently edited topic or it should be an automatically created DITA specialization topic.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component (or place the cursor inside an element you want to reuse).
2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Create Reusable Component dialog box is displayed.
3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This is used as a description for the reusable component, but is not part of the reused content. It is just to help you identify the reusable content and will not become part of your output.
5. If the Replace selection with content reference option is selected, the selection in the current topic will be replaced with a content reference (@conref) that points to the new reusable component. If multiple elements are selected (for example, multiple steps or list items), the selection is replaced with a content reference range (@conref and @conrefend).
6. Select a file name and location to save the topic containing the reusable component and click Save. It is considered best practice to save or store reusable components in an area set aside for that purpose.
A file is created that contains one reusable component. You can reference the reused content in other topics by using a content reference (on page 1901) or content key reference (on page 1903). Also, if the Replace selection with content reference option was selected, Oxygen XML Author Eclipse plugin replaces the selected content with a content reference that will be displayed in your current topic with a gray background and it can only be edited in the source file (the new reusable component). To edit the source file, click the Edit Content icon at the beginning of the content reference.

Inserting a Reusable Content Component

Oxygen XML Author Eclipse plugin includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 1920).

CAUTION:
This action is only designed to insert reusable components created using the Oxygen XML Author Eclipse plugin Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA @conref to insert the content, and creates a parent element for the @conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the @conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Insert Reusable Component dialog box is displayed.
3. Locate the reusable content file that you want to insert its content.
4. If you select Content reference in the Insert as drop-down list, the action will add a @conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click Insert to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.
For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the `@product` profiling attribute, as in the following example:

```
<p>The quick-heat feature allows <ph product="basic">Basic Widget</ph> <ph product="pro">Pro Widget</ph> to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```

When the content is published, the value defined in the `product` key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 1795) into a document in Oxygen XML Author Eclipse plugin Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Author Eclipse plugin feature you prefer):
• **DITA Reusable Components View Method**

Use the [DITA Reusable Components view](on page 1926) to insert a variable reference to the defined key (on page 1795). For example, in the **Keys** tab, find a key defined as a variable and double-click it. Oxygen XML Author Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Code Template Method**

Add the source code pattern of the defined key (on page 1795) to a code template (on page 114) so that it appears in the list of proposals in the *Content Completion Assistant* (on page 2078). For example, the code pattern could be something like `<ph keyref="product">` for defined `product` key.

• **Reuse Content Dialog Box Method**

Use the [Reuse Content](on page 1907) action on the main toolbar to open the [Reuse Content](on page 1907) dialog box. Use the **Key** option to select a key that is defined as a variable (key reference to metadata) (on page 1914) and Oxygen XML Author Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Manual Method**

Manually insert the `@keyref` attribute using the attributes editor as follows:

1. Press **Enter** and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
2. Select **Edit Attributes** from the contextual menu to bring up the attributes editor (on page 379).
3. In the **Name** field, select `keyref`.
4. In the **Value** field, select or enter the name of the defined key (on page 1795).

---

**Related Information:**

[DITA Reusable Components View](on page 1926)

[Defining Keys in DITA Maps](on page 1795)

---

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called *Key Scopes* (or scoped keys). It allows you to reuse a topic in multiple places within the same [DITA map](on page 2079), but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different. In this case, you could use key scopes to define a key that references a DITA map that contains the steps for installing the product on both Windows and Linux. Then, you could reuse this key in each topic with the appropriate operating system name included in the variable reference.
system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

**How to Use Key Scopes in Oxygen XML Author Eclipse plugin**

To use DITA 1.3 key scopes in Oxygen XML Author Eclipse plugin, follow these steps:

1. **Define the keys** *(on page 1891)* to be used in multiple places within your *DITA map*.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the DITA Maps Manager *(on page 1762)* and select **Edit properties**.
   b. In the **Keys** tab *(on page 1799)*, enter a value (or multiple values) in the **Key scopes** field.
   c. Click **OK** to save your changes.
3. Save the *DITA map*.

**Result:** In the DITA Maps Manager *(on page 1762)*, you can now see the key scopes in brackets and when you open each topic reference.

![Figure 368. Key Scopes in DITA Maps Manager](image)

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the *DITA map*, the scoped keys will be reflected in the published content.

**Resources**

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Key Scopes - Next Generation of Reuse* blog post.
- You can also watch our *DITA 1.3 video tutorial* to see how key scopes can be used in Oxygen XML Author Eclipse plugin.

- For more information about key scopes and other advanced DITA reuse concepts, watch our Webinar: *Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies*.

- [Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse](link)
- [Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)](link)
Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called Branch Filtering that enables you to set filtering conditions for specific branches of a DITA map (on page 2079). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Author Eclipse plugin

To use DITA 1.3 branch filtering in Oxygen XML Author Eclipse plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 73).
2. Assuming you have already defined your profiling attributes (on page 415), create a DITAVAL filter file (on page 2019).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 1762) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (on page 1762) and when you transform the DITA map, filtered content will be reflected in the published output.

Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

DITA Reusable Components View

The DITA Reusable Components view is helpful if you use a large number of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the root map (on page 2083) and presents them in a side view where you can easily locate and insert references to them. It recollects the keys anytime the root map is changed (on page 1778) or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from Window > Show View > Other. By default, it appears in the bottom-right section of the editor.

It includes the following tabs:

- **Keys (on page 1927)** - Displays all the keys that are defined in the root map (on page 2083) and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

- **Components (on page 1930)** - Displays all the reusable components found in the root map (on page 2083) and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Author Eclipse plugin looks for any topicref in the root map (on page 2083) that is marked as resource-only and then looks for elements with an assigned @id attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.
Keys Tab

The DITA Reusable Components view collects all the keys that are defined in the current root map (on page 2083) and displays them in the Keys tab. This tab has two view modes. The default tiles style view mode and a table style view mode.

Tiles Mode

The default tiles mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the @keys attribute), followed by its description and/or @href value, then followed by the name of the DITA map file where the key is defined.

Figure 370. DITA Reusable Components View - Keys Tab (Default tiles mode)

Table Mode

You can switch to a table style display mode by selecting the Table mode toggle action from the Settings menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in the Description column, while keys that are defined with a value in an @href attribute have that href value listed in the Href column.
Both display modes in the **Keys** tab include a variety of features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

**Tiles Mode:** In the default *tiles* display mode, to sort the keys alphabetically in ascending order, select **Sort by key name** from the 🛒. **Settings** menu.

**Table Mode:** In the *table* display mode, the following columns can be sorted by clicking the heading:

- **Key** - The name of the key (the value of the `@keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
- **Definition Location** - The name of the DITA map *(on page 2079)* where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `@href` value, it is inserted as a cross reference link *(xref)* *(on page 1935).*
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a variable reference *(ph)* *(on page 1921).*

![Figure 371. DITA Reusable Components View - Keys Tab (Table mode)](image)
Drag and Drop Mechanism

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

• If the selected key points to an `@href` value, it is inserted as a cross reference link (`xref`) (on page 1935).
• If the selected key is a reference to an image, it is inserted as an `<image>` element.
• If the selected key does not have an associated `@href`, it is inserted as a variable reference (`ph`) (on page 1921).

Contextual Menu Actions

Insert as Link

Inserts a cross reference link (`xref`) (on page 1935) to the selected key at the current cursor position or surrounding the current selection.

Insert as Variable

Inserts a variable reference (`ph`) (on page 1921) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

Insert as Keyref

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `@keyref` attribute and its value set to the selected key.

Rename Key

Opens a refactoring wizard (on page 584) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

Notes:

• This action does not work on DITA 1.3 key scopes.
• This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

Go to Definition

Opens the DITA map where the key is defined.

Search References

Searches for all references to the selected key in the entire DITA map structure.

Group by Definition Location (Available in Table mode only)
A toggle action that can be used to group (and sort) all the keys based on the value in the **Definition Location** column.

**Settings Menu**

This menu includes the following options:

**Filtering Options**

- **Show all** - Shows all defined keys found in the current root map (on page 2083).
- **Show only variables** - Filters the keys to show only those defined as variable references (on page 1921).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the table and tiles display modes.

**Components Tab**

The **DITA Reusable Components** view collects all the topics from the current root map (on page 2083) that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the `<topicref>` in the DITA map file must have a `@processing-role` attribute set like this:

```
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The **DITA Reusable Components** view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an ID attribute.
The **Components** tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (* or ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the **Components** tab to a compact visualization mode. When switched to **Compact mode**, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**

You can use this action force a re-indexing of the reusable components.

**Show Elements of Type**

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.
Source File(s)

You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

Double-Click Mechanism

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 1903).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 1901).

Drag and Drop Mechanism

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 1903).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 1901).

Hover and Click Actions

If you hover over a component shown in the preview window, you have access to the following link actions:

Insert

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (conkeyref) (on page 1903). Otherwise, it is inserted as a content reference (conref) (on page 1901).

Open

Opens the source file that contains the reusable component.

Contextual Menu Actions

Insert Content Reference

Inserts the component as a content reference (conref) (on page 1901) at the current cursor position or replaces the current selection.

Insert Content Key Reference
Inserts the component as a content key reference (conkeyref) (on page 1903) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition
Opens the source file that contains the reusable component.

Search References
Searches for all references to the selected component in the entire DITA map (on page 2079) structure.

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Author Eclipse plugin provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A DITA map (on page 2079) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (on page 1801).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the <xref> element. The destination of the link can be expressed directly using the @href attribute or indirectly using the @keyref attribute. If you use the @keyref
attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

**Linking Between Related Topics**

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the **Related Links** section of a topic and relationship tables in maps. To add related links, select **Related Link to Topic**, **Related Link to File**, or **Related Link to Web Page** from the **Link** drop-down menu from the toolbar (or the **Link** submenu in the contextual menu or **DITA** menu).

**Tip:**
You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Managing Links**

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The **DITA Maps Manager** *(on page 1762)* provides a way to **validate all the links in the documents that are included in the map** *(on page 1806)*. This can include validating all the profiling conditions that are applied.

**Hierarchical Linking in DITA Maps**

To create hierarchical linking between the topics in a **DITA map** *(on page 2079)*, you set the appropriate value of the `@collection-type` attribute on the map. See the **DITA documentation** for the meaning of each of the values of the `@collection-type` attribute.

**Note:**
Publishing scripts determine when and how to create hierarchical links. The `@collection-type` attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate.
for the particular type of media. You can provide additional instructions to the scripts using the @linking attribute.

To add the collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the @linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the <xref> element. The destination of the link can be expressed directly by using the @href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the <related-links> element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 1891) to create either inline links or related links (with the @keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 1795).
- Key Reference - Created in an <xref> element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the <topicref> element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Author Eclipse plugin

To insert a link in Author mode (on page 220), use the actions available in the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

Cross Reference
Opens the Cross Reference (xref) dialog box (on page 1937) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 1938).

**Web Link**

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 1938).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (on page 1937) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a related-links element.

**Tip:**
You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the
Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select **Location** for the target, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](image) button to use the **Choose Key** dialog box (on page 1938).

**Related Link to Web Page**

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select **URL** for the target resource, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](image) button to use the **Choose Key** dialog box (on page 1938).

**Cross Reference (xref) Dialog Box**

The **Cross Reference (xref)** dialog box is displayed when you insert a **Cross Reference** or **Related Link to Topic** (from the ![Link](image) drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.
Figure 373. Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select Location for the target, the link is expressed in an @href attribute.

Key

If you select Key for the target, keys will be used to express the link in a @keyref attribute. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2083) (you can also select one from the drop-down list in the Key field).
Tip:
You can also use the DITA Reusable Components view (on page 1926) for similar purposes.

Figure 374. Choose Key Dialog Box

The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 1778).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an @href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2079) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

**Preview Pane**

Displays the content that will be references.

**Source Pane**

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

### Tip:

You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

## Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference

Oxygen XML Author Eclipse plugin also includes support for inserting cross reference links with simple copy/paste or drag/drop actions (additionally, you can insert them using the **Paste as Link** or **Paste as Link (keyref)** actions found in the **Paste Special** submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an `@id` attribute or a `<topicref>`. Also, the location in the document where you paste or drop the link must be valid, although as long as the **Smart paste and drag and drop option (on page 144)** is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Author Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Author Eclipse plugin automatically tries to populate certain attributes based on detected values. The `@format`, `@scope`, and `@type` attributes are populated if their corresponding options are selected in the **Inserting Links** section of the DITA Topics preferences page (on page 78). Even if their corresponding options are not selected, the `@format` and `@scope` attributes are populated if their detected values are different than the default values.

### Note:

For the sake of performance, the `@type` attribute is never automatically computed in the following cases:
• When using drag/drop or copy/paste actions from the DITA Maps Manager view (on page 1762) or from the Keys tab of the DITA Reusable Components view (on page 1926).
• When using the Paste as Link or Paste as Link (keyref) actions to paste a topic reference that was copied from the DITA Maps Manager view (on page 1762) and its <topicref> elements do not have the @type attribute defined.

Typically, cross reference links are inserted with an @href attribute, but it is also possible to insert them with a @keyref attribute using the Paste as Link (keyref) contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps:

1. In the DITA Maps Manager view (on page 1762), make sure that the Context combo box (on page 1766) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 1762), select Edit Properties, and enter a value in the Keys field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a <topicref> from a DITA map.
4. Place the cursor at a location, where you want to insert the link.
5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:
1. If the map is currently open in the **DITA Maps Manager (on page 1762)**, double-click the map icon (/tos) to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.

2. Move the insertion point inside the *map* root element (usually `<map>`, but it might be `<bookmap>`, or another specialization of the `<map>` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the *map* root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the *map* root element.

3. Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.

   The **Insert Relationship Table** dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.

5. Enter the type of the topics in the header of each column.

   The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the `type` attribute of each `<relcolspec>` element to a value such as `concept`, `task`, or `reference`. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the `type` attribute in the **Attributes view (on page 377)**. You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select **Insert Reference (on page 1826)** from the contextual menu or the **DITA Map** toolbar.

7. To add a new row to the table or remove an existing row use **Insert Relationship Row**/**Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.

8. To add a new column to the table or remove an existing column, use **Insert Relationship Column**/**Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the **DITA map** is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the **DITA Maps Manager (on page 1762)** or the **Project Explorer (on page 244)** view into the appropriate cell in the relationship table.

   See the **DITA documentation** for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the **Relationship Table** submenu of the contextual menu) or by editing the underlying XML in **Text** mode.

10. Save the **DITA map**.

    Relationship tables are also displayed in the **DITA Maps Manager view (on page 1762)**, along with the other elements in its **DITA map**.
You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 1762).
- Select the relationship table in the DITA Maps Manager (on page 1762) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 1762).

### Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 2079) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Author Eclipse plugin publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Author Eclipse plugin using a transformation scenario or you can run it directly from a command line: [http://www.dita-ot.org/dev/topics/building-output.html](http://www.dita-ot.org/dev/topics/building-output.html).

The DITA-OT that comes bundled with Oxygen XML Author Eclipse plugin contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the DITA Open Toolkit registry or from the list of free plugins (on page 2030) on the Oxygen XML Author Eclipse plugin GitHub account.
Warning:
Keep in mind that there could be instances where there are differences between what you see in Author mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain advanced constructs such as key scopes, branch filtering, chunking, or reusing content through direct references between topics marked for publishing.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Author Eclipse plugin also includes a special Run DITA-OT Integrator that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

A variety of transformations scenarios are available for DITA maps:

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.

Important:
If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.
DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 908) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Author Eclipse plugin also provides numerous possibilities for customizing the WebHelp Responsive output (on page 989).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2079) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 1762) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 1969)** - This tab contains a set of built-in publishing templates (on page 950) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 989).
- **Parameters Tab (on page 1975)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page ) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab (on page 1976)** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab (on page 1977)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 1979)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 1981)** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click Apply associated to process the transformation.
Result: When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**General Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**editlink.remote.ditamap.url**

Use this parameter in conjunction with `editlink.web.author.url` to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Author Eclipse plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**
When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.index.elements.to.exclude**

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.search.stop.words.include**

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the DITA map, appended to this base URL value).

**webhelp.sitemap.change.frequency**

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have `Next` and `Previous` navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

**webhelp.enable.search.autocomplete**
Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

**webhelp.enable.html.fragments.cleanup**

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to true (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to false, the transformation will fail if at least one HTML fragment is not well-formed.

**webhelp.fragment.after.body**

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.main.page**

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.topic.page**

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use **webhelp.fragment.after.search.input.main.page** instead.
webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.search.page
This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.body.terms.page**

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.logo_and_title**

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use **webhelp.fragment.before.search.input.main.page** instead.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.topic.page**

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.search.page**

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.terms.page**

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.
webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Important:
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author Eclipse plugin (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header
This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page
This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.breadcrumb
This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.content**

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.content**

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.feedback**

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.feedback**

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toc**

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toc**

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.custom.search.engine.results**
This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (*for example, Related Tasks, Related References, Related Information*) are merged into a single group. The default value is *yes*.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (*for example: if,for,is*).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is *yes*.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is *no*.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is *yes*.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a *tree style* layout, this parameter should be set to *no*.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is *yes*.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is *yes*.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is *yes*.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is *yes*. The *webhelp.merge.nested.topics.related.links* parameter can be
used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

**webhelp.show.publication.toc**

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is *yes*.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is *yes*.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is *yes*.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for *chunked* topics. The default value is *yes*.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor’s siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.activated.on.click**

When this parameter is activated (set to *yes*), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to *no* (default), hovering over a menu item displays the menu content.
webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Author Eclipse plugin includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author Eclipse plugin also supports some third-party processors.
For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsi/fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author Eclipse plugin. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Author Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Author Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

**How to Create the Transformation Scenario**

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (on page 1762) toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
- **Templates Tab (on page 1969)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

**Figure 376. DITA Map to PDF Templates**

- **Parameters Tab (on page 1975)** - This tab includes numerous parameters that can be set to customize the transformation.
- **Filters Tab (on page 1977)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 1979)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 1981)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):
   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
   - **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If
this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 172).

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see CSS-based DITA to PDF Customization (on page 1115).

**Related Information:**

- Oxygen PDF Chemistry User Guide
- CSS-based DITA to PDF Customization (on page 1115)

**DITA Map PDF - based on XSL-FO Transformation**

Oxygen XML Author Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2079) to PDF output.

**Creating a DITA Map PDF - based on XSL-FO Transformation Scenario**

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the DITA Maps Manager (on page 1762) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the **Edit** button (or use the **Duplicate** button if your framework (on page 2080) is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
**show.changes.and.comments** - If set to *yes*, user comments, replies to comments, and *tracked changes* are published in the PDF output.

**customization.dir** - Specifies the path to a customization directory.

**editlink.present.only.path.to.topic** - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

XSL FO-based DITA to PDF Customization *(on page 1333)*

---

**DITA Map MS Office Word Transformation**

Oxygen XML Author Eclipse plugin comes bundled with a transformation scenario that allows you to convert **DITA maps** *(on page 2079)* to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This plugin contains a Word document named **Normal.docx** (located in: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:**

You can make general modifications to the **Normal.docx** template file to alter the published output.

### Configuring the Transformation Scenario

To configure a **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager** *(on page 1762).*
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** *(on page 1762)* toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:

   - **dotx.file** - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
   - **core.xsl** - Specifies the path to a core metadata stylesheet.
   - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
   - **document.xsl** - Specifies the path to a main document stylesheet.
   - **comments.xsl** - Specifies the path to a comments stylesheet.
   - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
   - **footnotes.xsl** - Specifies the path to a footnote stylesheet.
5. **Click OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

### DITA Map CHM (Compiled HTML Help) Transformation

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Author Eclipse plugin needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Author Eclipse plugin automatically detects if **HTML Help Workshop** is installed and uses it.

**Note:** **HTML Help Workshop** might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.

### Changing the Output Encoding

Oxygen XML Author Eclipse plugin uses the **htmlhelp.locale** parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Author Eclipse plugin has the **htmlhelp.locale** parameter set to **en-US**.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS))** action from the toolbar or the XML menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the **htmlhelp.locale** parameter and change its value to the desired language tag.

**Note:** The format of the **htmlhelp.locale** parameter is **LL-CC**, where **LL** represents the language code (**en**, for example) and **CC** represents the country code (**us**, for example). The language
codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the args.css parameter to point to the location of your custom CSS and make sure the args.copy.css parameter is set to yes to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory:
  OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/org.dita.htmlhelp/xsl/map2htmlhelp. The files are as follows:
  - map2hhcImpl.xsl - This file is used to compile the table of contents.
  - map2hhpImpl.xsl - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.

DITA Map Kindle Transformation

Oxygen XML Author Eclipse plugin requires KindleGen to generate Kindle output from DITA maps (on page 2079). To install KindleGen for use by Oxygen XML Author Eclipse plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 1762).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

DITA Map Zendesk Publishing

Restriction:
This feature is only available in the Enterprise edition of Oxygen XML Author Eclipse plugin.
Oxygen XML Author Eclipse plugin includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the Zendesk Help Center.

1. Start Oxygen XML Author Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 1762).
2. Click the Configure Transformation Scenario(s) button.
3. Create a new DITA-OT transformation scenario and choose the Zendesk Help Center transformation type.
4. Go to Parameters tab and set the following parameters:
   - **Host**: The URL reference to the Zendesk Help Center (for example, https://your-domain.zendesk.com).
   - **Username**: The username (e-mail address) for the account used to upload the content.
   - **Article category**: The name of the category where the articles are uploaded. The category needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tl4_kk.
   - **Article section**: The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.
   - **Create article draft**: This setting controls whether the articles should be published (if the value is false) or saved as drafts (if the value is true). The default value is false.
   - **Permission group name**: The name of the Zendesk permission group that controls who edits and publishes articles: https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups.
5. Save the changes and run the transformation.

For more information about publishing content to the Zendesk Help Center, watch our video demonstration:
Run DITA-OT Integrator Transformation

Oxygen XML Author Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2082). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 898).

Attention:
The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 73).

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Author Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 898) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 903)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 897).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Author Eclipse plugin with your normal permissions.

Installing a DITA-OT Plugin (on page 2026)
Integrating a DITA Specialization (on page 2038)

DITA Topic Transformation Scenarios

Oxygen XML Author Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 898).

The available transformations scenarios for individual DITA topics include:
• DITA HTML5 - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
• DITA XHTML - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
• DITA PDF - based on HTML5 & CSS - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS (on page 1161) or publishing template (on page 1130) that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected context DITA map (root map) (on page 1766) so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set (on page 2004) to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).

The transformation scenario also supports a parameter named args.enable.root.map.key.processing that can be used to specify whether or not the values for @keyref and @conkeyref attributes within the transformed topics are resolved. The possible values are:

- no - This means that the values for all @keyref and @conkeyref attributes are ignored in the transformation. This results in lower processing times.
- yes - This means that the values for any @keyref and @conkeyref attributes found in the transformed topic are processed and resolved using the value of the args.root.map parameter.
- auto - This means that the process will search for any @keyref and @conkeyref attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the args.root.map parameter. If none are found, the @keyref and @conkeyref attributes are ignored.

• DITA PDF - based on XSL-FO - This DITA-OT transformation scenario converts individual DITA topics to PDF using an xsl:fo processor.

Related Information:
Editing a Transformation Scenario (on page 894)
Configure Transformation Scenario(s) Dialog Box (on page 898)
Applying Associated Transformation Scenarios (on page 897)
DITA Map Transformation Scenarios (on page 1944)

Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:
1. Click the Configure Transformation Scenario(s) button on the DITA Maps Manager toolbar (on page 1764). The Configure Transformation Scenario(s) dialog box (on page 898) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Author Eclipse plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.

2. Select the transformation scenario you want to run and click Apply Associated. The transformation scenario runs in the background. You can continue to work in Oxygen XML Author Eclipse plugin while the transformation is running. If there are errors or warnings, Oxygen XML Author Eclipse plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Author Eclipse plugin opens the output in the appropriate application.

3. To rerun the same scenario again, click the Apply Transformation Scenario(s) button.

Creating or Editing a DITA-OT Transformation

Creating a DITA-OT Transformation Scenario

To create a DITA-OT Transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the New button and select DITA-OT Transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view. Click the + New Scenario drop-down menu button and select DITA-OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.
The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Editing a DITA-OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario.

   **Result:** This will open an Edit scenario configuration dialog box that contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**

- Creating a DITA-OT Plugin
- Installing a DITA-OT Plugin
- DITA Open Toolkit Documentation

**Templates Tab (DITA-OT Transformations)**

When you create a new transformation scenario or edit an existing one, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.
Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Author Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Author Eclipse plugin scans the locations specified in the DITA > Publishing preferences page (on page 77) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.
Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates *(on page 991)* to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the **DITA > Publishing preferences page (on page 77)** where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template *(on page 1138)*. Clicking this button will open a **template package configuration dialog box (on page 1972)** that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](https://www.youtube.com/embed/zNmXfKWXwO8)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️️) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, follow these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing (on page 77)** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (*.xpr*).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template](on page 1138). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA)
**Map WebHelp Responsive** (on page 788) or **DITA Map to PDF - based on HTML5 & CSS** (on page 802). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default **HTML Page Layout Files** (on page 969) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** (on page 788) or **DITA Map to PDF - based on HTML5 & CSS** (on page 802)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

*Figure 379. Template Package Configuration Dialog Box*
FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

![FO Processor Configuration Tab](image)

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Author Eclipse plugin.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Author Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:
• XEP was configured as an external FO Processor in the FO Processors option page (on page 168).
• The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
• XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Author Eclipse plugin installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

• Environment variable set by Antenna House installation (the newest installation version will be used).
• Antenna House was added as an external FO Processor in the Oxygen XML Author Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. Edit the transformation scenario.
2. Open the Parameters tab (on page 1975).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related information**

FO Processors Preferences (on page 168)

XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 877)

**Parameters Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:
• A simple text field for simple parameter values.
• A combo box with some predefined values.
• A file chooser and an editor variable (on page 199) selector to simplify setting a file path as the value of a parameter.

**Note:**
To input parameter values at runtime, use the ask editor variable (on page 200) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 199) button or the Browse button.

**Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**
Transformation parameters that are defined in an Oxygen Publishing Template (on page 1130) descriptor file are displayed in italics. After creating a publishing template (on page 1138) and adding it to the templates gallery (on page 991), when you select the template in the Templates tab (on page 1969), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**
DITA Open Toolkit Documentation

**Feedback Tab (DITA-OT Transformations)**
When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use **Oxygen Feedback** to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback** administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an **Oxygen Publishing Template** (on page 1130), either as an HTML fragment extension point (on page 960) or as a transformation parameter (on page 959) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

**Filters Tab (DITA Transformations)**

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2079), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

**Note:**

If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 1975)), the filters are combined (neither file takes precedence over the other).

**Use profiling condition set**

Sets the profiling condition set (on page 2004) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.
Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

**Figure 382. Advanced Settings Tab**

You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Author Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected,
other options (Custom build file, Build target, Ant Home) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**

Even when this option is selected, the `dita.bat` (dita for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the Parameters tab, the transformation is started as an ANT process instead of using the executable.

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (on page 1975) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 199) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as `-diagnostics`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author Eclipse plugin.

**Note:**

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default the application will use a maximum of 512 megabytes when used with the 32-bit Java Virtual Machine and one gigabyte with the 64-bit Java Virtual Machine.
Libraries

By default, Oxygen XML Author Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2080) files or additional class paths) to be used by the transformer.

Tip:
You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 816) or edit an existing one (on page 894), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

Figure 383. Output Settings Tab

![Output Settings Tab](image)
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

![Note:](image)

If the [DITA map](on page 2079) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Author Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

![Note:](image)

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML
file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Author Eclipse plugin allows you to set parameters (on page 1975) on a transformation scenario and you can save and share them with others (on page 903). You can also use the \$\{ask\} editor variable (on page 200) in the Parameters tab to instruct Oxygen XML Author Eclipse plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (on page 1985). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported.
- You can also write your own transformation code (and execute it using a custom build file (on page 1985)) to produce a type of output not supported by the DITA Open Toolkit. You can create Oxygen XML Author Eclipse plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 907).
- **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1333).

Publishing Customizations

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 2026).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Author Eclipse plugin at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheets to override various styles. If you edit an XHTML transformation scenario (on page 1968), there is a parameter called `args.css` that can be set to point to your custom CSS and a parameter called `args.copy.css` that as long as it is set to `yes`, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For information, see: https://blog.oxygenxml.com/topics/creating-simple-dita-open-toolkit.html. A list with all DITA-OT XSLT extension points can be found here: http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html.

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Author Eclipse plugin includes specific plugins that provide the ability to publish DITA content to WebHelp Responsive (on page 907) output.

For information about customizing WebHelp Responsive output, see Customizing WebHelp Responsive Output (on page 989).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1333).

There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Author Eclipse plugin also includes a transformation scenario called DITA Map PDF - based on HTML5 & CSS (on page 1958) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 2079) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1161).
Using a Custom Build File

You can use a Custom Build File to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the Configure Transformation Scenario(s) action to open the Configure Transformation Scenario(s) dialog box (on page 898).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 1979) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
<!--The DITA-OT default build file-->
<import file="build.xml"/>
<target name="dist">
  <!-- You could run your script here -->
  <!--Call the DITA-OT default target-->
  <antcall target="init"/>
</target>
</project>
```

Note:
If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Author Eclipse plugin, it is located in the [OXYGEN_INSTALL_DIR]/tools/ant directory. Any additional libraries for Ant must be copied to the Oxygen XML Author Eclipse plugin Ant lib directory.

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA Map (on page 2079) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:
   ```css
   body {
     background-image: url(MyWatermarkImage.png);
   }
   ```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the args.css parameter as the path to your watermark image.

3. Set the value of the args.copycss parameter to yes.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:
Adding a Watermark to PDF Output (on page 1337)

Adding Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the `<codeblock>` element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the `<codeblock>` element in the editor and in the Attributes view, click on the Value cell for the @outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the `<codeblock>` element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
- language-sql
Attention:
It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

Tip:
Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:

This codeblock:

```xml
<codeblock outputclass="language-xml">
  <p>This code is an example of how to use a coderef.<p></codeblock>
</codeblock>
```

would result in this in the output:

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Publishing with a DITA-OT Project File

The DITA Open Toolkit project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: https://www.dita-ot.org/dev/topics/using-project-files.html.

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the Configure Transformation Scenario(s) dialog box (on page 898):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
• **additional.args** - Specifies the additional arguments used in transformation.
• **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.

Related Information:
DITA Open Toolkit Project *(on page 2033)*

**Dynamic Word/Excel/HTML/Markdown to DITA Converter**

**Restriction:**
This feature works with no restrictions if the publishing process is done using Oxygen XML Editor/Author. However, if the publishing process is done from a command line, this feature requires an Oxygen Publishing Engine license.

The publishing engine has support to dynamically convert various types of non-DITA resources to DITA while publishing. To enable this support for a particular resource that is referenced in a DITA map, you must specify one of the following values for the `@format` attribute on the `<topicref>` element:

**Word to DITA (word-to-dita)**

*Microsoft Word* documents that are referenced in the DITA map using the `word-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing. Image references and internal links are preserved.

Example:

```xml
<topicref href="sample.docx" format="word-to-dita"/>
```

**Excel to DITA (excel-to-dita)**

*Microsoft Excel* documents that are referenced in the DITA map using the `excel-to-dita` format attribute get dynamically converted to DITA topics that contain one or more tables during publishing.

Example:

```xml
<topicref href="sample.xlsx" format="excel-to-dita"/>
```

**HTML to DITA (html-to-dita)**

HTML documents that are referenced in the DITA map using the `html-to-dita` format attribute get dynamically converted to DITA topics during publishing.

Example:

```xml
<topicref href="sample.html" format="html-to-dita"/>
```

**Markdown to DITA (markdown)**
Markdown documents that are referenced in the DITA map using the `markdown` format attribute get dynamically converted to DITA topics during publishing using the support for Markdown bundled with the publishing engine by default.

Example:

```xml
<topicref href="sample.md" format="markdown"/>
```

**Markdown to DITA (markdown-to-dita)**

Markdown documents that are referenced in the DITA map using the `markdown-to-dita` format attribute get dynamically converted to DITA topics during publishing using the special conversion plugin provided by Oxygen XML Author Eclipse plugin. The `markdown-to-dita` format conversion is more flexible than the built-in `markdown` conversion, allowing the conversion of Markdown documents that do not have consistent heading levels.

Example:

```xml
<topicref href="sample.md" format="markdown-to-dita"/>
```

**Troubleshooting DITA Transformation Problems**

This section contains some topics to help you troubleshoot DITA transformation issues.

**DITA Map Transformation Fails (Cannot Connect to External Location)**

**Problem**

*DITA map (on page 2079)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the **Network Connections**.

**DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)**

**Problem**

*DITA Map WebHelp* transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.
Solution

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Author Eclipse plugin (on page 1733). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter `logger org.apache.tools.ant.listener.ProfileLogger` in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

**DITA PDF Transformation Fails**

**Problem**

The DITA to PDF transformation fails.

**Cause**

To generate the PDF output, Oxygen XML Author Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 1991).

**Solution**

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 1806). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2079), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

**Related Information:**

How to Enable Debugging for FO Processor Transformations (on page 880)

**DITA PDF Processing Common Errors**

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.
**Problem: Cannot Save PDF**

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException: C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

**Solution: Cannot Save PDF**

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

**Problem: Table Contains More Cells Than Defined in Colspec**

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.>
(See position 179:-1)>net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.>
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

**Solution: Table Contains More Cells Than Defined in Colspec**

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:
1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Author Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the `Find/Replace in Files` action in the `DITA Maps Manager view (on page 1762)`) to find the original DITA topic where the table was generated.

**Problem: Broken Link**

There is a broken link in the generated `XSL-FO` file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

**Solution: Broken Link**

To resolve this issue:

1. Use the `Validate and Check for Completeness` action available in the `DITA Maps Manager view (on page 1762)` to find such problems.
2. If you publish to PDF using a `DITAVAL` filter, select the same DITAVAL file in the `DITA Map Completeness Check` dialog box.
3. If the `Validate and Check for Completeness` action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Author Eclipse plugin, and search for the `unresolved ID references` (for example: `unique_4_Connect_42_wrongID`).
5. Look in the `XSL-FO` file to find relevant text content that you can use (for example, with the `Find/Replace in Files` action in the `DITA Maps Manager view (on page 1762)`) to find the original DITA topic where the table was generated.

**Related Information:**

How to Enable Debugging for FO Processor Transformations (on page 880)

**DITA to CHM Transformation Fails - Cannot Open File**

**Problem**

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.
Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip:
It is a good practice to validate the DITA map (on page 2079) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1806). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 1963)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip:
It is a good practice to validate the DITA map (on page 2079) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1806). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 1963)
Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 1806) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 1762) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 843).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 308) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:

   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.

   - **Info** - Click the See More icon to open a web page that contains more details about DITA-OT error messages.

   - **Description** - A description of the problem.

   - **Resource** - The name of the transformation resource.

   - **System ID** - The path of the transformation resource.

5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Troubleshooting DITA Transformation Problems (on page 1989)
DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Author Eclipse plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Author Eclipse plugin includes a Attributes and Condition Sets preferences page (on page 135) where you can create and manage profiling attributes and condition sets. Oxygen XML Author Eclipse plugin also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 2013) or DITAVAL file (on page 2018).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (@product, @platform, @audience, @rev, @props, and @otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the @platform profiling attribute:

```xml
<section platform="windows">
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 1997).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 2002).

Resources

For more information about DITA profiling, see the following resources:

- Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies
- Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies
Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 2002).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.

   **Tip:**
   For less technical users who do not want to create attribute specializations in DTD/XML Schema, you may want to use profiling attribute groups (on page 2011) instead (use an existing profiling attribute with sub-attributes).

2. Open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition Sets.

   **Information:**
   The Profiling Attributes section (on page 136) is used to define the attributes and their values. For DITA documents, the default attributes are included (@audience, @platform, @product, @props, @otherprops, and @rev), but if a Subject Scheme Map (on page 2013) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Document type**

Select the document type (*framework (on page 2080)*).

**Tip:**

You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).
The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: `ParentAttrValue(SubAttrValue1 SubAttrValue2)`. For more information, see [Conditional Profiling Attribute Groups](on page 2011).
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode ([Edit Profiling Attributes dialog box](on page 2000), [Condition Set dialog box](on page 2002), [Profiling tab in the Edit Properties dialog box](on page 1802), [DITA Maps Manager](on page 1762)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

### Single value

Select this option if you want the attribute to only accept a single value.

### Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.

5. Click **Apply** to save the changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](on page 358) in Author mode, the [Attributes view](on page 377), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in Author mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Attributes and Condition Sets** preferences page (on page 135) where you can edit the profiling configuration.

**Note:**

If the **Allow contributing extra profiling attribute values** option (on page 136) is not selected in the **Attributes and Condition Sets** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.
Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 1997) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 1762), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**
To profile DITA content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the **Edit Profiling Attributes** dialog box.

### DITA Elements

To profile specific XML elements in **Author** mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the *breadcrumb* (on page 351) or *Outline* (on page 299) view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the **Attributes view** (on page 377) to set the profiling attributes on the element at the current cursor position.

**Figure 386. Edit Profiling Attributes Dialog Box**

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Author Eclipse plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your *root map* (on page 2083) references a DITA *subject scheme map* (on page 2084) that defines values for the profiling attributes (on page 2013), those values are used. Oxygen XML Author Eclipse plugin collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the **DITA Maps Manager** (on page 1762) or set as the *root map* (on page 1778). In the image above (on page 2001) (taken from the Oxygen XML Author Eclipse plugin documentation.
project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.

- If you have defined profiling attribute values (on page 1997) for the DITA document type in the Attributes and Condition Sets preferences page (on page 135), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the Show Profiling Attributes option (on page 424) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 387. Profiling Attribute Value Form Control Pop Up

- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2010)

Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in
maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

   Information:
   The Profiling Condition Sets section (on page 136) is used to define condition sets.

2. To add new condition set, click the **New** button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

   **Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

Figure 388. Condition Set Configuration Dialog Box

![Condition Set Configuration Dialog Box](image-url)
The following options are available in this dialog box:

Name
The name of the new condition set.

Document type
Select the document type ([framework (on page 2080)]) that has profiling attributes defined.

Use DITAVAL file
For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file ([on page 2018]). You can specify the path by using the text field, its history drop-down, the Insert Editor Variables ([on page 199]) button, or the browsing actions in the Browse drop-down list.

Include the content matching the following conditions
You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the Condition Set configuration dialog box.

4. Click Apply to save the condition set.

Related Information:
Applying Profiling Condition Sets in DITA ([on page 2004])

Applying Profiling Attributes in DITA ([on page 2000])
Showing and Filtering Profiled Content in DITA ([on page 2007])
Customizing Colors and Styles for Rendering Profiling in Author Mode ([on page 2010])

Applying Profiling Condition Sets in DITA

All defined Profiling Condition Sets ([on page 2002]) are available as shortcuts in the Profiling / Conditional Text toolbar menu ([on page 424]). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view ([on page 299]), and DITA Maps Manager view ([on page 1762]). Your selection will also be used as the default condition set ([on page 2021]) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:
Suppose that you have the following document:

Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop?]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop?]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop?]

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.
This is how the document looks in Author mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:

The garage is a good place to spray paint.

**Step 1**
Move the car out of the garage to avoid getting paint on it. Audience [novice]

**Step 2**
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

**Step 3**
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

**Step 4**
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

**Step 5**
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```
Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page.

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page.

**Show Excluded Content**

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager, and the Outline view. When this option is selected and a condition set is selected in this drop-down menu, the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu, the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page.

**Choose Condition Set (Available if more than 15 condition sets are defined)**

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

**List of Defined Condition Sets**

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager to only show content
that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 2007) to access a dialog box that presents all of them.

**Profiling Settings**

Opens the Attributes and Condition Sets preferences page (on page 135) where you can add and edit profiling attributes and condition sets.

**Figure 389. Example: Profiling Controls in Author Mode**

If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 390. Profiling Attribute Value Form Control Pop Up**

Also, the following icons are used to mark profiled and non-profiled topics in the DITA Maps Manager:
- The topic reference contains profiling attributes.
- The topic reference inherits profiling attributes from its ancestors.
- The topic reference contains and inherits profiling attributes.
- (hyphen) - The topic reference neither contains nor inherits profiling attributes.

**Figure 391. Rendering Profiled Topics in DITA Maps Manager**

Creating and Editing Profiling Attributes in DITA (on page 1997)
Applying Profiling Condition Sets in DITA (on page 2004)
Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2010)
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode and the **DITA Maps Manager (on page 1762)** so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager (on page 1762)**.

**Figure 392. Example: Profiling Colors and Styles in Author Mode**

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option (on page 424) from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings (on page 425)** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets** preferences page (on page 135).
3. Go to the **Colors and Styles preferences page** (on page 137) to configure the colors and styling for the profiling attributes.

4. Go to the **Attributes preferences page** (on page 138) to configure how you want the profiling attributes to appear in Oxygen XML Author Eclipse plugin.

**Result:** The styling is now applied in the **Author editing mode**, the **Outline view** (on page 299), and in the **DITA Maps Manager view** (on page 1762). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box (on page 415) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

**Figure 393. Profiling Attribute Value Form Control Pop Up**

![Profiling Attribute Value Form Control Pop Up](image)

**Alternate Method with a DITAVAL File:** If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the **Styling the Rendering of Profiled Content Using a DITAVAL File** (on page 2020) topic.

- Showing and Filtering Profiled Content in DITA (on page 2007)

**Conditional Profiling Attribute Groups**

**Overview**

Conditional processing attributes can be specified using **grouped values**. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (*operations* and *support*) and they use the `@audience` attribute with the values `ops` and `support`, but the Support team...
has several levels of personnel (L1, L2, and L3). They could use a group to define the levels \( L1, L2, \) and \( L3 \) as subcategories for the \texttt{support} value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as \texttt{@product}, \texttt{@audience}, \texttt{@otherprops}) and specify multiple attribute subcategories.

**Creating a Conditional Profiling Attribute Group**

To create a group in Oxygen XML Author Eclipse plugin:

1. Open the Preferences dialog box (on page 61) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition sets.

2. To add new attributes and values, click the \textbf{New} button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the \textbf{Edit} button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the Document type, Attribute name, and Display name.

   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 1997).

4. Click the \textbf{New} button at the bottom of the attribute values table.

5. In the Value field of the resulting dialog box, define groups using the following format: \texttt{ParentAttrValue(SubAttrValue1 SubAttrValue2)}. For example:

   \[
   \texttt{support(L1 L2 L3)}
   \]

6. Click \textbf{OK} and \textbf{Apply} to save and apply the changes.

**Using Conditional Groups in Conjunction with a DITAVAL File**

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2018) the values. For example, suppose the company described in the example in the Overview section (on page 2011) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

\[
\begin{verbatim}
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
\end{verbatim}
\]
That DITAVAL file could then be used for a condition set (on page 2002) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2021) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).

```
<val>
  <prop action="exclude" att="support"/>
</val>
```

DITA 1.3 Specifications: Conditional Processing Values and Groups

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 2084) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map (main DITA map (on page 2083)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the @type attribute needs to be set to subjectScheme for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.
Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 221) to create a new Subject Scheme document (New from Templates > Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 2015)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 2016)).

Note:
The pre-defined subject scheme template includes Navigation Titles (<navtitle> element). This element is not required, but if you use it, the text that you enter for the <navtitle> will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Author Eclipse plugin (on page 2017). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Author Eclipse plugin.

3. Bind the particular attribute to the key you define for the tree of values using the <attributedef> and <subjectdef> elements inside the <enumerationdef> element. Notice that in the examples below (on page 2015), the audience attribute is bound to the audienceKey value.

Tip:
By default, attributes can accept multiple values, but you can use outputclass="single_value" to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Author Eclipse plugin with radio buttons instead of checkboxes. For example:

```
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

You can also define a specific set of possible attribute values for a specific attribute name that is set on a specific element name. For example, you can define a specific set of attribute values only for the <image> element:

```
<enumerationdef>
  <elementdef name="image"/>
  <attributedef name="outputclass"/>
  <subjectdef keyref="imgOutputClassValuesKey"/>
</enumerationdef>
```
4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 2015)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Author Eclipse plugin (on page 2017).

5. Save your `subject scheme` file.

6. Reference your `subject scheme` in the highest level of map (main DITA map (on page 2083)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your `subject scheme` file opened in the editor, go to the DITA Maps Manager view, right-click the `main DITA map`, and select `Append Child > Reference to the currently edited file`.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select `subjectScheme`.
   c. Click the Insert and Close button and save your main DITA map.

### Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2018) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below (on page 2015)).

You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2002) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2021) and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.

### Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (`therapist, oncologist, physicist, radiologist, surgeon, and so on`). The `audience` attribute is bound to the `audienceKey` value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (`props` and `otherprops`) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Author Eclipse plugin (on page 2017).

### Example using Author mode controls:
Example code in Text mode:

```xml
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
</subjectScheme>
```
Where the Profiling Attributes are Available in Oxygen XML Author Eclipse plugin

When you edit a DITA topic in the Text or Author mode, Oxygen XML Author Eclipse plugin collects all the profiling values from the subject scheme map (on page 2084) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 1762) (or set as the root map (on page 1778)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Author Eclipse plugin (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 134)):

- The Profiling tab of the Edit Properties dialog box (on page 1802).
- The Edit Profiling Attribute dialog box (on page 2001).
- The inline profiling controls in Author mode (on page 2008).
- The proposals for the attribute values in the Content Completion Assistant (on page 2078).

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

Related Information:

Filtering Profiling Values with a DITAVAL File (on page 2018)

DITA 1.3 Specifications: Subject Scheme Maps
Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the `audience` profiling attribute to profile the content for the following types of users: therapist, physician, and surgeon. Suppose that in the output, you want to exclude any content that is profiled as surgeon value for the `@audience` attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as surgeon:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map (on page 2079) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon.

DITAVAL Filter File Editor in Author Mode

The Author editing mode in Oxygen XML Author Eclipse plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

![DITAVAL File Editor in Author Mode](image)

Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:}
• **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `@foreground-conflict-color` and `@background-conflict-color` attributes.

• **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, and `@background` attributes.

• **Flag** - Inserts a `<revprop>` element that identifies a value in the `@rev` attribute that should be flagged in some manner. The allowed actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, `@background`, and `@changebar` attributes.

See the [DITAVAL Element Specifications](#) for more details about the allowed filters and flags.

### How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITA** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

**Result:** The DITAVAL filter file can now be used for all of the following:

• To apply a reference to the DITAVAL file in a **Profiling Condition Set** using the **Use DITAVAL File** option in the **Condition Set** configuration dialog box ([on page 2002](#)).

• You can use the **Import from DITAVAL** option in the **Attributes and Condition Sets** preferences page ([on page 135](#)) to use the DITAVAL file to define profiling attributes.

• You can use the DITAVAL file to apply the filters to the output by specifying the **DITAVAL file in the transformation scenario** ([on page 1978](#)).

• You can use the filter file in the **DITA Map Completeness Check** dialog box ([on page 1807](#)) when validating your **DITA map** ([on page 2079](#)).

• DITAVAL files are also used when working with the DITA 1.3 **Branch Filtering** mechanism. For more details, see: **Working with DITA 1.3 Branch Filtering** ([on page 1925](#)).

• You can define the colors and styles to be used for rendering profiled condition sets ([on page 2020](#)) in **Author** mode and the **DITA Maps Manager** ([on page 1762](#)) view by using a **Flag** filter in the DITAVAL file.

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file to define your profiling condition set.
2. In Author mode, define the filters for your condition set.
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

Result: Test your changes by opening profiled content in Author mode or the DITA Maps Manager and use the options in the Profiling / Conditional Text drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a Flag on a Filter to define the styling for a condition set like this:

```
DITAVAL Filter file
+...
Filter exclude @ product = editor

Flag
style @ product = editor
color bold = maroon
background = silver
```

will render the styling of the profiled content in Author mode to look like this:

```
| Shortcut Keys | Many of the shortcut keys
| Markdown editor | product [editor] |
```

and will render the styling in the DITA Maps Manager view to look like this:
Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Author Eclipse plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set (on page 2004) into account during the transformation, as defined in the Filters tab (on page 1977) when creating a DITA transformation (on page 843). You can also specify a DITAVAL file (on page 2018) that defines filters for your profiled content.

Conditional Processing to Generate Multiple Deliverables

By default, the content of most elements is included in all output media. Within maps and topics, elements can specify the delivery targets to which they apply.

Within maps, topic references can use the @deliveryTarget attribute to indicate the delivery targets to which they apply. Within topics, most elements can use the @deliveryTarget attribute to indicate the delivery targets.

If a referenced topic should be excluded from all output formats, set the @processing-role attribute to resource-only instead of using the @deliveryTarget attribute. Content within that topic can still be referenced for display in other locations.

@deliveryTarget

The intended delivery target of the content, for example html, pdf, or epub. This attribute is a replacement for the now deprecated @print attribute.
The `@deliveryTarget` attribute is specialized from the `@props` attribute. It is defined in the `deliveryTargetAttDomain`, which is integrated into all OASIS-provided document-type shells. If this domain is not integrated into a given document-type shell, the `@deliveryTarget` attribute will not be available.

The `@deliveryTarget` attribute is processed the same way as any other conditional processing attribute. For example, `<topicref deliveryTarget="html5 epub" href="example.dita"/>` uses two values for `@deliveryTarget`. A conditional processing profile can then set rules for `@deliveryTarget` that determine whether the topic is included or excluded when the map is rendered as HTML5 or EPUB.

**DITA Open Toolkit Support**

The *DITA Open Toolkit* is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Author Eclipse plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT plugin (on page 2082), and how to use an external instance of the DITA Open Toolkit.

**Related Information:**
- DITA Open Toolkit Documentation

**DITA-OT Plugins**

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Author Eclipse plugin already has lots of plugins pre-installed but you can also install additional plugins (on page 2082) or create your own.

**Creating a DITA-OT Plugin**

Oxygen XML Author Eclipse plugin provides the ability to install additional DITA Open Toolkit plugins (on page 2082) that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the `plugins` folder located in your DITA-OT directory (for example, if you are using DITA 3.7.0, the path would look like this: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin`).
2. Create a `plugin.xml` file in that same folder. This file will contain the extension points for the `plugin`. For example, references to the XSLT stylesheets that will be used to style the output.
Example:

```xml
<plugin id="org.metadita.specialization.music">
  <feature extension="dita.specialization.catalog.relative"
           file="catalog-dita.xml"/>
  <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
  <feature extension="dita.xsl.html5" file="xsl/music2xhtml.xsl"/>
</plugin>
```

Tip:

Oxygen XML Author Eclipse plugin includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Install the newly created DITA-OT plugin (on page 2026) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 1966) from the Apply Transformation Scenario(s) (on page 786) or Configure Transformation Scenario(s) dialog box (on page 898).

Note:

If the integrator is not visible, select the Show all scenarios option in the Settings dropdown menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 2026).

Related Information:
DITA Open Toolkit Documentation
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2027)

Example: Creating a DITA-OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 2082), this topic uses an example of creating an XSLT customization plugin that provides support for referencing
video and audio content using the DITA `<object>` element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Author Eclipse plugin, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA-OT plugins folder (`DITA-OT-DIR/plugins/`).

2. Create a `plugin.xml` file (in the same plugin folder) that contains the extension points of the plugin.

   ```xml
   <plugin id="com.oxygenxml.media">
     <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
     <feature extension="package.support.email" value="support@oxygenxml.com"/>
     <feature extension="package.version" value="21.0"/>
     <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
     <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
   </plugin>
   ``

   The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

   You can find other DITA-OT plugin extension points here: [http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same `plugin` folder).

   ```xml
   <stylesheet language="xsl" version="2.0">
     <xsl:output method="html" encoding="UTF-8" indent="yes"/>
     <xsl:template match="*">
       <html xmlns:x="http://www.w3.org/1999/xhtml">
         <head>
           <title>Generated from DITA</title>
         </head>
         <body>
           <!-- Content here -->
         </body>
       </html>
     </xsl:template>
   </stylesheet>
   ``

   You can find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA `<codeblock>` element. Since a DITA `<object>` element has the `@class` attribute value - `topic/object`, you can take part of the class attribute value (`topic/object`) and search the DITA-OT resources for a similar stylesheet. The search might find the XSLT stylesheet [DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/xsl/xslhtml/dita2htmlImpl.xsl](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).
You can use it as a starting point to overwrite the `xhtmlMedia.xsl` stylesheet. For example, the results might be:

```xml
<xsl:template
    match="*[contains(@class, ' topic/object ')][contains(@outputclass, 'video')]">
    <video class="embed-responsive-item">
        <xsl:call-template name="commonattributes"/>
        <xsl:call-template name="setidname"/>
        <xsl:call-template name="copySource"/>
    </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the `pdfMedia.xsl` stylesheet, with results looking something like this:

```xml
<!--Treat video, audio or iframe objects as links-->
<xsl:template
    match="*[contains(@class,' topic/object ')][@outputclass = 'video']">
    <xsl:variable name="target" select="@data"/>
    <xsl:variable name="baseDir">
        <xsl:call-template name="substring-before-last">
            <xsl:with-param name="text" select="@xtrf"/>
            <xsl:with-param name="delim" select="/"/>
        </xsl:call-template>
    </xsl:variable>

    <fo:inline xsl:use-attribute-sets="object">
        <xsl:call-template name="commonattributes"/>
        <xsl:if test="exists($target)">
            <fo:basic-link external-destination="url({$target})" xsl:use-attribute-sets="xref">
                <xsl:value-of select="$target"/>
            </fo:basic-link>
        </xsl:if>
    </fo:inline>
</xsl:template>
```

5. To install the created plugin in the DITA-OT, run the built-in transformation scenario called Run DITA-OT Integrator (on page 1966) by executing it from the Apply Transformation Scenario(s) dialog box.
Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl`, a new import automatically appeared:

   ```xml
   <xsl:import href="/plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
   ```

   This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: [http://www.w3.org/TR/xslt#import](http://www.w3.org/TR/xslt#import).

b. Likewise, for the PDF output, in the top-level stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl`, a new import statement appeared:

   ```xml
   <xsl:import href="/..//com.oxygenxml.media/pdfMedia.xsl"/>
   ```

Now, you can distribute your plugin folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

Installing a DITA-OT Plugin

Oxygen XML Author Eclipse plugin comes bundled with various DITA-OT plugins (on page 2082), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins).

**Warning:**

Oxygen XML Author Eclipse plugin has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, `DITA-OT-DIR/plugins` directory).
2. Select the Configure Transformation Scenario(s) (on page 898) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 903)).
3. Select the **Run DITA-OT Integrator** transformation scenario *(on page 1966)*. If the **integrator** is not visible, select the **Show all scenarios** option that is available in the **Settings** drop-down menu.

**Important:**
The folder where the DITA-OT is located needs to have full write access permissions set to it. For example, in **Windows**, if you are integrating **plugins** in the **DITA-OT** folder bundled with Oxygen XML Author Eclipse plugin and your application is installed in the **Program Files** folder, you can start the Oxygen XML Author Eclipse plugin main executable with administrative rights for the integrator process to be able to modify resources in the **DITA-OT** folder.

4. **Apply the scenario** *(on page 897)*.
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.

After the installation, you can open a DITA map and use the **Configure Transformation Scenarios** dialog box to create a new **DITA-OT** transformation scenario. Oxygen XML Author Eclipse plugin detects that transformation type declaration from the **DITA-OT plugin** and presents descriptions in the **DITA Transformation Type** dialog box *(on page 843)*. Oxygen XML Author Eclipse plugin also shows the contributed parameters from the plugin in the **transformation scenario**'s **Parameters** tab *(on page 1975)*.

**Tip:**
You can declare the transformation type and allowed parameters by following the procedure found in: **Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin** *(on page 2027)*.

**Related Information:**
- Creating a DITA-OT Plugin *(on page 2022)*
- Installing the DITA For Publishers Package
- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin *(on page 2027)*

**Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin**

Custom **DITA-OT plugins** may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a **transtype**, Oxygen XML Author Eclipse plugin detects that transformation type declaration and presents descriptions in the **DITA Transformation Type** dialog box *(on page 843)* and the contributed parameters in the **transformation scenario**'s **Parameters** tab *(on page 1975)*.

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:
1. If you have not already done so, create a DITA-OT plugin.xml file (on page 2022) (you can easily create this file by using the DITA-OT Plugin new document template in the New from templates wizard (on page 228)).

2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

   ```xml
   <transtype name="xhtml" extend="base-html" desc="HTML"/>
   ```

3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

   ```xml
   <param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
   <val>yes</val>
   <val default="true">no</val>
   </param>
   ```

   Depending on the type declared for a parameter, Oxygen XML Author Eclipse plugin will help you pick values for each parameter edited in the Parameters tab of the transformation scenario configuration dialog box. For example, for parameters of type "enum", Oxygen XML Author Eclipse plugin will present a combo box for choosing the proper value for the parameter.

4. You can also extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

### Plugin Extension Example - Promote Parameters:

It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the Parameters tab of the transformation scenario configuration dialog box. To do this, you could create a pluginExtension.xml file in the root folder of the DITA-OT plugin and use the <promotedParams> element to define the promoted parameters. Here is an example:

```xml
<extensionPlugin>
   <transtype name="pdf-css-html5">
      <promotedParams>
         <param name="args.css" promotedName="CSS"/>
         <param name="args.css.param.numbering" promotedName="Numbering"/>
         <param name="args.chapter.layout" promotedName="Chapter layout"/>
      </promotedParams>
   </transtype>
</extensionPlugin>
```

The example above results in the Parameters tab looking like this:
5. Install the plugin *(on page 2026)*.

**Note:**
If the plugin is installed using an external command line, you may need to restart Oxygen XML Author Eclipse plugin to properly re-detect the newly contributed transtypes and parameters.

**Example of a plugin.xml File:**

```xml
<plugin id="com.oxygenxml.pdf.prince">
    <!-- extensions -->
    <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
    <feature extension="dita.conductor.target.relative" value="integrator.xml"
              type="file"/>
    <feature extension="dita.transtype.print" value="pdf-prince"/>
    <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
        <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
    </transtype>
</plugin>
```

[https://www.youtube.com/embed/LcrR0YUIFQ4](https://www.youtube.com/embed/LcrR0YUIFQ4)

**Built-in Third-Party DITA Open Toolkit Plugins**

The DITA Open Toolkit 3.7.0 distribution that is bundled with Oxygen XML Author Eclipse plugin includes some pre-installed third-party open-source plugins *(on page 2082)* that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Author Eclipse plugin include:
• **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.

• **DITA to Word** - This plugin allows users to publish DITA content to MS Word.

• **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

### Extra Free Publishing Plugins

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTM5, PDF, and Eclipse Help. Since the architecture of the publishing engine is plugin-based, over time, lots of useful plugins were developed in the *Oxygen XML GitHub* account that enhance the publishing and some of them are listed below. The plugins that are already installed within the DITA-OT engine that comes bundled with Oxygen XML Author Eclipse plugin are listed with a [Bundled] marker.

#### Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]

You can use this very popular plugin to publish DITA to PDF output using CSS. As the publishing engine, it can use the *Oxygen XML Chemistry* processor (freely bundled with *Oxygen XML Editor*), the Antenna House engine, or the Prince XML engine.

#### DITA Metrics Report [Bundled]

This is a very useful open-source plugin can be used to generate an HTML report from an existing DITA project and contains a lot of useful information, including:

- Total number of maps and topics that are part of the project.
- Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.
- The used elements for each DITA domain.
- Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.
- Statistics about the conditional attributes used in the project.
- Information about content reuse.
- Text and content statistics, including both total words (word count) and unique words (vocabulary).
- List of largest and smallest topics and the number of words each one uses.
- Listing of all links to resources outside of the project.
- A metrics evolution report between different versions of your documentation.

#### Export DITA Map Plugin [Bundled]

You can use this free plugin to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.
Publish DITA Content with References to Video and Audio Resources. [Bundled]

A DITA Open Toolkit plugin can be used to convert the DITA `<object>` element to various HTML 5 structures (such as `<video>`, `<audio>`, or `<iframe>`).

Show Consecutive Codeblocks in Multiple Tabs for WebHelp Output

This open-source plugin can be used to display consecutive DITA `<codeblock>` elements in separate tabs.

Add Edit Links in HTML or PDF-based Output [Bundled]

This plugin can be used to add edit links in HTML or PDF-based output that allows subject matter experts to offer feedback for the published content directly in the source using a DITA web editing tool (such as Oxygen XML Web Author).

Create a Single Merged XML Document From an Entire DITA Project [Bundled]

This plugin can be used to produce a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.

Dynamically Publish Excel Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert Excel files to DITA (Excel files referenced with `format="excel"` in DITA maps).

Dynamically Use JSON Content in DITA Topics

A DITA Open Toolkit plugin that can be used to dynamically convert JSON content to DITA (JSON files referenced with `format="json"` in DITA maps).

Dynamically Publish `ASCIIDoc` Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert `ASCIIDoc` content to DITA (`ASCIIDoc` files referenced with `format="ant-parser"` in DITA maps).

Embed HTML Content in DITA Topics [Bundled]

A plugin that can be used to embed well-formed HTML content in a DITA topic inside a special element.

Embed LaTeX Equations in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded LaTeX mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded UML diagrams equations to HTML and PDF.
Float Images in HTML and PDF Outputs

A plugin that can be used to float an image referenced in a DITA topic left or right depending on the specified @outputclass attribute value.

Embed Referenced MathML and SVGZ Images in HTML Output

A DITA Open Toolkit plugin that can be used to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs

A DITA Open Toolkit plugin that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]

This plugin can be used to display Oxygen XML Editor tracked changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output

This sample DITA Open Toolkit PDF customization plugin is a good starting point if you want to:

- Customize fonts.
- Customize a cover page to provide custom logos and coloring.
- Customize page headers and footers.

PDF (XSL-FO) - Generate Numbers Before a Topic's Title

A DITA-OT PDF2 customization plugin that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output

A PDF customization folder that can be used to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Author Eclipse plugin

Oxygen XML Author Eclipse plugin comes bundled with a DITA Open Toolkit, located in the DITA-OT-DIR directory. Starting with Oxygen XML Author Eclipse plugin version 17, if you want to use an external DITA-OT for all transformations and validations, you can open the Preferences dialog box (on page 61) and go to the DITA page (on page 73), where you can specify the DITA-OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:
1. Edit your transformation scenarios and in the **Parameters** tab change the value for the **dita.dir** parameter to point to the new directory.

2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the **Advanced** tab, click the **Libraries** button and deselect **Allow Oxygen to add high priority libraries to classpath**.

3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the **Document Type Association preferences page (on page 79)**, edit the **DITA** and **DITA Map** document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file **catalog-dita.xml**.

**Related Information:**

- Editing a Transformation Scenario *(on page 894)*
- Creating New Transformation Scenarios *(on page 816)*
- DITA Open Toolkit Documentation

### DITA Open Toolkit Project

The **DITA Open Toolkit** project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).

Oxygen XML Author Eclipse plugin has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

### Editing DITA Open Toolkit Project Files

The **New Document wizard (on page 221)** includes a template to help you create DITA Open Toolkit project files (with an .xml file extension). The template is located in the **Framework templates > DITA-OT** folder. There is also a sample project file that can be found in the application samples folder: **OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml**.

When working with a DITA-OT project file in the **Author** visual editing mode, you can see a compact representation of the file by default. You can switch to the **Edit** style in the **Styles** toolbar drop-down menu to edit the file using form controls and inline buttons. The additional **View as YAML** style can be selected to see a visual representation of the same document in YAML.

### DITA-OT Project File Content Completion

Content completion is available according to the associated schema and it is enhanced with proposals for ID references, available transformation types, parameter names, and values.
DITA-OT Project File Validation

The default automatic validation support for DITA-OT project files has enhanced Schematron rules that report invalid references to non-existing contexts. The default validation is based on a validation scenario named DITA-OT Project that is included in the DITA-OT project framework.

The DITA-OT Project framework also includes a validation scenario named DITA-OT Project Validation and Completeness Check. It contains validation units that automatically validate the project file based on the DITA-OT Project scenario and also a manual validation unit based on the DITA-OT Project Validation and Completeness Check validation engine that validates all contexts recursively.

When creating a validation scenario (on page 531), or editing an existing scenario (on page 541) for a DITA-OT project file, you can select DITA-OT Project Validation and Completeness Check engine in the Validation engine column and clicking the Settings button for that engine opens the Configure validation engine dialog box where you can configure options for validating the DITA-OT project.

Figure 398. Configure Validation Engine Dialog Box for DITA-OT Project Validation

The options available in this dialog box include:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:
• If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
• If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (on page 530).

Note:
If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources
Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Report references to resources outside of the DITA map folder
If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2083) folder.

Report links to topics not referenced in DITA maps
Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic
If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```xml
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context
Checks for multiple topics with the same ID in the context of the entire map.
Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note:
This option takes key scopes (on page 1923) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the “k2” key as a duplicate because it is defined in a key scope (on page 1923) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a @processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a @conref or @conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<cols>` is different than the number of columns detected from the table @cols attribute.
- For a CALS table, if the number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the @cols, @rowsep, or @colsep attributes are not numeric.
- For a CALS table, if the @namest, @nameend, or @colname attributes point to an incorrect column name.
### Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

### Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page](on page 134) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

### Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Author Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 199) button, or the browsing actions in the Browse drop-down list.

### Publishing DITA Open Toolkit Project Files

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the Configure Transformation Scenario(s) dialog box (on page 898):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional.args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.

### Main Files Support for DITA Open Toolkit Project Files

If you enable main files support at project level (on page 2043), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Main Files folder. You could also manually add the top-level files for your DITA-OT project in the Main Files folder. The benefit of this is that whenever you rename or move files in the Project Explorer view, the references to those resources will automatically be updated.

**Tip:**

The Resource Hierarchy/Dependencies view (on page 2045) also works for DITA-OT project files.
Editing Contexts Detected from DITA Open Toolkit Project Files

Once a DITA-OT project file is added to the Main Files folder, the Context drop-down menu on the DITA Maps Manager toolbar will contain context DITA maps defined in the project file and the Profiling/Conditional Text menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Author Eclipse plugin.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following:

- **DTD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
- **XSD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/Specialization Plugins. For Relax NG coding requirements, see [https://www.oxygenxml.com/dita/1.3 Specs/archSpec/base/relax-ng-requirements.html](https://www.oxygenxml.com/dita/1.3/Specs/archSpec/base/relax-ng-requirements.html).

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the @class attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Author Eclipse plugin, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:
1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, \DITA-OT-DIR\plugins directory).

   **Important:**
   The application needs to have full write access permissions to the DITA-OT directory.

2. If Oxygen XML Author Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.

3. Select the Configure Transformation Scenario(s) (on page 898) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 903)).

   **Tip:**
   If you don't see that scenario in the Configure Transformation Scenario(s) (on page 898) dialog box or Transformation Scenarios view (on page 903), click the Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.

5. Apply the scenario (on page 897).

6. Check the Results panel at the bottom of the application to make sure the build was successful.

7. Restart Oxygen XML Author Eclipse plugin with your normal permissions.

   **Tip:**
   Oxygen XML Author Eclipse plugin detects new document templates (on page 228) contributed by the DITA-OT plugin as long as you do the following:

   1. Create a new folder called template_folders inside your DITA OT plugin's folder. For example: \DITA-OT-DIR\plugins\my_custom_plugin\template_folders.

   2. Create one or more subfolders inside the template_folders directory that contain the new document templates. The new document templates found in those subfolders will be available in the New document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and
transformation of the **DITA maps** or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.

- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

  ! Important:
  
  If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association** preferences page (on page 79).

- You could *create your own document templates (on page 228)*, store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Author Eclipse plugin uses by adding the directory to the list in the **Document Templates Preferences (on page 78)** page.

**Related Information:**

DITA Configuration and Specialization Tutorials

**Editing DITA Map Specializations**

In addition to recognizing the default **DITA map (on page 2079)** formats (`<map>` and `<bookmap>`), the **DITA Maps Manager view (on page 1762)** can also be used to open and edit specializations of **DITA maps**.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager view (on page 1762)** are collected from the target files by matching the `@class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the **DITA Map** document type from the **Document Type Association preferences page (on page 79)** and edit the table actions to insert the element names as specified in your specialization. See **Creating a Framework through the Configuration Dialog (on page 1430)** for more details.

**Related Information:**

DITA Configuration and Specialization Tutorials

Integrating a DITA Specialization (on page 2038)
Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 79) and edit the actions to insert the element names, as specified in your specialization. See Creating a Framework through the Configuration Dialog (on page 1430) for more details.

- Integrating a DITA Specialization (on page 2038)

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 1895).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note:
If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).
**Optimizing Content for Translation**

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.
3. Avoid profiling/filtering content at inline level, for similar reasons.

**General DITA Project Structure**

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

**General Translation Workflow**

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The Oxygen Translation Package Builder Add-on could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 2042).

**Publishing Translated Content**

All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1030).

**Liability**

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.
Other Resources

Here are some links to other resources that might help you with translating DITA projects:

- DITA Translation: Organizing Your DITA Files
- DITA Translation: Using XLIFF to Translate DITA Projects
- WhP Localization Services Blog Page

Main Files Support in DITA

Oxygen XML Author Eclipse plugin includes a feature that allows you to define Main Files (on page 2081) at project level. This feature is typically used in Oxygen XML Author Eclipse plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Author Eclipse plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 1762), the root map (on page 2083) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Main Files support in DITA to update all the references to moved or renamed resources in the scope of the Main Files, and since the root map (on page 2083) will be set as the Main File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project Explorer view (on page 244), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Main Files Support in DITA

To use the Main Files support in DITA, follow these steps:

1. Go to the Project Explorer view (on page 244) and select Enable Main Files Support from the contextual menu of the project root folder.
2. Add the main DITA map (root map) (on page 2083) to the Main Files folder by doing one of the following:
   - Right-click the project root folder or the Main Files folder and select Detect Main Files from Project.
   - Manually add the root map (on page 2083) to the Main Files folder by right-clicking a file from your project and selecting Add to Main Files from the contextual menu (or simply drag and drop it into the Main Files folder).
Tip:
You can set multiple maps in the Main Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 1766).

3. [Alternative] If you have a defined DITA Open Toolkit project XML file (on page 2037) you can add it to the Main Files folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Main Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project Explorer view (on page 244) and Oxygen XML Author Eclipse plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the Main Files (in this case, the main DITA map (root map) (on page 2083)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Main Files support and add your root DITA map (on page 2083) to the Main Files folder as described in the How to Enable Main Files Support in DITA (on page 2043) section above.

2. Go to the Project Explorer view (on page 244), and use one of the following methods to move or rename the resources:

   **Moving Resources**

   To move resources in the Project Explorer view (on page 244), do one of the following:
   - Simply drag and drop the resource to the new location in the tree structure.
   - Use the Move action (or Copy and Paste actions) from the contextual menu.
   - Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

   **Result:** In all cases, a Move resource dialog box will be presented.

   **Renaming Resources**

   To rename resources in the Project Explorer view (on page 244), do one of the following:
   - Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.
   - Right-click the resource and select Rename or Refactoring > Rename resource.
Result: In all cases, a Rename resource dialog box will be presented.

3. Make sure the Update references of the moved resource(s) option is selected in the resulting Move or Rename dialog box and keep the scope as main files to make sure all the references to the moved or renamed resource are updated.

DITA Resource Hierarchy/Dependences View

The Resource Hierarchy/Dependencies view displays the hierarchy (on page 2080) or dependencies (on page 2078) for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the Project Explorer view (on page 244) and either select Show Resource Hierarchy or Show Resource Dependencies.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the Show Dependencies button on the toolbar of the Resource Hierarchy/Dependencies view, select the All files filter in the file browser, find the particular resource, and double-click it.

Figure 399. Resource Hierarchy/Dependencies View

The following actions are available on the toolbar of the Resource Hierarchy/Dependencies view:

- Refresh
  Refreshes the Hierarchy/Dependencies structure.

- Stop
Stops the hierarchy/dependencies from computing.

Show Hierarchy
Compute the hierarchy structure.

Show Dependencies
Compute the dependencies structure.

Configure dependencies search scope
Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple working sets (on page 2085). If the Use only Main Files, if enabled checkbox is selected, the scope of the search is restricted to the Main Files directory (on page 2043).

History
Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu for a resource listed in the Resource Hierarchy/Dependencies view contains the following actions:

Open
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Go to reference
Opens the source document where the resource is referenced.

Copy location
Copies the location of the resource.

Move resource
Opens the Move resource dialog box where the following fields are available:

- Destination - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name - Presents the current name of the moved resource and gives you the option to change it.
- Update references of the moved resource(s) - As long as Main Files support is enabled (on page 2043), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

Rename resource
Opens the Rename resource dialog box where the following fields are available:
• **New name** - Presents the current name of the edited resource and allows you to modify it.

• **Update references of the renamed resource(s)** - As long as Main Files support is enabled (on page 2043), you can select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

### Show Resource Hierarchy

Shows the hierarchy for the selected resource.

### Show Resource Dependencies

Shows the dependencies for the selected resource.

![Add to Main Files]

Adds the currently selected resource in the **Main Files** directory.

### Expand More

Expands more of the children of the selected resource from the Hierarchy/Dependencies structure.

### Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:**

When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🗓.

### Search and Rename Actions for IDs in DITA

Oxygen XML Author Eclipse plugin allows you to search references to ID attributes (either direct references using the `@href` and `@conref` attributes or indirect references using `@keyref` or `@conkeyref` attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename `@id` attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In **Author** mode, these operations are available for DITA documents in the contextual menu (grouped in the **Manage IDs** submenu). In **Text** mode, these actions are also available in the **Quick Assist** menu. To access it, place the cursor inside the value of an `@id` attribute and click the yellow light bulb icon.

The possible actions include:

**Rename in**

Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.
Rename in File (Available in the Text mode only)

Renames the ID you are editing and all its occurrences in the current file.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project.

Search References in

Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

Search Declarations (Available in the Text mode only)

Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

Search Declarations in (Available in the Text mode only)

Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

Search Occurrences in file

Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

Change scope (Available in the Quick Assist menu in Text mode only)

Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

Tip:

A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the Ctrl + Single-Click (Command + Single-Click on macOS) navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Author Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Related Information:

Main Files Support in DITA (on page 2043)

Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.
Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using subject scheme maps (on page 2084). When you are authoring, many of the values you choose from have been defined in subject scheme maps.

Migrating MS Office Documents to DITA

Oxygen XML Author Eclipse plugin integrates the entire DITA for Publishers plugins suite and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see Migrating Various Document Formats to and from DITA (on page 2051).

Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Smart Paste (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Author Eclipse plugin and create a new DITA topic.
3. Paste the selected content in Author mode. The Smart Paste functionality (on page 362) will attempt to convert the content to DITA structure.

HTML to DITA (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   - In Oxygen XML Author Eclipse plugin, select File > Import/Convert > HTML File to XHTML to import it as XHTML. Then, open the XHTML in Oxygen XML Author Eclipse plugin and use one of the XHTML to DITA transformation scenarios (on page 729) to convert the content to DITA structure.
Open the HTML file in any web browser, select all of its content, and copy it. Then, open Oxygen XML Author Eclipse plugin, create a new DITA topic, and paste the selected content in Author mode. The Smart Paste functionality (on page 362) will attempt to convert the HTML content to DITA structure.

**Word to LibreOffice to DITA (Single Document)**

1. Open the document in the LibreOffice application and save it as DocBook.
2. Open the DocBook document in Oxygen XML Author Eclipse plugin.
3. Run the built-in DocBook to DITA transformation scenario (on page 814).
4. You may need to make some manual adjustments for elements that could not be mapped.

**Word to DITA using DITA For Publishers (Single Document)**

1. Save the document in the MS Word DOCX format.
2. Open it in the Archive Browser view (on page 1353) in Oxygen XML Author Eclipse plugin and then open the document.xml file contained in the archive.
3. Run the built-in DOCX DITA transformation scenario. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the DITA For Publishers plugin and there is documentation for it available here: http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html.

**Word to DocBook to DITA (Multiple Documents)**

1. Use a tool to convert the documents to DocBook. For example, Pandoc is a free document converter engine that can convert DOCX documents to DocBook and according to Pandoc's manual, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted DocBook documents somewhere in your project.
3. Perform a batch transformation (on page 903) on all the newly converted DocBook documents:
   a. Select all the DocBook documents in the Project Explorer view (on page 244).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in DocBook to DITA transformation scenario (on page 814).
4. You may need to make some manual adjustments in the resulting documents for elements that could not be mapped.

**Migrating Excel and Other Types of Spreadsheets to DITA**

It is possible to convert Microsoft Excel (or other similar types of documents) to DITA. To do this, copy the spreadsheet content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 362) will attempt to convert the content to DITA structure.
Migrating Various Document Formats to and from DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 2049).

Migrating DocBook Content to DITA.

Since DocBook content is already in XML format, migrating it to DITA is more straight forward than with other non-XML formats:

1. Convert the DocBook content to a single large DITA composite file by performing a batch transformation (on page 903) on all the DocBook documents:
   a. Select all the DocBook documents in the Project Explorer view (on page 244).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 814).
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Tip:
There is also a utility XSLT stylesheet available on the Oxygen XML GitHub account that can be used convert a DITA composite file to a DITA map with separate DITA topic files. It can be found here: https://github.com/oxygenxml/old-userguide-docbookbased/blob/master/split-DITA-topic.xsl.
Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 362) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Author Eclipse plugin and run the built-in transformation scenario called DocBook to DITA (on page 814).

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Markdown Content to DITA

The DITA Open Toolkit publishing engine bundled with Oxygen XML Author Eclipse plugin allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see Working with Markdown Documents in DITA (on page 1888).

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 362) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting File > Import/Convert > HTML File to XHTML. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 729) to convert the content to DITA.

Migrating Unstructured FrameMaker to DITA

There is a FrameMaker plugin that can be used for this type of conversion: https://leximation.com/tools/info/fm2dita.php.

Migrating MadCap Content to DITA

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.
Migrate from DITA to Confluence and Other Formats

There are various possible methods available for converting DITA content to Confluence and other formats (such as Microsoft Word or HTML). For details and ideas for some of the possible methods, see the DITA to Confluence blog post.

Resources

For more information about migrating to DITA, see our webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring.

How to Count Words in DITA Topics or Maps

There are various ways to count words in Oxygen XML Author Eclipse plugin:

- Open a DITA topic in the Author visual editing mode, right-click anywhere in the editor, and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Open map in editor with resolved topics toolbar button. In the newly opened DITA map, right-click anywhere in the editor and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Configure Transformation Scenarios toolbar button and choose the DITA Map Metrics Report transformation scenario.

Tip:
Along with the word count, this DITA Map Metrics Report transformation provides additional information (such as the number of processed maps and topics, content reuse percentage, the number of elements, attributes, words, and characters used, and more).

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Author Eclipse plugin includes support for some DITA 1.3 features.

The Oxygen XML Author Eclipse plugin publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Author Eclipse plugin:
<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.7.0 is used]</th>
</tr>
</thead>
</table>
| DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc. | New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3  
Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements | N/A |
| Learning Object and Group maps                                         | New document templates                                                 | No specific support implemented             |
| Troubleshooting specialization                                         | Create and edit new troubleshooting topics                              | No specific support implemented             |
| XML markup domain                                                      | Validation and Content Completion                                        | Special rendering in PDF and XHTML-based outputs |
| Equation and MathML domain                                             | Validation and content completion                                        | Special rendering in PDF and XHTML-based outputs |
| SVG domain                                                             | Validation and content completion                                        | Special rendering in PDF and XHTML-based outputs |
| Other new DITA 1.3 elements (div, strike-through, overline, etc.)      | Validation and Content Completion                                        | Special rendering in PDF and XHTML-based outputs |
| Release management domain                                              | Validation and Content Completion                                        | No specific support implemented             |
| **Scoped keys (on page 1923)**                                         | Define key scopes  
Validate and check for completeness  
Resolve keyrefs and conkeyrefs taking key scopes into account  
Key scope information is displayed in a tooltip when hovering over an item in the DITA Maps Manager | Partially implemented (Various issues may still be encountered) |
### DITA 1.3 Features Implementation Status (continued)

</thead>
<tbody>
<tr>
<td>Branch filtering (on page 1925)</td>
<td>Display, create, and edit <code>&lt;ditavalref&gt;</code> elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to DITA maps with scope=&quot;peer&quot; and a defined keyscope &lt;br&gt;Gather and present keys from peer maps</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes (orientation, rotation, scope, and headers)</td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented</td>
</tr>
<tr>
<td>New Map topicref attributes (cascade, deliveryTarget)</td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

**Related information**<br>Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.

### DITA 2.0 Support

Starting with version 23, Oxygen XML Author Eclipse plugin includes support for some DITA 2.0 features. To enable this support, go to the Options > Preferences > DITA page and select the Enable DITA 2.0 Editing Support (Experimental) checkbox. Enabling it results in DITA 2.0 topic and map templates being available in the **New from templates** wizard (on page 228).

The following table is a list of DITA 2.0 features and their implementation status in Oxygen XML Author Eclipse plugin. The list of proposed DITA 2.0 changes is published here: https://www.oasis-open.org/committees/download.php/65626/DITA-2.0-proposals.pdf.
### Table 17. DITA 2.0 Features Implementation Status

<table>
<thead>
<tr>

Scripting Oxygen

Although Oxygen XML Author Eclipse plugin is mostly intended to be a visual editing tool, the all platforms distribution is bundled with a scripts subfolder that contains scripts to automate and run various utilities from a command line.

To run any of these scripts, you are required to purchase a special scripting commercial license. Trial scripting licenses are also available, by request, for clients who are interested in testing the scripts for their particular workflows. Once you have a scripting license key available, you should copy the license key to a file named scriptinglicensekey.txt and save it in the main application directory (the parent directory of the "scripts" directory).

For more information about the Oxygen Scripting support, watch our Webinar: Automate XML processing with Oxygen XML Scripting.

DITA Validate and Check For Completeness

⚠️ Attention:

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Validate and Check For Completeness (on page 1806) action that is available on the toolbar of the DITA Maps Manager view provides the ability to validate a DITA map or a DITA Open Toolkit project file with a large array of settings. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the validateCheckDITA.sh script to run a validation on a DITA map or DITA Open Toolkit project file and report the results in a separate XML document.

Sample Command-Line Arguments for the Validate and Check for Completeness Script:

```
sh scripts/validateCheckDITA.sh -i inputFile [-c contextId] [-s settingsFile] [-r reportFile]
```

A public example of using such a script as a GitHub action for reporting errors in pull requests on DITA project can be found here: https://github.com/oxygenxml/blog/blob/master/.github/workflows/workflow.yml. The GitHub action calls a Gradle script target named runValidation: https://github.com/oxygenxml/blog/blob/master/build/build.gradle.
Transform

Attention:

- This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.
- To execute a scenario based on WebHelp using this script, in additional to the scripting commercial license, you are required to purchase an Oxygen XML WebHelp license or an Oxygen Publishing Engine license.
- To execute a scenario based on Chemistry using this script, in additional to the scripting commercial license, you are required to purchase an Oxygen PDF Chemistry license or an Oxygen Publishing Engine license.

The Transform script (transform.sh) helps you to execute a transformation scenario. You can run the scenarios for the existing document types (frameworks) (on page 2080) without setting a scenarios file, but for others, you have to specify a specialized scenarios file or a project file that contains scenarios.

You can export transformation scenarios from Oxygen XML Author Eclipse plugin into a specialized scenarios file by using the Export selected scenarios action from the Transformation Scenarios view or using the Export Global Transformation Scenarios action from the Options menu.

Arguments for the Transform Script

```
sh scripts/transform.sh -i inputFile -sn scenarioName [-s scenariosFile] [-v]
```

- **-i inputFile**
  
  The input file that the transformation scenario is applied to.

- **-sn scenarioName**

  The name of the transformation scenario to be executed.

- **-s scenariosFile**

  The name of a file that contains additional scenarios. It can be a specialized scenarios file or a project file that contains project transformation scenarios.

  The scenarios from this file are merged with the scenarios from the document types (frameworks) (on page 2080).

- **-v**

  This argument can be specified to activate verbose logging for DITA-OT and ANT scenarios. It is useful for debugging.
XML Refactoring

Attention:

- This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.
- To execute an XQuery refactoring operation using this script, in addition to the scripting commercial license, you are required to purchase a Saxon EE license.

The XML Refactoring script (xmlRefactoring.sh) can be used to execute XML refactoring operations (on page 581). You can run a refactoring operation by specifying the operation id of the operation. If, in addition to the refactoring operations provided by Oxygen XML Author Eclipse plugin in the OXYGEN_INSTALL_DIR/refactoring folder and in framework configurations, you want to run a custom refactoring operation, you have to specify the directory that contains it, using the \( od \) (operations directory) argument.

Arguments for the XML Refactoring Script

```
sh scripts/xmlRefactoring.sh  -id operationId -i inputFilesOrDirectories [-f filesFilter]
[-od operationsDirectory] [-p param1=value1...] [-v]
```

- **-id operationId**
  The ID of the refactoring operation to be executed.

- **-i inputFilesOrDirectories**
  A list of space-separated input files or directories that the refactoring operation is applied to.

- **-f filesFilter**
  Specifies a filter for the input files by using a file pattern. For example, to restrict the operation to only analyze build files, you could use `build*.xml` for the file pattern.

- **-od operationsDirectory**
  A directory that contains additional refactoring operations.

- **-p param1=value1...**
  A list of space-separated pairs of a parameter’s name and value used by the refactoring operation.

- **-v**
  This argument can be specified to activate verbose logging.
DITA Translation Package Builder

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The DITA Translation Package Builder (translationPackageBuilder.sh) script helps you to build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

This script requires the DITA Translation Package Builder add-on to be installed in the all platforms distribution of Oxygen XML Author Eclipse plugin. To install it the add-on, follow these instructions:

1. Go on the DITA Translation Package Builder plugin Releases page and download the latest translation-package-builder-{version}-plugin.jar package.
2. Unzip it inside {oxygenInstallDir}/plugins.

Note:
Do not create any intermediate folders. Afterwards, the file system should look like this:
{oxygenInstallDir}/plugins/translation-package-builder-{version}/plugin.xml

Examples for the DITA Translation Package Builder Script

Example: Generating a Milestone File

```
sh scripts/translationPackageBuilder.sh -gm -i ditamapFile [-m milestoneFile] [-verbose]
```

This action is the first one to use. It will generate a unique hash for each documentation resource. This information will be used by the second action to detect which files have been modified. A milestone file should be generated the first time you install this plugin and henceforth, after each package is sent to translators.

```
-gm
  Requests the generation of a milestone file.

-i ditamapFile
  The main DITA map file.

-m milestoneFile
  The path to the milestone file. If missing, it is assumed that the milestone will be saved in the DITA map parent folder with the following name:
  {ditamapName}_translation_milestone.xml.

-verbose
  Generates a console log about the performed steps. It is useful for debugging.
```
Example: Creating a Package with the Modified Files to Send to Translation

```
sh scripts/translationPackageBuilder.sh -gp -i ditamapFile [-m milestoneFile] -p package.zip [-verbose]
```

This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

-gp
Requests the generation of a package with the modified files.

-i ditamapFile
The main DITA map file.

-m milestoneFile
The path to the milestone file. If missing, it is assumed that the milestone will be located in the DITA map parent folder with the following name: `{ditamapName}_translation_milestone.xml`.

-p package.zip
The path to the zip archive where all the modified files are collected.

-verbose
Generates a console log about the performed steps. It is useful for debugging.

Example: Applying a Translation Package Over a DITA Map

```
sh scripts/translationPackageBuilder.sh -ap -i ditamapFile -p package.zip [-verbose]
```

When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open `dita-map-french.ditamap` if the package contains the french translation). Invoking this action will extract the changed files inside the map's directory.

-ap
Requests the application of a translation package over a DITA map.

-i ditamapFile
The main DITA map file that matches the received package language. For example, if the package contains topics translated into French, then this map is the French version of your DITA map.

-p package.zip
The path to the archive with all the translated files.

-verbose
Generates a console log about the performed steps. It is useful for debugging.
Batch Converter

⚠️ Attention:
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Batch Converter script (batchConverter.sh) helps you to convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4 / DocBook5
- Markdown to XHTML
- Markdown to DITA
- Markdown to DocBook4 / DocBook5
- Word to XHTML
- Word to DITA
- Word to DocBook4 / DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- JSON to XML
- JSON to YAML
- XML to JSON
- YAML to JSON

This script requires the Oxygen Batch Documents Converter add-on to be installed in the all platforms distribution of an Enterprise edition of Oxygen XML Author Eclipse plugin.

To install the add-on, follow these instructions:

1. Go on the Oxygen Batch Documents Converter plugin Releases page and download the latest oxygen-batch-converter-{version}-plugin.jar package.
2. Unzip it inside {oxygenInstallDir}/plugins.

Note:
Do not create any intermediate folders. Afterwards, the file system should look like this:
{oxygenInstallDir}/plugins/oxygen-batch-converter-{version}/plugin.xml

Arguments for the Batch Converter Script

sh scripts/batchConverter.sh -i inputFiles -if inputFormat -o outputDirectory
-of outputFormat [-ss (true|false)] [-csd (true|false)] [-cs converterSettingsFile]

-i inputFiles
A list of space-separated input files or directories in file syntax form.

- **if inputFormat**
  The format of the input files. The possible values are: html, markdown, word, confluence, docbook, excel, json, yaml, or xml.

- **o outputDirectory**
  The output directory in file syntax form.

- **of outputFormat**
  The format of the output files. The possible values are: xhtml, dita, docbook4, docbook5, json, yaml, or xml.

- **ss (true|false) [only for Word to DITA, HTML to DITA, Markdown to DITA, and DocBook to DITA conversions]**
  Splits sections marked by titles or headings to separate files and create a DITA map. The possible values are true or false (default).

- **csd (true|false) [only for Markdown to DITA conversions]**
  Creates short description elements from the first paragraph before the headings. Possible values are true or false (default).

- **cs converterSettingsFile**
  A file that contains the Batch Documents Converter add-on preferences settings. It can be an xpr file that contains project options or an xml file that contains global options. If not specified, the operation uses the application's default settings.

### Confluence to DITA

The Confluence to DITA conversion processes the HTML content generated by the Confluence export process. For exporting, login to your Confluence account and navigate to the specific space that you want to export. Go to **Space Settings > Export space** and choose to export it as HTML. The **index.html** file resulting from this process has to be provided in the **inputFiles** argument.

### Compile Framework Script

⚠️ **Attention:**
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin.

A custom framework (on page 2080) (document type) can be created using a special XML descriptor file (on page 1431), either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it.

The Compile Framework Script (compileFrameworkScript.sh) helps you to compile the script into the *.framework file that represents the framework configuration. Although Oxygen XML Author Eclipse plugin is now able to automatically compile and load scripts, you might want to compile it yourself to obtain the
resulting *framework file if your framework runs on a different version of Oxygen XML Author Eclipse plugin.

**Arguments for the Compile Framework Script**

```bash
sh scripts/compileFrameworkScript.sh -i "script1.exf" "script2.exf" "frameworksDir"
```

- **inputFiles**
  
  A list of space-separated Framework Extension Script Files (*exf) or directories in file syntax form. If a directory is specified, the Framework Extension Script Files are searched for inside it and in its child directories.

**XSLT Stylesheets Documentation**

⚠️ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XSLT Stylesheets from Oxygen XML Author Eclipse plugin by using the Tools > Generate Documentation > XSLT Stylesheet Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `scripts/stylesheetDocumentation.sh` script to generate XSLT stylesheets documentation from the command line.

**Sample Command-Line Arguments for the Generate XSLT Stylesheet Documentation Script**

```bash
sh scripts/stylesheetDocumentation.sh xslFile [-cfg:configFile] | [-out:outputFile]
```

**Related information**

XML Schema Documentation (on page 2064)

WSDL Documentation (on page 2065)

**XML Schema Documentation**

⚠️ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XML Schemas from Oxygen XML Author Eclipse plugin by using the Tools > Generate Documentation > XML Schema Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `scripts/schemaDocumentation.sh` script to generate XML Schema documentation from the command line.
Sample Command-Line Arguments for the Generate XML Schema Documentation Script

```
```

Related information

- XSLT Stylesheets Documentation (on page 2064)
- WSDL Documentation (on page 2065)

WSDL Documentation

⚠️ Attention:

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for WSDL documents from Oxygen XML Author Eclipse plugin by using the Tools > Generate Documentation > WSDL Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the scripts/wsdlDocumentation.sh script to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate WSDL Documentation Script

```
sh scripts/wsdlDocumentation.sh wsdlFile [-cfg:configFile] [-out:outputFile]
```

Related information

- XSLT Stylesheets Documentation (on page 2064)
- XML Schema Documentation (on page 2064)

XML Instance Generator

⚠️ Attention:

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate multiple XML documents from an XML Schema from Oxygen XML Author Eclipse plugin by using the Tools > Generate Sample XML Files main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the scripts/xmlGenerator.sh script to generate multiple XML instance files from the command line.
Sample Command-Line Arguments for the Generate Sample XML Files Script

sh scripts/xmlGenerator.sh path/to/config/file [-verbose]

Extended Version of the Script and its Arguments

sh scripts/xmlGenerator.sh [[path_to_config_file] [-s XML_schema_path -r root [-n ns] [-o output_dir] [-f instance_name] [-i num_of_instances]] [-verbose]]

path_to_config_file
The path to the file that contains the configuration to be used.

-s XML_schema_path
The path to the XML schema to be used for generating the XML file(s).

-n ns
The namespace used for the XML namespace declaration.

-r root
The root element for the generated file(s).

-o output_dir
The output directory to be used for storing the generated file(s).

-f instance_name
The pattern name to be used for the generated file(s). It is usually the name plus extension.

-i num_of_instances
The number of XML files to be generated.

-verbose
This argument can be specified to activate verbose logging.

Note:
Any value specified by the -s, -n, -r, -o, -f, or -i arguments overrides the corresponding value from the configuration file, if that file is specified in the path_to_config_file argument.

Flatten XML Schema

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.
You can flatten an XML schema that contains multiple includes and redefines to a single schema file from Oxygen XML Author Eclipse plugin by using the **Tools > Flatten Schema** main menu action. You can use the equivalent `scripts/flattenSchema.sh` script to flatten an XML schema from the command line.

**Sample Command-Line Arguments for the Flatten Schema Script**

```
   [-flattenImports:<boolean_value>]
   | [-useCatalogs:<boolean_value>]
   [-flattenCatalogResolvedImports:<boolean_value>] [-verbose]]
```

**Compare Directories**

⚠️ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The **Compare Directories** script (`compareDirs.sh`) can be used to compare two directories and get the comparison results in various formats.

**Arguments for the Compare Directories Script**

```
sh scripts/compareDirs.sh firstDirPath secondDirPath [[baseDirPath] [-if includeFilesFilter] [-ia
   includeArchives] [-ef excludeFilesFilter] [-ed excludeSubdirsFilter] [-cm comparisonMode] [-alg
   ignoreAttrOrder] [-iee ignoreExpStateForEmptyElems] [-out outputFormat]] [-help | --help | -h |
   --h]
```

**firstDirPath**

Mandatory argument that specifies the first directory path (it can also be provided as a URL using 'file://' protocol).

**secondDirPath**

Mandatory argument that specifies the second directory path (it can also be provided as a URL using 'file://' protocol).

**baseDirPath**

Optional argument that specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments.

**-if includeFilesFilter**

Use this argument to only include files that match the specified pattern in the comparison (e.g. `.xml`, `.json`). Default value = `*`. 
-ia includeArchives
If set to true, files from archives are included in the comparison. Default value = false.

-ef excludeFilesFilter
Use this argument to exclude files that match the specified pattern from the comparison (e.g. *.jpg).

-ed excludeSubdirsFilter
Use this argument to exclude sub-directories that match the specified pattern from the comparison (e.g. .svn, _svn, .git).

-cm comparisonMode
Specifies the comparison mode. There are three modes available: content, binary, and timestamp. Default value = content.

-alg comparisonAlg
Specifies the algorithm to be used for the comparison. Possible values: auto, chars, words, lines, syntax_aware, xml_fast, and xml_accurate. Default value = auto.

-als algStrength
Specifies the strength of the algorithm to be used for the comparison. Possible values: low, medium, high, and very_high. Default value = medium.

-iws ignoreWS
If set to true, whitespaces are ignored if differences consist only of whitespaces. Default value = false.

-ipi ignorePI (only for the XML-aware algorithms)
If set to true, processing instructions are ignored in the comparison. Default value = false.

-icm ignoreComments (only for the XML-aware algorithms)
If set to true, comments are ignored in the comparison. Default value = false.

-idt ignoreDocType (only for the XML-aware algorithms)
If set to true, DOCTYPE sections are ignored in the comparison. Default value = false.

-itn ignoreText (only for the XML-aware algorithms)
If set to true, text content is ignored in the comparison. Default value = false.

-ins ignoreNS (only for the XML-aware algorithms)
If set to true, namespaces are ignored in the comparison. Default value = false.

-ind ignoreNSDecl (only for the XML-aware algorithms)
If set to true, namespace declarations are ignored in the comparison. Default value = false.

-inp ignorePrefixes (only for the XML-aware algorithms)
If set to true, prefixes are ignored in the comparison. Default value = false.
-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to true, the order of attributes is ignored in the comparison. Default value = false.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)

If set to true, the expansion state for empty elements is ignored in the comparison. Default value = false.

-merge mergeOperation

If set to true, a merge operation is invoked after the comparison. Default value = false.

Notes:

• This argument is considered only for 3-way comparisons (i.e. only if the baseDirPath argument is provided).
• The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second directories (relative to the base folder), all the differences of the type incoming are considered and the content of the first directory is updated accordingly.
• Conflicting changes are not addressed.
• After the comparison, a report is created that provides details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merge operation. For example, it allows you to specify a specific existing or new directory where the results of the merge operation is saved, other than the first directory path for the comparison (which is what happens when using only the -merge argument). The path of the directory can also be provided as a URL using file:// protocol. This argument and the -merge argument are not dependent on each other.

-out outputFormat

Notes:

• If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly. If you skip specifying the /grouped or the /raw qualifiers, /grouped takes precedence.
If you choose the html or htm output format, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.

- The "ifcr" qualifier for the html or htm values is considered only if the -outfile argument is also present. IFCR is an acronym for Include File Comparison Reports and it means that, along with generating the directory comparison report, separate file comparison reports will be generated for all modified file pairs. These reports are available through links from the main report and are saved to a specific directory based on the value provided by the outfile argument. It will have the same parent directory and the same name as the outputFile plus -OXY-FC-REPORTS added to the end of its name.

- The html value, as well as the grouped, raw, or ifcr qualifiers, are not considered if the -merge argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the -out argument. The output file path can also be provided as a URL using file:// protocol.

-help | --help | -h | --h

Displays help text.

Notes:

- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form bool_option true|false are accepted and interpreted accordingly.

- File markers used in reports are as follows: M = modified, O1 = only found in 1st directory, O2 = only found in 2nd directory.

Examples of Compare Directories Script

Example 1: Compare Directories and Include Archives While Excluding JPEGs

The following command results in archives being included in the comparison, while JPEGs are excluded:

```
sh scripts/compareDirs.sh dir1 dir2 -ia true -ef *.jpg
```

Example 2: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order
The following command only includes XML files (even from archives) in the comparison, while ignoring the comments and attribute order:

```
sh scripts/compareDirs.sh dir1 dir2 -if *.xml -ia -iao -icm
```

**Example 3: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order**

The following command redirects the comparison results to a JSON file named "results.json", with "raw" mode formatting:

```
sh scripts/compareDirs.sh dir1 dir2 -out json/raw > results.json
```

**Example 4: Compare Directories and Generate Comparison Report**

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the directories and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareDirs.sh dir1 dir2 -out html -outfile results.html
```

**Figure 400. Example of an HTML Report for Directory Comparison**

[Table showing file differences]

**Resources**

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:

- Webinar: [The New Oxygen Compare and Merge Scripts](#).
- Video: [Generating Directory Comparison Reports Using Command-Line Scripts](#).

**Related information**

[Compare Files Script (on page 2072)](#)
Compare Files

⚠️ Attention:
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The **Compare Files** script (`compareFiles.sh`) can be used to compare files (2-way or 3-way) and get the comparison results in various formats.

**Arguments for the Compare Files Script**

```
```

- **firstFilePath**
  Mandatory argument that specifies the first file path (it can also be provided as a URL).

- **secondFilePath**
  Mandatory argument that specifies the second file path (it can also be provided as a URL).

- **baseFilePath**
  Optional argument that specifies the path of the base file that the other two files will be compared against in a 3-way comparison (it can also be provided as a URL).

- **-ct contentType**
  Specifies the content type of the files to be compared. Possible values (based on known extensions of some of the most common file types): `.xml`, `.dtd`, `.css`, `.rnc`, `.xquery`, `.json`, `.yaml`, `.java`, `.js`, `.c`, `.cpp`, `.pl`, `.py`, `.php`, `.sql`, `.bat`, `.sh`, `.properties`, `.txt`. The option is used to force the file handling to the specific type of file. Otherwise, the file extension is auto-detected.

- **-alg comparisonAlg**
  Specifies the algorithm to be used for the comparison. Possible values: `auto`, `chars`, `words`, `lines`, `syntax_aware`, `xml_fast`, and `xml_accurate`. Default value = `auto`.

- **-als algStrength**
  Specifies the strength of the algorithm to be used for the comparison. Possible values: `low`, `medium`, `high`, and `very_high`. Default value = `medium`.

- **-iws ignoreWS**
  If set to `true`, whitespaces are ignored if differences consist only of whitespaces. Default value = `false`. 
-ipi ignorePI (only for the XML-aware algorithms)
  If set to true, processing instructions are ignored in the comparison. Default value = false.

-icm ignoreComments (only for the XML-aware algorithms)
  If set to true, comments are ignored in the comparison. Default value = false.

-idt ignoreDocType (only for the XML-aware algorithms)
  If set to true, DOCTYPE sections are ignored in the comparison. Default value = false.

-itn ignoreText (only for the XML-aware algorithms)
  If set to true, text content is ignored in the comparison. Default value = false.

-ins ignoreNS (only for the XML-aware algorithms)
  If set to true, namespaces are ignored in the comparison. Default value = false.

-ind ignoreNSDecl (only for the XML-aware algorithms)
  If set to true, namespace declarations are ignored in the comparison. Default value = false.

-inp ignorePrefixes (only for the XML-aware algorithms)
  If set to true, prefixes are ignored in the comparison. Default value = false.

-iao ignoreAttrOrder (only for the XML-aware algorithms)
  If set to true, the order of attributes is ignored in the comparison. Default value = false.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)
  If set to true, the expansion state for empty elements is ignored in the comparison. Default value = false.

-enx XPathExprToExcludeNodes
  Specifies an XPath expression to exclude certain nodes from the comparison.

-merge mergeOperation
  If set to true, a merge operation is invoked after the comparison. Default value = false.

Notes:

- This argument is considered only for 3-way comparisons (i.e. only if the baseFilePath argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second files (relative to the base file), all the differences of the type incoming are considered and the content of the first file is updated accordingly.
• If conflicting changes are detected, the merge operation is aborted and the first file remains unchanged.
• After the comparison and merge, a report is created that provides some details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merged file. Instead of directly affecting the first compared file (which is what happens when using only the -merge argument), a new file is created with the same name as the first file and it is saved in the specified directory. The path of the output directory can also be provided as a URL. This argument and the -merge argument are not dependent on each other.

-out outputFormat

Specifies the format of the output. Possible values: yaml, json, xml, html, htm, html/inlineCSS, or htm/inlineCSS. Default value = yaml.

Notes:

• If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly.
• If you choose any of the html, html/inlineCSS, htm, or htm/inlineCSS output formats, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
• The inlineCSS qualifier for the html and htm values implies that the CSS-based generated HTML code is more suitable to be directly inserted in emails (as most email clients only accept inline CSS styling for HTML emails.
• The html and htm values (with or without the inlineCSS qualifier) are not considered if the -merge argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the -out argument. The output file path can also be provided as a URL.

-help | --help | -h | --h

Displays help text.

Note:
For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent
to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.

**Examples of Compare Files Script**

**Example 1: Compare Files and View Results in XML Format**

The following command compares the files (ignoring the namespaces and prefixes) and redirects the console output to the `results.xml` file (XML-formatted):

```
sh scripts/compareFiles file1 file2 -ins -inp -ind -out xml > results.xml
```

**Example 2: Compare Files with Line by Line Algorithm**

The following command compares the files using the `lines` algorithm and ignores whitespaces:

```
sh scripts/compareFiles.sh file1 file2 -alg lines -iws
```

**Example 3: Compare Files and Generate Comparison Report**

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the files and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareFiles.sh file1 file2 -out html -outfile outFileName.html
```

![Figure 401. Example of File Comparison Report in HTML Format](image)

**Resources**

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:
• Webinar: The New Oxygen Compare and Merge Scripts.
• Video: Generating File Comparison Reports Using Command-Line Scripts.

Related information
Compare Directories Script (on page 2067)

Format and Indent Files

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Author Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Format and Indent Files script (batchFormatAndIndent.bat/batchFormatAndIndent.sh) can be used to format and indent multiple files at once.

Arguments for the Format and Indent Files Script

batchFormatAndIndent -i inputFilesAndDirs [-f filesFilter] [-s formattingSettingsFile] [-r] [-ih] [-v]

-i inputFilesAndDirs
   The input files and directories.

-f filesFilter
   A filter for the input files, specified by using a file pattern (e.g. *.xml, t_*.dita).

-s formattingSettingsFile
   A file that contains formatting settings. It can be an .xpr file that contains project options or an .xml file that contains global options. If not specified, the operation uses the application's default settings.

-r
   Use this argument if the operation should be performed recursively for the specified input directories.

-ih
   Use this argument if you want the operation to also format and indent hidden files.

-v
   Activates verbose logging. It is useful for debugging purposes.
22.

Glossary

Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Alternate CSS Style

The Alternate CSS Style refers to the choices in the bottom half of Styles drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. By default, the alternate styles are applied like layers, they are merged sequentially with the main CSS style (on page 2081), and you can activate any number of them. However, if you deselect the Enable multiple selection of alternate CSSs option (on page 87) in the CSS subtab of the Document Type configuration dialog box (on page 81), the alternate styles are treated like main CSS styles (on page 2081) and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Anchor

An Anchor is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the @href attribute with a # symbol followed by the anchor that is defined in a target ID (for example href="MyTopic.dita#anchor").

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A block element is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are block elements. It is distinct from a inline element, which has no such separation.

Bookmap

A bookmap is a specialized DITA map used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.
Callout

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Author Eclipse plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To canonicalize something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The Content Completion Assistant refers to a very helpful mechanism in Oxygen XML Author Eclipse plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode (on page 365)
- Content Completion Assistant in Text Mode (on page 292)
- Content Completion Assistant in Grid Mode (on page 337)
- Content Completion in CSS Stylesheets (on page 605)
- Content Completion in JavaScript Documents (on page 612)

Dependencies

The word dependencies in XML documents refers to resources or references that are relied upon in a particular scope (e.g. the scope of the entire project or a particular DITA map) for a selected resource. This is helpful if you want to see where the resource is used or referenced in the entire hierarchy of the project or map. For example, you might want to look for the dependencies of an XML document to find all the instances where it is referenced throughout the hierarchy of a project or DITA map.

Dockable

A Dockable window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A document fragment represents a portion of an XML document's tree of nodes or content.
Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a framework (on page 2080). In Oxygen XML Author Eclipse plugin, **Document Type Association** also specifically refers to a preferences page (on page 79) where you can create new custom frameworks or edit existing ones. Note that frameworks (document types) that come built-in with Oxygen XML Author Eclipse plugin are read-only, but you can Extend (on page 80) or Duplicate (on page 79) them to configure them as custom frameworks.

DITA Map

A **DITA map** is a component of the DITA framework (on page 2080) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually, the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap (on page 2077) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

**DITA Open Toolkit** is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the Apache License, Version 2.0.

The toolkit supports all versions of the OASIS DITA specification, including 1.0, 1.1, 1.2, and 1.3.

DITA-OT

**Related Information:**
http://www.dita-ot.org/

DITA-OT-DIR

**DITA_OT_DIR** refers to the default directory that is specified for your DITA Open Toolkit distribution in the Window > Preferences > Oxygen XML Author Eclipse plugin > DITA preferences page (on page 73).

For example, if you are using DITA-OT 3.7.0 that comes bundled with Oxygen XML Author Eclipse plugin, the default directory is: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x. You can also specify a custom directory.
Foldable Element

A foldable element refers to elements that can be collapsed and expanded in Oxygen XML Author Eclipse plugin. Foldable elements are marked with a small triangle (↑/↓) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All).

Framework

A framework refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A framework is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Author Eclipse plugin includes a Document Type Configuration Dialog Box (on page 81) that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks (on page 1430) section.

Hierarchy

In the Oxygen Resource Hierarchy view, the word hierarchy refers to a set of components (outgoing references) that are displayed as a tree, recursively, starting from the selected XML file (shown as the root). It makes it easy to navigate through the hierarchy (tree) to find specific data.

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a block element, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Key Space

The concept of a Key Space in DITA refers to a set of all possible keys that can be used in a DITA map structure. A Key Space is established when a root map (on page 2083) defines a set of effective key
bindings. When Oxygen XML Author Eclipse plugin processes key references, it determines the effective binding of a given key to a resource in the context of the specified root map (on page 1778).

Keystore

A Keystore is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Author Eclipse plugin:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)

Main CSS Style

The Main CSS Style refers to the selection in the top half of the Styles drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. The main CSS applies to the whole document and you can also select one or more alternate styles (on page 2077) (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the main CSS style.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1442).

Main File

A Main File typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Contextual Project Operations Using 'Main Files' Support (on page 252) section.

Named User

Named User is defined as an individual full or part-time employee who is authorized by You (the individual or entity who owns the rights for Oxygen XML Author Eclipse plugin) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared among multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User’s employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do
reassign the *Named User* license in accordance with the restrictions above, you do not need to notify
Syncro of such a reassignment.

**Note:**
This definition is taken from the Oxygen XML Author Eclipse plugin *End-User License Agreement.*

**Oxygen Publishing Template**

*Oxygen Publishing Template* defines all the aspects related with the **look and feel**(*layout and styles*) for
the *WebHelp Responsive* output.

The template is self-contained and packed as a ZIP archive making it easy t share with others. It
represents the main method for customizing the *WebHelp Responsive* output.

Related Information:
*Publishing Template Package Contents for WebHelp Responsive Customizations (on page 953)*

**Perspective**

In Oxygen XML Author Eclipse plugin, a **perspective** refers to an interface layout geared towards a
specific editing environment. Each **perspective** includes a unique set of interface objects, toolbars,
views, and features. You can change the **perspective** by selecting the respective icon in the top-right corner of Oxygen XML Author Eclipse plugin or by selecting the **perspective** from the *Window > Perspective > Open Perspective* menu.

The **perspectives** that are available in Oxygen XML Author Eclipse plugin are:

- **Editor (on page 214)** - The most commonly used **perspective** and it is used to edit XML
documents.
- **Database (on page 216)** - Used to browse and manage databases.

**Plugin**

In Oxygen XML Author Eclipse plugin, a **plugin** is a component that adds extended functionality using a
series of extension points and can be installed as an **add-on**. For more information, along with a full list
of **add-ons** that are officially supported for Oxygen XML Author Eclipse plugin, see *Oxygen XML Add-on Repositories*.

**Pretty-Print**

**Pretty-print** refers to formatting and indenting the source code in **Text** mode to make the content easier
to view and analyze. The formatting actions that are available in Oxygen XML Author Eclipse plugin
include:
• **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.

• **Format and Indent** - Available on the toolbar for the entire current document.

• **Format and Indent** - Available in the contextual menu of the **Text view** (on page 828) and applies to all the content in that view.

• **Format and Indent Files** - Available in the contextual menu of the **Project Explorer view** (on page 244) for one or more selected files.

**QName**

*QName* stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

**Quick Assist**

The **Quick Assist** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

**Quick Fix**

The **Quick Fix** support in Oxygen XML Author Eclipse plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. **Quick Fixes** are available in **Text mode** and **Author mode** and they can be presented and activated in several ways.

• When hovering over an area of text where a validation error or warning occurs, the **Quick Fix** proposals can be presented as links in a tooltip pop-up window.

• When hovering over an error or warning in **Author mode**, the **Quick Fix** proposals are presented in a small drop-down menu.

• If you place the cursor in the highlighted area where a validation error or warning occurs, a **Quick Fix** icon (💡) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.

• If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the **Quick Fix** menu by pressing **Ctrl + 1** (**Command + 1 on macOS**) on your keyboard.

**Root Map**

A **Root Map** (or main map) specifies a **DITA map** (on page 2079) that defines a hierarchical structure of submaps that are contained within the **root map**. Essentially, the **root map** defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a **key space** (on page 2080)).
In Oxygen XML Author Eclipse plugin, the **DITA Maps Manager** includes an option on its toolbar where you can easily specify the root map *(on page 1766)*, but there are also several other ways to **select or change the root map**(on page 1778).

### Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).

### Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. Subject scheme maps use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the subject scheme map where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon, radiologist, and so on). In a subject scheme map, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map *(on page 2013)*.

### Track Changes

The **Track Changes** feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view** *(on page 410)*.

For more information about this feature, see Managing Tracked Changes *(on page 389)*.

### WebHelp Output Directory

*WebHelp_OUTPUT_DIR* refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.
**Working Set**

A *Working Set* refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

**XML Catalog**

An *XML Catalog* maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an *XML Catalog* becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Author Eclipse plugin includes default global catalogs as well as default catalogs for each of the built-in *frameworks (on page 2080)*, and you can also create your own. Oxygen XML Author Eclipse plugin uses these *XML Catalogs* to resolve references for document validation and transformations. For more information, see *Working with XML Catalogs (on page 567)*.
