2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and click the Add as child or Add as sibling button to include it in the Current actions list. A Content Completion Item dialog box appears, giving you the possibility to select where to provide the selected action.
3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

Note:
In the Item name drop-down menu, <SPLIT> refers to the action of splitting the element and creating a new one, while <ENTER> refers to the action of inserting a new line.

Customizing the Content Completion Assistant Using a Configuration File (on page 2191)
Configuring Transformation Scenarios for a Framework

When distributing a framework (on page 3221) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an xsl folder inside your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR\]).

   The folder structure for the documentation framework should be:

   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
   schema
   css
   templates
   xsl
   ```

2. Create an xsl file and save it in the xsl folder. To help you get started, you can use the sample sdf.xsl file found in the sample framework customization package.

3. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type Configuration dialog box (on page 140), and choose the Transformation tab. Click the New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

   In the New scenario dialog box, fill in the following fields:
   - Fill in the Name field with the name of your transformation scenario.
   - Set the XSL URL field to path of your custom stylesheet (for example, ${framework}/xsl/mycustom.xsl).
4. Change to the **Output** tab. Configure the fields as follows:

- Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
- Select the **Open in Browser/System Application** option.

**Note:**

To set the browser or system application that will be used, open the **Preferences** dialog box (**Options > Preferences**) (*on page 124*), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- Select the **Saved file** option.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:
To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the sample framework customization package. Click the Apply Transformation Scenario(s) button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

### Configuring Validation Scenarios for a Framework

You can distribute a framework (on page 3221) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:**

If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using 'Main Files' Support (on page 418) or Modular Contextual XML Editing Using 'Main Files' Support (on page 829).

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association.
2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 140), then choose the Validation tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.
3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the + New button.
   In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.
Figure 583. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the `Browse` drop-down button to browse for a local, remote, or archived file.
- Use the `Insert Editor Variable` button to insert an editor variable (on page 323) or a custom editor variable (on page 332).
Figure 584. Insert an Editor Variable

```
${Desktop} - My Desktop
${start-dir} - Start directory of custom validator
${standard-params} - List of standard params for command line
${fn} - The current file name without extension
${currentFileURL} - The path of the currently edited file (URL)
${filePath} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${project} - Project directory (URL)
${home} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${project-name} - Project name
${env(VAR_NAME)} - Value of environment variable VAR_NAME
${system(var.name)} - Value of system variable var.name
```

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the URL of the file to validate field.

**Validation engine**

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 245), XQuery preferences page (on page 253), XML Schema preferences page (on page 238)).

- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the Validate and Check for Completeness action (on page 2943) in the DITA Maps Manager, but for a local file rather than an entire DITA map (on page 3220)).

- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the Validate and Check for Completeness action (on page 2943) in the DITA Maps Manager).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the Validate and Check for Completeness action (on page 2943) in the DITA Maps Manager).

- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option (on page 2948)).
Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 775). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 226), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

Settings

Depending on the selected validation engine, clicking the Settings button either opens the Specify Schema dialog box or the Configure validation engine dialog box.

Specify Schema Dialog Box

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 585. Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document (on page 817).

Use custom schema

Allows you to specify the schema using the following options:

• URL - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol (on page 2444). You can specify the URL by
using the text field, the history drop-down, the ✉️ Insert Editor Variables (on page 323) button, or the browsing actions in the 🗂️ Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (on page 3222) to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

- **Configure Validation Engine Dialog Box**

  This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the ✉️ Validate and Check for Completeness action (on page 2943) in the DITA Maps Manager).

---

**Note:**

The options presented in the Configure validation engine dialog box depends on type of validation engine. For example, when configuring the DITA-OT Project Validation and Completeness Check validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).
The Configure Validation Engine dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 787*).
Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view on page 2899. Clicking the Details icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 323) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 3225) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.
Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes key scopes (on page 3060) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 3060) on the second occurrence.

Report unreferenced key definitions
Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 187) (you can click the ⚙ Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**
Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the \[Insert Editor Variables (on page 323)\] button, or the browsing actions in the \[Browse\] drop-down list.

\[Move Up\]

Moves the selected validation unit up one spot in the list.

\[Move Down\]

Moves the selected validation unit down one spot in the list.

\[Add\]

Adds a new validation unit to the list.

\[Remove\]

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Click Ok.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (on page 166). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

### Customizing New Document Templates for a Framework

You can create your own custom document templates and attach them to a custom framework (on page 3221). You can then share the custom framework (on page 2288) so that all users will have access to the templates in the New document wizard (on page 368).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   **Tip:**

   You can use editor variables (on page 323) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 377) for other template customization tips (for example, you could add placeholders or hints (on page 380) to assist authors).

2. Save the new template in a directory (for example, called templates) within your custom framework directory.
Attention:
The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 379) section.

3. Open the Document Type configuration dialog box (on page 140) for that specific framework, go to the Templates tab (on page 163), and click the button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). Binding to an absolute file (e.g.: C:\some_dir\templates) makes the association difficult to share between users.
4. Click OK for all of the dialog boxes to save your changes.
5. To test the template, open the new document wizard ( toolbar button or File > New) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related Information:
Customizing Document Templates (on page 377)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 3227) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 3221) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

   Example:

   Create a new XML file called catalog.xml and save it in your custom framework directory (/OXYGEN_INSTALL_DIR\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

   ```xml
   <?xml version="1.0"?>
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <url name="http://www.oxygenxml.com/SDF/abs.xsd" url="schema/abs.xsd"/>
     <url name="http://www.oxygenxml.com/SDF/abs.xsd"
   ```
2. Add catalog files to your custom framework using the **Catalogs tab (on page 164)** from the **Document Type** configuration dialog box (on page 140).

To test the catalog settings, restart Oxygen XML Editor and try to validate a new sample document for your custom framework. There should be no errors.

**Example:**

The schema that validates the document refers the other file `abs.xsd` through an **import** element:

```xml
<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
  schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The `@schemaLocation` attribute references the `abs.xsd` file:

```xml
xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
  http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```xml
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the `abs.xsd` file located in the `schema` directory (note that the `schema` directory needs to be in the same folder as the **XML Catalog**). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

**Localizing Frameworks**

Oxygen XML Editor supports **framework (on page 3221)** localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Editor in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, follow this procedure:

1. Create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
</translation>
```
Oxygen XML Editor matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the < languagelist > tag for the corresponding framework is used.

2. The translation.xml file must be stored in a directory named i18n located in the framework folder. You also need to add a reference to the i18n directory in the Classpath list corresponding to the edited document type (on page 144).

3. After you create this file, you can use the keys defined in it to customize the name and description of the following:
   ◦ Actions
   ◦ Menu entries
   ◦ Contextual menus
   ◦ Toolbars
   ◦ Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 140), go to Author > Actions, and rename the bold action to $i18n(translation_key). Actions with a name format other than $i18n(translation_key) are not localized. Translation_key corresponds to the key from the translation.xml file.

4. Next, open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This is an example of an entry in the translation.xml file:

```
<key value="translation_key">
  <comment>Bold action name.</comment>
  <val lang="en_US">Bold</val>
  <val lang="de_DE">Bold</val>
  <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.
You can also reference a key directly in the CSS content:

```css
.title:before{
    content: "${i18n(title.key)} : ";
}
```

**Note:**
You can enter any language you want in the `<langagelist>` tag and any number of keys.

**DocBook Example:**

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type, the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

**Framework Java Extensibility Guide**

Advanced users can extend the functionality of custom frameworks and Author mode. The Oxygen SDK is also available to provide developers the ability to extend the functionality of Oxygen XML Editor.

You can add extensions (on page 3224) to your custom framework (on page 3221) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 140).

**Note:**
It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2444).

**Related Information:**
Extending Oxygen With the SDK (on page 2411)
SDK Common Use Cases (on page 2476)
Configuring an Extensions Bundle

All extensions (on page 3224) that are provided by Oxygen XML Editor are included in a single bundle.

Note:
The individual extensions can still be set (open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 3220) rules defined for the custom framework (on page 3221) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the \OXYGEN_INSTALL_DIR\lib folder.
2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   For example:
   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```
3. A Document Type ID and a short description should be defined by implementing the getDocumentTypeID and getDescription methods. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   For example:
   ```java
   public String getDocumentTypeID() {
   
   }
   ```
   ```java
   public String getDescription() {
   
   return "A custom extensions bundle used for the Simple Document" +
   "Framework document type";
   }
   ```
4. [Optional] To be notified about the activation of the custom Author Extension in relation with an open document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as ro.sync.ecss.extensions.api.AuthorListener,
ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.
The custom Author Extension state listener should be provided by implementing the createAuthorExtensionStateListener method.
For example:

```java
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of ro.sync.ecss.extensions.api.AuthorExtensionStateListener can be found in Implementing an Author Extension State Listener (on page 2245).

If Schema-Aware mode (on page 180) is active in Oxygen XML Editor, all actions that can generate invalid content will be redirected toward the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing ro.sync.ecss.extensions.api.InvalidEditException. The actions that are forwarded to this handler include typing, delete, or paste.

For more details about this handler, see Handling Schema-Aware Editing Events (on page 2283).

5. [Optional] You can customize the content completion proposals by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is ro.sync.contentcompletion.xml.SchemaManagerFilter. The filter can be applied on elements, attributes, or on their values. The createSchemaManagerFilter method is responsible for creating the content completion filter. A new SchemaManagerFilter will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration.
For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 2238) section.

6. [Optional] The Author mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the @id attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface should be returned by the createElementLocatorProvider method. Each time an element pointed by a link needs to be located, the method is invoked.
For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 2263) section.

7. **[Optional]** The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the Author editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in Author mode for both Oxygen XML Editor Eclipse plugin and standalone application. The Text mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the Author mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 2241) section.

8. **[Optional]** Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the `ref` element and the attribute indicating the referenced resource is `location`. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:

```java
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 2241) section.

9. **[Optional]** To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of
ro.sync.ecss.extensions.api.StylesFilter can be provided. The extensions bundle method responsible for creating the StylesFilter is createAuthorStylesFilter. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 2262) section for more details about the styles filter extension.

10. [Optional] To edit data in custom tabular format, implementations of the ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider and the ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are createAuthorTableCellSpanProvider and createAuthorTableColumnWidthProvider.

For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}
```

```java
public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 2254) and Configuring a Table Column Width Provider (on page 2249) sections.

If the functionality related to one of the previous extension points does not need to be modified, then the developed ro.sync.ecss.extensions.api.ExtensionsBundle should not override the corresponding method and leave the default base implementation to return null.

11. [Optional] An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the ro.sync.ecss.extensions.api.link.LinkTextResolver interface should be returned by the createLinkTextResolver method. This implementation is used each time the oxy_link-text() function (on page 2365) is encountered in the CSS styles associated with an element.

For example:
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}

12. Pack the compiled class into a JAR (on page 3222) file.
13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).
14. Add the JAR file to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select the document type (for example, SDF), click the Edit button, select the Classpath tab, and click the Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Editor frameworks folder.
15. Register the Java class by going to the Extensions tab. Click the Choose button and select the name of the class (for example, SDFExtensionsBundle).

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Adding a Custom Image Decorator for Author Mode

The AuthorImageDecorator extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an AuthorImageDecorator

To implement your own AuthorImageDecorator, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorImageDecorator interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 2232), you can return the `AuthorImageDecorator` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.

b. Specify the `AuthorImageDecorator` in the `Author image decorator` individual extension in the `Extensions tab` (on page 167) of the `Document Type` configuration dialog box (on page 140) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     *(ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     *ro.sync.exml.view.graphics.Rectangle,
     *ro.sync.ecss.extensions.api.node.AuthorNode,
     *ro.sync.ecss.extensions.api.AuthorAccess, boolean)
     */
    @Override
    public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
                      Rectangle originalSize, AuthorNode element,
                      AuthorAccess authorAccess, boolean wasAnnotated) {
        if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
            g.drawString("[Double-click to edit image]",
                        // Draw near the top-left corner
                        x + 15,
                        y + 15);
        }
    }
}
```

**Example result:** In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

**Adding Custom Persistent Highlights**

The `Author API` includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be
if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start propl="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the `AuthorPersistentHighlighter` class that is accessible through the `AuthorEditorAccess#getPersistentHighlighter()` method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

**Configuring the Automatic ID Generation and Unique Attributes Recognizer**

The `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` interface can be implemented if you want to provide for your framework (on page 3221) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 3221). The following methods can be implemented to accomplish this: `assignUniqueIDs(int startOffset, int endOffset)`, `isAutoIDGenerationActive()`

- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (on page 3218) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:**

The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework (on page 3221). You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

**Note:**

The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

**Configuring Content Completion Proposals**

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the filterAttributes method and changing the default content completion list of ro.sync.contentcompletion.xml.CIAttribute for the element provided by the current ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext context. For example, the SDFSchemaManagerFilter checks if the element from the current context is the table element and adds the frame attribute to the table list of attributes.

/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes, WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
}
The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements, WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = elementStack.peek();
            if ("header".equals(contextElement.getQName())) {
                if (elements != null) {
                    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
                        CIElement element = iterator.next();
                        // Remove the 'td' element
                        if ("td".equals(element.getQName())) {
                            elements.remove(element);
                            break;
                        }
                    }
                } else {
                    elements = new ArrayList<CIElement>();
                }
                // Insert the 'th' element in the list of content completion proposals
                CIElement thElement = new SDFElement();
                thElement.setName("th");
                elements.add(thElement);
            }
        }
    } else {
        // If the given context is null then the given list of content completion
        // elements contains global elements.
    }
    return elements;
}
```
The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the **Text** or **Author** modes.

**Interfaces for the Drag and Drop Listener**

- **ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener**
  Receives callbacks from the standalone application for Drag And Drop in **Author** mode.

- **com.oxygenxml.editor.editors.author.AuthorDnDListener**
  Receives callbacks from the Eclipse plugin for Drag And Drop in **Author** mode.

- **com.oxygenxml.editor.editors.TextDnDListener**
  Receives callbacks from the Eclipse plugin for Drag And Drop in **Text** mode.

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

To configure how dropped URLs or XHTML fragments are handled in documents, see **Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode** *(on page 2285)*.

**Related Information:**

- Customizing Smart Paste Support *(on page 2188)*

### Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the referenced resource is `location`. You need to implement a Java extension class for obtaining the referenced resources.
1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

```java
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
    implements AuthorReferenceResolver {

    public boolean hasReferences(AuthorNode node) {
        boolean hasReferences = false;
        if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
            AuthorElement element = (AuthorElement) node;
            if ("ref".equals(element.getLocalName())) {
                AttrValue attrValue = element.getAttribute("location");
                hasReferences = attrValue != null;
            }
        }
        return hasReferences;
    }
}
```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

```java
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```
4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node that needs the reference resolved, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog (on page 3227)`. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference()
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if(inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                } catch (SAXException e) {
                    logger.error(e, e);
                } catch (IOException e) {
                    logger.error(e, e);
                }

```

```java
```
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                            authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                }
            }
        }
    }
    return systemID;
}
```
In the listing below, the XML document contains the `ref` element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

**Figure 587. Reference with no specified reference resolver**

```
Reference without a reference resolver
Reference
```

When the above implementation is configured, the reference has the expected layout:

**Figure 588. Reference with reference resolver**

```
Reference with a reference resolver
Reference
  Edit referenced content
Referred paragraph
```

**Note:**

The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

## Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
```
private AuthorListener sdfAuthorDocumentListener;
private AuthorMouseListener sdfMouseListener;
private AuthorCaretListener sdfCaretListener;
private OptionListener sdfOptionListener;

When the association rules of the *framework* (on page 3221) (document type) configuration match that of a document open in the *Author* editing mode, the *activation* event received by this listener should be used to perform custom initializations and to register listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`.

```java
public void activated(AuthorAccess authorAccess) {
    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption(  
        "sdf.custom.option.key", "");  
    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

    // Add author DocumentListeners.
    sdfAuthorDocumentListener = new SDFAuthorListener();
    authorAccess.getDocumentController().addAuthorListener(  
        sdfAuthorDocumentListener);

    // Add MouseListener.
    sdfMouseListener = new SDFAuthorMouseListener();
    authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

    // Add CaretListener.
    sdfCaretListener = new SDFAuthorCaretListener();
    authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

    // Other custom initializations...
}
```

The `authorAccess` parameter received by the *activated* method can be used to gain access to specific *Author* mode actions and informations related to components such as the editor, document, workspace, tables, or the *change tracking* manager.

If options specific to the custom developed *Author Extension* need to be stored or retrieved, a reference to the `ro.sync.ecss.extensions.api.OptionsStorage` can be obtained by calling the `getOptionsStorage` method from the `authorAccess`. The same object can be used to register `ro.sync.ecss.extensions.api.OptionListener`
listeners. An option listener is registered in relation with an option key and will be notified about the value changes of that option.

An AuthorListener can be used if events related to the Author mode document modifications are of interest. The listener can be added to the ro.sync.ecss.extensions.api.AuthorDocumentController. A reference to the document controller is returned by the getDocumentController method from the authorAccess. The document controller can also be used to perform operations involving document modifications.

To provide access to the Author mode component-related functionality and information, the authorAccess has a reference to the ro.sync.ecss.extensions.api.access.AuthorEditorAccess that can be obtained when calling the getEditorAccess method. At this level, AuthorMouseListener and AuthorCaretListener can be added to provide notification of mouse and cursor events that occur in the Author editor mode.

The deactivation event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The deactivate method is typically used to unregister the listeners previously added on the activate method and to perform other actions. For example, options related to the deactivated Author Extension can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
            "sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(
            sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.
Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
table {
  display: table;
  border: 1px solid navy;
  margin: 1em;
  max-width: 1000px;
  min-width: 150px;
}

table[width] {
  width: attr(width, length);
}

tr, header {
  display: table-row;
}

header {
  background-color: silver;
  color: inherit
}

td {
  display: table-cell;
  border: 1px solid navy;
  padding: 1em;
}
```

Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Editor, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 2254).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Editor. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 2249).
The table from the example does not make use of the attributes \texttt{@colsep} and \texttt{@rowsep} (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 2258).

### Configuring a Table Column Width Provider

In a custom framework (on page 3221), the \texttt{table} element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 2248), if you use the table element attribute \texttt{width} Oxygen XML Editor can determine the table width automatically. In this example the table has \texttt{col} elements with \texttt{@width} attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class \texttt{simple.documentation.framework.TableColumnWidthProvider}. This class must implement the \texttt{ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider} interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.AuthorOperationException;
   import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
   import ro.sync.ecss.extensions.api.node.AuthorElement;

   public class TableColumnWidthProvider implements AuthorTableColumnWidthProvider {

   2. Method \texttt{init} is taking as argument an \texttt{ro.sync.ecss.extensions.api.node.AuthorElement} that represents the XML \texttt{table} element. In our case the column widths are specified in \texttt{col} elements from the \texttt{table} element. In such cases you must collect the span information by analyzing the \texttt{table} element.

   ```java
   public void init(AuthorElement tableElement) {
       this.tableElement = tableElement;
       AuthorElement[] colChildren = tableElement.getElementsByTagName("customcol");
       if (colChildren != null && colChildren.length > 0) {
           for (int i = 0; i < colChildren.length; i++) {
               AuthorElement colChild = colChildren[i];
               if (i == 0) {
                   colsStartOffset = colChild.getStartOffset();
               }
               // Determine the 'width' for this col.
               AttrValue colWidthAttribute = colChild.getAttribute("width");
               String colWidth = null;
           }
if (colWidthAttribute != null) {
    colWidth = colWidthAttribute.getValue();

    // Add WidthRepresentation objects for the columns this 'customcol'
    // specification spans over.
    colWidthSpecs.add(new WidthRepresentation(colWidth, true));
}
}
}

3. The method `isTableAcceptingWidth` should check if the table cells are a `<td>` element.

```java
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

4. The method `isTableAndColumnsResizable` should check if the table cells are a `<td>` element. This method determines if the table and its columns can be resized by dragging the edge of a column.

```java
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

5. Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return null for the tables / cells that do not have a specified width.

```java
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}
```

```java
public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
```
List<WidthRepresentation> toReturn = null;
int size = colWidthSpecs.size();
if (size >= colNumberStart && size >= colNumberStart + colSpan) {
    toReturn = new ArrayList<WidthRepresentation>(colSpan);
    for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
        // Add the column widths
        toReturn.add(colWidthSpecs.get(i));
    }
}
return toReturn;

6. Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```java
public void commitTableWidthModification(AuthorDocumentController authorDocumentController, int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);
                authorDocumentController.setAttribute("width",
                    new AttrValue(newWidth),
                    tableElement);
            } else {
                throw new AuthorOperationException("Cannot find the table element.");
            }
        }
    }
}

public void commitColumnWidthModifications(AuthorDocumentController authorDocumentController, WidthRepresentation[] colWidths, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (colWidths != null && tableElement != null) {
            if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
                authorDocumentController.delete(colsStartOffset, colsEndOffset);
            }
        }
    }
```
String xmlFragment = createXMLFragment(colWidths);

int offset = -1;
AuthorElement[] header = tableElement.getElementsByLocalName("header");
if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
}
if (offset == -1) {
    throw new AuthorOperationException("No valid offset to insert column width");
}
authorDocumentController.insertXMLFragment(xmlFragment, offset);
}
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol" +
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=" +
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=" +
    }  
    fragment.append("/>");
    return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

In the listing below, the XML document contains the table element:

```xml
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
    <customcol width="20%"/>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td cs=1, rs=1</td>
        <td cs=1, rs=1</td>
        <td row_span="2" cs=1, rs=2</td>
        <td row_span="3" cs=1, rs=3</td>
    </tr>
    <tr>
        <td cs=1, rs=1</td>
        <td cs=1, rs=1</td>
    </tr>
    <tr>
        <td column_span="3" cs=3, rs=1</td>
        </td>
                    </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:
When the above implementation is configured, the table has the correct layout:

**Figure 589. Table layout when no column width provider is specified**

<table>
<thead>
<tr>
<th></th>
<th>C1</th>
<th>C2</th>
<th>C3</th>
<th>C4</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td>cs=1, rs=2</td>
<td>cs=1, rs=3</td>
</tr>
<tr>
<td></td>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>cs=3, rs=1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

### Configuring a Table Cell Span Provider

In a custom framework (on page 3221), the `<table>` element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 2248), you need to indicate Oxygen XML Editor a method to determine the cell spanning. If you use the `@rowspan` and `@colspan` attributes, Oxygen XML Editor can determine the cell spanning automatically. In the following example, the `<td>` element uses the `@row_span` and `@column_span` attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.
1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public classTableCellSpanProvider
    implements AuthorTableCellSpanProvider {

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `<table>` element. In such cases, you must collect the span information by analyzing the `<table>` element.

```java
    public void init(AuthorElement table) {
```

3. The `getColumnSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return null for all the cells that do not change the span specification.

```java
    public Integer getColumnSpan(AuthorElement cell) {
        Integer colSpan = null;
        AttrValue attrValue = cell.getAttribute("column_span");
        if(attrValue != null) {
            // The attribute was found.
            String cs = attrValue.getValue();
            if(cs != null) {
                try {
                    colSpan = new Integer(cs);
                } catch (NumberFormatException ex) {
                    // The attribute value was not a number.
                }
            }
        }
        return colSpan;
    }
```

4. The row span is determined in a similar manner:

```java
    public Integer getRowSpan(AuthorElement cell) {
        Integer rowSpan = null;
```
AttrValue attrValue = cell.getAttribute("row_span");
if (attrValue != null) {
    // The attribute was found.
    String rs = attrValue.getValue();
    if (rs != null) {
        try {
            rowSpan = new Integer(rs);
        } catch (NumberFormatException ex) {
            // The attribute value was not a number.
        }
    }
}
return rowSpan;

5. The method hasColumnSpecifications always returns true considering column specifications always available.

    public boolean hasColumnSpecifications(AuthorElement tableElement) {
        return true;
    }

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

6. In the listing below, the XML document contains the table element:

    <table>
        <header>
            <td>C1</td>
            <td>C2</td>
            <td>C3</td>
            <td>C4</td>
        </header>
        <tr>
            <td>cs=1, rs=1</td>
            <td column_span="2" row_span="2">cs=2, rs=2</td>
            <td row_span="3">cs=1, rs=3</td>
        </tr>
        <tr>
            <td>cs=1, rs=1</td>
        </tr>
    </table>
When no table cell span provider is specified, the table has the following layout:

**Figure 591. Table layout when no cell span provider is specified**

When the above implementation is configured, the table has the correct layout:
Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 3221), the `<table>` element has separators between rows. As explained in Configuring Tables (on page 2248), you need to indicate a method to determine the way rows and columns are separated. If you use the `@rowsep` and `@colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider {
```

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `<table>` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table
model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

```java
public void init(AuthorElement table) {
}
```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}
```

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

5. In the example below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>H1</td>
        <td>H2</td>
        <td>H3</td>
        <td>H4</td>
    </header>
    <tr>
        <td>C11</td>
    </tr>
</table>
```
When the borders for the `<td>` element are removed from the CSS, the row separators become visible:

![Figure 593. Row separators provided by the Java implementation.](image)

<table>
<thead>
<tr>
<th>H1</th>
<th>H2</th>
<th>H3</th>
<th>H4</th>
</tr>
</thead>
<tbody>
<tr>
<td>C11</td>
<td>C12</td>
<td>C13</td>
<td>C14</td>
</tr>
<tr>
<td>C21</td>
<td>C22</td>
<td>C23</td>
<td>C24</td>
</tr>
<tr>
<td>C31</td>
<td>C32</td>
<td>C33</td>
<td>C34</td>
</tr>
</tbody>
</table>

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

### Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you customize the attribute value editing mechanisms in Oxygen XML Editor. It changes the **Browse** button found in the attribute editors to an **Edit** button. When a user clicks that **Edit** button, your custom attribute value editor will be presented.
The Edit button can be accessed in the following attribute editors:

- The Attributes view in Author mode (on page 627) (when the Expand button is used to reveal an expanded panel).
- The Attributes view in Text mode (on page 542) (when the Expand button is used to reveal an expanded panel).
- The In-place Attributes Editor (on page 630) when invoked in Author mode.
- The In-place Attributes Editor invoked in the Outline view (on page 539).

How to Implement a CustomAttributeValueEditor

To implement your own CustomAttributeValueEditor, follow this procedure:

1. Extend the ro.sync.ecss.extensions.api.CustomAttributeValueEditor abstract class.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2232), you can return the CustomAttributeValueEditor implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor() method.
   b. Specify the CustomAttributeValueEditor in the Author custom attribute value editor individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.

Example

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
     *      (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
     */
```
```java
@override
public String getAttributeValue(EditedAttribute attribute, Object parentComponent) throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog
        ("Set a new value for " + attribute.getAttributeQName() + ":");
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
 * (ro.sync.ecss.extensions.api.EditedAttribute)
 */
@override
public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
}
}
```

**Example result:** If a user were to click the **Edit** button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

![Dialog box](image)

**Customizing the CSS Styles Filter**

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the **Author** mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `<table>` element:

```java
package simple.documentation.framework;
```
Customizing Elements that Wrap Profiled Content

For each framework (on page 3221) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 2264) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.
Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.

Note:
The complete source code of the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, ro.sync.ecss.extensions.commons.IDElementLocator or ro.sync.ecss.extensions.commons.XPointerElementLocator can be found in the oxygen-sample-framework project.

Default Link Target Reference Finder

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (on page 2265).
- XPointer element() scheme (on page 2266).

The method getElementLocator determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null IDTypeVerifier will always be provided if a schema is associated with the document type.

The link string argument is the anchor (on page 3218) part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier,
                                        String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDEElementLocator(idVerifier, link);
        }
    }
```
catch (ElementLocatorException e) {
    logger.warn("Exception when create element locator for link: "+ link + ". Cause: "+ e, e);
}

return elementLocator;
}

ID Element Locator

The IDElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.

The constructor only assigns field values and the method endElement is empty for this implementation.

The method startElement checks each of the element’s attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is xml:id.
- The attribute type is ID.

The attribute type is checked with the help of the method IDTypeVerifier.hasIDType.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                    ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }

    return elementFound;
}
```
XPointer Element Locator

*XPointerElementLocator* is an implementation of the abstract class *ro.sync.ecss.extensions.api.link.ElementLocator* for links that have one of the following XPointer element() scheme patterns:

**element** (*elementID*)

Locate the element with the specified ID.

**element** (/1/2/3)

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

**element** (*elementID/3/4*)

A child sequence appearing after a *NCName* identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
    throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, ",", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }

        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            } catch (NumberFormatException e) {
                invalidFormat = true;
            }
        }
    }
```
The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

- `uri`  
  The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- `localName`  
  Local name of the element.

- `qName`  
  Qualified name of the element.

- `atts`  
  Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current
element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName,
                           String name, Attr[] atts) {
    boolean linkLocated = false;

    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startIndexWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if (xpointerElement.equals(atts[i].getValue())){
                if(idVerifier.hasIDType(
                        localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }

        if (xpointerPathDepth == startElementDepth){
            // check if xpointer path matches with the current element path
            linkLocated = true;
            try {
                int xpointerIdx = xpointerPath.length - 1;
                int stackIdx = currentElementIndexStack.size() - 1;
                int stopIdx = startIndexWithElementID ? 1 : 0;
                while (xpointerIdx >= stopIdx && stackIdx >= 0) {
```
int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
int currentElementIndex =
((Integer)currentElementIndexStack.get(stackIdx)).intValue();
if(xpointerIndex != currentElementIndex) {
    linkLocated = false;
    break;
}
xpointerIdx--;
stackIdx--;
}
} catch (NumberFormatException e) {
    logger.warn(e,e);
}
return linkLocated;

The method endElement will be invoked at the end of every element in the XML document (even when the element is empty).

The XPointerElementLocator implementation of the endElement updates the depth of the current element path and the index of the element in its parent.

public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (on page 539) in Author mode, breadcrumb navigation bar (on page 602) in Author mode, Outline view (on page 539) in Text mode, Content Completion Assistant (on page 3219) window, or DITA Maps Manager view (on page 2899).

Note:
There are two methods to provide an implementation of `ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer`:

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the Document type configuration dialog box (on page 140) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration dialog box (on page 140) (XML node renderer customizer field in the Individual extensions section of the Extensions tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the `XMLNodeRendererCustomizer` should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 724).

For example, for the `<title>` element, if the `XMLNodeRendererCustomizer` returns the path `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file (`myImg@2x.png`) should be added to the same images directory (`${framework}/images/myImg@2x.png`). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (on page 724) section.

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Related Information:
Customizing the Rendering of Elements (on page 2207)
Using Retina/HiDPI Icons for the Actions from a Framework (on page 2181)

Customizing Author Operations

Oxygen XML Editor Author mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (on page 2152)) and the execution of XPath expressions on the current document edited in Author mode. However, there are situations where you need to extend this set. The following examples are just a few of the possible situations:
• You need to enter an element whose attributes will be edited by the user through a graphical user interface.
• The user must send selected element content (or the whole document) to a+ server for some kind of processing.
• Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
• You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor **Author** mode functionality through Java, you will need the **Oxygen SDK** available on the Oxygen XML Editor website. It includes the source code of the **Author** mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for **Author** mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠ **Attention:**
Make sure the Java classes of your custom **Author** mode operations are compiled with the same Java version used by Oxygen XML Editor. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor with a Java 1.8 virtual machine but the Java classes of your custom **Author** mode operations are compiled with a Java 9 or later virtual machine then the custom operations cannot be loaded and used by the Java 1.8 virtual machine.

⚠ **Important:**
From a legal standpoint, you can freely develop and share extensions using the **Oxygen SDK** ONLY if you have a legal, active license to use Oxygen XML Editor and ONLY if such extensions are used from inside Oxygen XML Editor. To use such extensions outside of Oxygen XML Editor (for example, a 3rd-party application that has Oxygen XML Editor built in to it), an additional license must be purchased to use the SDK according to the **Oxygen XML SDK Licensing Policy**.

**Related Information:**
https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html
Extending Oxygen With the SDK (on page 2411)

**Example 1 - Simple Use of a Dialog Box from an Author Mode Operation**

In this example, functionality is added for inserting images in a custom framework (on page 3221). The images are represented by the `<image>` element. The location of the image file is represented by the value of the `@href` attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.
1. Set up a sample project following this set of instructions. The framework project is `oxygen-sample-framework`.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.
- The `getArguments` method is used by Oxygen XML Editor when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The `getDescription` method is used by Oxygen XML Editor when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**<n*/
 /* Performs the operation. */
/**<*/

public void doOperation(
  AuthorAccess authorAccess,
  ArgumentsMap arguments)
  throws IllegalArgumentException,
      AuthorOperationException {

  JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();

  String href = displayURLDialog(oxygenFrame);
  if (href.length() != 0) {
    // Creates the image XML fragment.
    String imageFragment =
      "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + "/">";

    // Inserts this fragment at the cursor position.
    int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
    authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
  }
```
```java
/**
 * Has no arguments.
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}
```

---

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

---

**Important:**
Make sure you always specify the namespace of the inserted fragments.

```xml
<image xmlns='http://www.oxygenxml.com/sample/documentation'
       href='path/to/image.png'/>
```

3. Package the compiled class into a JAR file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
        <jar destfile="sdf.jar" basedir="classes">
            <fileset dir="classes">
                <include name="**/*"/>
            </fileset>
        </jar>
    </target>
</project>
```
4. Copy the `sdf.jar` file into your custom `framework` directory
   (`{OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

5. Add the `sdf.jar` to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select SDF, and click the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 140) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory (`{OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

8. Define the action's properties:
   - Set ID to `insert_image`.
   - Set Name to Insert image.
   - Set Menu access key to letter `i`.
   - Set Toolbar action to `${framework}/toolbarImage.png`.
   - Set Menu icon to `${framework}/menuImage.png`.
   - Set Shortcut key to Ctrl (Meta on macOS)+Shift+i.

9. Next, set up the operation. You want to add images only if the current element is a `<section>`, `<book>` or `<article>`.
   - Set the value of XPath expression to
     ```
     local-name()='section' or local-name()='book'
     or local-name()='article'
     ```
   - Set the Invoke operation field to `simple.documentation.framework.InsertImageOperation`.
Figure 594. Selecting the Operation

10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

**Example 2 - Operations with Arguments - Report from Database Operation**

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Set up a sample project following this set of instructions. The *framework* project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface.
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation {

3. Now define the operation's arguments. For each of them, you will use a String constant representing the argument name:

private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";

4. You must describe the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] { 
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
            ARG_CONNECTION,
            ArgumentDescriptor.TYPE_STRING,
            "The database URL connection string."),
        new ArgumentDescriptor(
            ARG_USER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the database user."),
        new ArgumentDescriptor(
            ARG_PASSWORD,
            ArgumentDescriptor.TYPE_STRING,
            "The database password."),
        new ArgumentDescriptor(
            ARG_SQL,
            ArgumentDescriptor.TYPE_STRING,
            "The SQL statement to be executed.")
    };
}
These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the `doOperation` method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {

    // Collects the arguments.
    String jdbcDriver =
        (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection =
        (String)map.getArgumentValue(ARG_CONNECTION);
    String user =
        (String)map.getArgumentValue(ARG_USER);
    String password =
        (String)map.getArgumentValue(ARG_PASSWORD);
    String sql =
        (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();

    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql),
            caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: " + e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load ' " + jdbcDriver + "', e);"
    }
}
```

6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is
escaped. This means that the ‘<’ and ‘&’ characters are replaced with the ‘&lt;’ and ‘&amp;’ character entities to ensure that the fragment is well-formed.

```java
private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql) throws SQLException,
       ClassNotFoundException {
    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);
    pr.put("password", password);

    // Loads the database driver.
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection =
        DriverManager.getConnection(connectionURL, pr);
    java.sql.Statement statement =
        connection.createStatement();
    ResultSet resultSet =
        statement.executeQuery(sql);

    StringBuffer fragmentBuffer = new StringBuffer();
    fragmentBuffer.append(
        "<table xmlns=" +
        "'http://www.oxygenxml.com/sample/documentation'>");

    //
    // Creates the table header.
    //
    fragmentBuffer.append("<header>");
    ResultSetMetaData metaData = resultSet.getMetaData();
    int columnCount = metaData.getColumnCount();
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    }
```
fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

7. Package the compiled class into a JAR (on page 3222) file.
8. Copy the JAR file and the JDBC driver files into your custom framework directory
   (/OXYGEN_INSTALL_DIR/frameworks/[CUSTOM_FRAMEWORK_DIR]).
9. Add the JARS to the class path. To do this, open the Document Type Association preferences page
    (on page 138), select SDF and click the Edit button. Select the Classpath tab in the lower part of the
    Document Type configuration dialog box (on page 140) and click the Add button. In the displayed
    dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor frameworks folder.
10. Go to the Actions subtab. The action properties are:
   ◦ Set ID to clients_report.
   ◦ Set Name to Clients Report.
1. Set **Menu access key** to letter r.
2. Set **Description** to **Connects to the database and collects the list of clients.**
3. Set **Toolbar icon** to \$\{framework\}/TableDB20.png (the TableDB20.png icon is stored in the frameworks/sdf folder).
4. Leave empty the **Menu icon**.
5. Set **shortcut key** to **Ctrl + Shift + C (Command + Shift + C on macOS)**.

11. The action will work only if the current element is a **section**. Set up the operation as follows:

   - Set **XPath expression** to:
     \[
     \text{local-name()}='section'
     \]
   - Use the Java operation defined earlier to set the **Invoke operation** field. Click the **Choose** button, then select **simple.documentation.framework.QueryDatabaseOperation**. Once selected, the list of arguments is displayed. In the figure below the first argument, \textit{jdbc\_driver}, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: \texttt{jdbc://<database\_host>:<database\_port>/<database\_name>}.

   The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:
   
   ```
   SELECT userID, email FROM users
   ```

12. Add the action to the toolbar, using the **Toolbar** panel.

**Figure 595. Java Operation Arguments Setup**

![Java Operation Arguments Setup](image)

To test the action, open or create an XML file and place the cursor at a valid location. Then click the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.
Handling Author Mode Action Events

The AuthorActionEventHandler extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press Enter instead of it opening the Content Completion Assistant (on page 3219).

How to Implement an AuthorActionEventHandler

To implement your own AuthorActionEventHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorActionEventHandler interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2232), you can return the AuthorActionEventHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler() method.
   b. Specify the AuthorActionEventHandler in the Author action event handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses Enter in Author mode. It uses the canHandleEvent method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the handleEvent method inserts the new line at the current cursor position.
```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     * (AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }
        }

        return canHandle;
    }

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
     * (ro.sync.ecss.extensions.api.AuthorAccess,
     * ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
     */
    @Override
    public boolean handleEvent(AuthorAccess authorAccess,
```
AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, "\n");
    return true;
}

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
}

Handling Schema-Aware Editing Events

The AuthorSchemaAwareEditingHandlerAdapter extension point allows you to handle certain Author mode actions in various ways. For example, implementing the AuthorSchemaAwareEditingHandlerAdapter makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor when pasting content (through the use of some specific methods (on page 2284)).

How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema-Aware Editing option (on page 181) must be set to On or Custom in the Schema-Aware preferences page (on page 180). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Editor to use this newly created implementation, configure an extensions bundle (on page 2232) and return the AuthorSchemaAwareEditingHandlerAdapter implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter() method.

Example

Typing events can be handled using the handleTyping method. For example, the AuthorSchemaAwareEditingHandler checks if the schema is not a learned one, was loaded successfully, and if
the Smart paste and drag and drop option (on page 181) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter
    extends AuthorSchemaAwareEditingHandler {

    /**
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
    throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager =
            authorAccess.getDocumentController().getAuthorSchemaManager();
        if (!authorSchemaManager.isLearnSchema() &&
            !authorSchemaManager.hasLoadingErrors() &&
            authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment =
                    authorAccess.getDocumentController().createNewDocumentTextFragment
                    (String.valueOf(ch));
                handleTyping = handleInsertionEvent
                    (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
            } catch (AuthorOperationException e) {
                throw new InvalidEditException
                    (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
            }
        }
        return handleTyping;
    }

    Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in Author mode, if the result causes the document to become invalid, Oxygen XML Editor will propose solutions to make it valid. As a possible solution, Oxygen XML Editor might surround the pasted content in a sequence of ancestor elements. This
getAncestorDetectionOptions method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor. For example, when pasting an element inside an empty element with the same name, this canBeReplaced method allows Oxygen XML Editor to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

AuthorDocumentFragment Class

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The AuthorExternalObjectInsertionHandler extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own AuthorExternalObjectInsertionHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the AuthorExternalObjectInsertionHandler in the Author extern object Insertion handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.
   b. Otherwise, you can configure an extensions bundle (on page 2232), then return the AuthorExternalObjectInsertionHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler() method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:
   ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)
   and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 144) in the Document Type configuration dialog box (on page 140) for your particular document type.
Example

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler()
{
    return new DITAExternalObjectInsertionHandler();
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess)
{
    return "xhtml2ditaDriver.xsl";
}
```

Tip:
For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 2188).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 2232), you can return the EditPropertiesHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler() method.

b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Sample implementation that handles properties for a table element.";
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties(ro.sync.ecss.extensions.api.node.AuthorNode)
     */
    @Override
    public boolean canEditProperties(AuthorNode authorNode) {
        // If this node is an image element we can edit its properties.
        return "image".equals(authorNode.getDisplayName());
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties(ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorAccess)
     */
    @Override
    public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
        // If we receive this call then it surely an image.
        AuthorElement imageElement = (AuthorElement) authorNode;
        String currentValue = "";
        AttrValue altValue = imageElement.getAttribute("alt");
    }
}
```
```java
if (altValue != null) {
    currentValue = altValue.getValue();
}
String newValue = JOptionPane.showInputDialog((Component) authorAccess.getWorkspaceAccess().getParentFrame(),
                                          "Alternate text",
                                          currentValue);
if (newValue != null) {
    authorAccess.getDocumentController().setAttribute("alt", new AttrValue(newValue), imageElement);
}
}

Example result: If a user were to double-click an `<image>` tag icon (image) in Author mode, the following dialog box would be displayed that allows the user to edit the alternate text property for the image:

![Example dialog box](image)

### Sharing a Framework

You can create a custom framework by extending a built-in document type (on page 2133) (such as DITA or DocBook) using the Document Type Association preferences page (on page 138), make modifications to it, and then share the extension with your team.

### Sharing the Extended Framework

There are several ways that you can share the extended custom framework (on page 2133) with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project view (on page 402) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 2133), if you have not already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
4. Go to **Options > Preferences > Document Type Association > Locations** *(on page 139)* and select **Project Options** *(on page 3224)* at the bottom of the page.

5. In the **Additional frameworks directories** list, add an entry using the `$pd` editor variable *(on page 331)* like this: `$pd/custom_frameworks`.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their **Project view** *(on page 402)*, the new framework becomes available in the list of document types.

   • **Pack and deploy the extended framework as an add-on** *(on page 2289)*.
   
   • **Distribute the directory of the extended framework** *(on page 2133)* to the other members of your team. They will simply copy that directory to their `/frameworks` directory. The new framework will be available in their list of document types when Oxygen XML Editor starts.

To test the extended framework, the other members of your team can check the list of document types in the **Document Type Association** preferences page *(on page 138)* to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

### Packing and Deploying Frameworks as Add-ons

In Oxygen XML Editor, custom framework *(on page 3221)* can be packed and deployed as an **add-on**.

#### Packing a Framework as an Add-on

This procedure is suitable for developers who want a better control over the **add-on** *(on page 3224)* package or those who want to automate some of the steps:

1. Pack the full custom framework *(on page 2133)* (or an extension of a framework) as a ZIP file or a **Java Archive** *(on page 3222)*. Note that you should pack the entire root directory not just its contents.

2. **[Optional]** If you created a **Java Archive** at the previous step, digitally sign the package. You will need a certificate signed by a trusted authority. To sign the JAR, you can either use the `jarsigner` command-line tool inside Oracle's Java Development Kit (`[JDK_DIR]/bin/jarsigner.exe`) or if you are working with **Apache Ant** *(on page 3218)*, you can use the `signjar` task (a front for the `jarsigner` command-line tool). The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate, you can generate one yourself using the `keytool` command-line utility.

   **Note:**
   
   This approach is recommended for tests since anyone can create a self-signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Editor provides by going to **File > New** and selecting the **Oxygen add-ons update site** template. The products the add-on is compatible with can be specified in the template. Once deployed, this descriptor file is referenced as **update site**.
Alternate Packing Method: Add-ons Packager

Alternatively, you can use the Add-ons Packager plugin by following this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml in the Show add-ons from field.
3. Select the Add-ons Packager add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

   Result: If the add-on is correctly installed, the Add-ons packager toolbar action is available.

6. Invoke the Add-ons packager toolbar action and input the required information in the displayed dialog box.
7. Click OK to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the ZIP or Java Archive (on page 3222) file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.

Basic Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a framework (on page 3221). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip:
A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.
XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor detects the schema, see *Associating a Schema to XML Documents* (on page 816).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
    </xs:element>
</xs:schema>
```
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a `table-row` style. Similarly, the `row` elements must contain elements with a `table-cell` style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

```xml
<xs:sequence maxOccurs="unbounded">
  <xs:element name="entry">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="test_name" type="xs:string"/>
        <xs:element name="passed" type="xs:boolean"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:schema>
```
title

The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

title {  
display:block;  
font-size:2em;  
}

description

Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it standout.

description {  
display:block;  
background-color:#EEEEFF;  
color:black;  
}

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

line {  
display:block;  
}

important

Defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

important {  
display:inline;  
font-weight:bold;  
}

results

Displays the list of test_names and the results for each one. To make it easier to read, it is displayed as a table, with a green border and margins.

results{  
display:table;  
}
The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```css
entry {
    display: table-row;
}
```

test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
    display: table-cell;
    border: 1px solid green;
    padding: 20px;
}
passed{
    font-weight: bold;
}
```

The full content of the CSS file `test_report.css` is:

```css
report {
    display: block;
    margin: 1em;
}
description {
    display: block;
    background-color: #EEEEFF;
    color: black;
}
line {
    display: block;
}
```
```css
:important {
  display:inline;
  font-weight:bold;
}

title {
  display:block;
  font-size:2em;
}

results{
  display:table;
  margin:2em;
  border:1px solid green;
}

entry {
  display:table-row;
}

test_name, passed{
  display:table-cell;
  border:1px solid green;
  padding:20px;
}

passed{
  font-weight:bold;
}
```
XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran. Each test suite is ran at 20:00h each day.
    Please <important>check</important> the failed ones!</line>
  </description>
  <entry>
    Database connection test  true
    XSLT Transformation test  true
    DTD validation test  false
  </entry>
</report>
```
The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    <description>......
```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (framework (on page 3221)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action.

Step 1: Organize Framework Files

First, create a new folder for your customized framework (on page 3221). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```

The `frameworks` directory is the container where all the Oxygen XML Editor framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a `framework` directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the `frameworks` directory of the newly installed application and start Oxygen XML Editor by running the provided start-up script files.

You should copy the created schema files `abs.xsd` and `sdf.xsd`, `sdf.xsd` being the main schema, to the `schema` directory and the CSS file `sdf.css` to the `css` directory.

**Step 2: Extend an Existing Framework**

The easiest way to create a custom framework (on page 3221) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Locations (on page 139). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page (on page 138) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 140) where you can define the set of rules and settings for your custom framework.

3. Give the extension an appropriate name, select External for the Storage option, click the browsing button ( ) to specify the location of your custom framework directory.

4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

**Step 3: Create a Custom XML Schema**

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 3221), suppose the documents are either articles or books, and composed of sections. The sections may contain
<title>, <para>, <figure>, <table>, and other <section> elements. To complete the picture, each section includes a <def> element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"

targetNamespace="http://www.oxygenxml.com/sample/documentation"
xmlns:doc="http://www.oxygenxml.com/sample/documentation"
xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
elementFormDefault="qualified">

<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
schemaLocation="abs.xsd"/>

Next, the structure of the sections is defined. They all start with a <title>, then have the optional <def> element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
  <xs:sequence>
    <xs:element name="title" type="xs:string"/>
    <xs:element ref="abs:def" minOccurs="0"/>
    <xs:choice>
      <xs:sequence>
        <xs:element ref="doc:section" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:choice maxOccurs="unbounded">
        <xs:element ref="doc:para"/>
        <xs:element ref="doc:image"/>
        <xs:element ref="doc:table"/>
      </xs:choice>
    </xs:choice>
  </xs:sequence>
</xs:complexType>"
The paragraph contains text and other custom styling markup, such as bold (\textbf{}) and italic (\textit{}) elements.

```xml
<xs:element name="para" type="doc:paragraphType"/>
<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="emphasis"/>
    <xs:element name="i"/>
  </xs:choice>
</xs:complexType>
```

The \texttt{image} element has an attribute with a reference to the file containing image data.

```xml
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The \texttt{table} element contains a header row and then a sequence of rows (\texttt{tr} elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```xml
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
      <xs:element name="tr" maxOccurs="unbounded">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" type="doc:tdType" maxOccurs="unbounded"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
  <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

### Step 4: Associate the Schema to the Framework

In the bottom section of the Document Type configuration dialog box (on page 140), there are a series of tabs. The Schema tab refers to the schema that is used for validation of the documents that match the defined association rules.

**Important:**

If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this Schema tab is not used for validation or content completion.

**Schema Type**

Select from the combo box the value XML Schema.

**Schema URI**

Enter the value of the schema location (for example, `${framework}/schema/sdf.xsd`). Use the `$(frameworks)` editor variable (on page 330) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor installations.

**Important:**

The `$(frameworks)` variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 3221).
Step 5: Create a Custom CSS

If you read the Framework Customization Overview (on page 2290) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

Important:

Having block display children in an inline display parent results in Oxygen XML Editor changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```
title{
    font-size: 2.4em;
    font-weight:bold;
}

* * title{
```
It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo-elements will be used, plus the CSS counters.

First declare a counter named \texttt{sect} for each \texttt{book} or \texttt{article}. The counter is set to zero at the beginning of each such element:

\begin{verbatim}
book,
article{
    counter-reset: sect;
}
\end{verbatim}

The \texttt{sect} counter is incremented with each \texttt{section}, that is a direct child of a \texttt{book} or an \texttt{article} element.

\begin{verbatim}
book > section,
article > section{
    counter-increment: sect;
}
\end{verbatim}

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the \texttt{sect} counter and a dot.

\begin{verbatim}
book > section > title:before,
article > section > title:before{
    content: "Section ", counter(sect), ". ";
}
\end{verbatim}

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

\begin{verbatim}
section{
    margin-left: 1em;
    margin-top: 1em;
}
\end{verbatim}
In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoid" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

**Styling Inline Elements**

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```css
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

**Styling Images**

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor.

```css
image{
    display: block;
}
```
The `image` element has the required `@href` attribute of type `xs:anyURI`. The `@href` attribute contains an image location so the rendered content is obtained by using the function:
```
attr(href, url)
```
The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor handles both absolute and relative specified URLs. If the image has an *absolute* URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is *relative* specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:
```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```
and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:
```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```
The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the *Author* mode:
```
imagedata[entityref]{
    content: url(unparsed-entity-uri(attr(entityref)));
}
```
To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:
```
imagedata[width]{
    width:attr(width, length);
}
```
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file (on page 146).

Step 7: Testing the Framework Customization

To test the new framework (on page 3221) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Editor will detect its associated document type and use the specified schema.

```
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be as error.
Invalid content was found starting with element 'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}' is expected.

Undo the tag name change, go to Author mode, and Oxygen XML Editor should load the CSS from the document type association (on page 3220) and create a layout similar to this:

Figure 600. Example: Testing a Framework Customization

CSS Support in Author Mode

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language. Also, Oxygen XML Editor has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 2133).

Resources

To see a visual demonstration of various advanced customization possibilities (including ideas for tailoring the editing experience using CSS), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

Associating a CSS with an XML Document

Associating a Stylesheet with an XML Document

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:
• Insert the `xml-stylesheet` processing instruction with the `@type` attribute at the beginning of the XML document. The easiest way to do this is by using the `Associate XSLT/CSS Stylesheet` action that is available on the toolbar or in the Document > XML Document menu.

CSS example:
```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:
```
<?xml-stylesheet type="text/css" href="test.less"?>
```

• Add a new CSS or LESS file to a framework (on page 3221) (document type). To do so, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Click the `New` button to add a new CSS or LESS file.

Note:
The built-in frameworks are read-only, so you need to Extend (on page 138) or Duplicate (on page 138) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 601. Document with no CSS association default rendering

For information about associating a CSS to a framework (document type), see Configuring and Managing Multiple CSS Styles for a Framework (on page 2145).
Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog URI mappings to determine an indirect CSS referenced location.

Example: CSS Import

For example, if you have a CSS import, such as:

```css
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog file that maps the location to a custom CSS in the XML Catalog preferences page:

```xml
<uri name="http://host/path/to/location/custom.css"
     uri="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
     uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual Author editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables in CSS imports. When editing an XML document with an associated CSS in Author mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```css
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework folder where the custom.css is placed. In the Document Type Association preferences page, you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the framework() function.

Note:

If you use editor variables like ${cfdu} (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.
Displaying Processing Instructions from Other XML Editors

By default, some external processing instructions are hidden (for example, certain processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS (on page 2307) like this:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end]
{
    display:block !important;
}
```

Specifying Media Types in the CSS

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.). You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor Author mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

**Example: oxygen Media Type**

```css
b{
    font-weight:bold;
    display:inline;
}

@media oxygen{
    b{
        text-decoration:underline;
    }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Editor Author mode.

You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor in Windows, and another set of style rules for macOS. The supported properties are as follows:
- **os** - The possible values are: `win`, `linux`, or `mac`.
- **platform** - The possible values are: `standalone`, `eclipse`, or `webapp`.

### Example: os and platform Properties

```css
@media oxygen AND (os: "win") AND (platform: "standalone") {
    p{
        content: "PPP";
    }
}
```

### Related information

- [@media Rule (on page 231)]

### CSS At-Rules

Oxygen XML Editor supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Editor.

#### @font-face At-Rule

Oxygen XML Editor allows you to use custom fonts in the Author mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.

### Example: @font-face Rule

```css
@font-face{
    font-family: "Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
}
```

### @media Rule

The `@media` rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.).

### Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
• **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode. For more information, see [Specifying Media Types in the CSS](on page 2310).

• **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode when a dark theme is used (for example, *Graphite*).

• **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode on a Windows High Contrast Theme with a black background.

• **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode on a Windows High Contrast Theme with a white background.

**Example: @media Rule**

```css
@media oxygen {
  b {
    text-decoration: underline;
  }
}

@media oxygen-high-contrast-white {
  b {
    font-weight: bold;
  }
}
```

**Supported Properties**

Oxygen XML Editor also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

• **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.

• **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```css
@media (min-width: 500px) {
  p {
    content: 'XXX';
  }
}

@media (max-width: 700px) {
  p:after {
    content: 'yyy';
  }
}
```
Standard W3C CSS Supported Features

Oxygen XML Editor supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties.

Supported CSS Selectors

Tip:
CSS rules that match attributes are always more specific than element selectors. For more information, see https://drafts.csswg.org/selectors-3/#specificity.

The following table lists the CSS selectors that are supported in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any E element (i.e. an element with the local name E)</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a descendant of an E element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a child of an element E.</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type E if it is in (human) language c (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any F element immediately preceded by a sibling element E.</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any F element preceded by a sibling element E.</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[lang=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;lang&quot; attribute has a hyphen-separated list of values beginning (from the left) with &quot;en&quot;.</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo-elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element E when E is the first child of its parent.</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An E element that does not match simple selector s.</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For more information, see ':has Relational Pseudo-Class (on page 2319)'</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements that will have the</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>:focus</td>
<td>:focus pseudo-class</td>
<td></td>
<td>:focus pseudo-class applied. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E:marker</td>
<td>The marker pseudo-class</td>
<td>CSS Level 4</td>
<td>The ::marker pseudo-element represents the automatically generated marker box of a list item.</td>
</tr>
<tr>
<td>E#myid</td>
<td>The ID selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with ID equal to &quot;myid&quot;.</td>
</tr>
<tr>
<td>! Important: Limitation: In Oxygen XML Editor the match is performed only taking into account the attributes with the exact name: &quot;id&quot;.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>E[att^=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value begins exactly with the string val.</td>
</tr>
<tr>
<td>E[att$=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value ends exactly with the string val.</td>
</tr>
<tr>
<td>E[att*=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value contains the substring val.</td>
</tr>
<tr>
<td>E:root</td>
<td>Root pseudo-class</td>
<td>CSS Level 3</td>
<td>Matches the root element of the document. In HTML, the root element is always the HTML element.</td>
</tr>
<tr>
<td>E:empty</td>
<td>Empty pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element that has no text or child elements.</td>
</tr>
<tr>
<td>E:nth-child(n)</td>
<td>The nth-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent.</td>
</tr>
<tr>
<td>E:nth-last-child(n)</td>
<td>The nth-last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent, counting from the last one.</td>
</tr>
<tr>
<td>E:nth-of-type(n)</td>
<td>The nth-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type.</td>
</tr>
<tr>
<td>E:nth-last-of-type(n)</td>
<td>The nth-last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type, counting from the last one.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E:last-child</td>
<td>The last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last child of its parent.</td>
</tr>
<tr>
<td>E:first-of-type</td>
<td>The first-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, first sibling of its type.</td>
</tr>
<tr>
<td>E:last-of-type</td>
<td>The last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last sibling of its type.</td>
</tr>
<tr>
<td>E:only-child</td>
<td>The only-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, only child of its parent.</td>
</tr>
<tr>
<td>E:only-of-type</td>
<td>The only-of-type pseudo-class</td>

</table>

### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```xml
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```css
b {font-weight: bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

#### Example: Defining prefixed and default namespaces

Given the namespace declarations:
Then:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

**sync|A**

Represents the name A in the `http://sync.example.org` namespace.

**|B**

Represents the name B in ANY namespace, including NO NAMESPACE.

**C**

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `<def>` element its namespace declares, bind it to the abs prefix and then write a CSS rule:

```
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

```
abs|def
```

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

```
abs|def:before
```

Represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Editor supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/](http://www.w3.org/TR/selectors4/)). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

**Example:**
A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

**Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

- `a:has(b c)`
- `a:has(b>c)`
Oxygen XML Editor supports the CSS Level 4 subject selector (currently a working draft at W3C http://www.w3.org/TR/selectors4/), as described in Subject Selector (on page 2317). Oxygen XML Editor also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```css
table:has( tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `<thead>` element in the `<tbody>` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (`PI`) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <![important level='high']>?
</chapter>
```

**Descendant Selectors Limitation**

**Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
chapter:has(tbody > thead){
  border: 1px solid red;
}
```
Supported CSS Properties

Oxygen XML Editor validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor-specific (extension) CSS properties, see CSS Extensions (on page 2333).

*<length>* - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px.

For more information, see the W3 CSS Level 3 length type specifications.

### Related Information:

- CSS Extensions *(on page 2333)*

## Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**
attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```css
title:before{  
    content: "[Audience Level: " attr(audience) "]";
}
```

If the `<title>` element from the XML document is:

```xml
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Editor, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional. The arguments of the function are:

```
attr ( attribute_name , attribute_type , default_value )
```

attribute_name

The attribute name. This argument is required.

attribute_type

The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor accepts one of the following types:

```
color
```
The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFEEFF.

url

The value is a URL pointing to a media object. Oxygen XML Editor supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

integer

The value must be interpreted as an integer.

number

The value must be interpreted as a float number.

length

The value must be interpreted as an integer.

percentage

The value must be interpreted relative to another value (length, size) expressed in percents.

em

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

ex

The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

px

The value must be interpreted as a size expressed in pixels relative to the viewing device.

mm

The value must be interpreted as a size expressed in millimeters.

cm

The value must be interpreted as a size expressed in centimeters.

in

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.
The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: attr Function**

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The `<para>` elements have `@bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);  
```

The `font_size` represents the font size in em units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);  
```

The complete CSS rule is:

```css
para{
  display:block; 
  background-color: attr(bg_color, color); 
  font-size: attr(font_size, em); 
  margin:attr(space, em); 
}
```

The document is rendered as:
CSS Level 3 target-counter() and target-counters() Functions

The CSS Level 3 functions target-counter and target-counters can be used as values for the content property to retrieve counter values and display information obtained from a target at the end of a link.

The target-counter Function

This function retrieves the value of the innermost counter with a given name.

```
target-counter ( <fragment> , <counter-name> [, , <counter-style> ] ? )
```

- **fragment**
  
  The URI fragment pointing to the ID of the target element.

- **counter-name**
  
  The name of the counter. This argument is required.

- **counter-style**
  
  This optional argument can be used to format the result.

Example:

HTML:

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
  </ol>
</nav>
```
The target-counters Function

This function fetches the value of all counters of a given name from the end of a link and formats them by inserting a given string between the value of each nested counter.

```plaintext
target-counter (<fragment>, <counter-name>, <delimiter> [, <counter-style>] ?)
```

**fragment**

The URI fragment pointing to the ID of the target element.

**counter-name**

The name of the counter. This argument is required.

**delimiter**

The string to be inserted between the value of each nested counter. This argument is required.

**counter-style**

This optional argument can be used to format the result.

https://www.w3.org/TR/css-gcpm-3/#target-counters
calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```css
elem {
  width: calc(100% - 1em);
}
```

For more information, see: [https://drafts.csswg.org/css-values-3/#calc-notation](https://drafts.csswg.org/css-values-3/#calc-notation)

Custom CSS Properties (CSS Variables)

Custom properties (also referred to as CSS variables) are properties defined by CSS authors that contain specific values to be reused throughout a document.

Complex websites have many CSS rules, often with a lot of repeated values. For example, the same color might be used in dozens of different places, requiring a global search-and-replace operation if that color needs to be changed. Custom properties allow a value to be stored in one place, then referenced in multiple other places. An additional benefit is semantic identifiers. For example, `--main-text-color` is easier to understand than `#00ff00`, especially if this same color is also used in other contexts.

Custom properties follow the same rules as other CSS properties, so you are able to define and use them at multiple levels, following standard CSS cascading and specificity rules.

Usage

A custom property name begins with a double hyphen (--) and its value that can be any valid CSS value. You use the custom property value by specifying your custom property name inside the `var()` function, in place of a regular property value:

### Defining a Custom Property

```css
element {
  --main-bg-color: brown;

  background-color: var(--main-bg-color);
}
```

**Note:**

Custom property names are case sensitive: `--my-color` will be treated as a separate custom property from `--My-color`.

Inheritance of Custom Properties

If you define a custom property on an element, you will be able to access it on all of its descendents.
Inheritance

```xml
<one>
  <two>
    <three/>
    <four/>
  </two>
</one>
```

```css
one {
  --color:green;
}

three {
  --color:red;
}

* {
  color: var(--color);
}
```

**Result:**

- `<one>` has the color green.
- `<two>` has the color green.
- `<three>` has the color red.
- `<four>` has the color green.

**Custom Properties Fallback Values**

The `var()` function has two arguments. The first argument is the name of the custom property to be substituted. The second argument (optional) is a fallback value, which is used as the substitution value when the referenced custom property is invalid or undefined.

**Specifying a Fallback Value**

```css
one {
  color: var(--color, blue);
}

one {
  color: var(--color, var(--fallback-color, red));
}
```
Dependencies

A custom property can reference the value of another custom property through the var() function.

A Custom Property Safely Using a Variable

```css
:root {
    --border-color: red;
    --main-border: 1px solid var(--border-color, green);
}

p {
    border: var(--main-border);
}
```

Combining Custom Variables with calc()

```css
:root {
    --foo: 10px;
    --bar: calc(var(--foo) + 10px);
}

p {
    font-size: var(--bar);
}
```

⚠️ CAUTION:

This can create cyclic dependencies where two or more custom properties each attempt to reference each other.

An Invalid Situation of Variables Depending on Each Other

```css
:root {
    --color: var(--bg-color);
    --bg-color: var(--color);
}
```

CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements (on page 3221) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
• Constructing a URL from a relative path location.
• String processing functions.

Built-in CSS Selectors

When Oxygen XML Editor renders content in the Author mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

 *
 */

oxy|processing-instruction[oxy-placeholder] {
Example:

To show all entities in the Author mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:
Additional CSS Selectors

Oxygen XML Editor provides support for selecting additional types of nodes. These custom selectors apply to: `document`, `doctype`, `processing-instruction`, `comment`, `CDATA sections`, `entities`, and `reference sections`. 

`Processing-instructions` are not displayed by default. To display them, open the Preferences dialog box (`Options > Preferences`) (on page 124), go to Editor > Author, and select Show processing instructions.

Note:
The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with the `!important` flag. For this reason, you have to set the `!important` flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```xml
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

  ```css
  oxy|document {
    display:block !important;
  }
  ```

- **oxy|doctype** - The following example changes the rendering of `doctype` sections:

  ```css
  oxy|doctype {
    display:block !important;
    color:blue !important;
    background-color:transparent !important;
  }
  ```

- **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

  ```css
  oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
  }
  ```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```
You can match a processing instruction with a particular target from the CSS using the following construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

- **oxy|comment** - The XML comments displayed in Author mode can be changed using the `oxy|comment` selector:

```css
oxy|comment {
  display: block !important;
  color: green !important;
  background-color: transparent !important;
}
```

- **oxy|cdata** - The `oxy|cdata` selector matches `CDATA` sections:

```css
oxy|cdata{
  display: block !important;
  color: gray !important;
  background-color: transparent !important;
}
```

- **oxy|entity** - The `oxy|entity` selector matches the entity content:

```css
oxy|entity {
  display: morph !important;
  editable: false !important;
  color: orange !important;
  background-color: transparent !important;
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```css
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name='#']{
  -oxy-display-tags: none;
}
```
**oxy|reference** - The references to entities, XInclude, and DITA `@conref` and `@conkeyref` attributes are expanded by default in Author mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

You can use the `reference` property to customize the way these references are rendered in Author mode:

```html
oxy|reference {
  border:1px solid gray !important;
}
```

In the Author mode, content is highlighted when text contains comments (on page 642) and changes (if Track Changes (on page 642) was active when the content was modified).

If this content is referenced, the Author mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

---

**Note:**

Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

  ```html
  oxy|reference[comments]:before {
    content: "Comments: " attr(comments) !important;
  }
  ```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector:

  ```html
  oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
  }
  ```

- Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

  ```html
  oxy|reference[changeTracking][comments]:before {
    content: "Change tracking: " attr(changeTracking)
    " and comments: " attr(comments) !important;
  }
  ```
Figure 602. Example: A Document Rendered Using these Rules

```
<!DOCTYPE SAMPLE [
<!ENTITY cnt "Some entity">
<!ENTITY % xinclude SYSTEM "http://www.docbook.org/xml/4.4/xinclude.mod" >
%xinclude;

Change tracking: 2

Referred text with changes.

#sample1.xml referred-with-comment-and-track-changes

Change tracking: 1 and comments: 1

Referred text with comments and changes.

### Additional CSS Properties

Oxygen XML Editor provides various additional CSS properties to extend the standard CSS properties.

#### Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

**-oxy-append-content Property**

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

**Example:**
The content shown before the `element` will be `Hello World!`.

**-oxy-prepend-content Property**

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.

Oxygen XML Editor allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:
Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Editor allows you to set the value of the list-style-type property to Cyrillic counters. For example, -oxy-lower-cyrillic-ru, -oxy-lower-cyrillic-uk, -oxy-upper-cyrillic-ru or -oxy-upper-cyrillic-uk, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```xml
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: -oxy-display-tags Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named -oxy-display-tags, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode (on page 594).
- **default** - The tag markers will be created depending on the current display mode (on page 594).
- **inherit** - The value of the property is inherited from an ancestor element.

```
-oxy-display-tags
  Value: none | default | inherit
  Initial: default
  Applies to: all nodes(comments, elements, CDATA, etc.)
  Inherited: false
  Media: all
```

Example: -oxy-display-tags Property

In this example, the para element from DocBook uses a :before and :after element and its tag markers will not be visible.
Editable: -oxy-editable Property

Used to inhibit editing the content of a particular element.

If you want to inhibit the editing of the content of a certain element, you can set the -oxy-editable CSS property to false (the deprecated editable property is also supported).

Floating Toolbar: -oxy-floating-toolbar Property

Used to display a configured floating toolbar in Author mode.

The -oxy-floating-toolbar property is used to configure and display a floating toolbar in Author mode. It accepts a space-separated list of the following functions:

- oxy_button
- oxy_combobox
- oxy_label

Note:
The "|" text value can be used to add a separator between elements of the toolbar.

It must be used in conjunction with the -oxy-selected and -oxy-selection-inside pseudo-classes. The -oxy-selected pseudo-class is automatically set on an element that is fully selected and the -oxy-selection-inside pseudo-class is automatically set on an element that has a selection inside.

Example 1:

```xml
p:-oxy-selection-inside {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'bold')
    oxy_button(actionID, 'italic')
}
```
oxy_button(actionID, 'underline')
}

This results in a floating toolbar that contains bold, italic, and underline actions presented in **Author** mode every time text inside a paragraph element is selected.

**Example 2:**

```xml
p:-oxy-selected {
    -oxy-floating-toolbar:
        oxy_label(text, "Platform: ")
        oxy_combobox{
            edit, '@platform',
            editable, false,
            values, 'windows, mac, linux',
            labels, 'Windows, MacOS, Linux'
        }
}
```

This results in a floating toolbar that contains a **Platform:** label and a drop-down menu used to change the value of the `@platform` profiling attribute. This is presented in **Author** mode every time a paragraph element is fully selected.

**Example 3:**

```xml
[conref]:-oxy-selected, [conkeyref]:-oxy-selected {
    -oxy-floating-toolbar:
        oxy_button(actionID, 'add_edit_content_reference')
        oxy_button(actionID, 'remove_content_reference')
        "|"
        oxy_button(actionID, 'conref.replace')
}
```

This results in a floating toolbar that contains **Edit Content Reference**, **Remove Content Reference**, and **Replace Reference with Content** actions presented in **Author** mode every time an element with a `@conref` or `@conkeyref` attribute is fully selected.

**Folding Elements: -oxy-foldable Property**

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor allows you to declare some elements to be **foldable (on page 3221)**. This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor marks the **foldable** content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:
Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on macOS))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: -oxy-foldable:true. To define the elements that are folded by default, use the -oxy-folded:true property.

Note:
The -oxy-folded property works in conjunction with the -oxy-foldable property. Thus, the folded property is ignored if the -oxy-foldable property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The -oxy-not-foldable-child property is used to identify the child element that is kept visible. As its value, it accepts an element name or a list of comma-separated element names. The first occurrence of each child element specified in the list of element names will be identified as the not-foldable child and displayed. If the element is marked as foldable (-oxy-foldable:true) but it doesn't have the -oxy-not-foldable-child property or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the before pseudo-element.

Note:
Deprecated properties foldable, not-foldable-child, and folded are also supported.

Example: Folding DocBook Elements

All the elements below can have a <title> child element and are considered to be logical sections. You mark them as being foldable leaving the <title> element visible.

set,
book,
part,
reference,
chapter,
preface,
Links: -oxy-link Property

Used to specify that a particular element should be considered a link.

Oxygen XML Editor allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the -oxy-link property on the :before or :after pseudo-element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to attr(href)

Example: DocBook Link Elements

The following elements are defined to be links on the :before pseudo-element and their values are defined by the value of an attribute.

```
*[href]:before{
    -oxy-link:attr(href);  
    content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
    -oxy-link:attr(url);  
    content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
    -oxy-link: attr(targetdoc);  
    content: "Click to open: " attr(targetdoc);
}
```
Link Navigation: -oxy-link-activation-trigger Property

Used to specify how hyperlinks are handled in Author mode.

The -oxy-link-activation-trigger property is used to specify when hyperlinks are clickable in Author mode. This is helpful for those who are used to the hyperlink activation procedure in other applications (for example, apps that use Ctrl+Click (Command+Click on macOS) to activate hyperlinks.

The possible values are:

- **click** - Hyperlinks are opened when a user mouse-clicks the link icon or text.
- **modifier-click** - Hyperlinks are opened when a user holds down Ctrl (Command on macOS) and mouse-clicks the link icon or text.
- **auto** - The hyperlink strategy is determined automatically, depending on the context.
- **inherit** - The value is inherited from the parent element.

Morph Elements: -oxy-morph Property Value

Used to specify that an element should be displayed inline.

Oxygen XML Editor allows you to specify that an element has an -oxy-morph display type (deprecated morph property is also supported), meaning that the element is inline (on page 3222) if all its children are inline.

**Example: -oxy-morph Property Value**

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (on page 3222) or block (on page 3218) behavior, depending on the behavior of its child elements:

```xml
wrapper{
    display:-oxy-morph;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content Property

Used to configure placeholders for empty elements.

Oxygen XML Editor displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option (on page 176) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (-oxy-placeholder-content and -oxy-show-placeholder).

**-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the -oxy-placeholder-content CSS property.

The following example would change the `<keyword>` element to be displayed as `key:`
-oxy-placeholder-content: "key";
%

---

**Note:**

This CSS property accepts the $i18n(key) (on page 331) localization editor variable, as in the following example:

- oxy-placeholder-content: "$i18n(id)";

---

**-oxy-show-placeholder CSS Property**

The -oxy-show-placeholder property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if before or after content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the **Show placeholders for empty elements** option (on page 176) (if before and after content is not declared).
- **no** - Never display placeholders.

---

**Note:**

Deprecated properties show-placeholder and placeholder-content are also supported.

---

Related information

Using Placeholders in Document Templates (on page 377)

---

**Style Elements: -oxy-style Property**

Used to configure the style of particular elements.

Oxygen XML Editor allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

*{
    -oxy-style: attr(style);
}
Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

Tip: The @style attribute is supported by default in HTML5 documents.

### Tags Color: -oxy-tags-color Property

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Editor does not display element tags. You can use the `Partial Tags` button from the Author toolbar to control the amount of displayed markup (on page 594).

To configure the default background and foreground colors of the tags, open the Preferences dialog box (Options > Preferences) (on page 124), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (on page 178) and Tags foreground color (on page 178) options.

If you want to be more specific and configure the colors using a CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

**Example:**

```css
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}
title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

### Custom CSS Functions

Oxygen XML Editor provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

#### Arithmetic Functions

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:
### Syntax Details

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_add (param1, ..., paramN, 'returnType')</code></td>
<td>Adds the values of all parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_subtract (param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply (param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_divide (param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
<tr>
<td><code>oxy_modulo (param1, param2, 'returnType')</code></td>
<td>Returns the reminder of the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>

### Note:
The `returnType` can be 'integer', 'number', or any of the supported CSS measuring types.

### Example: `oxy_multiply` Function

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:

```css
image:before{
  content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: `oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function (on page 2379) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (`framework` configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the `framework` configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an `editor variable` (on page 323).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of `predefined operations` (on page 2152) that can be used.
Note:
If the name of the operation specified in the CSS is not qualified (has no Java package
name), then it is considered to be one of the built-in Oxygen XML Editor operations from
ro.sync.ecss.extensions.commons.operations package. If the class is not found in this
package, then it will be loaded using the specified name.

- `arg-string` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the
  `arg-` prefix is passed).
- ID - (optional) - The ID of the action from the framework. If this is specified, all others parameters are
disregarded.

Example: `oxy_action` function inside an `oxy_button` form control (on page 2379):

```lisp
oxy_button(
  action, oxy_action{
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation,
      'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'),
  showIcon, true)
```

Example: `oxy_action` Function
You can also create a button form control directly from an `oxy_action` function:

```lisp
oxy_action(
  name, 'Insert',
  description, 'Insert an element after the current one',
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After')
```

Tip:
A code template is available to make it easy to add the `oxy_action` function with the `Content
Completion Assistant (on page 3219)` by pressing Ctrl + Space (Command + Space on macOS) and
select the `.oxy_action` code template.
Action Lists: oxy_action_list() Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from the oxy_buttonGroup() function (on page 2381) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the oxy_action_list() function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action_list() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (on page 2354). The following properties are supported in the oxy_action() function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (on page 323).
- **operation** - The name of the Java class implementing the ro.sync.ecss.extensions.api.AuthorOperation interface. There is also a variety of predefined operations (on page 2152) that can be used.
- **arg-string** - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed).
- **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  )
}
```

**Note:**
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor operations from ro.sync.ecss.extensions.commons.operations package. If the class is not found in this package, then it will be loaded using the specified name.
actions,
 oxy_action_list{
   oxy_action{
      name, 'Insert a new paragraph',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<p></p>',
      arg-insertLocation, '.','
      arg-insertPosition, 'After'
   },
   oxy_action{
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
   }
}

Tip:

A code template is available to make it easy to add the oxy_action_list function with the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_action_list code template.

Related information

Actions: oxy_action() Function (on page 2354)
Button Group Form Control (on page 2381)

Attributes Concatenation: oxy_attributes() Function

This function concatenates the attributes for an element and returns the serialization.

Syntax:

```
oxy_attributes()
```

Example: oxy_attributes Function

```
element{
   content:oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="&quot;"/>`, the CSS function will display:
Base URL: `oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node. It does not have any arguments and takes into account the `xml:base` context of the current node. See the [XML Base specification](https://www.w3.org/TR/xlink/) for more details.

**Example: `oxy_base-uri` Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in **Author** mode):

```xml
image[href] {'
  content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

Capitalization: `oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.

**Syntax:**

```
oxy_capitalize( text )
```

`text`

The text in which the first letter will be capitalized.

**Example: `oxy_capitalize` Function**

```xml
*:before{
  content: oxy_capitalize(oxy_name()) ': ':';
}
```

This would insert the capitalized qualified name as static text content before the element.

Compound Actions: `oxy_compound_action()` Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 2379) or the `oxy_buttonGroup()` form control function (on page 2381).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 2354).
You can use three optional properties (name, description, icon) in the oxy_compound_action() function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first oxy_action function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the oxy_getActionName function.

- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the oxy_getActionDescription function.

- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as an editor variable (on page 323). If you want to reuse the icon of an action already defined in your framework, you can use the oxy_getActionIcon function.

The oxy_getActionName, oxy_getActionDescription, and oxy_getActionIcon functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.

- **fallback** (optional) - A fallback value in case the ID value provided in the framework.defined.action.id parameter is not found.

**Example: oxy_compound_action Function**

```java
oxy_button(
    action,
    oxy_compound_action(
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, '<p audience='''></p>'
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Activate edit mode',
            description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
```
operation, 'SetPseudoClassOperation',
    arg-name, 'edit-mode-on',
    arg-elementLocation, '.'
  )
)
, showIcon, true)

Tip:
A code template is available to make it easy to add the `oxy_compound_action` function with the [Content Completion Assistant](on page 3219) by pressing **Ctrl + Space** (Command + Space on macOS) and selecting the `oxy_action_list` code template.

Related information
- Actions: [oxy_action() Function](on page 2354)
- [Button Form Control](on page 2379)

**Concatenation: oxy_concat() Function**
This function concatenates the received string arguments.

**Syntax:**
```
oxy_concat ( str_1 , str_2 )
```

str_1 ... str_n
The string arguments to be concatenated.

**Example: oxy_concat Function**
If an XML element has a @padding-left attribute:
```
<p padding-left="20">...</n
```
and you want to add a padding before it with that specific amount specified in the attribute value:
```
* [padding-left]{
  padding-left: oxy_concat(attr(padding-left), "px");
}
```

**Get Text: oxy_getSomeText(text, length) Function**
This function allows you to truncate a long string and to set a maximum number of displayed characters.

**Syntax:**
oxy_getSomeText (text, length, endsWithPoints)

text
Displays the actual text.

length
Sets the maximum number of characters that are displayed.

endsWithPoints
Specifies if the truncated text ends with ellipsis.

Example: oxy_getSomeText Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

```xml
*[longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```

Indexing: oxy_indexof() Function

This function is used to define searches.

The oxy_indexof() function has two signatures:

Syntax 1:

```xml
oxy_indexof (text, toFind)
```

Returns the index within text string of the first occurrence of the toFind substring.

  text
  Text to search in.

  toFind
  The searched substring.

Syntax 2:

```xml
oxy_indexof (text, toFind, fromOffset)
```

Returns the index within text string of the first occurrence of the toFind substring. The search starts from fromOffset index.

  text
  Text to search in.

  toFind
The searched substring.

**fromOffset**

The index to start the search from.

**Example: oxy_indexof Function**

```
oxy_indexof('abcd', 'bc') returns 1.
oxy_indexof('abcdbc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an *Appendix* string:

```
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0,
                        oxy_indexof(attr(longdesc), "Appendix");
}
```

**Label: oxy_label() Function**

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are *property name - property value* pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - `font-weight, font-size, font-style, font`  
  - `text-align, text-decoration`  
  - `width`  
  - `color, background-color`  
  - `link` - For more information about this property, see the *link* property section *(on page 2350).*

```
element{
  content: oxy_label(text, "Label Text", styles,
                    "font-size:2em; color:red; link: attr(href); ");
}
```
Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```css
* {
    width: 40%;
    text-align: center;
}
```

Then refer that file with an `@import` directive, as follows:

```css
elem {
    content: oxy_label(text, 'my_label', styles, '@import 'labels.css';')
}
```

**CAUTION:**
Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:**
The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control (on page 2373) function to create a form control based layouts.

**Example: oxy_label Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
person:before {
    content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the `Name` label to be set to bold, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```css
person:before {
    content: oxy_label(text, "Name:", styles, "font-weight:bold;width:200px")
    oxy_textfield(edit, '@name', columns, 20) "\A *
    oxy_label(text, "Address:", styles, "width:200px")
}
```
oxy_textfield(edit, '@address', columns, 20)
}

Tip:
A code template is available to make it easy to add the `oxy_label` function with the `Content Completion Assistant (on page 3219)` by pressing `Ctrl + Space (Command + Space on macOS)` and select the `.oxy_label` code template.

Last Occurrence: `oxy_lastindexof()` Function

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_lastindexof(text, toFind)
```

Returns the index within `text` string of the rightmost occurrence of the `toFind` substring.

- **text**
  - Text to search in.
- **toFind**
  - The searched substring.

**Syntax 2:**

```javascript
oxy_lastindexof(text, toFind, fromOffset)
```

The search starts from `fromOffset` index. Returns the index within `text` string of the last occurrence of the `toFind` substring, searching backwards starting from the `fromOffset` index.

- **text**
  - Text to search in.
- **toFind**
  - The searched substring.
- **fromOffset**
  - The index to start the search backwards from.

**Example: `oxy_lastindexof` Function**

- `oxy_lastindexof('abcdbc', 'bc')` returns 4.
- `oxy_lastindexof('abcdbccdbc', 'bc', 2)` returns 1.
If you only want to display part of an attribute value, for instance the part that comes before an *Appendix* string:

```xml
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0,
  oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

**Link Text: oxy_link-text() Function**

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 3221), go to Configuring an Extensions Bundle (on page 2232).

**DITA Support**

For DITA, the `oxy_link-text()` function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

**DocBook Support**

For DocBook, the `oxy_link-text()` function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: oxy_link-text Function**

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `@xreflabel` attribute.

```xml
<para>
  <code id="para.id" xreflabel="The reference label">my code</code>
</para>
<para>
  <xref linkend="para.id"/>
</para>

xref {
  content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `@href` is not valid), you can use an optional argument to display fallback text.

```xml
*[class~="map/topicref"]:before{
  content: oxy_link-text("Cannot find the topic reference");
  link:attr(href);
}
```
Local Name: oxy_local-name() Function

This function evaluates the local name of the current node.

It does not have any arguments.

Example: oxy_local-name Function

To insert the local name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_local-name() "": ";
}
```

Lowercase: oxy_lowercase() Function

This function transforms the text received as argument to lower case.

Syntax:

```
oxy_lowercase ( text )
```

- `text`

  The text to be lower cased.

Example: oxy_lowercase Function

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_lowercase(oxy_name()) ": ";
}
```

Name: oxy_name() Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

Example: oxy_name Function

To insert a qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_name() "": ";
}
```

Parent URL: oxy_parent-url() Function

This function evaluates the parent URL of a URL received as string.
Syntax:

```xml
oxy_parent-url ( URL )
```

**URL**

The URL as string.

**Replace: oxy_replace() Function**

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

**Syntax 1:**

```xml
oxy_replace ( text, target, replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- **text**
  - The text in which the replace will occur.
- **target**
  - The target string to be replaced.
- **replacement**
  - The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```xml
image[href] {
  content: oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

**Syntax 2:**

```xml
oxy_replace ( text, target, replacement, isRegExp )
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

- **text**
  - The text in which the replace will occur.
- **target**
The target string to be replaced.

replacement

The string replacement.

isRegExp

If true the target and replacement arguments are considered regular expressions, if false they are considered literal strings.

Example: Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```xml
image[title]{{
  content:oxy_replace(attr(title), "\s+", ", true)
}
```

Substring of Text: oxy_substring() Function

This function is used to return a string of text.

Theoxy_substring() function has two signatures:

Syntax 1:

```
oxy_substring ( text , startOffset )
```

Returns a new string that is a substring of the original text string. It begins with the character at the specified index and extends to the end of text string.

<table>
<thead>
<tr>
<th>text</th>
<th>The original string.</th>
</tr>
</thead>
<tbody>
<tr>
<td>startOffset</td>
<td>The beginning index, inclusive</td>
</tr>
</tbody>
</table>

Syntax 2:

```
substring ( text , startOffset , endOffset )
```

Returns a new string that is a substring of the original text string. The substring begins at the specified startOffset and extends to the character at index endOffset - 1.

<table>
<thead>
<tr>
<th>text</th>
<th>The original string.</th>
</tr>
</thead>
<tbody>
<tr>
<td>startOffset</td>
<td>The beginning index, inclusive</td>
</tr>
<tr>
<td>endOffset</td>
<td>The end index, exclusive</td>
</tr>
</tbody>
</table>

The ending index, exclusive.

**Example: oxy_substring Function**

oxy_substring('abcd', 1) returns the string 'bcd'.

oxy_substring('abcd', 4) returns an empty string.

oxy_substring('abcd', 1, 3) returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value: oxy_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains %20 it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

```xml
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:

http://www.example.com/a simple example.html
```

**Unparsed Entity URI: oxy_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.

**Syntax:**

```
oxy_unparsed-entity-uri ( unparsedEntityName )
```

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an imagedata with entityref to an unparsed entity:

```xml
imagedata[entityref]{
    content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```
Uppercase: oxy_uppercase() Function

This function transforms the text received as argument to upper case.

Syntax:

```python
oxy_uppercase( text )
```

text
The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_uppercase(oxy_name()) " ";
}
```

URL: oxy_url() Function

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Editor uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 323) (built-in or custom).

Syntax:

```javascript
oxy_url( base_location , loc_1 , loc_2 )
```

base_location
String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)
Strings representing relative location path components.

Examples: oxy_url Function

The following function receives String objects as input parameters:

```javascript
```

and returns:

'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```xml
image[href] {
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href),
        '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 323) as the first parameter to point to the Oxygen XML Editor installation location:

```xml
image[href] { 
    content: oxy_url('${oxygenHome}', 'logo.png');
}
```

**Related information**

*Editor Variables** (on page 323)

**XPath: oxy_xpath() Function**

This function is used to evaluate XPath expressions.

**Syntax:**

```xml
oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ])
```

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced `xi:include` section or inside artificially referenced content (for example, DITA `@conref` or `@topicref` references).

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there are changes in the document.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other
nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.

- **static**: If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

### Note:

When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

### Example: `oxy_xpath` Function

The following example counts the number of words from a paragraph (including tracked changes (on page 3226)) and displays the result in front of it:

```xml
para:before{
  content:
  concat("|Number of words:",
  oxy_xpath{
    "count(tokenize(normalize-space(string-join(text(), ')'), ')'))",
    processChangeMarkers, true),
  "| ");
}
```

### Note:

The `oxy_xpath()` function supports editor variables (on page 323), as in the following example:
Form Controls

Oxygen XML Editor provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Editor also supports custom form controls in Java (on page 2404).

How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 2390), its dedicated function is oxy_datePicker.
3. Associate the CSS file with the XML document in one of the following ways:
   ◦ If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 2145). This approach is recommended if you intend on sharing the customization with others.
   ◦ If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 2307).

Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```xml
oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px)
```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: **oxy_audio Form Control**

```xml
object {
  content:
    oxy_audio(
      href, 'resources/audio.mp3',
      width, 200px),
}
```

**Tip:**

To insert a sample of the oxy_audio form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_audio code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM
Browser Form Control

The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor workspace.

The `oxy_browser` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.
- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```json
object {
  content:
  oxy_browser{
    href, 'http://example.page',
    width, 600px,
    height, 400px,
  }
}
```

**Tip:**

To insert a sample of the `oxy_browser` form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the `oxy_browser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.
Interacting with the Oxygen XML Editor Workspace

The oxy_browser form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the oxy_browser form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

**Important:**
This will only work if the loaded HTML is located inside a framework or plugin directory (on page 139), such as: `[OXYGEN_INSTALL_DIR]/frameworks/` or `[OXYGEN_INSTALL_DIR]/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute("counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    (java.lang.String, java.lang.String, boolean),
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute("counter", newAttrValue, contextElement);
...
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.
Warning:

On macOS, you need to use asynchronous calls to the API, due to the following JDK bug: https://bugs.openjdk.java.net/browse/JDK-8087465. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
    ctrl.sync();
}
```

Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
    // We declare a member function for each method of the
    // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
    var handler = {
        attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();

            if (node.equals(contextElement) && attrName === "counter") {
                init();
            }
        },

        contentDeleted : function(event) {},
        contentInserted : function(event) {}
    };

    // We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
    // delegate its methods to the JS object's functions.
    // We assign the listener to a global variable so that we can remove it later on,
```
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
    "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);
}

2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, the dispose() JavaScript function is invoked, so if you have any cleanup to do, make sure you define a function with this name and remove any previously created listeners in it.

/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}

Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above (on page 2376), you can debug the script by using the following guidelines:

- Calls to alert("message.to.present") or console.log("message.to.present") will be presented in the Results panel (on page 548).
- You can install the Firebug extension by executing the following script:

{code:javascript}
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
        E = E ? document['createElement' + 'NS'](E, 'script')
            : document['createElement']('script');
        E['setAttribute']['id', 'FirebugLite'];
        E['setAttribute']['src',
            'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened'];
        E['setAttribute']['FirebugLite', '4'];
        (document['getElementsByName']('head')[0]
            || document['getElementsByName']('body')[0]).appendChild(E);
}
E = new Image;
E.setAttribute('src', 'https://getfirebug.com/' + '#startOpened');
}
}
{code}

Note:
To force the Browser Form Control to reload after making changes to the JavaScript file, you need to use the Reload page action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:
https://www.youtube.com/embed/-WY3wzkMSLM

Custom CSS Functions (on page 2353)
URL: oxy_url() Function (on page 2370)

Button Form Control
The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be true or false (default value).

- **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```
element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

- **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.
• **enableInReadOnlyContext** - To enable button form controls (on page 2379) or groups of buttons form controls (on page 2381) this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
<p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
}
<p:showBorder {
  border: 1px solid red;
}
```

• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• **actionID** - The ID of the action, specified in the *document type association (on page 148)*, that is invoked when you click the button.

**Note:**

The element that contains the form control represents the context where the action is invoked.

• **action** - Defines an action directly, rather than using the `actionID` parameter to reference an action from the *document type association (on page 148)*. This property is defined using the `oxy_action` function (on page 2354).

**Tip:**

You can also create a button form control directly from an `oxy_action` function (on page 2355).
Tip:
To execute multiple actions sequentially, you can use the `oxy_compound_action` function (on page 2358).

Example: `oxy_button` Form Control

```plaintext
button:before {
    content: "Label:"
    oxy_button{
        /* This action is declared in the document type associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection";
    }
}
```

Tip:
To insert a sample of the `oxy_button` form control in a CSS file (or LESS file), invoke the *Content Completion Assistant* (on page 3219) by pressing **Ctrl + Space** (Command + Space on macOS) and select the `.oxy_button` code template. Also, an `.oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an action parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[/OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Actions: `oxy_action()` Function (on page 2354)

**Button Group Form Control**

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom `Author` mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:
- **label** - Specifies the label to be displayed on the button. This label can be translated using the $\{i18n()\} editor variable *(on page 331)*.
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be **true** or **false**.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the fontInherit property to **true**.
- **enableInReadOnlyContext** - To enable button form controls *(on page 2379)* or groups of buttons form controls *(on page 2381)* this property needs to be set to **true**. This property can be used to specify areas as read-only (by setting the -oxy-editable property to **false**). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

- **actionIDs** - The IDs of the actions that will be presented in the group of buttons.
- **actionID** - The ID of the action, specified in the document type association *(on page 148)*, that is invoked when you click the button.

⚠️ **Note:**

The element that contains the form control represents the context where the action is invoked.

- **actions** - Defines a sequential list of actions directly, rather than using the actionID parameter to reference actions from the document type association *(on page 148)*. This property is defined using the oxy_action_list function *(on page 2356)*.

```json
oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
        oxy_action(
            name, 'Insert',
        )
    )
)"
description, 'Insert an element after the current one',
operation, 'InsertFragmentOperation',
arg-fragment, '<element></element>',
arg-insertLocation, '.',
arg-insertPosition, 'After'
),
oxy_action(
    name, 'Delete',
    description, 'Deletes the current element',
    operation, 'DeleteElementOperation'
)
)
)

Tip:
To execute multiple actions sequentially, you can use the oxy_compound_action function (on page 2358) in the oxy_action_list function (on page 2356).

p:before {
  content:
    oxy_buttonGroup{
      label, 'A group of actions',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      actions,
      oxy_action_list{
        oxy_compound_action{
          name, oxy_getActionName('framework.id', 'Fallback'),
          description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
          icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
          oxy_action{
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, '<p audience=""></p>",
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
          },
          oxy_action{
            name, 'Activate edit mode'
description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
    operation, 'SetPseudoClassOperation',
    arg-name, 'edit-mode-on',
    arg-elementLocation, '.'
  )
),
oxy_action{
  name, 'Delete',
  description, 'Deletes the current element',
  operation, 'DeleteElementOperation'
}
)
)
}

• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or `both`.

**Example: oxy_buttonGroup Form Control**

```css
buttgroupp:before {
  content:
  oxy_label(text, "Button Group:", width, 150px, text-align, left)
  oxy_buttonGroup(
    label, 'A group of actions',
    /* The action IDs are declared in the document type associated with the XML document. */
    actionIDs, "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both")
}
```

**Tip:** To insert a sample of the oxy_buttonGroup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_buttonGroup code template. Also, an oxy_buttonGroup_in_place_action code
A template is available that inserts an oxy_buttonGroup function that includes an oxy_action_list function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR\]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Checkbox Form Control

The oxy_checkbox built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The oxy_checkbox form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3225) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the `visibility` property to -oxy-collapse-text (on page 2345) to render the text only in the form control that the oxy_editor function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the \${comma} variable (on page 329).
• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:**
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has `1, 2, 3` for the first value and `4` for the second value.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

• **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `${i18n()}` editor variable (on page 331). If this property is not specified, the `values` property is used as the label.

• **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: Single oxy_checkbox Form Control**

```css
checkBox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)
  The values are specified in the CSS:"
  oxy_checkbox{
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
```
Example: Multiple `oxy_checkbox` Form Controls

```css
multipleCheckBox[attribute]:before {
    content: "Multiple checkboxes editor that edits an attribute value. Depending whether the check-box is selected, a different value is committed:"
    oxy_checkbox{
        edit, "@attribute",
        values, "true, yes, on",
        uncheckedValues, "false, no, off",
        resultSeparator, ",",
        labels, "Present, Working, Started";
    }
}
```

**Tip:**

To insert a sample of the `oxy_checkbox` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing `Ctrl + Space (Command + Space on macOS)` and select the `oxy_checkbox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `{OXYGEN_INSTALL_DIR}/samples/form-controls`.

**Related information**

- Custom CSS Functions *(on page 2353)*
- Collapse Text: `-oxy-collapse-text Property Value *(on page 2345)*

**Combo Box Form Control**

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:
**edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:

- **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* (on page 3225) and the CSS must have a namespace declaration for the prefix.
- **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:**
You can set the value of the *visibility* property to -oxy-collapse-text (on page 2345) to render the text only in the form control that the *oxy_editor* function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The *width* property takes precedence over the *columns* property (if the two are used together).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **editable** - This property accepts the true and false values. In addition to a drop-down menu, the true value also generates an editable text field box that allows you to insert other values than the proposed ones. The false value generates a drop-down menu that only accepts the proposed values.
- **tooltips** - Associates tooltips to each value in the *values* property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 329).
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:**
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the *fontInherit* property to true.
- **labels** - This property must have the same number of items as the *values* property. Each item provides a literal description of the items listed in the *values* property. These labels can be translated using the ${i18n()} editor variable (on page 331).

**Note:**
This property is only available for read-only combo boxes (the *editable* property is set to false).
• **color** - Specifies the foreground color of the form control. If the value of the color property is `inherit`, the form control has the same color as the element that was used to insert it.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

• **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

• **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 2354) or referenced from the framework (on page 3221) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: **oxy_combobox** Form Control

```css
comboBox:before {
    content: "A combo box that edits an attribute value. The possible values are provided from CSS:
    oxy_combobox{
        edit, "@attribute",
        editable, false,
        values, "value1, value2, value3",
        labels, "Value no1, Value no2, Value no3",
        onChange, oxy_action{
            name, 'Insert',
            operation, 'XQueryUpdateOperation',
            arg-script, "insert node <product>{xs:string(@attribute)}</product>
                as last into ."};
    }
}
```

Tip:

To insert a sample of the **oxy_combobox** form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** (on page 3219) by pressing **Ctrl + Space (Command + Space on macOS)** and select the **oxy_combobox** code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

**Date Picker Form Control**

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3225) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to `-oxy-collapse-text` (on page 2345) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is `inherit`, the form control has the same color as the element that was used to insert it.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **format** - This property specifies the format of the inserted date, if a specific format is not detected from the associated document schema. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_datePicker Form Control**

date {
  content:
    oxy_label(text, "Date time attribute with format defined in CSS: ", width, 300px)
    oxy_datePicker(
      columns, 16,
      edit, "@attribute",
      format, "yyyy-MM-dd");
}

**Tip:**
To insert a sample of the `oxy_datePicker` form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing `Ctrl + Space (Command + Space on macOS)` and select the `oxy_datePicker` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Label: oxy_label() Function (on page 2362)
HTML Content Form Control

The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- **href** - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- **id** - The unique identifier of an item. This is a `<div>` element that has a unique `@id` and is a child of the `<body>` element. The `<div>` element is the container of the HTML content to be rendered by the form control.
- **content** - An alternative to the `@href` and `@id` pair of elements. It provides the HTML content that will be displayed in the form control.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `<p_description>` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```html
p#@intro_id:before {
  oxy_htmlContent(
    href, "descriptions.html",
    id, "p_description",
    width, 400px);
}
```
An alternative example, using the `content` property:

```css
do#intro_id:before {
  content: oxy_htmlContent("<div style='font-weight:bold;'>My content</div>", width, 400px);
}
```

**Tip:**
To insert a sample of the `oxy_htmlContent` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing Ctrl + Space (Command + Space on macOS) and select the `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

---

**Related information**
Custom CSS Functions (on page 2353)

**Pop-up Form Control**

The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3225) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2345) to render the text only in the form control that the `oxy_editor` function specifies.

- **rows** - This property specifies the number of rows that the form control presents.
Note:
If the value of the **rows** property is not specified, the default value of **12** is used.

- **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element that was used to insert it.

Note:
This property is used for rendering in the **Author** mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.

- **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the **${comma}** variable (on page 329).

Example:

```css
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac, Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```

- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note:
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the **space** character is used.

Note:
The value of the **resultSeparator** property cannot exceed one character.
• **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.

• **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.

• **columns** - Controls the width of the form control. The unit size is the width of the `w` character. This property is used for the visual representation of the form control.

• **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are `ascending` and `descending`.

• **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are `ascending` and `descending`.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.

• **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the `editorSort` and `rendererSort` properties have a higher priority. The possible values of this property are `ascending` and `descending`.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_popup Form Control**

```css
code-sample
popupWithMultipleSelection:before {

    content: "This editor edits an attribute value. The possible values are specified inside the CSS:"
    oxy_popup(
        edit, "@attribute",
        values, "value1, value2, value3, value4, value5",
        labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
        resultSeparator, "|",
        columns, 10,
    )
}
```

Example: `oxy_popup` Form Control
```javascript
selectionMode, "multiple",
    color, "blue",
  fontInherit, true);
}
```

**Tip:**

To insert a sample of the `oxy_popup` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing `Ctrl + Space` (Command + Space on macOS) and select the `.oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

---

**Text Area Form Control**

The **oxy_textArea** built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.
  - `#content` - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

**Note:**

You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2345) to render the text only in the form control that the `oxy_editor` function specifies.
For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph></codeblock>
<apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```xml
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

**Note:**
When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- `#content` - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph></codeblock>
<apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```xml
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

**Note:**
When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.
• **columns** - Controls the width of the form control. The unit size is the width of the \texttt{w} character.

• **width** - Specifies the width of the content area using relative (\texttt{em}, \texttt{ex}), absolute (\texttt{in}, \texttt{cm}, \texttt{mm}, \texttt{pt}, \texttt{pc}, \texttt{px}), and percentage (followed by the \% character) length units. The \texttt{width} property takes precedence over the \texttt{columns} property (if the two are used together).

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be \texttt{true} or \texttt{false} (default value). To make the form control inherit its font from its parent element, set the \texttt{fontInherit} property to \texttt{true}.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are \texttt{true} (default value) and \texttt{false}.

• **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.

• **contentType** - Specifies the type of content that the form control will format with syntax highlighting. The following values are supported: \texttt{text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text/xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/batch; text/rnc; text/dtd; text/nvdl; text/plain}.

• **indentOnTab** - Specifies the behavior of the \texttt{Tab} key. If the value of this property is set to \texttt{true} (default value), the \texttt{Tab} key inserts characters. If it is set to \texttt{false}, \texttt{Tab} is used for navigation, jumping to the next editable position in the document.

• **white-space** - CSS property that influences the value that you edit, as well as the form control size:
  ◦ **pre** - The whitespaces and new lines of the value are preserved and edited. If the \texttt{rows} and \texttt{columns} properties are not specifies, the form control calculates its size on its own so that all the text is visible.
  ◦ **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.

  \textbf{Note:}
  The \texttt{rows} and \texttt{columns} properties must be specified. If these are not specified, the form control considers the value to be \texttt{pre}.

  ◦ **normal** - The white spaces and new lines are normalized.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

\begin{verbatim}
  p:before {
    content: oxy_textArea(hoverPseudoclassName, 'showBorder')
  }
  p:showBorder {
    border: 1px solid red;
  }
\end{verbatim}

**Example:** \texttt{oxy_textArea} Form Control
The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```css
textArea {
    visibility: -oxy-collapse-text;
    white-space: pre;
}

textArea[language="CSS"]:before {
    content: oxy_textArea{
        edit, '#text',
        contentType, 'text/css';
    }
}

textArea[language="XML"]:before {
    content: oxy_textArea{
        edit, '#text',
        contentType, 'text/xml',
        rows, 10,
        columns, 30};
}
```

**Tip:**
To insert a sample of the `oxy_textArea` form control in a CSS file (or LESS file), invoke the *Content Completion Assistant (on page 3219)* by pressing `Ctrl + Space (Command + Space on macOS)` and select the `.oxy_textArea` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

[https://www.youtube.com/embed/-WY3wzkMSLM](https://www.youtube.com/embed/-WY3wzkMSLM)

**Related information**

- [Custom CSS Functions (on page 2353)]
- [Collapse Text: -oxy-collapse-text Property Value (on page 2345)]

**Text Field Form Control**

The `oxy_textfield` built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.
The `oxy_textfield` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName (on page 3225)` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility property to `oxy-collapse-text (on page 2345)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em, ex`), absolute (`in, cm, mm, pt, pc, px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (on page 329).
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

Note: If the value is `false`, the `Content Completion Assistant (on page 3219)` considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: `value a, value b, and other values`. If the `hasMultipleValues` property is set to `true` and the user enters `"value a value b"` (notice the space character after `value`) in the text field, the `Content Completion Assistant` will suggest all three values because the prefix is whatever comes after the space, and in this case the user
did not enter anything after the space. If the hasMultipleValues property was set to false, the Content Completion Assistant would only suggest value a and value b because the space is considered part of the prefix.

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_textfield Form Control**

```css
element {
    content: "Label: "
    oxy_textfield{
        edit, "@my_attr",
        values, "value1, value2",
        color, "red",
        columns, 40);
}
```

**Tip:**
To insert a sample of the oxy_textfield form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_textfield code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls

For more information about form controls, watch our video demonstration:

URL Chooser Form Control

The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently open editor.

The `oxy_urlChooser` editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName (on page 3225)` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2345) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as `"jpg,png,gif"` is mapped to a single filter that will display all `.jpg`, `.png`, and `.gif` files.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
    content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_urlChooser Form Control**
Oxygen XML Editor 24.1 | 17 - Framework and Author Mode Customization | 2403

urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a URL. The selected URL is made relative to the currently edited file:"
    oxy_urlChooser(
        edit, "@file",
        columns 25);
}

Tip:
To insert a sample of the oxy_urlChooser form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_urlChooser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4'), width, 400px, height, 300px)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: **oxy_video Form Control**

object {
    content:

Tip:
To insert a sample of the oxy_video form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3219) by pressing Ctrl + Space (Command + Space on macOS) and select the oxy_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Implementing Custom Form Controls
If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation
You can specify custom form controls using the following properties:

• rendererClassName - The name of the class that draws the edited value. It must be an implementation of ro.sync.ecss.extensions.api.editor.InplaceRenderer. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.

• swingEditorClassName - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of ro.sync.ecss.extensions.api.editor.InplaceEditor.

• swtEditorClassName - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the ro.sync.ecss.extensions.api.editor.InplaceEditor.

Note:
If the custom form control is intended to work in the Oxygen XML Editor standalone distribution, the declaration of swtEditorClassName is not required. The renderer (the class
that draws the value) has different properties from the editor (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.

- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

- **saHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas). It is also helpful if you want to use JavaFX, since JavaFX-based form controls are not compatible with the classic form control architecture.

The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 3222) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 144) for your particular framework (on page 3221) or specified with the **classpath** property (on page 2405).

**Example: Java Code**

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```
The custom form controls can use any of the predefined properties of the built-in form controls (on page 2373), as well as specified custom properties.

**Example: CSS**

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
  content: oxy_editor(
    rendererClassName, "com.custom.editors.CustomRenderer",
    swingEditorClassName, "com.custom.editors.SwingCustomEditor",
   .swtEditorClassName, "com.custom.editors.SwtCustomEditor",
    edit, "@my_attr",
    customProperty1, "customValue1",
    customProperty2, "customValue2"
  )
}
```

**How to Implement Custom Form Controls**

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 3222) library.
4. Copy the JAR library to the `\[OXYGEN_INSTALL_DIR\]/frameworks/\[FRAMEWORK_DIR\]` directory.
5. In Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.

**Tip:**

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `\[OXYGEN_INSTALL_DIR\]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM
Editing Processing Instructions Using a Form Control

Oxygen XML Editor allows you to edit *processing instructions, comments, and CDATA* by using CSS extensions.

**Note:**
You can edit both the content and the attribute value from a *processing instruction*.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**

```xml
<?pi_target attr="val"?>
```

**CSS:**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content:"EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}

oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

**Related information**

- [Text Field Form Control](#)
- [Collapse Text: -oxy-collapse-text Property Value](#)
- [Displaying Processing Instructions from Other XML Editors](#)

**Custom CSS Pseudo-classes**

You can set your custom CSS pseudo-classes on the nodes from the *AuthorDocument* model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified).

You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor they are used to hide/show the *colspec* elements from CALS tables. To take a look at the implementation, see:
1. [OXYGEN_INSTALL_DIR]/frameworks/docbook/css/cals_table.css (Search for -oxy-visible-colspecs)

2. The definition of action `table.toggle.colspec` from the DocBook framework (on page 3221) makes use of the pre-defined `TogglePseudoClassOperation` Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```css
section {
    display:none;
}

section:access-control-user {
    display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
    color:red;
}
```

The API that you can use from the `CaretListener`:

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)
```

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)
```

**Predefined Pseudo-Class Author Mode Operations**

Pre-defined Author mode operations can be used directly in your framework to work with custom pseudo-classes:
Using the :before(n) and :after(n) CSS Pseudo-Elements

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a :before or :after pseudo-element.

This example adds static text before the title ("Chapter 1", "Chapter 2", etc.):

```css
h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```

All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple before(n) or after(n) pseudo-elements:

```css
h1:before(3) {
  content: "Chapter ";
  color: blue;
}

h1:before(2) {
  content: counter(chapter);
  color: red;
  font-size: large;
}

h1:before(1) {
  content: ".";
  color: blue;
}
```

Notes:

- The bigger the level, the more distant the pseudo-element is.
- Level 1 corresponds to normal :before or :after pseudo-elements.

Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a CSS Inspector view (on page 640) to examine the CSS rules that match the currently selected element.
This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

![CSS Inspector View](image)

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

Related Information:

- [CSS Inspector View (on page 640)](on_page_640)
18. Extending Oxygen With the SDK

Oxygen XML Editor has an SDK that can be used as a base to develop frameworks (on page 3221) and plugins (on page 3224). It can be also used to create projects that use the Oxygen XML Author Component or Oxygen XML Web Author. The SDK is a Java library available under the Oxygen XML SDK licensing terms and is delivered with a set of examples that demonstrate how to extend Oxygen XML functionality through API calls. The SDK is available at https://www.oxygenxml.com/oxygen_sdk.html.

Important:
From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Editor and ONLY if such extensions are used from inside Oxygen XML Editor. To use such extensions outside of Oxygen XML Editor (for example, a 3rd-party application that has Oxygen XML Editor built in to it), an additional license must be purchased to use the SDK according the Oxygen XML SDK Licensing Policy.

Extending Oxygen XML Editor with Plugins

A plugin (on page 3224) is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Editor. The Plugins Development Kit contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Editor Eclipse plugin you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen XML Editor APIs.

General Configuration of an Oxygen XML Editor Plugin

The Oxygen XML Editor functionality can be extended with plugins (on page 3224) that implement a clearly specified API. On the Oxygen XML Editor website, there is an SDK with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the ro.sync.exml.plugin.Plugin class.
- A Java class that implements the ro.sync.exml.plugin.PluginExtension interface.
- A plugin descriptor file called plugin.xml.
A `ro.sync.exml.plugin.PluginDescriptor` object is passed to the constructor of the subclass of the `ro.sync.exml.plugin.Plugin` class. It contains the following data items about the plugin:

- **baseldir** (*File object*) - The base directory of the plugin.
- **description** (*String object*) - The description of the plugin.
- **name** (*String object*) - The name of the plugin.
- **vendor** (*String object*) - The vendor name of the plugin.
- **version** (*String object*) - The plugin version.
- **id** (*String object*) - A unique identifier.
- **classLoaderType** - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Editor `lib` directory will have precedence over those referenced in the `plugin.xml` configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the `plugin.xml` configuration file will have precedence over those found in the Oxygen XML Editor `lib` directory, if they have the same package names.

The plugin descriptor is an XML file that defines how the plugin is integrated in Oxygen XML Editor and what libraries are loaded. The structure of the plugin descriptor file is fully described in a DTD grammar located in `{OXYGEN_INSTALL_DIR}/plugins/plugin.dtd`. Here is a sample plugin descriptor used by the Capitalize Lines sample plugin:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="Capitalize Lines"
    description="Capitalize the first character on each line"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
    <runtime>
        <library name="lib/caplines.jar"/>
    </runtime>
    <extension type="selectionProcessor"
        class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension"
        keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your plugin is of the Selection, Document or General types, and thus contributes an action either to the contextual menu or to the main menu of the Text editing mode, then you can assign a keyboard shortcut for it. You can use the `@keyboardShortcut` attribute for each `<extension>` element to specify the desired shortcut.
Tip:
To compose string representations of the desired shortcut keys you can go to Options > Menu Shortcut Keys, select an action, and click Edit. Then choose the desired key sequence and use the representation that appears in the resulting dialog box.

Referencing Libraries

To reference libraries, use either of the following elements:

• `<library name="path/libraryName" scope="global">` - To point to specific libraries. Notice that the value of library name includes the path (relative or absolute) to the library.

**Note:**
You can use the `${oxygenInstallDir}` editor variable (on page 331) as part of the value of the @name attribute. You can also use a system variable (${system(var.name)}) or environment variable (${env(VAR_NAME)})

• `<librariesFolder name="path/libraryFolderPath" scope="global">` - To point to multiple libraries located in the specified folder. Notice that the value of libraryFolder name includes the path (relative or absolute) to the library folder.

Both elements support the @scope attribute that defines the loading priority. It can have one of the following two values:

• `local` - The library is loaded in the plugin's own class loader. This is the default behavior.
• `global` - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application lib directory).

Installing an Oxygen XML Editor Plugin

Choose one of the following methods to install a plugin (on page 3224) in Oxygen XML Editor:

Manual Method

To manually install a plugin in Oxygen XML Editor, follow these steps:

1. Go to the Oxygen XML Editor installation directory and locate the plugins directory.

**Note:**
The plugins directory contains all the plugins available to Oxygen XML Editor.

2. In the plugins directory, create a subfolder to store the plugin files (for example, `{OXYGEN_INSTALL_DIR}/plugins/myPlugin`).
3. In the new folder, place the plugin descriptor file (`plugin.xml`), the Java classes of the plugin, and the other files that are referenced in the descriptor file.

4. Restart Oxygen XML Editor.

**Automatic Method**

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to Help > Install new add-ons.

2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the Show add-ons from field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml). If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose ALL AVAILABLE SITES from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

   **Note:**
   To see all the versions of the add-ons, deselect Show only compatible add-ons and Show only the latest version of the add-ons. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, click the Next button, then follow the on-screen instructions.

   **Note:**
   Accepting the license agreement of the add-on is a mandatory step in the installation process.

   **Note:**
   All add-ons are installed in the extensions directory inside the Oxygen XML Editor preferences directory (on page 125).

   **Tip:**
   As an alternate approach, you can add an Install button to a web page that links to a URL that has the syntax [https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue](https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue) and drop the button into the application's main editing area.

**Types of Plugin Extensions Available with the SDK**

A plugin (on page 3224) can have one or more defined plugin extensions that provide functionality to the application. This section presents the plugin extensions that are available.
Workspace Access Plugin Extension

This type of plugin allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an open editor.

The plugin must implement the ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension interface. The callback method applicationStarted of this interface allows access to a parameter of the ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace type (allows for API access to the application workspace).

The StandalonePluginWorkspace interface has three methods that can be called to customize toolbars, menus, and views:

addToolbarComponentsCustomizer

Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated plugin.xml descriptor file using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ............>
    <runtime>
        ........
    </runtime>

    <extension type="WorkspaceAccess" ............/>
    ............
    <toolbar id="SampleID" initialSide="NORTH" initialRow="1"/>
</plugin>
```

The <toolbar> element adds a toolbar in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- **id** - Unique identifier for the toolbar.
- **initialSide** - Specifies the place where the toolbar is initially displayed. The allowed values are NORTH and SOUTH.
- **initialRow** - Specifies the initial row on the specified side where the toolbar is displayed.
  
  For example, the first toolbar has an initial row of 0 and the next toolbar has an initial row of 1.
The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

**addViewComponentCustomizer**

Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated `plugin.xml` descriptor using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ................>
  <runtime>
  ........
  </runtime>

  <extension type="WorkspaceAccess" ................/>
  ........
  <view id="SampleID" initialSide="WEST" initialRow="0"/>
</plugin>
```

The `<view>` element adds a view in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:

- **id** - Unique identifier of the view component.
- **initialSide** - Specifies the place where the view is initially displayed. The allowed values are: NORTH, SOUTH, EAST, and WEST.
- **initialRow** - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Editor, the **Project view (on page 402)** has an initial row of 0 and the **Outline view (on page 539)** has an initial row of 1. Both views are in the WEST part of the workbench.
- **initialState** - Specifies the initial state of the view. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The `<view>` element also supports an optional `<perspective>` child element so that you can show or hide a certain view for a specified perspective. The `<perspective>` element supports the following attributes:

- **id** (required) - Unique identifier for the perspective. The possible values are: editor, dita, xslt_debugger, xquery_debugger, and database.
- **initState** (optional) - Specifies the initial state of the perspective. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.
The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

**addMenuBarCustomizer**

Contributes to or modifies existing menu components.

Access to the open editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)` API method. There are two available editing areas: the DITA Maps Manager editing area and the main editing area. Using the URL of an open resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the Text mode (`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`) and the Author mode (`ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

**Examples:**

- A simple Maven-based sample of a workspace access plugin is available here: [https://github.com/oxygenxml/sample-plugin-workspace-access](https://github.com/oxygenxml/sample-plugin-workspace-access).
- A more complex sample of a workspace access plugin mimicking a CMS integration is available in the Author SDK: [https://www.oxygenxml.com/oxygen_sdk.html](https://www.oxygenxml.com/oxygen_sdk.html).

**Example: Adding a Custom View in Oxygen XML Editor**

To add a custom view in Oxygen XML Editor, follow this procedure:

1. Locate the `plugin.xml` descriptor file for your plugin (should be located inside the `plugins` folder, for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). Define the ID of the view you want to add and specify the location where it will be placed:

   ```xml
   <view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
   ```

2. In your **Workspace Access Plugin Extension** implementation, where the `applicationStarted` callback is received, add a view component customizer like this:

   ```java
   pluginWorkspaceAccess.addViewComponentCustomizer(new ViewComponentCustomizer() {
       public void customizeView(ViewInfo viewInfo) {
           if (viewInfo.getViewID().equals("SampleWorkspaceAccessID")) {
               cmsMessagesArea = new JTextArea("CMS Session History: ");
           }
       }
   });
   ```
viewInfo.setComponent(new JScrollPane(cmsMessagesArea));
viewInfo.setTitle("CMS Messages");
viewInfo.setIcon(Icons.getIcon(Icons.CMS_MESSAGES_CUSTOM_VIEW_STRING));
}
}
});

3. Define the `cmsMessagesArea` as a static field (if you can access the messages area from anywhere in your code).

Related Information:
https://www.oxygenxml.com/oxygen_sdk/oxygen_standalone_plugins.html

**Workspace Access Plugin Extension (JavaScript-Based)**

This is a JavaScript-based plugin (on page 3224) extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the Workspace Access plugin extension (on page 2415), but the implementation is JavaScript-based and uses the bundled Rhino library to create and work with Java API from the JavaScript code.

First, you need to create a custom plugin folder inside the plugins folder (for example, `{OXYGEN_INSTALL_DIR}/plugins/myPlugin`). This folder will contain your custom plugin descriptor file (plugin.xml) and all other resources for the plugin.

The plugin descriptor file (named plugin.xml) needs to reference a JavaScript file, as in the following example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds action to DITA Maps Manager contextual menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file `wsAccess.js` (located in your custom plugin folder (on page 2418)) will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:
With regard to the `applicationStarted` callback, besides using the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the DITA Maps Manager view (on page 2899). The action starts the `notepad.exe` application and passes the reference to the currently selected `<topicref>` to it.

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application started "+ pluginWorkspaceAccess);
    edChangedListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {
            Packages.java.lang.System.err.println("\nrunning "+ editorLocation);
        },
        /*Get the opened DITA Map*/
        editor = pluginWorkspaceAccess.getEditorAccess(editorLocation, Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
        ditaMapPage = editor.getCurrentPage();
        /*Add listener called when right-click is done in the DITA Maps manager*/
        customizerObj = {
            customizePopUpMenu: function (popUp, ditaMapDocumentController) {
                Packages.java.lang.System.err.println("RIGHT CLICK" + popUp);
                tree = ditaMapPage.getDITAMapTreeComponent();
                /*Selected tree path*/
                sel = tree.getSelectionPath();
                if (sel != null) {
                    selectedElement = sel.getLastPathComponent();
                    /*Reference attribute*/
                    href = selectedElement.getAttribute("href");
                    if (href != null) {
                        try {
                            /*Create absolute reference*/
                            absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
                        } catch (e) {
                            Packages.java.lang.System.err.println(e.toString());
                        }
                    }
                }
            },
            customizePopUpMenu2: function (popUp, ditaMapDocumentController) {
                Packages.java.lang.System.err.println("RIGHT CLICK2" + popUp);
            },
        }
    };
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
}
```

With regard to the `applicationStarted` callback, besides using the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the DITA Maps Manager view (on page 2899). The action starts the `notepad.exe` application and passes the reference to the currently selected `<topicref>` to it.

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application started "+ pluginWorkspaceAccess);
    edChangedListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {
            Packages.java.lang.System.err.println("\nrunning "+ editorLocation);
        },
        /*Get the opened DITA Map*/
        editor = pluginWorkspaceAccess.getEditorAccess(editorLocation, Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
        ditaMapPage = editor.getCurrentPage();
        /*Add listener called when right-click is done in the DITA Maps manager*/
        customizerObj = {
            customizePopUpMenu: function (popUp, ditaMapDocumentController) {
                Packages.java.lang.System.err.println("RIGHT CLICK" + popUp);
                tree = ditaMapPage.getDITAMapTreeComponent();
                /*Selected tree path*/
                sel = tree.getSelectionPath();
                if (sel != null) {
                    selectedElement = sel.getLastPathComponent();
                    /*Reference attribute*/
                    href = selectedElement.getAttribute("href");
                    if (href != null) {
                        try {
                            /*Create absolute reference*/
                            absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
                        } catch (e) {
                            Packages.java.lang.System.err.println(e.toString());
                        }
                    }
                }
            },
            customizePopUpMenu2: function (popUp, ditaMapDocumentController) {
                Packages.java.lang.System.err.println("RIGHT CLICK2" + popUp);
            },
        }
    };
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
    /*Create absolute reference*/
    absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
}
```
mi = new Packages.javaw.swing.JMenuItem("Run notepad");

if (pluginWorkspaceAccess == null) {
    mi.addActionListener(new Packages.javaw.awt.event.ActionListener() {
        public void actionPerformed(ActionEvent e) {
            http servlet
        }
    });
}

edChangedListener = new Packages.ro.sync.exml.workspace.api.listeners.WSEditorChangeListener, edChangedListener);

applicationClosing(pluginWorkspaceAccess) { { function applicationClosing(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application closing "+ pluginWorkspaceAccess);
}
Declaring Multiple Modules

JavaScript-based plugins can include multiple modules of JavaScript files in the plugin. In those files, you can declare functions that can be used in the main WorkspaceAccessJS JavaScript file. Thus, you can use those external script files as a library of functions. The modules must be declared in the plugin descriptor file (plugin.xml).

For example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
    id="unique.id.value"
    name="Add Action To DITA Maps Manager popup-menu"
    description="Plugin adds action to DITA Maps Manager contextual menu."
    version="1.0"
    vendor="Syncro Soft"
    class="ro.sync.exml.plugin.Plugin"
    classLoaderType="preferReferencedResources">
    <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
    <extension type="WorkspaceAccessJSModule" href="wsAccessModule1.js"/>
    <extension type="WorkspaceAccessJSModule" href="wsAccessModule2.js"/>
</plugin>
```

For more information and some samples, see GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples.

Trusted Hosts Plugin Extension

This type of plugin (on page 3224) can be used by developers to automatically allow or reject remote connections that Oxygen XML Editor would normally ask the user for confirmation.

The name of the plugin extension is TrustedHosts. For security reasons, Oxygen XML Editor intercepts all connections to remote hosts and displays a dialog box that asks the user for confirmation. By implementing this plugin extension, the application will automatically allow or deny connections from websites you consider and configure as trusted or untrusted.

To develop an integration project, follow this steps:

- Copy the oxygen.jar file from [OXYGEN_INSTALL_DIR]/lib to the lib folder of your project.
- Implement the ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension extension point.
- In the plugin descriptor file, define the <extension> element that points to the implementation of your classes:

```xml
<extension type="TrustedHosts" class="my.trusted.hosts.provider.class.qualified.name"/>
```

Detailed information regarding the accepted or rejected connections from plugins are logged in the Information view (on page 512).
Example implementation:

```java
import ro.sync.exml.plugin.workspace.security.Response;
import ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension;

public class DummyTrustedHostsProviderImpl implements TrustedHostsProviderExtension {

    @Override
    public Response isTrusted(String hostName) {
        // Connections from this website will always be
        // considered safe and always accepted.
        if ("trusted.website:80".equals(hostName)) {
            return TRUSTED;
        } else if ("malicious.website:80".equals(hostName)) {
            // Always reject connections from malicious website
            return UNTRUSTED;
        }
        // All other connections are unknown, so a dialog will
        // appear and ask user's confirmation
        // to allow or deny the connection to this website.
        return UNKNOWN;
    }
}
```

### Author Stylesheet Plugin Extension

This type of plugin (on page 3224) allows you to add a stylesheet (CSS or LESS) that renders elements in Author mode.

To specify additional stylesheets, edit the plugin descriptor and add `<extension>` elements that point to them, as in the following example:

```xml
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```

Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in Author mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the StylesFilter plugin extension (on page 2430).

### Additional Framework Plugin Extension

This type of plugin (on page 3224) allows you to add a new framework straight from the plugin.
To specify additional frameworks, edit the plugin descriptor and add `<extension>` elements that point to them, as in the following example:

```
<extension type="AdditionalFrameworks" path="framework_directory"/>
```

The path attribute should be a sub-directory of the plugin. If the plugin is installed as an add-on (on page 120), the new framework will be set as read-only and editing it will only be possible if you duplicate it (on page 138). If the plugin is installed in the `[OXYGEN_INSTALL_DIR]/plugins` directory, the new frameworks will be editable.

**Additional XProc Engine Plugin Extension**

This type of plugin (on page 3224) contributes a folder that contains an external XProc engine.

The name of the plugin extension is `AdditionalXProcEngine` and it makes it easier to integrate an external XProc engine (on page 1534). After the plugin is installed, when you run an XProc transformation scenario, your external XProc engine can be selected from the Processor drop-down menu in the XProc tab.

An example of the `plugin.xml` file looks like this:

```
<plugin
    id="morgana.xproc.addon"
    name="Contribute Morgana XProc"
    description="Contribute Morgana XProc"
    version="1.0"
    vendor="Syncro Soft"
    class="ro.sync.exml.plugin.Plugin"
    classLoaderType="preferReferencedResources">
    <extension type="AdditionalXProcEngine" path="MorganaXProcEngine/"/>
</extension>
```

The `@path` attribute points to the XProc engine folder that contains the `engine.xml` and all the libraries necessary to run it.

**Components Validation Plugin Extension**

This type of plugin (on page 3224) allows you to customize the menus, toolbars, and other components by enabling or filtering them from the user interface.

This plugin provides the following API:

* **ComponentsValidatorPluginExtension interface**

  There is one method that must be implemented:

  ```java
  getComponentsValidator()
  ```

  Returns a `ro.sync.exml.ComponentsValidator` implementation class used for validating the menus, toolbars, and their actions.
ComponentsValidator interface

Provides methods to filter various features from being added to the GUI of Oxygen XML Editor:

validateMenuOrTaggedAction(String[] menuOrActionPath)
Checks if a menu or a tag action from a menu is allowed and returns a boolean value. A tag is used to uniquely identifying an action. The String[] argument is the tag of the menu / action and the tags of its parent menus if any.

validateToolBarTaggedAction(String[] toolbarOrAction)
Checks if an action from a toolbar is allowed and returns a boolean value. The String[] argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

validateComponent(String key)
Checks if the given component is allowed and returns a boolean value. The String argument is the tag identifying the component. You can remove toolbars entirely using this callback.

validateAccelAction(String category, String tag)
Checks if the given accelerator action is allowed to appear in the GUI and returns a boolean value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.

validateContentType(String contentType)
Checks if the given content type is allowed and returns a boolean value. The String argument represents the content type. You can instruct Oxygen XML Editor to ignore content types such as text/xsl or text/xquery.

validateOptionPane(String optionPaneKey)
Checks if the given options page can be added in the preferences option tree and returns a boolean value. The String argument is the option pane key.

validateOption(String optionKey)
Checks if the given option can be added in the option page and returns a boolean value. The String argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.

validateLibrary(String library)
Checks if the given library is allowed to appear listed in the About dialog box and returns a boolean value. The String argument is the library. This method is mostly for internal use.

validateNewEditorTemplate(EditorTemplate editorTemplate)
Checks if the given template for a new editor is allowed and returns a `boolean` value. The `EditorTemplate` argument is the editor template. An `EditorTemplate` is used to create an editor for a given extension. You can thus filter what appears in the list of the New dialog box.

`isDebuggerPerspectiveAllowed()`

Checks if the debugger perspective (on page 3223) is allowed and returns a `boolean` value.

`validateSHMarker(String marker)`

Checks if the given marker is allowed and returns a `boolean` value. The `String` argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.

`validateToolbarComposite(String toolbarCompositeTag)`

Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

```
<plugin id="romanian.i18n.provider" name="Add Romanian as an user interface language" description="Add Romanian as an user interface language" version="1.0" vendor="Syncro Soft">
  <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```

where the `translation.xml` has a structure like this:

```
<additionalUITranslation>
  <language id="ro"/>
</additionalUITranslation>
```

Tip:

The best way to decide what to filter is to observe the values that Oxygen XML Editor passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.

Contribute Additional Languages Plugin Extension

This type of plugin (on page 3224) allows you to contribute new translation languages to the Oxygen XML Editor UI.

The `AdditionalUITranslation` plugin extension provides the ability to contribute new translation languages to the interface in Oxygen XML Editor.

A sample `plugin.xml` file looks like this:

```
<plugin id="romanian.i18n.provider" name="Add Romanian as an user interface language" description="Add Romanian as an user interface language" version="1.0" vendor="Syncro Soft">
  <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```
If all error keys are not translated in the custom translation.xml contributed by the plugin, the fallback is the default English translation. Once this plugin is installed, the Languages drop-down menu in the Options > Preferences > Global (on page 126) will be updated to include the newly added languages. The end-user will still need to select that language in the drop-down menu to use it.

Contribute External DITA-OT Distribution Plugin Extension

This type of plugin (on page 3224) allows you to contribute an external DITA-OT distribution to Oxygen XML Editor.

Oxygen XML Editor comes bundled with DITA-OT version 3.7.0. If you want to use a different DITA-OT version, the AdditionalDITAOT plugin extension provides the ability to contribute an external distribution of the DITA Open Toolkit to Oxygen XML Editor.

Example

For instance, if you wanted to use a DITA-OT version 1.8, your plugin.xml file might look like this:

```xml
<plugin id="dita-ot-18"
   name="Contribute DITA-OT 1.8"
   description="Contributes DITA-OT 1.8"
   version="1.0"
   vendor="Syncro Soft"
   class="ro.sync.exml.plugin.Plugin">
   <extension type="AdditionalDITAOT" path="DITA-OT1.8.5" description="DITA-OT 1.8"/>
</plugin>
```

The @path attribute points to a folder located relative to the plugin.xml file and this folder is where the additional distribution of DITA-OT would be located.

When Oxygen XML Editor is started with this plugin enabled, that addition DITA-OT version can now be selected in the DITA Open Toolkit option in the DITA preferences page (on page 269).
Custom Protocol Plugin Extension

This type of plugin (on page 3224) allows you to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

**URLStreamHandlerPluginExtension interface**

There is one method that must be implemented:

**getURLStreamHandler(String protocol)**

It takes as an argument the name of the protocol and returns a URLStreamHandler object, or null if there is no URL handler for the specified protocol.

This type of plugin extension can be usually combined with a Workspace Access plugin extension (on page 2415) that can add a custom toolbar with custom actions for opening documents from a certain source.

As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

**URLChooserPluginExtension2 interface**

Makes it possible to create your own dialog box that works with the custom protocol. This interface provides two methods:

**chooseURLs(StandalonePluginWorkspace workspaceAccess)**

Returns a URL[] object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Editor.

**getMenuName()**

Returns a String object that is the name of the entry added in the File menu.

**URLChooserToolbarExtension interface**

Makes it possible to provide a toolbar entry that is used for launching the custom URLs chooser from the URLChooserPluginExtension implementation. This interface provides two methods:

**getToolbarIcon()**

Returns the javax.swing.Icon image used on the toolbar.

**getToolbarTooltip()**

Returns a String that is the tooltip used on the toolbar.

Lock Handler Plugin Extension

This type of plugin extension (on page 3224) is used for locking resources from a specific protocol.
It provides the following API:

**LockHandlerFactoryPluginExtension interface**

You need to implement the following two methods:

- `LockHandler getLockHandler()`
  
  Gets the lock handler for the current handled protocol. Might be `null` if not supported.

- `boolean isLockingSupported(String protocol)`
  
  Checks if a lock handler can be provided for a specific protocol.

To use this type of extension in your plugin, create an extension of `LockHandlerFactory` type in your `plugin.xml` file and specify the class implementing `LockHandlerFactoryPluginExtension`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler" ..............>
   <runtime>........
   </runtime>
   <extension type="LockHandlerFactory"
                class="LockHandlerFactoryPluginExtensionImpl"/>
   .............
</plugin>
```

**Open Redirect Plugin Extension**

This type of plugin (on page 3224) is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the Archive Browser view (on page 2008) a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the `document.xml` main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface `OpenRedirectExtension`. It only has one callback: `redirect(URL)` that receives the URL of the file opened by the Oxygen XML Editor user. If the plugin decides to open also other files it must return an array of information objects (`OpenRedirectInformation[]`) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, `text/xml`). The content type is used for determining the type of editor panel. A `null` content type allows auto-detection of the file type.
Option Page Plugin Extension

This type of plugin extension (on page 3224) allows you to add custom Preferences pages.

The extension must implement the ro.sync.exml.plugin.option.OptionPagePluginExtension class. The provided callbacks allow you to create a custom Swing component that will be added to the page and to react to various calls to persistently save the page settings using the OptionsStorage API.

All preferences pages that are contributed by a plugin are listed in the Preferences dialog box in the Plugins category. As long as the added preferences page has the same name as its plugin, it will be promoted to the first level of the hierarchy within the Plugins category.

The plugin.xml configuration file can specify one or more such extensions using constructs like this:

```xml
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension"/>
```

Sharing Options Through Project Files

To share options that are configured in certain plugin preferences pages, you can store them in a project file (.xpr file extension) that can easily be shared with others. To do this you must:

1. Override ro.sync.exml.plugin.option.OptionPagePluginExtension.getProjectLevelOptionKeys() and return a set of options that need to be saved inside the project.
2. Install the plugin in an Oxygen XML Editor instance. (on page 2413)
3. In the Project view (on page 402), create a project or open an existing one.
4. Open the Preferences dialog box (Options > Preferences) (on page 124).
5. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to Project Options (on page 3224) in each page.

   **Note:**
   Some pages do not have the Project Options button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

6. Click OK and close the Preferences dialog box.

   All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

   **Note:**
   The project file extension (.xpr) must be preserved when the file is distributed to others.

   **Notice:**
   When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.
Resource Locking Custom Protocol Plugin Extension

This type of plugin allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource when opening it in Oxygen XML Editor.

This type of plugin extends the custom protocol plugin type with resource locking support and provides the following API:

**URLStreamHandlerWithLockPluginExtension interface**

The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Editor.

There are two additional methods that must be implemented:

- `getLockHandler()`
  Returns a `LockHandler` implementation class with the implementation of the lock specific methods from the plugin.

- `isLockingSupported(String protocol)`
  Returns a `boolean` that is `true` if the plugin accepts to manage locking for a certain URL protocol scheme (such as `ftp`, `http`, `https`, or `customName`).

Styles Filter Plugin Extension

This type of plugin allows you to dynamically modify the CSS styles used to render elements in the Author mode.

The plugin must extend the `ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension` class. This class has a callback on which you can alter the styles for an Author mode element.

This extension point is similar with the Styles Filter that you set at the framework level. The only difference is that the plugin filters styles are used for any open XML document, regardless of the document type. The changes made by this plugin are prioritized over the changes made by the framework-level filter.

**Note:**
Alternatively, you can use the AuthorStylesheet plugin extension (on page 2422), which does not require any additional Java development and is compatible with Oxygen XML Web Author.

Related Information:
Customizing the CSS Styles Filter (on page 2262)
Targeted URL Stream Handler Plugin Extension

This type of plugin (on page 3224) can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This plugin extension can handle the following protocols: http, https, ftp or sftp. Oxygen XML Editor usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension prompts for the URL stream handler for each open connection of a URL that has that protocol.

To use this type of plugin, you have to implement the ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension interface that provides the following methods:

boolean canHandleProtocol(String protocol)

This method checks if the plugin can handle a specific protocol. If this method returns true for a specific protocol, the getURLStreamHandler(URL) method will be called for each open connection of a URL having this protocol.

URLStreamHandler getURLStreamHandler(URL url)

This method provides the URL handler for the specified URL and it is called for each open connection of a URL with a protocol that has the canHandleProtocol(String) method return true.

If this method returns null, the default Oxygen XML Editor URLStreamHandler is used.

To use this type of extension in your plugin, create an extension of TargetedURLHandler type in your plugin.xml file and specify the class that implements TargetedURLStreamHandlerPluginExtension:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin" ..............>
  <runtime>
    ........
  </runtime>

  <extension type="TargetedURLHandler"
              class="CustomTargetedURLStreamHandlerPluginExtension"/>

    ............

</plugin>
```

This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Editor HTTP URLStreamHandler may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Editor) to use the default SUN URLStreamHandler, since it is more compatible with sending and receiving SOAP requests.
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {
        boolean handleProtocol = false;
        if ("http".equals(protocol) || "https".equals(protocol)) {
            // This extension handles both HTTP and HTTPS protocols
            handleProtocol = true;
        }
        return handleProtocol;
    }

    @Override
    public URLStreamHandler getURLStreamHandler(URL url) {
        // This method is called only for the URLs with a protocol
        // where canHandleProtocol(String) method returns true (HTTP and HTTPS)
        URLStreamHandler handler = null;

        String host = url.getHost();
        String protocol = url.getProtocol();
        if ("some_host\".equals(host)) {
            // When there are connections opened from some_host, the SUN HTTP(S)
            // handlers are used
            if ("http\".equals(protocol)) {
                    .getConstructor(new Class[0]).newInstance(new Object[0]);
            } else {
                handler = (URLStreamHandler) Class.forName("sun.net.www.protocol.https.Handler\")
                    .getConstructor(new Class[0]).newInstance(new Object[0]);
            }
        }
        return handler;
    }
}

XML Refactoring Operations Plugin Extension

This type of plugin (on page 3224) allows you to specify one or more directories where the XML Refactoring
operation resources are loaded.
The `RefactoringOperationsProvider` extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Editor will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

**Example: XML Refactoring Operations Plugin Extension**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">

<plugin
   id="refactoring.operations"
   name="Refactoring operations plugin"
   description="Contains operation descriptors and related scripts"
   version="1.0">
   <extension type="RefactoringOperationsProvider">
     <folder path="customDir/>
     <folder path="customDir2"/>
   </extension>
</plugin>
```

**XSLT Transformer Plugin Extension**

This type of plugin (on page 3224) allows you to add an external XSLT transformer plugin.

The name of the plugin is **Transformer** and it makes it easier to contribute your own implementation of the **XSLT Processor**. After the plugin is installed, you can create a new XML transformation with XSLT scenario (on page 1464) and select your external XSLT engine from **Transformer** drop-down menu in the **XSLT** tab.

To create an XSLT integration project, follow these steps:

- Copy the oxygen.jar file from `${OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the jars of your transformer to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.XSLTTransformerPluginExtension` interface.
- In the plugin descriptor file, define the `<extension>` element that points to the implementation of your classes:

  ```xml
  <extension type="Transformer" class="my.xslt.plugin.extension"/>
  ```

**Validator Plugin Extension**

This type of plugin (on page 3224) allows you to add an external validation engine from a plugin.

The name of the plugin extension is **DocumentValidator** and it makes it possible to contribute your own implementation of a validation engine. After the plugin is installed, if you create a new validation scenario or edit an existing validation scenario to add a validation stage, you will find the name of the new engine contributed by the plugin in the **Validation Engine** combo box.
To create a plugin that implements the validator extension:

1. Implement the `ro.sync.exml.plugin.validator.ValidatorPluginExtension` interface in your plugin's libraries.
2. In the `plugin descriptor file`, define the `<extension>` element that points to the implementation of your classes:

   `<extension type="DocumentValidator" class="my.validator.plugin.extension"/>

### Saxon XSLT Transformer Plugin Extension

This type of plugin (on page 3224) allows you to add an external Saxon XSLT transformer plugin.

The name of the plugin is **Transformer** and it makes it easier to contribute your own implementation of the **Saxon XSLT Processor**. After the plugin is installed, you can create a new **XML transformation with XSLT scenario** (on page 1464) and select your external Saxon engine from **Transformer** drop-down menu in the **XSLT** tab.

To create an XSLT integration project, follow these steps:

- Copy the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the Saxon jars to the `lib` folder of your project.
- Implement the `ro-sync.exml.plugin.transform.SaxonXSLTTransformerPluginExtension` interface.
- In the `plugin descriptor file`, define the `<extension>` element that points to the implementation of your classes, following example:

  `<extension type="Transformer" class="my.saxon.xslt.plugin.extension"/>

An add-on that implements the Saxon XSLT transformer can be found here: **Saxon XSLT and XQuery Transformer Add-on** (on page 2565). For more information, see the Oxygen XML SDK Add-on Repositories web page.

### XQuery Transformer Plugin Extension

This type of plugin (on page 3224) allows you to add an external XQuery transformer plugin.

The name of the plugin is **XQueryTransformer** and it makes it easier to contribute your own implementation of the **XQuery Processor**. After the plugin is installed, you can create a new **XQuery transformation scenario** (on page 1536) and select your external XQuery engine from **Transformer** drop-down menu in the **XQuery** tab.

To create an XQuery integration project, follow these steps:

- Copy the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the jars of your transformer to the `lib` folder of your project.
- Implement the `ro-sync.exml.plugin.transform.XQueryTransformerPluginExtension` interface.
- In the `plugin descriptor file`, define the `<extension>` element that points to the implementation of your classes:

  `<extension type="XQueryTransformer" class="my.xquery.plugin.extension"/>

An add-on that implements the Saxon XSLT transformer can be found here: **Saxon XSLT and XQuery Transformer Add-on** (on page 2565). For more information, see the Oxygen XML SDK Add-on Repositories web page.
Saxon XQuery Transformer Plugin Extension

This type of plugin (on page 3224) allows you to add the Saxon external XQuery transformer plugin.

The name of the plugin is XQueryTransformer and it makes it easier to contribute your own implementation of the Saxon XQuery Processor. After the plugin is installed, you can create a new XQuery transformation scenario (on page 1536) and select your Saxon external XQuery engine from Transformer drop-down menu in the XQuery tab.

To create an XQuery integration project, follow these steps:

- Copy the oxygen.jar file from \[OXYGEN_INSTALL_DIR\]/lib to the lib folder of your project.
- Copy the Saxon jars to the lib folder of your project.
- Implement the ro.sync.exml.plugin.transform.SaxonXQueryTransformerPluginExtension interface.
- In the plugin descriptor file, define the <extension> element that points to the implementation of your classes:

  ```xml
  <extension type="XQueryTransformer" class="my.saxon.xquery.plugin.extension"/>
  ```

An add-on that implements the Saxon XQuery transformer can be found here: Saxon XSLT and XQuery Transformer Add-on (on page 2565). For more information, see the Oxygen XML SDK Add-on Repositories web page.

Plugin Extensions Designed to Work only in the Text Editing Mode

These plugin (on page 3224) extensions operate only when editing documents in the Text mode. They are mounted automatically by the application on the contextual menu in the Plugins submenu.

The Workspace Access Plugin Extension (on page 2415) offers an API that can be used to implement similar functionality for both Text and Author mode.

General Plugin Extension

This type of plugin (on page 3224) allows you to invoke custom code to interact with the workspace in Text mode.

This plugin is the most general plugin type and provides a limited API:

**GeneralPluginExtension interface**

Intended for general-purpose plugins, kind of external tools but triggered from the Plugins menu. The implementing classes must provide the method process(GeneralPluginContext), which must provide the plugin processing. This method takes as a parameter a GeneralPluginContext object.

**GeneralPluginContext class**

Represents the context in which the general plugin extension does its processing. The getPluginWorkspace() method allows you access to the workspace of Oxygen XML Editor.
Selection Plugin Extension

This type of plugin (on page 3224) allows you to manage selections of text.

A selection plugin can be applied to both XML and non-XML documents. The plugin is started by making a selection in the editor, then selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode.

This plugin type provides the following API:

*SelectionPluginExtension* interface

The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The process(GeneralPluginContext) method must return a SelectionPluginResult object that contains the result of the processing. The String value returned by the SelectionPluginResult object can include editor variables (on page 323) such as ${caret} and ${selection}.

*SelectionPluginContext* object

 Represents the context and provides four methods:

- getSelection() - Returns a String that is the current selection of text.
- getFrame() - Returns a Frame that is the editing frame.
- getPluginWorkspace() - Returns access to the workspace of Oxygen XML Editor.
- getDocumentURL() - Returns the URL of the currently edited document.

Related information

Editor Variables (on page 323)

Example - Uppercase Plugin

The following plugin (on page 3224) is called UppercasePlugin and is an example of a Selection plugin. (on page 2436). It is used in Oxygen XML Editor for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor file (plugin.xml):

- UppercasePlugin.java:

```java
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {
    /**
     * Plugin instance.
     */
```
private static UppercasePlugin instance = null;

/**
 * UppercasePlugin constructor.
 * @param descriptor Plugin descriptor object.
 */
public UppercasePlugin(PluginDescriptor descriptor) {
    super(descriptor);

    if (instance != null) {
        throw new IllegalStateException("Already instantiated!");
    }
    instance = this;
}

/**
 * Get the plugin instance.
 * @return the shared plugin instance.
 */
public static UppercasePlugin getInstance() {
    return instance;
}

• UppercasePluginExtension.java:

package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {
    /**
     * Convert the text to uppercase.
     *
     * @param context Selection context.
     * @return Uppercase plugin result.
     */}
public SelectionPluginResult process(SelectionPluginContext context) {
    return new SelectionPluginResultImpl(
        context.getSelection().toUpperCase());
}

• plugin.xml:

```xml
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
  <runtime>
    <library name="lib/uppercase.jar"/>
  </runtime>
  <extension type="selectionProcessor"
    class="ro.sync.sample.plugin.uppercase.UppercasePluginExtension"/>
</plugin>
```

Document Plugin Extension

This type of plugin allows you to manage the current document.

The document plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode. It provides the following API:

**DocumentPluginExtension interface**

Receives the context object containing the current document. The `process(GeneralPluginContext)` method can return a `DocumentPluginResult` object containing a new document.

**DocumentPluginContext object**

Represents the context and provides three methods:

- `getDocument()` - Returns a `javax.swing.text.Document` object that represents the current document.
- `getFrame()` - Returns a `java.awt.Frame` object that represents the editing frame.
- `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Editor.
How to Write a CMS Integration Plugin

To have a complete integration between Oxygen XML Editor and a CMS, you usually have to write a plugin (on page 3224) that combines the following two available plugin extensions:

- Workspace Access (on page 2415)
- Custom protocol (on page 2444)

The usual set of requirements for an integration between Oxygen XML Editor and the CMS are as follows:

1. Contribute to the Oxygen XML Editor toolbars and main menu with your custom Check Out and Check In actions:
   - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
   - **Check In** allows you to send the modified content back to the server.

   You can use the Workspace Access plugin extension (and provided sample Java code) for all these operations.

2. When **Check Out** is called, use the Oxygen XML Editor API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a Custom Protocol extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Editor. Your custom java.net.URLStreamHandler implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```java
/**
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess)
throws MalformedURLException {
//TODO Show the user a custom dialog box for browsing the CMS
//TODO After user selected the resource create a URL with a custom protocol
//which will uniquely map to the resource on the CMS using the URLHandler
//something like:
URL customURL = new URL("mycms://host/path/to/file.xml");
//Ask Oxygen to open the URL
pluginWorkspaceAccess.open(customURL);
//Oxygen will then your custom protocol handler to provide the contents for
//the resource "mycms://host/path/to/file.xml"
//Your custom protocol handler will check out the file in a temporary
```
Figure 604. Check Out Process Diagram

The phases are:

1. Browse CMS repository
2. User chooses a resource
3. Use API to open custom URL: mycms://path/to/file.xml
4. Get content of URL: mycms://path/to/file.xml
5. Get content of resource
6. Store on disk for faster access
7. Retrieve content from disk if already checked out
8. Retrieved content

3. Contribute a special Browse CMS action to every dialog box in Oxygen XML Editor where a URL can be chosen to perform a special action (such as the Reuse Content or Insert Image action). Sample code:

```java
//Add an additional browse action to all dialog boxes/places
//where Oxygen allows selecting a URL.
pluginWorkspaceAccess.addInputURLChooserCustomizer(new InputURLChooserCustomizer() {
```
```java
public void customizeBrowseActions
(List<Action> existingBrowseActions, final InputURLChooser chooser) {
    //IMPORTANT, you also need to set a custom icon on the action
    //for situations when its text is not used for display.
    Action browseCMS = new AbstractAction("CMS") {
        public void actionPerformed(ActionEvent e) {
            URL chosenResource = browseCMSAndChooseResource();
            if (chosenResource != null) {
                try {
                    //Set the chosen resource in the combo box chooser.
                    chooser.urlChosen(chosenResource);
                } catch (MalformedURLException e1) {
                    //
                }
            }
        }
    };
    existingBrowseActions.add(browseCMS);
}
```

When inserting references to other resources using the actions already implemented in Oxygen XML
Editor, the reference to the resource is made by default relative to the absolute location of the edited
XML file. You can gain control over the way that the reference is made relative for a specific protocol
like this:

```java
//Add a custom relative reference resolver for your custom protocol.
//Usually when inserting references from one URL to another Oxygen
//makes the inserted path relative.
//If your custom protocol needs special relativization techniques then
//it should set up a custom relative
//references resolver to be notified when resolving needs to be done.
pluginWorkspaceAccess.addRelativeReferencesResolver{
    //Your custom URL protocol that you already have a
    //custom URLStreamHandlerPluginExtension set up.
    "mycms",
    //The relative references resolver
    new RelativeReferenceResolver() {
        public String makeRelative(URL baseURL, URL childURL) {
            //Return the referenced path as absolute for example.
            return childURL.toString();
            //Or return null for the default behavior.
        }
    }
};
```
4. Write the plugin.xml descriptor file. Your plugin combines the two extensions using a single set of libraries. The descriptor would look like this:

```
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="CustomCMSAccess"
    description="Test"
    version="1.0.0"
    vendor="ACME"
    class="custom.cms.CMSAccessPlugin">
    <runtime>
        <library name="lib/cmsaccess.jar"/>
    </runtime>

    <!--Access to add actions to the main menu and toolbars or to add custom views.-->
    <!--See the "CustomWorkspaceAccessPluginExtension" Java sample for more details-->
    <extension type="WorkspaceAccess"
        class="custom.cms.CustomWorkspaceAccessPluginExtension"/>

    <!--The custom URL handler that will communicate with the CMS implementation-->
    <!--See the "CustomProtocolURLHandlerExtension" Java sample for more details-->
    <extension type="URLHandler"
        class="custom.cms.CustomProtocolURLHandlerExtension"/>
</plugin>
```

5. Create a cmsaccess.jar JAR (on page 3222) archive containing your implementation classes.
6. Copy your new plugin directory in the plugins subfolder of the Oxygen XML Editor install folder (for example, [OXYGEN_INSTALL_DIR]/plugins/myPlugin) and start Oxygen XML Editor.

https://github.com/oxygenxml/oxygen-cmis-plugin
https://github.com/axxepta/project-argon

Class Loading Issues

It is possible that the Java libraries you have specified in the plugin libraries list conflict with the ones already loaded by Oxygen XML Editor. To instruct the plugin to prefer its libraries over the ones used by Oxygen XML Editor, you can add the following attribute on the <plugin> root element:

```
classLoaderType="preferReferencedResources"
```
from the plugin.xml descriptor file.
A **Late Delegation Class Loader** (the main class loader in Oxygen XML Editor) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Editor Class Loader uses as libraries all JARS specified in the `\{OXYGEN_INSTALL_DIR\}\lib` directory. Its parent class loader is the default JVM Class loader. For each **plugin** instance, a separate class loader is created having as parent the Oxygen XML Editor Class Loader.

The **plugin** class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Editor `LateDelegationClassLoader`.

If you experience additional problems, such as:

```java
java.lang.LinkageError: ClassCastException:
  attempting to cast
  jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/javax/xml/ws/spi/Provider.class
to jar:file:/D:/Program Files/Oxygen XML Editor 12/plugins/wspcaccess/../../../xdocs/lib/jaxws/jaxws-api.jar!/javax/xml/ws/spi/Provider.class
  at javax.xml.ws.spi.Provider.provider(
  Provider.java:94) at
  javax.xml.ws.Service.<init>(Service.java:56)
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a `try/finally` statement:

```java
ClassLoader oldClassLoader =
  Thread.currentThread().getContextClassLoader();
try {
    //This is the implementation of the
    //WorkspaceAccessPluginExtension plugin interface.
    Thread.currentThread().setContextClassLoader(
      CustomWorkspaceAccessPluginExtension.
        this.getClass().getClassLoader());
    //WRITE YOUR CODE HERE
}
finally {
    Thread.currentThread().
      setContextClassLoader(oldClassLoader);
}
```
How to Write A Custom Protocol Plugin

To create a custom protocol plugin (on page 3224), follow these steps:

1. Write the handler class for your protocol that implements the `java.net.URLStreamHandler` interface. Be careful to provide ways to encode and decode the URLs of your files.
2. Write the `plugin` class by extending `ro.sync.exml.plugin.Plugin`.
3. Write the `plugin` extension class that implements the `ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface.

   It is necessary that the `plugin` extension for the custom protocol implements the `URLStreamHandlerPluginExtension` interface. Without it, you cannot use your `plugin`, because Oxygen XML Editor is not able to find the protocol handler.

   You can choose also to implement the `URLChooserPluginExtension` interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

   An implementation of the extension `URLHandlerReadOnlyCheckerExtension` allows you to:
   - Mark a resource as read-only when it is opened.
   - Switch between marking the resource as read-only and read-write while it is edited.

   It is useful when opening and editing CMS resources.

4. Write the `plugin.xml` descriptor file.
   Remember to set the name of the `plugin` class to the one from the second step and the `plugin` extension class name with the one you have chosen at step 3.
5. Create a `JAR (on page 3222)` archive with all these files.
6. Create a custom plugin folder inside the `plugins` folder (for example, `\[OXYGEN_INSTALL_DIR]\plugins/myPlugin`) that contains your new `plugin`.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Editor both through a framework (on page 3221) and through a `plugin` (on page 3224). Normally, a `framework` and a `plugin` both run in their own private classloader. If the `framework` and the `plugin` use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one `ClassLoader` and they will both use the same static objects and have the ability to cast objects between one another.

To do this, open the `Preferences` dialog box (Options > Preferences) (on page 124), go to Document Type Association, select the document type, go to the Classpath tab, and in the Use parent classloader from plugin with ID fields introduce the ID of the `plugin`. This ID is declared in the `configuration file of the plugin (on page 2412)`. 
If you have created the framework using a Framework Extension Script, then edit the script and specify the plugin ID on the classpath (on page 2138).

**Important:**
The shared classes must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.

## Packing and Deploying Plugins as Add-ons

In Oxygen XML Editor, a plugin can be packed and deployed as an add-on to provide additional functionality to the application.

### Packing a Plugin as an Add-on

This procedure is suitable for developers who want a better control over the add-on (on page 3224) package or those who want to automate some of the steps:

1. Pack the plugin (on page 3224) as a ZIP file or a Java Archive (on page 3222). Note that you should pack the entire root directory not just its contents.
2. **[Optional]** If you created a Java Archive at the previous step, digitally sign the package. You will need a certificate signed by a trusted authority. To sign the JAR, you can either use the jarsigner command-line tool inside Oracle's Java Development Kit ([JDK_DIR]/bin/jarsigner.exe) or if you are working with Apache Ant (on page 3218), you can use the signjar task (a front for the jarsigner command-line tool). The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate, you can generate one yourself using the keytool command-line utility.

   **Note:**
   This approach is recommended for tests since anyone can create a self-signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Editor provides by going to File > New and selecting the Oxygen add-ons update site template. The products the add-on is compatible with can be specified in the template. Once deployed, this descriptor file is referenced as update site.

### Alternate Packing Method: Add-ons Packager

Alternatively, you can use the Add-ons Packager plugin by following this procedure:

1. Install the Add-ons Packager plugin following the procedure described in Installing Add-ons (on page 120). In the displayed dialog box, enter or paste https://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml in the Show add-ons from field.
2. Restart Oxygen XML Editor. If the add-on is correctly installed, the Add-ons packager toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Click **OK** to complete the packaging process.

### Deploying an Add-on

To deploy an add-on, copy the **.zip** or **Java Archive (on page 3222)** file and the descriptor file to an HTTP server. The URL to this location serves as the **Update Site URL**.

**Related Information:**
- Packing and Deploying Frameworks as Add-ons (on page 2289)
- Oxygen XML Add-on Repositories

### Testing Plugins and Java Extensions

In the various procedures for creating a **plugin (on page 3224)**, you are usually instructed to copy your plugin folder to the `{OXYGEN_INSTALL_DIR}/plugins/` directory. If you want to test the code in your plugin without copying it to that folder, follow this procedure:

1. Create a file called `plugin.redirect` that contains the full file path references to your project (for example, `C:\Users\john_doe\Documents\sample-plugin-folder`).
2. Save that file in any folder (for example, called `sample_test_folder`) inside the `{OXYGEN_INSTALL_DIR}/plugins/` directory.

**Step Result:** Oxygen XML Editor will automatically load the plugin from your project location.
3. Now you can modify the Java code, the IDE will automatically compile it, and if the **plugin.xml** file has a classpath reference to the compiled classes folder, you can restart Oxygen XML Editor and test your changes.

### Creating and Running Automated Tests

If you have developed complex custom **plugins (on page 3224)** or **frameworks (on page 3221)** (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Editor standalone installation includes a main `oxygen.jar` library located in the `{OXYGEN_INSTALL_DIR}`. That **JAR (on page 3222)** library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop **JUnit** tests for your customizations using the Eclipse workbench, follow these steps:
1. Create a new Eclipse Java project and copy the entire contents of the `{OXYGEN_INSTALL_DIR}` folder to the new project under “oxygen” sub-directory.

2. Add all JAR libraries present in the `./oxygen/lib` directory to the **Java Build Path->Libraries** tab. Make sure that the main JAR library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the **Order and Export** tab.

3. Click **Add Library** and add the **JUnit** and **JFCUnit** libraries.

4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

5. Pass the following parameters to the constructor of the super class:
   - **File installationFolder** - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started. According to step 1 it should be "oxygen".
   - **File frameworksFolder** - The file path to the `frameworks` directory. It can point to a custom `framework` directory where it resides. According to step 1 it should be "oxygen/frameworks".
   - **File pluginsFolder** - The file path to the `plugins` directory. It can point to a custom `plugin` directory where it resides. According to step 1 it should be "oxygen/plugins".
   - **File optionsFolder** - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
   - **String licenseKey** - The license key used to license the test class.
   - **int productID** - The ID of the product and should be one of the following: `PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT`, `PluginWorkspaceTCBase.XML_EDITOR_PRODUCT`, or `PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT`.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```java
public class MyTestClass extends PluginWorkspaceTCBase {

    public MyTestClass() throws Exception {
        super(null, new File("frameworks"), new File("plugins"), null,
                "------START-LICENSE-KEY------
                Registration_Name=Developer
                Company=
                Category=Enterprise
                Component=XML-Editor, XSLT-Debugger, Saxon-SA
                Version=14
                "
        }

    }
```
"Number_of_Licenses=1
"\n"+ 
"Date=09-04-2012\n" + 
"\n" + 
"Trial=31\n" + 
"\n" + 
"SGN=MCwCFGNoEGJSeiC3CYIya1vjjHhGhhqAhRNR0pEu88RIWb8icCJO7HgfVP4++A\n=\n" + 
"\n" + 
"-------END-LICENSE-KEY-------

","PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
}

/**
 * <p><b>Description:</b> TC for opening a file and using a bold operation</p>
 * <p><b>Bug ID:</b> EXM-20417</p>
 *
 * @author radu_coravu
 *
 * @throws Exception
 */

public void testOpenFileAndBoldEXM_20417() throws Exception {

Debugging a Plugin Using IntelliJ IDEA

To use IntelliJ IDEA to debug problems in the code of a plugin (on page 3224) without having to re-bundle the plugin’s Java classes in a JAR (on page 3222) library, follow these steps:

1. Download and install Oxygen XML Editor.
2. Set up the Oxygen SDK following this set of instructions.
3. Create a Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where IntelliJ IDEA copies the compiled output. To find out where this directory is located, go to File > Project Structure. Then select the Modules category and inspect the value of the Output path text box from the Path tab.

Example: If the output path is C:$/Users/myUser/Documents/MyPluginProject/target/classes, then in the plugin.xml, you need to add the following library reference in the runtime element:

```xml
<library name="../target/classes"/>
```

5. Copy the plugin.dtd from the [OXYGEN_INSTALL_DIR]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject dependencies (File > Project Structure > Modules > Dependences), add external JAR references to all the JAR libraries in the [OXYGEN_INSTALL_DIR]/lib folder. Now your MyPluginProject should compile successfully.
7. In IntelliJ IDEA, create a new Java Application configuration for debugging (Run > Edit Configurations... > + > Application). Set the Main class box to ro.sync.exml.Oxygen and add the following code snippet in the VM options input box, making sure that the path to the plugins directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
-XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

8. Add a breakpoint (on page 2126) in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your breakpoint (on page 2125), the IntelliJ IDEA debugging view should take over.
Debugging a Plugin Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of a plugin (on page 3224) without having to re-bundle the plugin's Java classes in a JAR (on page 3222) library, follow these steps:

1. Download and install Oxygen XML Editor.
2. Set up the Oxygen SDK following this set of instructions.
3. Create an Eclipse Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the Project view (on page 402)), and go to Build Path > Configure Build Path. Then inspect the value of the Default output folder text box.

   **Example:** If the compiled output folder is classes, then in the plugin.xml, you need to add the following library reference:

   ```xml
   <library name="../classes"/>
   ```

5. Copy the plugin.dtd from the {OXYGEN_INSTALL_DIR}/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject build path, add external JAR references to all the JAR libraries in the {OXYGEN_INSTALL_DIR}/lib folder. Now your MyPluginProject should compile successfully.
7. In the Eclipse IDE, create a new Java Application configuration for debugging. Set the Main class box to ro.sync.exml.Oxygen. Click the Arguments tab and add the following code snippet in the VM arguments input box, making sure that the path to the plugins directory is the correct one:

   ```
   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
   -XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
   ```

8. Add a breakpoint (on page 2126) in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your breakpoint (on page 2125), the Eclipse IDE debugging perspective should take over.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of an extension (on page 3224) without having to bundle its Java classes in a JAR (on page 3222) library, perform the following steps:

1. Download and install Oxygen XML Editor.
2. Create an Eclipse Java Project (for example, MySDKProject) with the corresponding Java sources (for example, a custom implementation of the ro.sync.ecss.extensions.api.StylesFilter interface).
3. In the Project build path, add external JAR references to all the JAR libraries in the {OXYGEN_INSTALL_DIR}/lib folder. In the build path Order and Export panel, make sure that the oxygen.jar entry is before all other libraries. Now your Project should compile successfully.
4. Start the standalone version of Oxygen XML Editor from the \[OXYGEN_INSTALL_DIR\] and in the Document Type Association preferences page (on page 138), edit the document type (for example, DITA) to open the Document Type configuration dialog box (on page 140). In the Classpath tab, add a reference to your Project's classes directory and in the Extensions tab, select your custom StylesFilter extension as a value for the CSS styles filter property. Close the application to save your changes.

5. Create a new Java Application configuration for debugging. The Main Class should be ro.sync.exml.Oxygen. The given VM Arguments should be:

   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m

6. Add a breakpoint (on page 2126) in one of the source Java classes.

7. Debug the created configuration. When the code reaches your breakpoint (on page 2125), the Eclipse IDE debugging perspective should take over.

Disabling a Plugin

To disable a plugin (on page 3224), use one of the following two methods:

- Open the Preferences dialog box (Options > Preferences) (on page 124), go to Plugins, and deselect the plugin that you want to disable.
- Create an empty file called plugin.disable next to the plugin configuration file (plugin.xml). The plugin will be disabled and will no longer be loaded by the application on startup.

Note:
This is useful if you want to temporarily stop work on a plugin and use the application without it.

Oxygen XML Author Component

The Oxygen XML Author Component was designed as a subset of Oxygen XML Editor that can be integrated into another application under the terms of the Oxygen XML Editor SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application to provide WYSIWYG-like XML editing directly in your application.

More information about the setup for the Oxygen XML Author Component can be found on the Oxygen SDK page.

Licensing

The licensing terms and conditions for the Oxygen XML Author Component are defined in the Oxygen SDK License Agreement. To obtain the licensing terms and conditions and other licensing information as well, you can also contact the support team at support@oxygenxml.com. You may also obtain a free of charge evaluation license key for development purposes, subject to registration. Any deployment of an application developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.
There are two main categories of Oxygen XML Author Component integrations:

- **Integration for internal use:**
  
  You develop an application that embeds the *Author Component* to be used internally (in your company or by you). You can buy and use previously purchased Oxygen XML Editor floating licenses to enable the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

- **Integration for external use:**

  Using the Oxygen XML Author Component, you create an application that you distribute to other users outside your company (with a CMS for example). In this case, you should apply for a Value Added Reseller (VAR) partnership by contacting the *Oxygen Sales Team* (https://www.oxygenxml.com/sales_support.html).

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- **Inject floating license server details in the Java code:**

  The following link provides details about how to configure an HTTP floating license server: https://www.oxygenxml.com/license_server.html#floating_license_servlet.

```java
AuthorComponentFactory.getInstance().init(frameworkZips,
    optionsZipURL, codeBase, appID,
    //The servlet URL
    "http://www.host.com/servlet",
    //The HTTP credentials user name
    "userName",
    //The HTTP credentials password
    "password");
...
```

Related Information:
https://www.oxygenxml.com/sdk_agreement.html

**Installation Requirements**

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

- Oracle (Sun) Java JRE version 1.8.
- At least 100 MB disk space and 100MB free memory.

**Customization**

For a special type of XML, you can create a custom framework (on page 3221) (which also works in a standalone version of Oxygen XML Editor). Oxygen XML Editor already has frameworks for editing DocBook,
DITA, TEI, and so on. Their sources are available in the Oxygen SDK. This custom framework is then packed in a zip archive and used to deploy the component.

**Figure 605. Components of a Custom Framework**

Multiple frameworks can coexist in the same component and can be used at the same time for editing XML documents.
You can add on your custom toolbar all actions available in the standalone Oxygen XML Editor application for editing in the **Author** mode. You can also add custom actions defined in the **framework** customized for each XML type.

The Oxygen XML Author Component can also provide the **Outline (on page 539)**, **Model (on page 545)**, **Elements (on page 633)**, and **Attributes (on page 627)** views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the **AuthorComponentFactory** class.

**Related Information:**
- Creating and Configuring Custom Frameworks (on page 2133)
- Oxygen XML Author Component (on page 2451)
- AuthorComponentFactory API

**Example - Customizing the DITA Framework**

If you look inside the `bundle-frameworks\oxygen-frameworks` folder distributed with the Oxygen XML Author Component sample project, it contains a **frameworks** folder. Customizations that affect the...
framework configuration for the component should first be done in a standalone installation of Oxygen XML Editor.

The Oxygen XML Editor installation also includes a frameworks folder that contains the dita framework located in \OXYGEN_INSTALL_DIR\frameworks\dita. The dita framework contains a bundled DITA-OT distribution that contains the DTDs used for DITA editing. If your DTD specialization is a DITA-OT plugin, it should be installed (on page 2413) in the DITA-OT-DIR\plugins folder.

To make changes to the DITA framework configuration, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, and edit or extend the framework. These changes will affect the \OXYGEN_INSTALL_DIR\frameworks\dita\dita.framework configuration file.

After you do this, you can re-pack the Oxygen XML Author Component following the instructions from the README.html file located in the Oxygen XML Author Component sample project. The Author Component sample project and the Oxygen XML Editor standalone installation should be of the same version.

Related Information:
Framework and Author Mode Customization (on page 2133)

Packing a Fixed Set of Options

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have Preferences dialog boxes. However, the Author Component can be configured to use a fixed set of user options on startup.

The sample project contains a module called bundle-options. The module contains a file called options.xml in the oxygen-options folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Editor.

To create an options file in the Oxygen XML Editor:

- Make sure the options that you want to set are not stored at project level (on page 311).
- Set the values you want to impose as defaults in the Preferences pages (on page 124).
- Select Options > Export Global Options.

Adding MathML support in the Oxygen XML Author Component

By default, the Oxygen XML Author Component does not come with the libraries necessary for viewing and editing MathML equations in the Author mode. You can view and edit MathML equations either by adding support for JEuclid (on page 2455) or by adding support for MathFlow (on page 2456).

Adding MathML Support Using JEuclid

By default, the JEuclid library is excluded from the Oxygen SDK artifact dependencies. To enable it, comment the following lines in the pom.xml file:
To edit specialized DITA Composite documents with MathML content, include the entire MathML2 framework directory (for example, the default location is: \( \text{[OXYGEN\_INSTALL\_DIR]/frameworks/mathml2} \)) in the frameworks (on page 3221) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

### Adding MathML Support Using MathFlow

In the pom.xml file, add dependencies to the following additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

**Note:**

For MathFlow 2.1, all of these JAR (on page 3222) files are packaged into one file called MathFlow.jar.

You can reference these additional libraries from the MathFlow SDK as in the example below:

```xml
<dependency>
  <groupId>com.dessci</groupId>
  <artifactId>MFComposer</artifactId>
  <version>1.0.0</version>
  <scope>system</scope>
  <systemPath>${MathFlowSDKDir}/lib/MFComposer.jar</systemPath>
</dependency>
```

In addition, you must obtain fixed MathFlow license keys for editing and composing MathML equations and register them using these API methods: `AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and `AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.

To edit specialized DITA Composite with MathML content, include the entire \( \text{[OXYGEN\_INSTALL\_DIR]/frameworks/mathml2 Mathml2 framework} \) directory in the frameworks (on page 3221) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.
More documentation is available on the Wiris MathFlow website.

**Adding Support to Insert References from a WebDAV Connection**

Predefined actions that insert references, such as the *Insert Image* action, includes a URL chooser field with a drop-down menu that allows you to select a *Browse Data Source Explorer* action. This action opens the **Data Source Explorer (on page 2015)** that allows you to view a WebDAV connection.

To use a WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Editor 24.1 and **configure a WebDAV connection (on page 2068)**.
2. Pack the **fixed set of options (on page 2455)** from the standalone application to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the **httpclient** dependency of the **Oxygen SDK** artifact is excluded. You can enable it by commenting the following lines:

   ```xml
   <exclusion>
     <artifactId>httpclient</artifactId>
     <groupId>org.apache.httpcomponents</groupId>
   </exclusion>
   ```

   If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:

   ```java
   //DBConnectionInfo(String id, String driverName, String url, String user,
   String passwd, String host, String port)
   DBConnectionInfo info = new DBConnectionInfo("WEBDAV", "WebDAV FTP",
   "http://host/webdav-user-root", "userName", "password", null, null);
   AuthorComponentFactory.getInstance().setObjectProperty
   ("database.stored.sessions1", new DBConnectionInfo[] {info});
   ```

**Using Plugins with the Oxygen XML Author Component**

To bundle Workspace Access plugins (on page 3224) that are developed for the standalone application with the Oxygen XML Author Component, follow these steps:

- The **bundle-plugins** module must contain the additional plugin directories in the **dropins** subdirectory. The content must also contain a **plugin.dtd** file. Copy the **plugin.dtd** file from an `{OXYGEN_INSTALL_DIR}\plugins` folder.
- In the class that instantiates the **AuthorComponentFactory** (for example the `ro.sync.ecss.samples.AuthorComponentSample` class), call the methods `AuthorComponentFactory.getPluginToolbarCustomizers()`, `AuthorComponentFactory.getPluginViewCustomizers()`, and `AuthorComponentFactory.getMenubarCustomizers()`, obtain the customizers that have been added
by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the `AuthorComponentSample.reconfigureActionsToolbar()` method for adding the toolbar from the Acrolinx plugin.

**Important:**
As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin will work.

**Frequently Asked Questions**

**Installation and Licensing**

1. Are there any client requirements beyond the Java VM?

   Oracle (formerly Sun) Java JRE version 1.8. At least 200 MB disk space and 200MB free memory is necessary for the Oxygen XML Author Component.

2. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?

   A single `AuthorComponentFactory` instance can create multiple `EditorComponentProvider` editors that can then be added and managed by the developer who customizes the component in a Swing `JTabbedPane`. A single license (floating or user-based) is enough for this.

   If you need to run multiple distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.

**Functionality**

1. What graphic formats can be directly rendered in the Oxygen XML Author Component?

   GIF, JPEG, PNG, BMP and SVG.

2. Can links be embedded to retrieve (from the server) and "play" other types of digital assets, such as audio or video files?

   You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the Oxygen SDK. The Oxygen XML Author Component can only render static images (no GIF animations).

3. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

   No.
4. Does the Oxygen XML Author Component provide any type of autosave functionality?

By default no, but you could customize it to save its content periodically to a file on disk.

5. Assuming multiple documents can be edited simultaneously, can content be copied, cut, and pasted from one Oxygen XML Author Component "instance" to another?

Yes.

6. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?

If no customizations are available, the content is pasted as simple text. Customizations are provided for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

7. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, Serif for the Oxygen XML Author Component), the JVM will know how to map all characters to glyphs. There is no character map available but you could implement one.

**Customization**

1. Describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the-box.

You can mount all actions available in the standalone Oxygen XML Editor application on your custom toolbar. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the Outline (on page 539), Model (on page 545), Elements (on page 633), and Attributes (on page 627) views that can be added to your own panels.

2. Describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The Author mode internal engine uses CSS to render XML.

For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Editor standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions, it could take a long time. Oxygen XML Editor has built-in frameworks for editing (DocBook, DITA, TEI, etc.) and sources for them are available in the Oxygen SDK.

Multiple frameworks can co-exist in the same Oxygen XML Editor instance and can be used at the same time for editing XML documents.
3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

- **Showing/hiding menus, toolbars, helpers, etc.**
  
  You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two implementations: one for advanced users and one for content authors.

- **Forcing behaviors (for example, ensuring change tracking (on page 3226) is on and preventing it from being shut down).**
  
  You could avoid placing the change tracking toolbar actions in the UI. You could also use the API to turn change tracking ON when the content has been loaded.

- **Preventing access to “privileged” editor processes (for example, accept/reject changes).**
  
  You can remove the change tracking actions completely in a custom implementation, including the ones from the contextual menu.

- **Presenting and/or describing XML constructs (for example, tags) in "plain-English".**
  
  Using our API, you can customize what the Outline view or Breadcrumb displays for each XML tag. You can also customize the in-place content completion list.

- **Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para, and inline emphasis).**
  
  The API allows for a content completion filter that also affects the Elements view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?

   Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a "form" (with scripting behind to tag the collection information and embed it in the XML document)?

   Yes.

6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

   A **framework** developed for the standalone version of the Oxygen XML Editor application can then be bundled with the Oxygen XML Author Component. For example, you could use the same framework that you use in the Oxygen XML Editor standalone distribution.

   A custom editing solution can deploy one or more frameworks that can be used at the same time.
Print Document Within the Oxygen XML Author Component

Question

Can a document be printed within the Oxygen XML Author Component?

Answer

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the `preview` parameter value:

```java
AuthorComponentProvider.print(boolean preview)
```

Here is the online Javadoc for this method: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean)

Oxygen XML Web Author Component

The Oxygen SDK provides the ability to integrate the Oxygen XML Web Author into your existing content ecosystem and it allows anyone in your organization to access your content from anywhere they have an internet connection. Oxygen XML Web Author is highly versatile and can be customized to work with any XML vocabulary, most file repository systems, and virtually any type of workflow.

Web Author Component Integration

For information about integrating Oxygen XML Web Author into your environment, see Web Author Integration.

Web Author Customization

For detailed information about customizing Web Author, see the Oxygen XML Web Author Customization Guide.

Using Web Author

For information about using the Web Author product, see the Oxygen XML Web Author User Manual.

Web Author vs. Web Author Component

The purpose of this topic is to help you choose which distribution of Oxygen XML Web Author is appropriate for your particular use-case.

Oxygen XML Web Author has two distributions:

1. **Oxygen XML Web Author** (product) - This version can be downloaded from the Oxygen website and is licensed according to the Web Author License Agreement.
2. **Web Author Component** - Provided as a Maven artifact (according to the SDK Agreement) that is used in the Web Author Component integration project. This project can be used as a starting point for your integration.
For End-Users

For end-users, the recommended distribution is Oxygen XML Web Author (product).

For Plugin and Framework Developers

If you develop frameworks or plugins that provides enhanced functionality for Oxygen XML Web Author, it is recommended to distribute the plugin or framework separately from Web Author. They will work with both types of distributions and the end-users can choose:

- To install your plugin or framework in Web Author.
- To use a solution based on Web Author that has the plugin or framework installed by default.
- To use a solution based on Web Author and install the plugin or framework themselves.

Example of such plugins/frameworks:

- Integration with a terminology database.
- Adding support to edit embedded SVG snippets.
- Providing support for a specific XML language.

For Integration Developers

If you want to integrate Oxygen XML Web Author into another application (for example, a CMS), that you distribute to your end-users, there are several aspects to consider when choosing between the two distributions:

Functionality

There are some features that are available in the installable Oxygen XML Web Author product requires an additional plugin to be available in the Web Author Component. For example, the File Comparison Tool is available by default in the Oxygen XML Web Author product, but requires an additional plugin to be installed for it to be available in the Web Author Component version.

Legal

If you want to use the Web Author Component, you must have your own application that is not called Oxygen XML Web Author, but will contain Web Author as a software component provided by Syncro Soft. Hence,
Syncro Soft does not have a direct legal link with your users, you will handle the licensing of your application to your end-users.

For the official details, you can consult the license agreements for both distributions:

2. **Web Author Component**: [https://www.oxygenxml.com/sdk_agreement.html](https://www.oxygenxml.com/sdk_agreement.html)

**Financial**

If you choose to use the **Web Author** product to distribute as a plugin or framework, then you act as a channel reseller, basically reselling Oxygen XML Web Author to your end-users and you must pay Syncro Soft the corresponding cost of the license.

The **Web Author Component** has more flexible pricing alternatives for resellers that are negotiated for each contract and include:

- Subscription packages similar to the ones used for the Web Author product, but you may get a discount depending on the partnership level (Gold, Silver, Bronze).
- Solution OEM license.

If you choose to integrate the **Web Author Component** into your application, the cost is based on royalties, rather than a cost for the license. That means you do not need to pay for the ability to include the component in your application, but when you distribute your application you must pay a royalty to Syncro Soft.

**Customization**

It is strongly recommended to implement any customization as a combination of plugins, frameworks, and options. If you are using **Web Author Component**, you can also alter the Web Author files, but this is discouraged since those files are not considered API and may change in a future version.

**Deployment**

If you want to use **Oxygen XML Web Author** (product), you can install it using the installation kits, then configure the plugins, frameworks, and options using a browser-based UI. Alternatively, you can configure Oxygen XML Web Author to load the configuration from a custom directory (**Oxygen Data Directory**) along with desired plugins, frameworks, and options.

If you want to use **Web Author Component**, you can use the **Web Author Component integration project** to build a custom WAR file with plugins, frameworks, and options bundled. This WAR file can be deployed in any Servlet container (for example, Tomcat).
Distribution

If you want to use Oxygen XML Web Author (product), your users must download Oxygen XML Web Author from the Oxygen website, while you will distribute your plugins/frameworks to your users. You should provide instructions on how to deploy and use Oxygen XML Web Author. Alternatively, you can install and configure it for them.

If you want to use Web Author Component, you will distribute the customized WAR file.

Developer Quick Start Guide

Oxygen XML Editor allows you to develop add-ons to customize the editing experience. Such customizations can be achieved through a plugin or a framework configuration. This section is meant to provide guidance to developers who are getting started with these types of customizations and to offer links to various resources to help with customizations.

- A plugin can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Once created, a plugin can be deployed and installed as an add-on (on page 2445). For more information, see the The Oxygen SDK (Part 1: Plugins) blog post.

- A framework configuration provides validation, content completion, and editing support for a specific XML vocabulary. See: https://blog.oxygenxml.com/topics/oxygenFrameworks.html. Once created, a framework can be deployed and installed as an add-on. See: https://www.oxygenxml.com/doc/ug-editor/topics/packing-and-deploying-addons.html.

From a legal point of view, you can freely develop and share such extensions as long as they are only used from inside Oxygen XML Editor. For details, see: https://www.oxygenxml.com/sdk_agreement.html.

Plugins

A plugin can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Since Oxygen XML Editor is a Java-based application, most of the allowed plugin types are Java-based but some JavaScript-based plugin types are also supported.

There are lots of plugin types (on page 2414) but the Workspace Access plugin type (on page 2415) is the most versatile of them. This type of plugin allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. A Workspace Access plugin can also contribute frameworks (on page 2422).

The Maven-based Oxygen XML SDK comes with sample plugins and it provides the ability to compile Java extensions for your plugins and frameworks. Also, as a quick start for a Workspace Access plugin, you can use this project: https://github.com/oxygenxml/sample-plugin-workspace-access.

The Workspace Access plugin API can also be used with a JavaScript-based plugin (on page 2418). Small plugin samples can be found here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins.
You can create automated tests (on page 2450) for your plugins and debug them using the Eclipse IDE (on page 2450).

A plugin can either be installed manually or packed as an add-on and installed using Help->Install new add-ons (on page 2413).

Sample Plugins

The Oxygen GitHub site contains lots of open-source plugins (https://github.com/topics/oxygen-standalone-plugin). Most of these plugins are of the Workspace Access type.

There is also a sample project which contains various JavaScript-based plugins: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins.

You can also find a variety of other publicly-hosted Oxygen plugins in the Public Hosted Oxygen Plugin and Framework Projects blog post.

Workspace Access Plugin

This type of plugin extension allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. It is the most useful and most commonly used plugin extension.

A Workspace Access plugin (on page 2415) can also provide frameworks, allowing you to have a single add-on that provides both workspace-level extensions (independent of any given framework) and document type-specific frameworks. If the frameworks involve Java extensions (for example, custom dialog boxes or link text resolvers), they use the Java code for the Workspace Access plugin.

You can include frameworks with a Workspace Access plugin by declaring an "additional frameworks" extension in the plugin.xml file (on page 2422).

Java or JavaScript?

Oxygen XML Editor is a Java-based application and all of its APIs are Java-based. The entire user interface (buttons, views, dialog boxes) is built on top of the Java Swing architecture. The entire Javadoc API documentation is available here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/.

A Workspace Access plugin can be implemented either in Java or in JavaScript. Sample Java-based Workspace Access plugins can be found on the Oxygen XML GitHub page.

Sample JavaScript-based implementations can be found in this sample project: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins. The Rhino library is used to convert the JavaScript method calls to Java API calls: https://github.com/mozilla/rhino.

Related Information:
API Overview

The *Workspace Access plugin extension* is called when the application starts and when it closes.

The *StandalonePluginWorkspace* API can be used in numerous ways:

- Customize the toolbars, contextual menu, and main menus. See: *Adding Toolbar and Menu Actions* (on page 2466).

- Access the API for the *Project* view. See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/StandalonePluginWorkspace.html#getProjectManager--.

- Access utility methods to interact with the end-user (for example, show warning and error dialog boxes, update the results view, or change the status bar). See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/WorkspaceUtilities.html.

- Add a listener to be notified when a new XML document is opened, selected, or closed either in the main editing area or in the *DITA Maps Manager* view. See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/PluginWorkspace.html#addEditorChangeListener--ro.sync.exml.workspace.api.listeners.WSEditorChangeListener-int-

- Provide access to opened XML documents via the *WSEditor* interface. Each opened XML document can be manipulated using the *WSEditor* interface. You can obtain its content, set new content to it, or save its content. You can also validate the editor contents or disable editing inside it. Depending on the current editing mode (*Text* or *Author*), you can gain access to the current *editing page* and send it either to the *Author editing page* or *Text editing page*. Both APIs allow you to make changes to the current document content.

Adding Toolbar and Menu Actions

A *Workspace Access plugin extension* (on page 2415) can contribute custom actions to the contextual menu, main menus, or to the general toolbars.

- **Contributing a new toolbar action:**

  This sample *Workspace Access plugin* contributes a new toolbar called *SampleWorkspaceAccessToolbarID*. The java code of the sample plugin will use the toolbar components customizer API.

- **Contributing an action on the main menu:**
As exemplified in the sample plugin, the `addMenuBarCustomizer` API can be used either to add a new menu or to customize the existing main menu.

- **Contributing a contextual menu action:**

  The same sample plugin uses the `addMenusAndToolbarsContributorCustomizer` API to contribute a contextual menu customizer. Such a customizer can be contributed either for the Text or Author editing modes.

Once an action is added, you can define a new shortcut key for it using the `ActionProvider` API. The action can use the `WSEditor` API to make changes to an open XML document.

The same customizer API can be used to remove actions from the main menu, toolbars, framework-specific menus, and contextual menus.

### Adding a New Side-View

A **Workspace Access plugin (on page 2415)** type can contribute a new side view to Oxygen XML Editor. For example, the following plugin.xml descriptor file defines a new view ID called `SampleWorkspaceAccessToolbarID`: https://github.com/oxygenxml/sample-plugin-workspace-access/blob/master/plugin.xml.

Once the new view ID is declared, the Java code of the plugin can add content to the view using the `pluginWorkspaceAccess.addViewComponentCustomizer` API.

### Customizing the Project View

The API method `StandalonePluginWorkspace.getProjectManager()` allows access to various project-related functionalities:

- Add a new contextual menu action in the Project view.
- Access the set of resources currently selected in the Project view.
- Customize the icons that appear in the Project view.

A sample JavaScript-based plugin that uses this API to add a new contextual menu to the Project view can be found here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/OpenInTerminalProjectContextualAction.

### Customizing the DITA Maps Manager View

You can add a listener to be notified when a new DITA map is opened, selected, or closed in the DITA Maps Manager view. Once the `editorOpened()` callback is received, you can obtain the opened WSEditor API, then send its current page to the WSDitaMapEditorPage.
The API method **WSDitaMapEditorPage** allows you to interact with the DITA map that is open in the **DITA maps Manager** view:

- Add a customizer for the icons and text presented in the tree.
- Enable or disable editing on the tree.
- Set a popup menu customizer.
- Get the selected nodes.
- Get access to the **AuthorDocumentController** API to make changes to the content.

**Sample plugins:**

- JavaScript-based plugin that customizes the icons and text presented for a DITA map that is open in the **DITA Maps Manager** view: [https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/dmmCustomizeTopicTitlesAndIcons](https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/dmmCustomizeTopicTitlesAndIcons).
- JavaScript-based plugin that adds a new contextual menu action for a DITA map that is open in the **DITA Maps Manager** view: [https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/contributePopupActionDMM](https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/contributePopupActionDMM).

**Persistent Storage**

Your plugin may need to save plugin-specific information persistently between two sessions. The **PluginWorkspace.getOptionsStorage()** method allows you to save and retrieve (key, value) pairs persistently between sessions (between closing and restarting Oxygen XML Editor). You can also add listeners to be notified when the values for a certain key are changed.

**Contributing a Custom Preferences Page**

There is a specific plugin extension type that can be used to contribute a custom preferences page (on page 2429) to the **Preferences** dialog box in Oxygen XML Editor. An example of how such a page is implemented can be found in this sample plugin: [https://github.com/oxygenxml/oxygen-dita-prolog-updater-addon/blob/master/src/main/java/com/oxygenxml/prolog/updater/plugin/PrologOptionPageExtension.java](https://github.com/oxygenxml/oxygen-dita-prolog-updater-addon/blob/master/src/main/java/com/oxygenxml/prolog/updater/plugin/PrologOptionPageExtension.java).

**Imposing a Fixed Set of Global Preferences**

You may want to impose a fixed set of global options to be used by all end-users who install the plugin. The **GlobalOptionsStorage** API provides the ability to set the following:

- **Set a certain global option to a certain value:** [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#setGlobalObjectProperty-java.lang.String-java.lang.Object-](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#setGlobalObjectProperty-java.lang.String-java.lang.Object-) The **APIAccessibleOptionTags** interface contains a list with all keys that can be set to a custom value.

Other ways to share a common set of options with others are listed here: https://blog.oxygenxml.com/topics/sharingSettings.html.

Interaction with the End-User

If you need your plugin to frequently interact with the end user, some possibilities include:

• Your plugin can create Java Swing-based components (dialog boxes, frames) that are displayed when custom toolbar or menu actions (on page 2466) added by the plugin are called. You can also extend the Oxygen-specific API base class OKCancelDialog to create a dialog box that already includes OK and Cancel buttons. This specific base also automatically resizes its internal components depending on the currently used fonts or DPI settings and also properly positions the OK and Cancel buttons depending on the operating system (on macOS, the OK button is on the right part of the dialog box, while on Windows and Linux, it is placed on the left part of the dialog box). There is an entire API package that contains base implementations of Swing components and such implementations are recommended to be used for the plugin-contributed components to look like the ones contributed by Oxygen XML Editor.

• Your plugin can add a specific side view (on page 2467).

• The WorkspaceUtilities API allows you to:
  ◦ Show file and folder choosers.
  ◦ Show confirmation dialog boxes.
  ◦ Show information, warning, or error dialog boxes.
  ◦ Show a custom status message in the application.

• The ResultsManager API allows you to add results in the Results view. These results can point to a specific document at a specific line/column location.

• The title of the main application frame can be modified using this API: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/Workspace.html#setParentFrameTitle-java.lang.String-.
Contributing Translations for New Labels and UI Text

You may want your plugin's interaction with the end-user (dialog boxes, pop-up messages, etc.) to be properly translated in all user interface languages (on page 338) supported by Oxygen XML Editor. The API method `StandalonePluginWorkspace.getResourceBundle()` will allow you to pass message keys that will be resolved by the application to specific language-dependent values by looking at a file called `translation.xml`, which needs to be placed in a folder called `i18n` in the plugin installation folder. The structure of the `translation.xml` file needs to look like this: https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html.

Customizing the Application Layout

There are two main ways to customize the layout of the application:

- Remove some of the toolbars, actions, menus, or views that Oxygen XML Editor shows by default when the application starts. A sample plugin that filters the user interface based on an XML configuration file is available here: https://github.com/oxygenxml/oxygen-components-filter-plugin.

- Export the layout of the current views and toolbars in the application using the Window->Export Layout action, then use the `WorkspaceAccess` plugin API to impose a fixed value for a global option key:

```java
File layoutFile = new File(baseDir, "application.layout");
if (layoutFile.exists()) {
    PerspectivesLayoutInfo info = new PerspectivesLayoutInfo(true, false, "",
    layoutFile.getAbsolutePath());
    pluginWorkspaceAccess.setGlobalObjectProperty("perspectives.layout.info", info);
    ...
```

Adding new User Interface Translations

There is a particular plugin extension to contribute a new language to Oxygen XML Editor: https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html.

Frameworks

A framework configuration provides validation, content completion, and visual editing functionality for a certain XML vocabulary. Usually, a framework customization provides a schema used to validate and edit certain type of XML documents, a CSS used to edit the XML documents in the Author visual editing mode and various custom actions or behaviors used to enhance the editing experience. For more information about framework customization, see: https://blog.oxygenxml.com/topics/oxygenFrameworks.html.

Oxygen XML Editor comes with a lot of framework configuration folders (`[OXYGEN_INSTALL_DIR]/frameworks`) to support editing XML documents of various types (such as DocBook, DITA, XHTML, or TEI). All of these existing framework configurations can be further customized in the Preferences->Document Type Associations page. These framework configurations can be used as examples for building your own
customization for a certain XML vocabulary or they can be extended if you want to share a modified version of a framework with others.

The Document Type Association configuration dialog box allows you to configure all the framework-specific settings.

You can also find various open-source frameworks for Oxygen XML Editor online: https://blog.oxygenxml.com/topics/Oxygen%20plugins%20and%20frameworks.html.

Once you have set up a framework configuration folder, it can be packaged as an add-on and shared with others or it can be packaged in workspace access plugins using the “additional framework” extension point in the plugin.xml file (on page 2422).

**Customizing an Existing Framework**

An existing framework that has full built-in support (for example the DITA framework) can be extended and customized. Afterward, this customization can be shared with others. You can use such a framework customization extension to:

- Provide custom new file templates.
- Provide a custom CSS layer to render the framework in the Author visual editing mode.
- Provide custom Schematron-based validation for the XML documents.
- Provide custom Author mode actions on the toolbar, in the contextual menu, and in the main framework-specific menu.
Customizing the Content Completion Proposals

When editing an XML document either in the **Text** or **Author** editing modes, you can invoke the **Content Completion Assistant** (Ctrl+Space in **Text** mode or ENTER in **Author** mode) to see the allowed XML elements or attributes that can be inserted at the current location. The **Elements** view also presents the elements that can be inserted in the document at a certain location, while the **Attributes** view presents a list of allowed attributes and their values.

The content completion proposals can be customized in various ways:

- Each framework can contain a special content completion configuration file. Such a file can:
  - Filter out element proposals for a parent element.
  - Configure a set of required attributes to be inserted along with a certain element.
  - Add new attribute value proposals and for each proposal, add an annotation that will appear in the **Attributes** view for each value.
  - Call an external XSLT script to compute value proposals for a certain attribute.
  - Customize how the element names are presented in the **Outline** view, **Elements** view, and **Content Completion Assistant**.

- You can alter the schema that is associated with the XML document. For example, in the case of the **DITA** vocabulary, you can create a DTD specialization plugin and integrate it into Oxygen XML Editor.

- You can use the **SchemaManagerFilter** API to filter the set of proposed elements and attribute values using Java code.

Adding Custom New File Templates

The **New Document Wizard** (on page 368) (**File->New** or the **New** button on the toolbar) presents custom file templates gathered from all frameworks installed in Oxygen XML Editor. A custom framework can have one or more special folders that contain custom new file templates.

Adding Custom Validation Stages

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation. See: **Configuring Validation Scenarios for a Framework**.

Adding Custom Transformation Scenarios

When distributing a framework to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the
framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs. See: Configuring Transformation Scenarios for a Framework.

### Customizing the Author Visual Editing Mode

The **Author** visual editing mode is based on CSS. Besides supporting most of the CSS 3 specification, Oxygen XML Editor adds some **custom CSS selectors, properties, and functions**. Customization possibilities include:

- Use **CSS selectors** to match XML comments, processing instructions, entities, and CDATA sections.

- Change the tags display mode and tag color for certain elements, mark certain XML elements as not editable, and other customizations using **additional CSS properties**.

- Use **custom CSS functions**. For example, the `oxy xpath` function allows you to run an XPath search over the document and use that value as static text.

- In **custom pseudo-classes**, you can match values that can be changed via a custom action.

- There are specific **@media types** that can be used to mark certain CSS sections for a certain distribution.

- **Fonts can be dynamically loaded** and used for rendering.

### Adding Toolbar and Menu Actions

The **framework customization** *(on page 2470)* can define actions that appear on a framework-specific toolbar when editing content in the **Author** visual editing mode.

You can use the **Author Action** dialog box *(on page 148)* to configure the name, description, icons, menu shortcuts, and various **XPath-enabled activation operations** *(on page 152)*.

You can use a **variety of pre-defined operations** in each activation mode to achieve various things:

- Insert an XML fragment in the document either at the current position or at a specified offset.

- Set an attribute with a certain value on a certain element.

- Invoke an XSLT script using the **XSLTOperation** to produce an XML fragment to be inserted in the document.

- Invoke a JavaScript function that can use the **Author** mode APIs to modify the document. Some samples of such operations can be found here: [https://github.com/oxygenxml/javascript-sample-operations](https://github.com/oxygenxml/javascript-sample-operations).

- Set a CSS pseudo-class on a certain element. The pseudo-class can be matched from the CSS to style various elements differently.

You can also create custom **Author** mode operations by extending the **AuthorOperation** Java API.
Once a custom action has been created, it can be added to the main menu, toolbar, or contextual menu.

**Embedding Form Controls**

By using custom CSS functions, you can embed form controls (checkboxes, combo boxes, text fields, pop-up boxes, buttons, etc.) in the **Author** visual editing mode to edit attribute values or text content for certain elements.

All the supported form controls can be found in the [Form Controls section](#).

Sample XML and CSS documents that use form controls can be found in the `samples/form-controls` folder.

**Adding Inline Actions**

Using the `oxy_button` and `oxy_buttonGroup` form controls, you can add inline actions in the **Author** visual editing mode. To see an example, you can open a Lightweight DITA topic from the folder `samples/dita/lw-dita`.

**Debugging CSS-related Problems**

The **CSS Inspector** view can be used to find out how various CSS styles are applied. For more information, see [Debugging CSS Stylesheets](#).

**Customizing Links**

If you need to have working links between your XML document instances in the **Author** visual editing mode, consider the following possibilities:

- You can use the `-oxy-link` CSS property to specify a link target on a static icon placed before the element.

- You can use the `oxy_link-text()` CSS function to take control over the text presented inside a link using a specific Java extension.

- You can use a custom **ExtensionsBundle** implementation to be notified on a specific callback if the reference needs further processing.

- You can implement a custom link target element finder if the links are not referenced directly to elements that have an ID attribute. The link target element finder will be used to locate the target when the end-user clicks the link.

**Customizing the Smart Paste Mapping**

The **Smart Paste feature** in Oxygen XML Editor preserves certain style and structure information when copying content and pasting it into XML documents. It is also possible to customize the mapping for the **Smart Paste** mechanism.
If you want full control over this behavior, there are also Java extensions that can be customized.

**Difference Between a Framework (Document Type) and a Plugin Extension**

**Question**

What is the difference between a Framework (on page 3221) and a Plugin (on page 3224) Extension?

**Answer**

There are two possible ways to customize the application:

1. Implement a plugin.

   A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Editor.

   For the Oxygen XML Editor Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type (on page 2133) that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end-users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA framework. If you look in the Document Type Association preferences page (on page 138) there is a DITA document type. If you edit that document type you will see that it has an Author tab in the Document Type Configuration dialog box (on page 140). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

   For information about developing your own document types (frameworks), see the Creating and Configuring Custom Frameworks (on page 2133) section.

   If you look on disk in the \[OXYGEN_INSTALL_DIR\]\frameworks\dita folder, there is a file called dita.framework. That file gets updated when you edit a document type from the Document Type Association preferences page (on page 138). Then you can share that updated file with all users.

   The same folder contains some JAR (on page 3222) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

   The Oxygen SDK contains the Java sources from all the DITA Java customizations:

   https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK
**Important:**

It is possible for a plugin to share the same classes with a framework. For further details, go to [How to Share the Classloader Between a Framework and a Plugin](on page 2444).

Related Information:

Adding a Custom Operation to an Existing Framework (on page 2177)

### SDK Common Use Cases

This section contains details for specific use cases regarding customizations using the [Oxygen SDK, Author Component](on page 2451), or plugins (on page 2411).

For additional questions, contact the [Oxygen support team](#). The preferred approach is via email because these types of questions must be analyzed thoroughly. The [Oxygen support team](#) also provides code snippets, if applicable.

To stay up-to-date with the latest changes, discuss issues, and ask for solutions from other developers working with the [Oxygen SDK](#), register on the [Oxygen-SDK mailing list](#).

### Add Custom Actions to the Contextual Menu

**Use Case**

You want to add your own custom actions to the contextual menu using an API.

**Solution**

The `WSAuthorEditorPageBase.addPopUpMenuCustomizer` and `WSTextEditorPage.addPopUpMenuCustomizer` API methods allow you to customize the contextual menu shown either in the Author or Text modes. The API is available both in the standalone application and in the Eclipse plugin.

To add actions to the Author page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

   ```java
   import org.eclipse.jface.action.ContributionManager;
   import org.eclipse.ui.PlatformUI;
   import org.eclipse.ui.menus.IMenuService;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;

   /**
    * This class is used to create the possibility to attach certain menuContributions to the ContributionManager, which is used for the popup menu in the Author Page of the Oxygen Editor.
    */
   ```
* You just need to use the `org.eclipse.ui.menus` extension and add a
* `menuContribution` with the locationURI: `<b>menu:oxygen.authorpage</b>`
*/

```java
public class OxygenAuthorPagePopupMenuCustomizer implements AuthorPopupMenuCustomizer {

@Override
    public void customizePopUpMenu(Object menuManagerObj, AuthorAccess authoraccess) {
        if (menuManagerObj instanceof ContributionManager) {
            ContributionManager contributionManager = (ContributionManager) menuManagerObj;
            IMenuService menuService = (IMenuService) PlatformUI.getWorkbench().getActiveWorkbenchWindow().getService(IMenuService.class);

            menuService populateContributionManager(contributionManager,
            "menu:oxygen.authorpage");
            contributionManager.update(true);
        }
    }
}
```

2. Add a workbench listener and add the pop-up customizer when an editor is open in the **Author** page:

```java
Workbench.getInstance().getActiveWorkbenchWindow().getPartService().addPartListener(
    new IPartListener() {
        @Override
            public void partOpened(IWorkbenchPart part) {
                if (part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {
                    WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
                    if (currentPage instanceof WSAuthorEditorPage) {
                        ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer(new OxygenAuthorPagePopupMenuCustomizer());
                    }
                }
            }
    });
```

3. Implement the extension point in your `plugin.xml` file:

```xml
<extension point="org.eclipse.ui.menus">
    <menuContribution allPopups="false">
```
```
Add Custom Callouts

Use Case

You want to highlight validation errors, instead of underlining them (for example, changing the text background color to red or yellow) and display a message directly at the error position that describes the problem.

Solution

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the Author mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

![Figure 607. Custom Callouts with Persistent Highlights](image)

Here is a working example:

```java
/**
 * Plugin extension - workspace access extension.
 */
```
public class CustomWorkspaceAccessPluginExtension implements WorkspaceAccessPluginExtension {

    /**
     * @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension
     * #applicationStarted(
     * ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
     */

    public void applicationStarted{
        (final StandalonePluginWorkspace pluginWorkspaceAccess) {
            pluginWorkspaceAccess.addEditorChangeListener
                (new WSEditorChangeListener() {
                    /**
                     * @see WSEditorChangeListener#editorOpened(java.net.URL)
                     */
                    @Override
                    public void editorOpened(URL editorLocation) {
                        final WSEditor currentEditor = pluginWorkspaceAccess.getEditorAccess
                            (editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
                        WSEditorPage currentPage = currentEditor.getCurrentPage();
                        if(currentPage instanceof WSAuthorEditorPage) {
                            final WSAuthorEditorPage currentAuthorPage =
                                (WSAuthorEditorPage)currentPage;
                            currentAuthorPage.getPersistentHighlighter().setHighlightRenderer
                                (new PersistentHighlightRenderer() {
                                    @Override
                                    public String getTooltip(AuthorPersistentHighlight highlight) {
                                        return highlight.getClonedProperties().get("message");
                                    }
                                    @Override
                                    public HighlightPainter getHighlightPainter
                                        (AuthorPersistentHighlight highlight) {
                                        //Depending on severity could have different color.
                                        ColorHighlightPainter painter = new ColorHighlightPainter
                                            (Color.COLOR_RED, -1, -1);
                                        painter.setBgColor(Color.COLOR_RED);
                                        return painter;
                                    }
                                });
                            currentAuthorPage.getReviewController()
                                .getAuthorCalloutsController().setCalloutsRenderingInformationProvider(
                                    new CalloutsRenderingInformationProvider() {
                                        @Override
                                        public String getOverview(String fileName, String encoding, URL baseURL) {
                                            return "Author Callouts in " + fileName + ".
                                        }
                                    });
        }
    }
}
```java
@Override
public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
    // All custom highlights are ours
    return true;
}

@Override
public AuthorCalloutRenderingInformation getCalloutRenderingInformation(
    final AuthorPersistentHighlight highlight) {
    return new AuthorCalloutRenderingInformation() {
        @Override
        public long getTimestamp() {
            // Not interesting
            return -1;
        }
        @Override
        public String getContentFromTarget(int limit) {
            return "";
        }
        @Override
        public String getComment(int limit) {
            return highlight.getClonedProperties().get("message");
        }
        @Override
        public Color getColor() {
            return Color.COLOR_RED;
        }
        @Override
        public String getCalloutType() {
            return "Problem";
        }
        @Override
        public String getAuthor() {
            return "";
        }
        @Override
        public Map<String, String> getAdditionalData() {
            return null;
        }
    };
    currentEditor.addValidationProblemsFilter(new ValidationProblemsFilter() {
        ...
    });
```
List<int[]> lastStartEndOffsets = new ArrayList<int[]>();
/**
 * @see ro.sync.exml.workspace.api.editor.validation.ValidationProblemsFilter
 #filterValidationProblems
 (ro.sync.exml.workspace.api.editor.validation.ValidationProblems)
 */
@Override

 */
    public boolean applicationClosing() {
        return true;
    }
Add Custom Highlights to Content

Use Case

You want to add custom highlights to the document content in Author mode.

Solution

There are two types of highlights you can add:

1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
   ```

   to obtain an `AuthorHighlighter` that allows you to add a highlight between certain offsets with a specified painter.

   For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlighter()
   ```

   to obtain an `AuthorPersistentHighlighter` class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

   For example, you can use this support to implement your own way of adding review comments.

Adding Custom Persistent Highlights ([on page 2237](#))

Auto-Generate an ID When a Document is Opened or Created

Use Case

You want to configure how the application generates IDs (you need IDs that have a certain format for each created topic).
Solution

This could be done implementing a plugin (on page 3224) for Oxygen XML Editor using the Plugins SDK:

There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the open editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```java
public class WSEditorChangeListener implements WSEditorChangeListener {

    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }

    @Override
    public void editorPageChanged(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }

    private void generateID(WSEditor ed) {
        if (ed.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
            AuthorDocumentController ctrl = authorEditPage.getDocumentController();
            AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
            if (root.getAttribute("id") == null || !root.getAttribute("id").getValue().startsWith("generated_")) {
                ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
            }
        }
    }
}
```
Change the Default Track Changes (Review) Author Name

Use Case

You want to change the default author name used for *Tracked Changes* (on page 3226) in the *Author Component*.

Solution

The *Track Changes* (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:
   
   ```java
   ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
   ```

2. **Options** - If the author name was not imposed from the API, it is determined from the *Author* option set in the *Review* preferences page (on page 184).

3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:
   
   ```java
   System.getProperty("user.name")
   ```

So, to impose the *Track Changes* author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method:
   
   https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/
   
   AuthorReviewController.html#setReviewerAuthorName(java.lang.String)

2. Customize the default options and set a specific value for the *Author* name option set in the *Review* preferences page (on page 184).

3. Set the value of *user.name* system property when the *Author Component* is initializing and before any document is loaded.

Change the DOCTYPE of an Open XML Document

Use Case

You want to change the DOCTYPE of a document that is open in the *Author* mode.

Solution

The following API:

```java
ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()
``` 

allows you to get the **DOCTYPE** of the current XML file open in the *Author* mode.

There is also an API method available that would allow you to set the **DOCTYPE** back to the XML:

```java
ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)
```
Here is an example of how this solution would work:

```java
AuthorDocumentType
dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
  "<!DOCTYPE article PUBLIC \"testPublicID\" \"testSystemID\">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing DOCTYPE,

```java
ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()
```

modify it to your needs, and create another `AuthorDocumentType` object with the new content and with the same public, system IDs.

For example, you could use this API is you want to add unparsed entities in the XML `DOCTYPE`.

### Control XML Serialization in the Oxygen XML Author Component

#### Use Case

You want to force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside `block elements (on page 3218)`.

#### Solution

Usually, in a standalone version of Oxygen XML Editor, the **Editor > Format** and **Editor > Format > XML** preferences pages allow you to control the way the XML is saved on the disk after you edit it in the **Author** mode.

Also, the `APIAccessibleOptionTags` interface contains a list of all accessible keys that can be read or set from the options.

In the Oxygen XML Editor application, you can either bundle a default set of options *(on page 309)* or use the **PluginWorkspace.setGlobalObjectProperty(String, Object)** API:

```java
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty
  (APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty
  (APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);
//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty
  (APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);
//Zero indent size
```
In the Oxygen XML Author Component, you can either bundle a **fixed set of options** *(on page 2500)*, or use the **Java API** to set properties that overwrite the default options.

```java
//For not breaking the line
//Long line
AuthorComponentFactory.getInstance().setObjectProperty()
(APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));
//Do not break before inline elements
AuthorComponentFactory.getInstance().setObjectProperty()
(APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);
//For forcing zero indent
//Force indent settings to be controlled by us
AuthorComponentFactory.getInstance().setObjectProperty()
(APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);
//Zero indent size
AuthorComponentFactory.getInstance().setObjectProperty()
(APIAccessibleOptionTags.EDITOR_INDENT_SIZE, 0);
```

**Customize the Outline View in Text Mode**

**Use Case**

You want to customize the **Outline view** *(on page 539)* in **Text mode**.

**Solution**

Suppose that you have the following XML document:

```xml
<doc startnumber="15">
  <sec counter="no">
    <info/>
    <title>Introduction</title>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
</doc>
```
and you want to display the XML content in a simplified Outline view like this:

```xml
<doc>
  <sec>
    <title>Introduction</title>
    <para>Content</para>
  </sec>
</doc>
```

Usually, an Outline view should have the following characteristics:

1. Double-clicking a node in the Outline view would select the corresponding XML content in the editor.
2. When the cursor moves in the open XML document, the Outline view would select the proper entry.
3. When modifications occur in the document, the Outline view would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```java
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */

public class CustomWorkspaceAccessPluginExtension implements WorkspaceAccessPluginExtension {

  /*
   * The custom outline list.
   *
   */
  private JList customOutlineList;

  /*
   * Maps outline nodes to ranges in document
   *
   */
  private WSXMLTextNodeRange[] currentOutlineRanges;

  /*
   * The current text page
   *
   */
  private WSXMLTextEditorPage currentPage;

  /**
   */
```

```java
```
* Disable CaretListener when we select from the CaretListener.

    private boolean enableCaretListener = true;

    /**
     * @see WorkspaceAccessPluginExtension#applicationStarted
     * (ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
     */
    @Override
    public void applicationStarted(
        final StandalonePluginWorkspace pluginWorkspaceAccess) {
        pluginWorkspaceAccess.addViewComponentCustomizer
            (new ViewComponentCustomizer() {
                /**
                 * @see ViewComponentCustomizer#customizeView
                 * (ro.sync.exml.workspace.api.standalone.ViewInfo)
                 */
                @Override
                public void customizeView(ViewInfo viewInfo) {
                    if (//The view ID defined in the "plugin.xml"
                        "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
                        customOutlineList = new JList();
                    //Render the content in the Outline.
                    customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
                        /**
                         * @see javax.swing.DefaultListCellRenderer#getListCellRendererComponent
                         * (javax.swing.JList, java.lang.Object, int, boolean, boolean)
                         */
                        @Override
                        public Component getListCellRendererComponent
                            (JList<?> list, Object value, int index, boolean isSelected,
                             boolean cellHasFocus) {
                            JLabel label = (JLabel) super.getListCellRendererComponent
                                (list, value, index, isSelected, cellHasFocus);
                            String val = null;
                            if (value instanceof Element) {
                                Element element = ((Element)value);
                                val = element.getNodeName();
                                if (!"".equals(element.getAttribute("startnumber"))) {
                                    val += " " + "'
                                
                                JList component
                                    (JList<?>, Object, int, boolean, boolean) {"}
NodeList titles = element.getElementsByTagName("title");
if(titles.getLength() > 0) {
    val += " " + titles.item(0).getTextContent() + "\"; 
}
label.setText(val);
return label;
});

//When we click a node, select it in the text page.
customOutlineList.addMouseListener(new MouseAdapter() {

    return true;
}
}

Disable Context-Sensitive Menu Items for Custom Author Actions

Use Case

You want to disable menu items for custom Author mode actions depending on the cursor context.

Solution

By default, Oxygen XML Editor does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain Author mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own ro.sync.ecss.extensions.api.ExtensionsBundle implementation you can overwrite the method:

ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()

and when the extension state listener gets activated, you can use the API like this:

/**
 * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated(ro.sync.ecss.extensions.api.AuthorAccess)
 */

public void activated(final AuthorAccess authorAccess) {

    //Add a caret listener to enable/disable extension actions:

authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener()
{
    @Override
    public void caretMoved(AuthorCaretEvent caretEvent) {
        try {
            Map<String, Object> authorExtensionActions =
            authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();
            //Get the action used to insert a paragraph. It's ID is "paragraph"
            AbstractAction insertParagraph = (AbstractAction) authorExtensionActions.get("paragraph");
            //Evaluate an XPath expression in context of the current node
            Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath
            ("*[ancestor-or-self::p]", false, false, false, false);
            if(evaluateXPath != null && evaluateXPath.length > 0 &&
            evaluateXPath[0] != null) {
                //We are inside a paragraph, disable the action.
                insertParagraph.setEnabled(false);
            } else {
                //Enable the action
                insertParagraph.setEnabled(true);
            }
        } catch (AuthorOperationException e) {
            e.printStackTrace();
        }
    }
});

When the extension is deactivated, you should remove the CaretListener to avoid adding multiple listeners that
perform the same functionality.

Dynamically Add Form Controls Using a Styles Filter

Use Case

You want to add form controls using an API.

Solution

Usually, a form control is added from the CSS using one of the built-in form controls (on page 2373). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically
ro.sync.ecss.extensions.api.StylesFilter.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
            && "before".equals(authorNode.getName())) {
            authorNode = authorNode.getParent();
        }
        if ("country".equals(authorNode.getName())) {
            // This is the BEFORE pseudo element of the "country" element.
            // Read the supported countries from the configuration file.
            Map<String, Object> formControlArgs = new HashMap<String, Object>();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE, InplaceEditorArgumentKeys.TYPE_COMBOBOX);
            // This will be a comma separated enumeration: France, Spain, Great Britain
            String countries = readCountriesFromFile();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");
            // We also add a label in form of the form control.
            Map<String, Object> labelProps = new HashMap<String, Object>();
            labelProps.put("text", "Country: ");
            labelProps.put("styles", "* {width: 100px; color: gray;}");
            StaticContent[] mixedContent = new StaticContent[] {
                new LabelContent(labelProps),
                new EditorContent(formControlArgs)
            };
            styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
        }
        // The added form control is the only way the element can be edited.
        if ("country".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
        }
        return styles;
    }
}

If the execution of the formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries); line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called lazy evaluation and can be implemented as follows:
The lazy evaluation approach can be used for the following form controls properties:

- `InplaceEditorArgumentKeys.PROPERTY_VALUES`
- `InplaceEditorArgumentKeys.PROPERTY_LABELS`
- `InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS`

The full source code for this example is available inside the Oxygen SDK.

**Dynamically Modify the Content Inserted by the Author**

**Use Case**

You want to insert typographic quotation marks instead of double quotes.

**Solution**

By using the API you can set a document filter to change the text that is inserted in the document in Author mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```java
authorAccess.getDocumentController().setDocumentFilter
(new AuthorDocumentFilter() {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
     * (ro.sync.ecss.extensions.api.AuthorDocumentFilterBypass, int, java.lang.String)
     */
    @Override
    public void insertText(AuthorDocumentFilterBypass filterBypass, int offset, String toInsert) {
        if(toInsert.length() == 1 && ".\u201c\u201d.equals(toInsert)) {
            //User typed a quote but he actually needs a smart quote.
            //So we either have to add \u201E (start smart quote)
            //Or we add \u201C (end smart quote)
            //Depending on whether there's already a start smart quote inserted
        }
    }
});
```
```java
try {
    AuthorNode currentNode =
authorAccess.getDocumentController().getNodeAtOffset(offset);
    int startOfTextInCurrentNode = currentNode.getStartOffset();
    if (offset > startOfTextInCurrentNode) {
        Segment seg = new Segment();
        authorAccess.getDocumentController().getChars(startOfTextInCurrentNode, offset - startOfTextInCurrentNode, seg);
        String previousTextInNode = seg.toString();
        boolean insertStartQuote = true;
        for (int i = previousTextInNode.length() - 1; i >= 0; i--) {
            char ch = previousTextInNode.charAt(i);
            if ('\u201C' == ch) {
                // Found end of smart quote, so yes, we should insert a start one
                break;
            } else if ('\u201E' == ch) {
                // Found start quote, so we should insert an end one.
                insertStartQuote = false;
                break;
            }
        }
        if (insertStartQuote) {
            toInsert = "\u201E";
        } else {
            toInsert = "\u201C";
        }
    } catch (BadLocationException e) {
        e.printStackTrace();
    }
}
System.err.println("INSERT TEXT |" + toInsert + "|");
super.insertText(filterBypass, offset, toInsert);
```
An alternative to using a document filtering is the use of a `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

**Extend the Java Functionality of an Existing Framework (Document Type)**

**Use Case**

You want to change the way a DocBook 4 `<xref>` displays in Author mode based on what element is at the `@linkend`.

**Solution**

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Editor classes:

   ```xml
   <dependency>
     <groupId>com.oxygenxml</groupId>
     <artifactId>oxygen-sdk</artifactId>
     <version>${oxygen.version}</version>
   </dependency>
   ```

   where `${oxygen.version}` is the version of Oxygen XML Editor.

   Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `{OXYGEN_INSTALL_DIR}\frameworks\docbook\docbook.jar` to the class path of the project.

4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).

5. Pack your extension classes in a JAR (on page 3222) file. Copy the JAR to: `{OXYGEN_INSTALL_DIR}\frameworks\docbook\custom.jar`.

7. **Open the Preferences dialog box (Options > Preferences) (on page 124)** and go to **Document Type Association**. Edit the DocBook 4 document type. In the **Classpath** list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.

8. You can rename the document type and the `docbook framework` folder to something else (such as `custom_docbook`) and share it with others. A document type can also be installed using the add-on support (on page 2289).
Impose Custom Options for Authors

Use Case

You want to force Track Changes (on page 3226) to be enabled at startup.

Solution

There are two ways to enable Track Changes for every document that you open:

1. You could customize the default options (on page 309) that are used by your authors and set the Track Changes - Initial State option (on page 183) to Always On.
2. Use an API to toggle the Track Changes state after a document is opened in Author mode:

```java
// Check the current state of Track Changes
boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
    // Set Track Changes state to On
    authorAccess.getReviewController().toggleTrackChanges();
}
```

Insert an Element with all the Required Content

Use Case

You want to insert a DITA image element that points to a certain resource and has required content and you want the required content be automatically inserted.

Solution

The API ro.sync.ecss.extensions.api.AuthorSchemaManager can propose valid elements that can be inserted at the specific offset. Using the method AuthorSchemaManager.createAuthorDocumentFragment(CIElement), you can convert the proposed elements to document fragments (on page 3220) (which have all the required content filled in) that can then be inserted in the document.

```java
AuthorSchemaManager schemaManager =
    this.authorAccess.getDocumentController().getAuthorSchemaManager();

WhatElementsCanGoHereContext context =
    schemaManager.createWhatElementsCanGoHereContext(
        this.authorAccess.getEditorAccess().getCaretOffset());

List<CIElement> possibleElementsAtCaretPosition =
    schemaManager.whatElementsCanGoHere(context);

loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
    CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
    List<CIAttribute> attrs = possibleElement.getAttributes();
```
if (attrs != null) {
  for (int j = 0; j < attrs.size(); j++) {
    CIAttribute ciAttribute = attrs.get(j);
    if (ciAttribute.getName().equals("class")) {
      if (ciAttribute.getDefaultValue() != null
          && ciAttribute.getDefaultValue().contains(" topic/image ")) {
        //Found a CIElement for image
        //Create a fragment that contains all required child elements already built.
        AuthorDocumentFragment frag =
            schemaManager.createAuthorDocumentFragment(possibleElement);
        //Now set the @href to it.
        //Ask the user and obtain a value for the @href
        //Then:

        String href = "test.png";
        List<AuthorNode> nodes = frag.getContentNodes();
        if (!nodes.isEmpty()) {
          AuthorElement imageEl = (AuthorElement) nodes.get(0);
          imageEl.setAttribute("href", new AttrValue(href));
        }
        //And insert the fragment.
        this.authorAccess.getDocumentController().insertFragment
            (this.authorAccess.getEditorAccess().getCaretOffset(), frag);
        break loop;
      }
    }
  }
}

AuthorDocumentFragment Class

Modify the XML Content on Open

Use Case

You want to convert fixed paths in an attribute value to relative paths.

Solution

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:
1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use the **Author API** to change attributes:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
            (StandalonePluginWorkspace.MAIN_EDITING_AREA);
        if(openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authPage = (WSAuthorEditorPage) openedEditor.getCurrentPage();
            AuthorDocumentController docController = authPage.getDocumentController();
            try {
                //All changes will be undone by pressing Undo once.
                docController.beginCompoundEdit();
                fixupImageRefs(docController, docController.getAuthorDocumentNode());
            } finally {
                docController.endCompoundEdit();
            }
        }

        private void fixupImageRefs(AuthorDocumentController docController, AuthorNode authorNode) {
            if(authorNode instanceof AuthorParentNode) {
                //Recurse
                List<AuthorNode> contentNodes = ((AuthorParentNode)authorNode).getContentNodes();
                if(contentNodes != null) {
                    for (int i = 0; i < contentNodes.size(); i++) {
                        fixupImageRefs(docController, contentNodes.get(i));
                    }
                }
            }
            if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
                AuthorElement elem = (AuthorElement) authorNode;
                if("image".equals(elem.getLocalName())) {
                    if(elem.getAttribute("href") != null) {
```
Modify the XML Content on Save

Use Case

You the revised date on a DITA document to be updated when it is saved.

Solution

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes before the save takes place:

```java
@Override
public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
        // An editor was opened
        @Override
        public void editorOpened(URL editorLocation) {
            final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
```
Multiple Rendering Modes for the Same Document in Author Mode

Use Case

You want to add multiple buttons, each showing a different visualization mode of the same document, in **Author** mode.
Solution

In the toolbar in Author mode, there is a Styles drop-down menu that contains alternate CSS styles (on page 3218) for the same document. To add an alternate CSS stylesheet, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select the document type associated with your documents and click Edit. In the Document Type configuration dialog box (on page 140) that appears, go to the Author tab, and in the CSS subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets offered for the DITA document type is located here (by default):

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css
```

If you open it, you will see that it imports the main CSS (on page 3222) and then adds selectors of its own.

Obtain the Currently Selected Element Using the Author API

Use Case

In Author mode, if an element is fully selected, you want to perform an action on it. If not, you want to perform an action on the node that is located at the cursor position.

Solution

When an element is fully selected by the user the selection start and end offsets are actually outside of the node’s offset bounds. So using AuthorDocumentController.getNodeAtOffset will actually return the parent of the selected node. A special API is available that makes it easier for you to determine this situation: WSAuthorEditorPageBase.getFullySelectedNode().

```
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

AuthorElement nodeAtCaret =
    (AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();

if (nodeAtCaret == null) {
    // We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement) authorAccess.getDocumentController().getNodeAtOffset(caretOffset);

    // Or we could look at the selection start and end, see which node is
    // the parent of each offset and get the closest common ancestor.
}
```
Open a Document from Another Application

Restriction:
This feature is currently only available for macOS users.

Use Case
You want to open a document from another application in Oxygen XML Editor.

Solution
The Oxygen XML Editor installation kit for macOS comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is `edit-in-oxygen` and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:

```
```

Oxygen XML Editor will start and open the HTML content from the URL `http://www.oxygenxml.com/index.html`.

Tip:
You can also use anchors on the URL to point to specific lines or elements inside the open document:

Opening a Document at a Specific Location Using a Command-Line Interface (on page 383).

Run XSLT or XQuery Transformations

Use Case
You want to run XSL 2.0 / 3.0 transformations with Saxon EE using the Oxygen SDK.

Solution
The API class `ro.sync.exml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an AuthorAccess API available:

```java
InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl"))).toString();
xxlSrc = new SAXSource(is);
javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```
If you want to create the transformer from the plugin side, you can use this method instead:

\[
\text{ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess()}
\]

### Save a New Document with a Predefined File Name Pattern

**Use Case**

You want Oxygen XML Editor to automatically generate a file name comprising a UUID plus file extension using the SDK.

**Solution**

This could be done implementing a plugin (on page 3224) for Oxygen XML Editor using the Plugins SDK.

There is a type of plugin called Workspace Access that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```java
private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace pluginWorkspaceAccess;
    private boolean saving = false;
    public CustomEdListener(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }

    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
        if(! saving &&
            editor.getEditorLocation().toString().contains("Untitled") ) {
            File chosenDir = pluginWorkspaceAccess.chooseDirectory();
            if(chosenDir != null) {
                final File chosenFile =
                new File(chosenDir, UUID.randomUUID().toString() + ".dita");
                SwingUtilities.invokeLater(new Runnable() {
                    @Override
                    public void run() {
                        try {
                            saving = true;
                            editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
                        }
                        catch (MalformedURLException e) {
                            
                        }
                    }
                });
            }
        }
    }
}
```
e.printStackTrace();
}
finally {
    saving = false;
}
}
});

//Reject the original save request.
return false;
}
return true;
}

@Override
public void applicationStarted(
    final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(
        new WSEditorChangeListener() {
            @Override
            public void editorOpened(URL editorLocation) {
                final WSEditor editor = pluginWorkspaceAccess.getEditorAccess
                    (editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
                if(editor != null && editor.getEditorLocation().toString().contains("Untitled")) {

                    //Untitled editor
                    editor.addEditorListener(
                        new CustomEdListener(pluginWorkspaceAccess, editor));
                }
            }
        },
    PluginWorkspace.MAIN_EDITING_AREA);
................................................

Split Paragraph on Enter (Instead of Showing Content Completion List)

Use Case

You want to split the paragraph on Enter instead of showing the content completion list.

Solution

Yes, it is possible by creating your own custom operation.
To obtain this behavior, follow this procedure:

1. Create a custom **Author** mode operation *(on page 2177)* that handles the split. You can use the `AuthorDocumentController.split` API to achieve this.
2. Create a JAR library that contains its compiled version.
3. Open the **Preferences** dialog box *(Options > Preferences) *(on page 124)*, go to **Document Types Association**, and select your *framework*.
4. Click **Edit** and in the **Document Type** configuration dialog box *(on page 140)*, go to the **Classpath** tab *(on page 144)* and add a reference to the JAR library for your custom operation.
5. Go to the **Author** tab, then go to the **Actions** subtab.
6. Click the **+ New** button and use the **Action** dialog box *(on page 148)* to create your own paragraph split action.
7. Make sure you assign **Enter** as the **Shortcut Key** and specify your custom operation in the **Operations** section.

**Result:** Now, when you press **Enter**, your Java operation will be invoked to split the paragraph instead of opening the **Content Completion Assistant**.

**Tip:**
The **Content Completion Assistant** can still be invoked by using the **Ctrl+Space** keyboard shortcut.

**Use Custom Rendering Styles for Entity References, Comments, or PIs**

**Use Case**
You want to display entity references in the **Author** mode without the distinct gray background and tag markers.

**Solution**
There is a built-in CSS stylesheet in the Oxygen XML Editor libraries that is used when styling content in the **Author** mode, no matter what CSS you use. This CSS has the following content:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
```
```css
display: morph !important;
white-space: pre-wrap !important;
border-width: 0px !important;
margin: 0px !important;
padding: 0px !important;
}

oxy|processing-instruction {

display: block !important;
color: rgb(139, 38, 201) !important;
white-space: pre-wrap !important;
border-width: 0px !important;
margin: 0px !important;
padding: 0px !important;
}

oxy|comment {

display: morph !important;
color: rgb(0, 100, 0) !important;
background-color: rgb(255, 255, 210) !important;
white-space: pre-wrap !important;
border-width: 0px !important;
margin: 0px !important;
padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
    link: attr(href) !important;
text-decoration: underline !important;
color: navy !important;

    margin: 2px !important;
padding: 0px !important;
}

oxy|reference:before {

display: morph !important;
content: url(/images/editContent.gif) !important;
}

oxy|entity[href]:before{
```
display: morph !important;
content: url(../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
  editable:false !important;
  background-color: rgb(240, 240, 240) !important;
  margin:0px !important;
  padding: 0px !important;
}

oxy|reference {
  display:morph !important;
}

oxy|entity {
  display:morph !important;
}

oxy|entity[href] {
  border: 1px solid rgb(175, 175, 175) !important;
  padding: 0.2em !important;
}

xi|include {
  display:block !important;
  margin-bottom: 0.5em !important;
  padding: 2px !important;
}

xi|include:before,
xi|include:after{
  display:inline !important;
  background-color: inherit !important;
  color:#444444 !important;
  font-weight:bold !important;
}

xi|include:before {
  content:url(../images/link.gif) attr(href) !important;
  link: attr(href) !important;
}
/*No direct display of the MathML and SVG images.*/
In the CSS used for rendering the XML in Author mode, do the following:

1. Import the special Author mode namespace.
2. Use a special selector to customize the entity node.

Example:

```css
@namespace oxy url(http://www.oxygenxml.com/extensions/author);

oxy|entity {
  background-color: inherit !important;
  margin: 0px !important;
  padding: 0px !important;
  -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and CData sections. You can also customize the way `<xi:include>` elements are rendered.
19. Add-ons

Oxygen XML Editor offers various default add-ons that can be installed to provide additional functionality to Oxygen XML Editor. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For a full list of add-ons that are officially supported for Oxygen XML Editor, see Oxygen XML Add-on Repositories.

This chapter contains information about the default add-ons that are available to install directly from Oxygen XML Editor.

To install one of the default add-ons, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the add-on you want to install and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Collaboration

Git Client Add-on

An add-on is available that contributes a built-in Git client directly in Oxygen XML Editor. Once the add-on is installed, a Git Staging view is available that includes various actions that perform common Git commands, such as push, pull, change branch, commit, and more. It also includes a built-in tool for comparing and merging changes.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
2. Select the Git Client add-on and click Next.
3. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.

4. Restart the application.

**Result:** The **Git Staging** view is now available. To open the view, select **Git Staging** from the **Window > Show View** menu (or select **Git Client** from the **Tools** menu). This view acts as a basic Git client integrated directly in Oxygen XML Editor, and it provides support for committing changes to a Git repository, comparing and merging changes, resolving conflicts, and other Git commands. A **Git** menu is also contributed in the main menu bar that includes various Git actions.

**Git Staging View Interface**

Once the **Git Client** add-on is installed, the **Git Staging** view is available by selecting it from the **Window > Show View** menu (or select **Git Client** from the **Tools** menu). The **Git Staging** view is the main interface where most of the actions that trigger Git commands and other features can be accessed.

**Figure 608. Git Staging View**

The **Git Staging** view includes the following actions/features (most are also available in the **Git** menu):

**Push**

Pushes your local repository changes to the remote repository.
Pull

Pulls the changes from the remote repository into your local repository.

Stash drop-down menu

Includes the following submenu items:

Stash changes

Creates a new stash from the working copy changed file.

List stashes

Opens a dialog box that lists the existing stashes and you can choose to apply or remove a stash.

Show current repository history

Opens the Git History view (on page 2521) at the bottom of the application.

Show Git Branch Manager view

Opens the Git Branch Manager view (on page 2525) on the right side of the application.

Ellipsis (three vertical dots) menu

Includes the following submenu items:

Clone new repository

Clones a repository into a new directory.

Push

Pushes your local repository changes to the remote repository.

Pull (merge)

Pulls the latest changes from the remote repository and combines them with your local unpublished changes.

Pull (rebase)

Pulls the latest changes from the remote repository and combines them with your local unpublished changes.

Show branches

Opens the Git Branch Manager view (on page 2525) on the right side of the application.

Show tags

Opens a dialog box that lists all the tags.

Show history

Opens the Git History view (on page 2521) at the bottom of the application.
Submodule

Opens a combo box where you can select the desired submodule to open and work with.

Stash changes

Creates a new stash from the working copy changed file.

List changes

Opens a dialog box that lists the existing stashes and you can choose to apply or remove a stash.

Manage remote repositories

Opens a dialog box where you can add, edit, or delete existing remote repositories.

Track remote branch

Opens a dialog box where you can select a remote branch that the local branch will track for executing fetch, push, or pull commands.

Edit repository "config" file

Opens the configuration file for the repository in the main editor so that it can be edited.

Preferences

Opens the Git Client preferences page where you can configure some options that relate to the add-on.

Reset all credentials

Resets all credentials to the default values.

Unstaged files area

Any changed, unstaged files are listed in this box. The following actions are available at the top-right corner of the box:

- **Stage selected**
  
  Moves the selected unstaged, changed files to the Staged files area.

- **Stage all**
  
  Moves all unstaged, changed files to the Staged files area.

- **Switch to tree view**
  
  Switches to a tree-like view.

Staged files area

All staged files are listed in this box. The following actions are available at the top-right corner of the box:
**Unstage selected**

Moves the selected staged files to the **Unstaged files** area.

**Unstage all**

Moves all staged files to the **Unstaged files** area.

**Switch to tree view**

Switches to a tree-like view.

**Commit message area**

This box in this area is used to write a commit message. The following actions are available at the top-right corner of the box:

- **Choose a previously used comment**
  Allows you to re-use a commit message that you used in the past.

- **Automatically push changes to remote branch**
  When a commit is performed, the committed changes are also pushed to the remote repository.

- **Ammend last commit**
  Allows you to edit the selected commit. You can combine staged changes with the previous commit instead of creating an entirely new commit. It can also be used to simply edit the previous commit message without changing its snapshot. This action should not be performed on public commits (commits that were pushed to the remote repository).

**Cloning a Repository**

Click the **Clone new repository** button (it has a '+' sign as the icon) and provide the following:

- **Repository URL** - The URL of the remote repository to be cloned.
- **Checkout branch** - A specific branch of the repository that is being cloned. The default branch will be cloned if another one is not specified.
- **Destination path** - The local path where the repository will be cloned.

After cloning a repository, it will automatically be set as the current working copy.

**Making an Oxygen Project a Git Repository**

When showing the **Git Staging** side-view after opening an Oxygen XML Editor project that is not already a Git repository, Oxygen XML Editor offers the possibility to make that project also a local Git repository. This is very useful, for example, for newly created projects. After creating the local repository, bind it to a remote repository. You will be asked to specify the URL of the corresponding remote repository on your first attempt to push or pull changes.
Authentication

The Git Client supports both HTTPS and SSH connections to GitHub, GitLab, Bitbucket, and more.

To access the remote repository, you need to provide your authentication details (if not using unprotected SSH keys). If no such information is found in the add-on's settings, you will be prompted for them.

The Git Client allows you to authenticate over HTTPS by using either a basic authentication method (username + password) or a personal access token.

Notes:

- The authentication using personal access tokens has been tested with GitHub and GitLab.
- Bitbucket uses a concept similar to personal access tokens, named app passwords. An app password must be provided as the password for Basic authentication, along with the correct username.
- As of August 13, 2021, GitHub will no longer accept password-based authentication.

If you have the two-factor authentication (2FA) enabled for GitHub or GitLab, to authenticate over HTTPS, you must generate a personal access token for your profile, and back in the Git Staging view in Oxygen XML Editor, use the generated token value as the authentication password when asked for your credentials.

If, for example, you have been using a GitHub account but you decide to switch to another GitHub account, you would need to reset your credentials so that you will be prompted for new ones. This is because only one set of credentials for each Git platform/server is stored. To reset your credentials, go to the toolbar at the top of the Git Staging side-view, click the settings icon (a cogwheel), and select Reset all credentials.

Selecting a Working Copy

Click the Browse button to the right of the Working copy combo box to select a working copy from your file system. The selected folder must be a Git repository.

Switching Between Local Branches

To switch between local branches from the Git Staging view, use the Branch combo box. Local branches can also be changed using the Git Branch Manager (on page 2525).

New branches can be created from the Git Branch Manager (on page 2525) or from the History table using the Create branch action in the contextual menu.

Stashing Files

A Git stash is a way of temporarily saving the changes you have made to your working copy so that you can continue to use other Git operations in the meantime, and you can then re-apply the stashed changes later.
On the toolbar, there is a **Stash** drop down menu with a **Stash changes** action for creating a new stash out of the working copy changed file and a **List stashes** action that presents a dialog box with the existing stashes. From the **List stashes** dialog box, you can also choose to apply or remove a stash.

### Creating Tags

Tagging is used to capture a specific point in history, for example to mark a release. A tag is like a branch that doesn't change. You can create tags from the **History view** (on page 2521) contextual menu. In the **Ellipsis (three vertical dots)** menu on the right side of the **Git Staging** view's toolbar, there is a **Show tags** action that lists all the tags. For tags present only in the local branch, you can choose to delete them or to push them to the remote repository. The **Show tags** action is also available in the **Git** menu from the main menu bar.

### Working with Submodules

When cloning a repository that contains submodules, all submodules are initialized and cloned as well. When pulling changes from the remote repository, the submodules are also updated. The update of the submodules when performing a pull operation depends on the **Update all submodules after pulling changes from the remote repository** option from **Options > Preferences > Plugins > Git Client** (the option is enabled by default).

To open and work with a Git submodule, use the **Submodules** action from the **Ellipsis (three vertical dots)** menu (on the right side of the **Git Staging** view's toolbar) and select the desired submodule from the presented combo box. As an alternative, if the submodule is modified and is presented in the **Unstaged files area** (on page 2523), the **Open** contextual menu action can be used to open it.

The tooltip of a modified submodule shown in the **Unstaged files area** (on page 2523) presents information about the currently and previously tracked commits.

### Showing the Repository History

To show the history, invoke the **Show current repository history** action from the toolbar of the **Git Staging** panel (look for the clock icon) or go to **Window > Show view > Git History**. This opens the **Git History** view at the bottom of the application.

In the toolbar, you can choose which branches will have the history shown. You have the following options:

- **Current branch** - Shows the commits for the current branch, including unpushed local and unpulled remote commits.
- **Current local branch** - Shows the commits only for the current local branch, including unpushed local commits.
- **All branches** - Shows the commits for all branches (both local and remote), including unpushed local and unpulled remote commits.
- **All local branches** - Shows the commits only for local branches, including unpushed local commits.

For each commit in the history table, the following actions are available:
• **Create branch** - Used to create a new branch starting from the selected commit. The new branch is automatically checked out by default. To disable this behavior, deselect the **Checkout branch** option in the *Create branch* dialog box.

  **Tip:**
  To publish a new branch to the remote repository and start tracking that branch, you need to simply push the local branch using the dedicated action from the **Git Staging** side-view.

• **Create tag** - Used to create a new tag on the selected commit. You have the option to push the tag to the remote repository.

• **Checkout** - Used to checkout a branch at a specific commit (either in detached head form or by creating a new branch at that commit).

• **Revert commit** - Used to create a new commit that reverts all the changes from the selected commit.

• **Reset "[branch_name]" to this commit** - Used to undo changes by moving the HEAD of the current branch to the selected commit.

The **Git History** view presents all the affected resources for each commit in a list, in the bottom-right area. It includes a text filter field at the top that you can use to conduct searches (e.g. by Date, Author, or Commit ID). An included revision graph helps you to understand how commits connect with one another. For each resource, the following actions are available in the contextual menu:

• **Open** (available for added and modified resources) - This action opens the selected resource.

• **Open previous version** (available for deleted resources) - This action opens the version of the selected resource from before its deletion.

• **Open working copy version** (available for added and modified resources) - This action opens the working copy version of the selected resource. It also works if the resource has been renamed in between versions.

• **Reset file to this commit** (available for added and modified resources) - This action checks out the selected version of the resource, overwriting its current version. It does not work if the resource has been renamed or deleted in between versions.

• **Compare with previous version** (available for modified resources) - This action compares the selected version of the selected resource with the previous one using the **Compare Files** tool (on page 474).

• **Compare with working copy version** (available for modified resources) - This action compares the selected version of the selected resource with the current one using the **Compare Files** tool (on page 474).

• **Compare with each other** (available when selecting 2 versions of a single file) - This action compares the selected versions with each other using the **Compare Files** tool (on page 474).

**Blame**

The contextual menu of each unstaged resource contains a **Show blame** action that opens the selected resource in the main editing area and colors the editor lines with different colors based on the revision
information. Selecting a line in the opened editor will highlight the corresponding entry from the history table in the Git History side-view.

This action is also available in the contextual menu of the current editor and of the Git resources from the Project side-view (on page 402).

Unstaged Files Area

In the Unstaged files area, you will see all the modifications that have occurred in your working copy (files that have been modified, new files, and deleted files) and are not part of the next commit.

- Various actions are available in the contextual menu (Open, Open in compare editor, Stage, Discard, Show history, Show blame, and more).
- You can stage files (i.e. move them to the Staged files area (on page 2523)) using the actions from the toolbar found above the top-right corner of this area. You can choose between staging all the files, by clicking the Stage all button (double arrow icon), and staging specific files, by selecting them and clicking the Stage selected button (single arrow icon).
- You can switch between the list view and the tree view by clicking on the Switch to tree/list view button positioned to the right of the staging buttons.

Staged Files Area

In the Staged files area, you will see all the resources that are ready to be committed. The files from this area can be unstaged and sent back to the Unstaged files area (on page 2523). This area has actions similar to those from the Unstaged files area (on page 2523), with the exception of the Show history and Show blame actions that are not available here.

Comparing Changes and Conflict Resolution

At any time, if you want to see the differences between the last commit and your current modifications, you can double-click a file from either the Unstaged files area (on page 2523) or Staged files area (on page 2523), and the Compare Files (on page 474) window will appear and highlight the changes.

If the file has a conflict (has been modified both by you and another), Oxygen's 3-Way file comparison feature (on page 477) will show a comparison between the local change, the remote change, and the original base revision.

Committing

After staging the files, on the bottom of the view you can provide a commit message and commit them to your local repository. For convenience, you can also select a previously provided message.

In the toolbar above the Commit message text area, there are a few toggle buttons that affect your commit if they are enabled:
• **Amend last commit** - Enabling this option is a convenient way to modify the most recent commit. It lets you combine staged changes with the previous commit instead of creating an entirely new commit. It can also be used to simply edit the previous commit message without changing its snapshot. This action should not be performed on public commits (commits that were pushed to the remote repository).

• **Automatically push changes to remote when committing** - If this option is enabled, when a commit is performed, the committed changes are also pushed to the remote repository.

### Push/Pull (with Merge or Rebase)

To push your local repository changes to the remote repository, use the **Push** button from the view's toolbar (up arrow).

To bring the changes from the remote repository into your local repository, use one of the **Pull** actions from the same toolbar (down arrow). You can choose between **Pull (merge)** and **Pull (rebase)**. The invoked action is promoted as the current action of the toolbar button.

---

**Note:**

When pushing a local branch that does not have a corresponding remote branch, a remote branch will automatically be created with the same name as the local branch.

### File Conflict Solving Workflow

After editing a file, committing it to the local repository, and trying to push it to the remote repository, if a warning appears about not being up to date with the repository, follow these steps:

1. Pull the data from the repository using one of the **Pull** actions.
2. In the **Unstaged files area** (on page 2523), select each conflicted file and resolve the conflicts. You can do this, for example, by opening the conflicted files in the compare editor, either by double-clicking on them or by using the contextual menu action, and then choose what changes you want to keep and discard, and save the document. You can also use the **Resolve using Mine, Resolve using Theirs**, or **Mark as resolved** actions from the contextual menu of a resource.
3. If you choose to use the compare editor, after you close it, the file will be staged automatically and moved to the **Staged files area** (on page 2523).

At this point, the next actions depend on which **Pull** action was chosen:

• **Pull (merge):**

  1. When all the conflicts are resolved and no more files are left in the **Unstaged files area** (on page 2523), the changes can be committed.
  2. Enter a message and commit. You will now have new changes to push.
  3. Push the changes to the remote repository.
You can abort the merge by clicking the **Abort merge** button. This will revert the repository to its previous state prior to the pull attempt.

**Pull (rebase):**
1. When all the conflicts are resolved, click the **Continue rebase** button.
2. Push any outgoing changes.

You can abort the rebase by clicking the **Abort rebase** button. This will revert the repository to its previous state prior to the pull request.

---

**The Project View and the Current Editor**

For resources from Git repositories, this add-on also contributes a variety of actions in the contextual menus of the **Project side-view (on page 402)** and the current editor (**Text** and **Author** modes). These actions include: **Show history**, **Show blame**, **Git Diff** (only in the **Project** view), and **Commit** (only in the **Project** view).

**Git Branch Manager**

To show all the local and remote branches, click the **Show Git Branch Manager** button on the toolbar of the **Git Staging** panel (look for the branches icon) or select **Git Branch Manager** from **Window > Show view**. By default, the **Git Branch Manager** is presented to the right of the editing area.

The **Git Branch Manager** side-view displays all the branches as a tree. The tree can be filtered using the text field at the top of the panel and you can reload the information by using the **Refresh** action. When hovering the cursor over a branch name, a tooltip is displayed that provides information about the last commit performed on that branch (such as the author and the date of the commit).

The following actions are available in the contextual menu for each local branch:

- **Checkout branch** - Checks out the selected branch and switches the local repository to the selected branch.

- **Create branch** - Creates a new branch using the selected branch as the starting point. The new branch is automatically checked out by default. To disable this behavior, deselect the **Checkout branch** option in the **Create branch** dialog box.

**Tip:**
To publish a new branch to the remote repository and start tracking that branch, you need to simply push the local branch using the dedicated action from the **Git Staging** side-view.
• **Merge "SELECTED_BRANCH" into "CURRENT_BRANCH"** - Brings all the changes from SELECTED_BRANCH into CURRENT_BRANCH.
• **Delete branch** - Deletes the selected branch.

For the remote branches, the **Checkout branch** action checks out the selected branch and creates a local branch from the selected remote branch.

### Preferences

The **Git Client** add-on contributes a preferences page to Oxygen XML Editor. To access it, go to **Options > Preferences > Plugins > Git Client** or click the **Settings** button from the toolbar of the **Git Staging** view and select **Preferences**. This preferences page includes the following options:

• **When detecting a Git repository inside a newly opened project** - This determines what happens to the current working copy when a project that contains a Git repository is opened in the **Project side-view (on page 402)**. You can choose between:
  ◦ **Always switch to the new working copy**
  ◦ **Never switch to the new working copy**
  ◦ **Always ask** (default value)

• **Notify me about new commits in the remote repository** - When this option is selected, Oxygen XML Editor will show notification messages when it detects that new commits have been pushed to the remote repository. By default, this option is not selected.

• **Update all submodules after pulling changes from the remote repository** - If this option is selected, when a repository is updated using the **Pull** operation, all sub-modules are updated as well. This option is selected by default.

• **Global Options/Project Options** - If you select **Project Options**, the settings are stored in the project file (.xpr) that can easily be **shared with other users (on page 313)**.

### Editor Variables

The **Git Client** contributes the following editor variables:

• **${git(working_copy_name)}** - The name of the working copy directory.
• **${git(working_copy_path)}** - The absolute file path of the working copy directory.
• **${git(working_copy_url)}** - The location of the working copy directory as a URL.
• **${git(short_branch_name)}** - The short name of the current branch (e.g. dev).
• **${git(full_branch_name)}** - The full name of the current branch (e.g. refs/heads/dev).

### Resources

For more information about the Git Client add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinars/presentations:
Content Fusion Connector Add-on

An Oxygen Content Fusion Connector add-on is available that can be installed to integrate Oxygen Content Fusion with Oxygen XML Editor. Content Fusion is a flexible, intuitive collaboration platform designed to adapt to virtually any type of workflow that a collaborative team may use for their documentation review process.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the Oxygen Content Fusion Connector add-on in Oxygen XML Editor or Oxygen XML Author, follow these steps:

1. Go to Window > Show View and select Content Fusion Task Manager.
2. If it has not already been installed, a message will appear asking you if you want to install the add-on.
3. To continue, click Install and follow the on-screen instructions.
4. Restart Oxygen XML Editor.

Result: Content Fusion Task Manager is now available in the Window > Show View menu. Selecting this button/action opens the Content Fusion Task Manager view.

To fully take advantage of all of the benefits and features, your organization will need an Oxygen Content Fusion Enterprise Server. This solution allows you to host, setup, and configure your own server and control your data. With this model, you are also able to upload custom frameworks and plugins, and to configure various settings. It is possible to evaluate Content Fusion free of charge, for a limited time. For more information, see the Oxygen Content Fusion website.

For more information about using Content Fusion in Oxygen XML Editor, see the Oxygen Content Fusion User Guide.

Integrating Oxygen Feedback with Oxygen XML Editor/Author

It is possible to integrate Oxygen Feedback with Oxygen XML Editor/Author so that your documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application. This is made possible by
an add-on that when installed in Oxygen XML Editor/Author, a Feedback Comments Manager view becomes available.

⚠️ **Attention:**
The Feedback Comments Manager view only functions in Oxygen XML Editor or Oxygen XML Author. It does not work in the Oxygen XML Developer edition.

To see a demonstration of Oxygen Feedback being integrated with Oxygen XML Editor/Author, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

**Quick Installation**

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install Button](image)

**Manual Installation**

To manually install this add-on in Oxygen XML Editor/Author, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select Oxygen Feedback Connector add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** The Feedback Comments Manager view is now available. By default, it is displayed to the right of the main editing panel. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. You can also use the Show Feedback Comments Manager from the contextual menu in the DITA Maps Manager.

**Connecting the Feedback Comments Manager View**

If this is your first time using it, you need to configure a mapping between Oxygen XML Editor/Author and your Feedback site configuration(s). If you have already configured a mapping, you just need to connect the Feedback Comments Manager to your Feedback account.

To connect, follow this procedure:

1. Select Connect from the user drop-down menu at the top-right corner of the Feedback Comments Manager.

**Step Result:** You are directed to the administration login page in your default browser.
2. Log in with your credentials, click **Authorize** in the resulting page, and go back to *Oxygen XML Editor/Author*.

3. If this is your first time using the **Feedback Comments Manager**, you need to configure a mapping:
   a. Select **Preferences** from the user drop-down menu at the top-right corner of the **Feedback Comments Manager**.

   **Step Result:** You are directed to the **Oxygen Feedback Connector** preferences page (you can also reach this page by going to **Options > Preferences > Plugins > Oxygen Feedback Connector**).

   b. Click the **New** button at the bottom of the mappings table.

   **Step Result:** This opens the **New Oxygen Feedback Mapping** dialog box where you can configure the mapping.

   c. In the **Context DITA map location** field, click the ✂️ browsing button and specify the URL of your context DITA map. This is the path to the root DITA map used to publish your output.

   d. For the **Published site base URL** field, *Oxygen XML Editor/Author* automatically detects all the base URLs for the site configurations that you have the role of **Moderator**, **Admin**, or **Owner**. You can type the base URL or select it from the drop-down menu.

   e. Click **OK** in both dialog boxes.

**Result:** The comments that exist in the published WebHelp output for the site configurations attached to the current user’s organization (based on the configured mapping) will be loaded in the **Feedback Comments Manager** view.

**Using the Feedback Comments Manager View**

If the view is not already open in *Oxygen XML Editor/Author*, go to **Window > Show View > Feedback Comments Manager**. You can also use the ✉️ **Show Feedback Comments Manager** from the contextual menu in the **DITA Maps Manager**.
The **Feedback Comments Manager** view contains the following actions and components:

**Home button**

Use this button to open the **Oxygen Feedback** administration interface in your default browser.

**User Name drop-down menu**

Once connected and authorized, your user name will appear in the upper right corner of the view. The drop-down menu offers the following actions:

- **Refresh**

  Forces a refresh to synchronize the information in the view and reloads the first 20 items.

- **Preferences**

  Opens the **Oxygen Feedback Connector** preferences page where you can configure a mapping between **Oxygen XML Editor/Author** and your Feedback site configuration(s).

- **Help**

  Opens the **Oxygen Feedback** user guide in your default browser.
Signs you in or out of your Oxygen Feedback account.

**Feedback for**

You can choose which display mode to use for retrieving comments. The options are:

- **Context DITA map** - If there are base URLs mapped to the current context map, comments from all versions defined by the given base URLs will be loaded.
- **Current editor** - Only comments added in the output for the current topic will be loaded. This mode will retrieve comments from web pages generated from any DITA source file (.dita file extension) as well as any source file with a file extension of xml, html, or md.

**Filters**

You can apply filters for **Site, Version, and Status**:  

**Site**

You can choose to show **All** site configurations that you are assigned as **Moderator, Admin, or Owner** or you can choose a specific site configuration.

**Version**

You can choose show **All** versions for the site configurations that you are assigned as **Moderator, Admin, or Owner** or you can choose a specific version for the specified site configuration. If the **Site** filter is set to **All**, this drop-down includes the name for all the versions available for the currently detected sites. If there are multiple versions with the same name, the name will be shown only once, but the filtering will detect all the versions with the selected name.

**Status**

You can choose between:

- **Not resolved (Pending, Open, Reopened)** - Displays comments that are in a state of Pending, Open, or Reopened.
- **Pending** - Only displays comments that are in a Pending state.
- **Open** - Only displays comments that are in an Open state.
- **Reopened** - Only displays comments that are in an Reopened state.
- **Resolved** - Only displays comments that are in a Resolved state.
- **All** - Displays all comments.

**Note:**

The filters are persistent between sessions. If the comments are retrieved for the **Context DITA map**, they are saved in options associated with the context map. Otherwise, they are associated to a ditamap that is determined from the one that is set in the mapping preferences.
Note:
Comments are only retrieved for site configurations that you have the role of Moderator, Admin, or Owner.

In the comments area, each comment is displayed as its own box and they are grouped by the topic title or path of the web page where the comments were added and then sorted by date (most recent first). If a DITA topic from context map (or the current topic) can be computed from the web page where a comment is added, you can double-click anywhere in the comment box to open the topic in the main editor. You can also click the group name (the topic title or path) to open the particular topic in the WebHelp output, in your default browser.

At the bottom-right corner of the comment box for each first-level comment (a comment that is not a reply), there is a link to Resolve or Reopen the comment. The Resolve action is only available for first-level comments (not replies) and it marks the comment as Resolved. The Reopen action is only available for resolved comments and it marks the comment as Reopened.

Note:
If a new reply is added to a thread that is marked as Resolved, the thread is automatically marked as Reopened.

Each comment box also includes the commenter’s name and avatar, the time the comment was added, the state of the comment (e.g. Open, Rejected, Deleted, Resolved, Reopened), the initials of the site configuration, the version number, a link to open the WebHelp topic in your browser (the most specific URL for a version is used), and the content of the comment (up to 4 lines). If you hover over a status badge for comments whose status is Rejected, Deleted, or Resolved, you can see the user name who changed the status and the time it was changed.

If there are more than 20 top-level comments, the comments are retrieved in chunks of 20 (replies are not limited) and there is a Load more comments button at the bottom that will retrieve the next chunk of top-level comments.

Contextual Menu

If you right-click anywhere in a comment box, the contextual menu offers the following actions:

Open topic
If the Feedback for option is set to Context DITA Map and a parent file (from the current DITA map hierarchy) could be determined, selecting this option opens the parent document in the main editor. If the Open topic action is executed on a block-level comment, the parent document is opened and the element that the block-level comment is attached to is highlighted in Author mode (or the cursor is placed at the beginning of the element in Text mode).

Copy content (Ctrl + C)
Copies the content of the comment to the system clipboard.

**Show comment**

Opens a dialog box with the entire comment displayed. You can copy selected content from the comment to the system clipboard by clicking the Copy button at the bottom of the dialog box. If not content is selected, it copies the entire content of the comment.

### Migration/Conversions

**Batch Documents Converter Add-on**

Oxygen XML Editor offers an add-on that contributes actions in the following submenus:

- **Batch Documents Converter** submenu located in the Tools menu and the contextual menu of resources in the Project view.
- **Additional conversions** submenu located in File > Import/Convert.
- **Import** submenu located in the Append child, Insert Before, and Insert After submenus from the contextual menu of the DITA Maps Manager view.

The first time you invoke any of these actions, Oxygen XML Editor will ask you if you want to install it and offer a wizard to help with the installation process. Once installed, you need to restart Oxygen XML Editor and those same actions will then contain the list of available conversions. Selecting an action from the submenu will open a dialog box where you can configure the options for the corresponding conversion. You can batch convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4
- HTML to DocBook5
- Markdown to XHTML
- Markdown to DITA
- Markdown to DocBook4
- Markdown to DocBook5
- Word (`.doc` or `.docx`) to XHTML
- Word (`.doc` or `.docx`) to DITA
- Word (`.doc` or `.docx`) to DocBook4
- Word (`.doc` or `.docx`) to DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- JSON to XML
- XML to JSON
When actions are invoked from the contextual menu of the **DITA Maps Manager** view, the resulting documents from the conversion are automatically inserted in the map as follows:

- Actions from **Append child** inserts map nodes as children of the currently selected node.
- Actions from **Insert Before** inserts map nodes as siblings of the currently selected node, above the current node in the map.
- Actions from **Insert After** inserts map nodes as siblings of the currently selected node, below the current node in the map.

### Quick Installation

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:

![Install Button]

### Manual Installation

To manually install the **Batch Documents Converter** add-on:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste **https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml** in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Batch Documents Converter** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** A **Batch Documents Converter** submenu will now be available in the **Tools** menu and in the contextual menu. This submenu will contain a list of the various types of available conversions. Selecting one of the types of conversions will open a dialog box where you can configure options for the conversion.

The add-on can also be installed using the following alternative installation procedure:

2. Unzip it inside **{oXygenInstallDir}/plugins**. Make sure you don't create any intermediate folders. After unzipping the archive, the file system should look like this: **{oXygenInstallDir}/plugins/oxygen-batch-converter-addon-x.y.z**, and inside this folder, there should be a **plugin.xml** file.
Configuration

Options for configuring the conversions can be found in the preferences page of the add-on (Options > Preferences > Plugins > Batch Documents Converter) or in the conversion dialog box.

Conversions from Word (Word Styles Mapping)

The conversions from MS Word work best if you only use the MS Word styles to semantically mark up your document. It is important that sections from the Word document are well defined using the heading styles.

Use the Word styles mapping option from the Batch Documents Converter preferences page to configure any of the types of Word conversions (Word to HTML, Word to DITA, Word to DocBook4, and Word to DocBook5) by setting a mapping between Word elements and styles to the corresponding HTML element.

If the Word document contains paragraphs formatted with custom styles, they have to be set in the Word styles mapping configuration. Those that are not set will be converted into simple paragraphs. To add custom styles, you can use the default configuration from the table. For example, if you use a custom Word style named Document Title, you can map this to the HTML "h1" element:

<table>
<thead>
<tr>
<th>Word element</th>
<th>Word style</th>
<th>HTML elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Document Title</td>
<td>h1:fresh</td>
</tr>
</tbody>
</table>

The resulting 'h1' element will be transformed into the corresponding element when converting to DITA, DocBook 4, and DocBook 5.

The Word styles mapping table contains the following columns:

**Word element**

This column allows one of the following Word elements:

- **p** - Word paragraph
- **r** - Word run
- **b** - bold text
- **i** - italicized text
- **u** - underlined text
- **strike** - strikethrough text
- **table** - table
- **p:unordered-list(x)** - unordered list (where 'x' is the nesting level of the list)
- **p:ordered-list(x)** - ordered list (where 'x' is the nesting level of the list)

**Word style**
This column can be used to map a paragraph, run, or table with a specific style (referenced by name).

Styles can also be referenced by style ID. This is the ID used internally in the .docx file. To map a paragraph or run with a specific style ID, append a dot followed by the style ID in the Word element column (for example: p.Heading1).

**HTML elements**

This column can be used to map the resulting HTML elements. It allows a single element or multiple nested elements.

The nested elements can be declared by using the '>' character (for example: ul > li).

The `class` attribute can be specified on the resulting HTML elements by appending a dot followed by the class value, after the element (for example: p.myClass).

When converting Word to DITA, these `class` attributes are automatically converted to `outputclass` attributes. This may be useful if you want to apply extra processing on the resulting DITA document using a custom XLS stylesheet.

The `:fresh` syntax can be used to create new elements. If it is not used, the converter will try to reuse the element and close it only when it is necessary.

For example, if the following configuration is set:

<table>
<thead>
<tr>
<th>p</th>
<th>Heading 1</th>
<th>h1</th>
</tr>
</thead>
</table>

When the converter finds consecutive Word paragraphs with the style name `Heading 1`, these will be converted into a single `h1` element that contains the text appended from all of the Word paragraphs.

If `h1:fresh` is set in the last column, the converter will create separate `h1` elements.

To ignore elements, the `!' character can be added in the HTML elements column.

The Export button can be used to export the word styles configuration to an XML file. This exported file can be used to configure the MS Word Dynamic Conversion (on page 3127) from Oxygen XML Editor by copying the file in the DITA-OT plugin directory: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/com.oxygenxml.dynamic.resources.converter`.

The Import button allows you to import the word styles configuration from an exported XML file.

**Note:**

The Word styles mapping configuration is applied only for the newer version of MS Word files formatted in the Microsoft Office Open XML (DOCX) format.
**Maximum Heading Level for Creating Topics**

The **Maximum heading level for creating topics** option from the **Batch Documents Converter** preferences page allows you to set a maximum heading level that the converter will process as DITA topics. The headings with a higher level will be converted to `section` elements.

When the output is a DITA topic, this option sets the maximum heading level that will be converted as a nested topic in the document.

When the output is a DITA map, this option sets the maximum heading level that will be extracted as a DITA topic file and referenced in the DITA map hierarchy.

**Note:**

This option only applies to the HTML to DITA and Word to DITA conversions.

**Word to DITA**

The **Create DITA maps from Word documents containing multiple headings** option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the sections from your Word document marked by titles or headings will be separated into individual DITA topics and referenced in a DITA map. If the word document does not contain multiple sections, the output will be a single topic. When this option is not selected, the output will be a topic with nested topics and sections according to the number of titles and headings from the Word document.

**Markdown to DITA**

The **Create DITA maps from Markdown documents containing multiple headings** option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, all headings from your Markdown document will be separated into individual DITA topics and referenced in a DITA map. If the Markdown document does not contain multiple headings, the output will be a single topic. When this option is not selected, the output will be a topic with nested topics or sections according to the number of headings from the document.

The **Create short description elements** option from the conversion dialog box allows you to decide whether or not the `shortdesc` elements are created in the output DITA document. When this option is selected, the first paragraph before the headings from the Markdown document will be converted into DITA short description elements. When this option is not selected, the output will not contain the short description element.

**HTML to DITA**

The **Create DITA maps from HTML documents containing multiple headings** option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the headings from your HTML document will be separated into individual DITA topics and referenced in a DITA map. If the HTML document does not
contain multiple sections, the output will be a single topic. When this option is not selected, the output will be a topic with nested topics or sections according to the number of headings from the document.

**Confluence to DITA**

The Confluence to DITA conversion processes the HTML content generated by the Atlassian® Confluence (see [https://www.atlassian.com/software/confluence](https://www.atlassian.com/software/confluence)) export process. To export Confluence content to HTML, log in to your Atlassian® Confluence account and navigate to the specific space that you want to export. Then go to Space Settings > Export space and choose to export it as HTML. The resulting index.html file must be provided in the Input files list from the conversion dialog box.

**DocBook to DITA**

The Create DITA maps from DocBook documents containing multiple sections option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the sections from your DocBook document will be converted into individual DITA topics and referenced in a DITA map. When this option is not selected, the output will be a single topic with nested topics.

**Resources**

For more information about the Batch Converter add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinars/presentations:

- Webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring
- Webinar: Extending the Functionality of Oxygen Using Add-ons

**DITA Editing**

**DITA Prolog Updater Add-on**

Oxygen XML Editor offers an add-on that contributes a preferences page (Options > Preferences > Plugins > DITA Prolog Updater) that includes various options for updating the prolog section of a DITA topic or map.

**Quick Installation**

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install](install_button)

**Manual Installation**

To manually install the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.

2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

3. Select the DITA Prolog Updater add-on and click Next.

4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.

5. Restart the application.

Result: The DITA Prolog Updater preferences page will now be available in Options > Preferences > Plugins.

DITA Prolog Updater Preferences Page

The contributed preferences page (Options > Preferences > Plugins) includes the following general options:

**Author**

Specifies the name of the author. By default, it is the system user name.

**Date format**

Specifies the format of the date that will be added in the prolog section. If the date format entered is invalid, the yyyy/MM/dd format is used by default.

**Limit the number of revised dates to**

Specifies the number of revisions that will be kept. Anytime a <revised> element is added in the prolog section and the specified limit has been reached, the oldest <revised> element is deleted.

**Custom type attribute value for the original author**

Specifies a custom value for the type attribute of the <author> element that is inserted to emphasize the primary or original author of the content. When is not set, the creator value is used.

**Custom type attribute value for an additional author**

 Specifies a custom value for the type attribute of the <author> element that is inserted to emphasize an additional author who is not the primary/original author. When is not set, the contributor value is used.

These options are followed by the following options that can be set for DITA topics or maps (or both):

**Enable automatic prolog update on save**

When this option is selected, the prolog is updated anytime the document is saved.

**Set original author**

When this option is selected, the primary or original author is set in the prolog when the document is saved. This option is only applicable for new documents.

**Set created date**

When this option is selected, a created date is added to the prolog when the document is saved. This option is only applicable for new documents.
Update additional authors

When this option is selected, an additional author is set in the prolog when the document is saved. This option is only applicable for already existing documents.

Update revised dates

When this option is selected, a revised date is added to the prolog when the document is saved. This option is only applicable for already existing documents.

For more information, see the details for this DITA Prolog Updater add-on in GitHub.

DITA References View Add-on

Oxygen XML Editor offers an add-on that contributes a DITA References side view that shows all outgoing and incoming references for the current DITA topic. Once the add-on is installed, the view is available in both Text and Author modes.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA References View add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: Once installed, you need to restart Oxygen XML Editor and the DITA References view becomes available. To open the view, select DITA References in the Window > Show View menu.

Outgoing References

The types of outgoing references that are presented in this view include:

- Image references (referenced with an @href or @keyref attribute)
- References to other media resources (DITA objects pointing to video, audio, or embeddable frames)
- Cross references (referenced in an `<xref>` element with an @href or @keyref attribute)
- Key references (referenced with a @keyref attribute)
- Content references (referenced with a @conref or @conkeyref attribute)
• Related links (referenced with an @href or @keyref attribute)
• Related links defined in relationship tables

This side-view is synchronized with the main editor to make it easy to locate a reference in the current document. It also includes contextual menu actions for opening the target of an outgoing reference or showing its definition location. You can also double-click a reference to open its target.

Incoming References

The Incoming references tab shows all references to the current opened DITA topic.

• The references are presented by taking both the Main Files support and the current context map configured in the DITA Maps Manager view into account.
• The references are grouped into three categories: Map, Cross, and Content.
• To open the target of a reference, you can double-click the references, or press Enter with the cursor located on the reference, or right-click the reference and choose Open reference.
• To copy the location of the target of the reference, select the reference and press Ctrl + C (Cmd + C on Mac).
• If a referenced topic is expanded, references to that topic are also displayed.
• While editing a document, if changes appear that might influence how the references were computed, the Refresh button can be used to re-compute the references graph and show an updated list of incoming references.

For more information, see the details for the DITA Outgoing References View add-on in GitHub.

Resources

For more information about the DITA References add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinars/presentations:

• Webinar: Add-ons You Can Use for Technical Writing
• Webinar: Extending the Functionality of Oxygen Using Add-ons

Terminology

Terminology Checker Add-on

Oxygen XML Editor offers an add-on that provides support for checking terminology. Once the add-on is installed, you can create a terminology file with a set of rules for each term (or sequence of characters) you want flagged. After referencing the custom file, Oxygen XML Editor will automatically highlight matched terms in the Author visual editing mode and offer some contextual menu actions.

Tip:
The terminology checker works for any document opened in the Author visual editing mode, including XML file types, and JSON and HTML5 document types.
**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:

![Install]

**Manual Installation**

To manually install the add-on, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Terminology Checker** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Creating Custom Rules for the Terminology Checker**

To create your own custom rules for the terminology checker, follow this procedure:

1. Create a terminology file. There is a template available to help you get started in the **New Document wizard (on page 368)**. Click the **New** button on the toolbar or select **File > New** and search for the **Terminology File** template. Here is an example of the structure for this type of file:

   ```xml
   <incorrect-terms lang="en">
     <incorrect-term ignorecase="true">
       <match>Oxygen</match>
       <suggestion></suggestion>
       <message>Product name should be inside a tag.</message>
     </incorrect-term>
   </incorrect-terms>
   ```

2. Go to **Options > Preferences > Plugins > Oxygen Terminology Checker** and in the **Default project terminology folder** field, specify the folder where the default terminology file is located (note that the default location is displayed in the **Default project terminology folder** field regardless of whether or not the file exists on disk. You can also specify an **Additional Terminology folder**.
3. Click **OK** several times to apply the changes and close the preferences dialog box.

**Result:** If any of the terms (or sequence of characters) that are defined in the terminology file are detected in any open file, Oxygen XML Editor highlights the matches in the **Author** visual editing mode.
Note:
If you have a folder named `oxygen-term-checker` in the current project that is open in the Project view, all the files in that folder will also be loaded by the terminology checker.

Structure of Terminology Rules File

The following elements can be used in the terminology rules XML file:

```
<incorrect-terms>
```

This is the root element of the XML rules file.

You can specify the `@lang` attribute on the `<incorrect-terms>` root element. When set, the terms defined in this terminology file are applied when the closest `@xml:lang` attribute of the checked node matches the value specified. Not setting this attribute means that the incorrect terms are applied for all nodes.

If the `@xml:lang` attribute is not defined in your document, the language specified in the Spell Check preferences (on page 229) is used.

Note:
If the value of the document's `@xml:lang` attribute is not a superset of the value of the `@lang` attribute for the `<incorrect-terms>` element, there will not be a match.

<table>
<thead>
<tr>
<th>@lang value for <code>&lt;incorrect-terms&gt;</code> element</th>
<th>@xml:lang value</th>
</tr>
</thead>
<tbody>
<tr>
<td>en</td>
<td>en_US</td>
</tr>
<tr>
<td>match</td>
<td>match</td>
</tr>
<tr>
<td>en_US</td>
<td>not matched</td>
</tr>
<tr>
<td></td>
<td>match</td>
</tr>
</tbody>
</table>

You can specify the `@phase` attribute on the `<incorrect-terms>` root element. The value of this attribute is inherited by `<incorrect-term>` children nodes. Not setting this attribute means the default phase is used.

The allowed values are:

- **always** - Incorrect terms are always presented (default value).
- **editing** - Incorrect terms are shown when the document is opened in the Author mode.
- **validation** - Incorrect terms are shown when the document is checked from a validation scenario.
For example, set this attribute if you want to apply the most important rules when validating with the *Validate and Check for Completeness* action, while still keeping them applied in the editing window.

```xml
<incorrect-term

Defines ways to match and correct an incorrect term. The `<incorrect-term>` element must include a `<match>` element.

The `@ignorecase` attribute specifies whether or not the match is case-sensitive.

The `@severity` attribute can be set to one of the following values: *info*, *warning*, or *error*. Example:

```xml
<incorrect-term severity="error">
    <match>he</match>
    <message>Pronouns should be avoided.</message>
</incorrect-term>
```

An experimental `@part-of-speech` attribute can be set on the `<incorrect-term>` element with the value set to a part of speech tag (for example: *adjective*, *verb*, etc.) If set, when scanning for terminology problems, the problem is presented only if the term's part of speech matches the one specified. The processor used to identify the part of speech is *Apache OpenNLP* and this feature is supported only for the English language.

**Note:**

The results may not be 100% accurate, so you should double-check them.

```xml
<match>

Specify the text fragment to match.

You can specify the `@type` attribute on the `<match>` element, with the values *character*, *whole-words*, or *regular-expression*. The default value is *whole-word*, unless the matched term contains Japanese, Chinese, or Korean characters because Asian languages often do not use spaces to separate words. Example:

```xml
<incorrect-term>
    <match type="character">ing</match>
    <message>Progressive tense should not be allowed</message>
</incorrect-term>
```

```xml
<suggestion>

The `<suggestion>` element can be left blank or there can be one or more of them inside the `<incorrect-term>` element. It supports regular expressions grouping.

If you want to replace the match with an XML fragment, you can set the `@format` attribute on the `<suggestion>` element with the value *xml*. For example:
The `<message>` element is optional. If present, its content is displayed in a tooltip when you hover over a highlight. It supports regular expressions grouping.

The `<link>` element is optional. If present, it provides the source for this rule. Example:

The `<xpath-context>` element can be used to define simple XPath expressions that match specific elements.

You can specify `@include` and `@exclude` attributes. The elements covered by this simplified XPath will be checked for matches (or the exclusion of a match). A list of comma-separated XPath values can be used. Example:

The following are examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

Note:
The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.

You can use one or more of the following attribute conditions:

Attention:
Default attribute values are not taken into account.
**Using Vale Rules with the Terminology Checker**

The **Terminology Checker** has partial support for applying custom **Vale** rules.

Supported **Vale scopes**: heading, table.header, table.cell, list, paragraph, code, strong, emphasis.

Supported **Vale extension points**: Existence, Substitution, Occurrence, Repetition, Conditional.

**Result:** If any of the terms (or sequence of characters) that are defined in the terminology file are detected in any open file, Oxygen XML Editor highlights the matches in the **Author** visual editing mode.

**Note:**
If you have a folder named oxygen-term-checker in the current project that is open in the **Project** view, all the files in that folder will also be loaded by the terminology checker. As an example, the Oxygen XML Editor user guide has a folder with some of the Microsoft style guide rules: https://github.com/oxygenxml/userguide/tree/master/DITA/oxygen-term-checker. Once the user guide project is open in the Oxygen XML Editor **Project** view, the add-on will start using those rules to check the content.

**Resources:** You can find already created Vale rules that implement various checks on the following websites:

- Vale rules that aim to automate the Microsoft style guide: https://github.com/errata-ai/Microsoft/tree/master/Microsoft.

**Working with the Terminology Checker**

The **Terminology Checker** side view shows all problems found in the document. You can right-click each problem to apply possible fixes or to find out more details about it. The tooltip for each problem displays a custom message and more information (e.g. for Vale rules, it also displays the name of the Vale rule file that defines the rule). You can filter problems based on their severity, match, and message and the toolbar has actions to navigate between problems or to open the **Terminology Checker** preferences page.
You can also right-click problems highlighted in the Author visual editing mode to access the following contextual menu actions:

- **Replace with "..."** - Replaces the currently highlighted match with the content inside the `<suggestion>` element.
- **Replace all with "..."** - Replaces all instances of the highlighted match found in the current document with the content inside the `<suggestion>` element.
- **Correct all matching highlights** - Replaces all highlighted matches (all matched terms) within the document with the content inside the first `<suggestion>` element from the terminology file.

The terminology checking can be disabled by clicking the ![Show/Hide Terminology Highlights](icon) toolbar button.

### Other Notes:

- The checker automatically skips deleted content with tracked changes and space-preserved elements (e.g. codeblocks).
- When replacements are performed, the capitalization is preserved.
- In the Oxygen XML Editor Options > Preferences > Plugins > Oxygen Terminology Checker page, you can define the highlight colors to be used for each issue depending on its severity. You can also reference a folder that contains the terminology rules. This folder can contain other folders with terminology files or just the terminology files. The option that controls automatic capitalization can also be found in this preferences page.
- If you select Project Options (in the Oxygen Terminology Checker preferences page), the settings are stored in the project file (.xpr) that can be shared with other users (on page 313).

### Checking Multiple Resources

Once installed, the terminology checker add-on can be used to batch-check multiple files:

- Right-click on the root of the DITA map opened in the DITA Maps Manager view and choose Check terminology.
- Right-click a folder in the Project view and choose Check terminology.
- Create a new validation scenario (on page 787) or edit an existing validation scenario, and add a new validation stage. For the File type field, choose XML Document and for the Validation engine field, choose Terminology checker. The validation scenario can be used in multiple ways:
  - In the Project view, you can right-click a folder and validate using a specific validation scenario.
  - In the DITA Maps Manager view, you can use the Validate and Check for Completeness toolbar action and choose to Batch validate referenced DITA resources. This will apply the associated validation scenario for each topic or map referenced in the context of the main DITA map.
Resources

For more information about the Terminology Checker add-on, along with details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinar:

- Webinar: Add-ons You Can Use for Technical Writing

Vale Linter for Markdown and HTML Validation Add-on

The Vale Validation add-on runs the Vale linter over the currently edited file and presents the validation errors in the results area at the bottom of the application. A Linter is a tool that automatically verifies specific rules against your code or documentation. This is useful for enforcing a style guide or for catching commonly mistaken branding issues.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install button]

Manual Installation

To manually install this add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Vale Linter for Markdown and HTML Validation add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Setup the Oxygen Vale Validation

To set up the Vale validation, follow this procedure:

1. Download and unzip the proper Vale executable for your OS. On Linux and macOS, you must give executable permission to the Vale executable. You can do this by opening a console in the Vale directory and running:
   ```
   chmod u+x vale
   ```
2. Go to Options > Preferences > Plugins > Oxygen Vale Validation and specify the path to the previously downloaded Vale executable.
3. In the same preferences page, you can also specify a path to a Vale configuration file (.vale.ini). Vale automatically detects this file by looking 6 levels up in the current file's ancestor directories, but you can also impose one.
Vale Styles

Vale uses collections of individual YAML files (or "rules") to enforce particular writing constructs. These collections are referred to as *styles* and are organized in a nested folder structure at a user-specified location. The .vale.ini file is where you will control most of Vale's behavior, including which files to lint and how to lint them. Vale automatically detects .vale.ini, but you can also specify the path to .vale.ini from the plugin's preferences page (Options > Preferences > Plugins > Oxygen Vale Validation).

Third-party Styles

Vale has a growing selection of pre-made styles available for download from its *style library*.

Validation

After setting up the Vale executable, creating or downloading Vale styles, and specifying the path to .vale.ini, the add-on will intercept the Automatic Validation (on page 775) and Manual Validation (on page 775) and contribute errors and warning obtained by running Vale validation over the current file. The errors and warnings are highlighted in the editor.

**Note:** Although Vale supports multiple file formats, the Vale Validation add-on currently only supports Markdown (*.md files) and HTML files.

Translation

Translator Helper Add-on

Oxygen XML Editor offers an add-on that provides support for helping translators. Once the add-on is installed, you can use Google Translate to create a preliminary translation for your XML content that can later be manually improved. The add-on is also useful for showing potential customers how a DITA project will look like after it is translated into their native language. After the add-on is installed, a Translator Helper view is available from the Window > Show View menu.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field.
3. Select the Translator Helper add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart Oxygen XML Editor.

Result: The Translator Helper view now be available and can be selected from the Window > Show View menu.

Features:

- You can translate content to various languages using Google Translate or DeepL Translator:
  1. In Oxygen XML Editor, select the content you want to translate in Author mode. You can also select the entire contents of the document.
  2. Right-click, select Translate, and choose the target translator and language.
  3. Copy the translated content from the resulting web page (the easiest way to do this is to use the Copy translation button for Google Translate or the Copy to clipboard button for DeepL Translator).
  4. Go back to Oxygen XML Editor. If your original selection included multiple inline elements (or entire block elements or the entire document), a dialog box will be displayed. Click the Replace button to replace the selection with the copied translated content. If you leave the Show original content side-by-side option selected, the original untranslated content will be displayed in the Translator Helper side view.

- You can choose to display your original content in a Translator Helper side view so that you can see the original untranslated content side-by-side with the content that you are editing/translating. To open this side view, right-click anywhere in the Author mode editor pane and select the Original Content Side By Side action (or select Window > Show View > Translator Helper).

Resources

For more information about the Translator Helper add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinar:

- Webinar: Add-ons You Can Use for Technical Writing

DITA Translation Package Builder Add-on

Oxygen XML Editor offers an add-on that contributes contextual menu actions that help you build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.
Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install](Install.png)

Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA Translation Package Builder add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: A Translation Package Builder submenu will now be available in the contextual menu of the DITA Maps Manager. This submenu includes actions to generate a ZIP package of modified files that can be sent to translators, as well as an action to extract translated files back into your DITA project.

For more information, see the details for this Translation Package Builder add-on in GitHub.

Using the Translation Package Builder

Once the add-on is installed, a sub-menu named Translation Package Builder is available in contextual menu of the DITA Maps Manager with the following actions:

- **Generate Milestone** - Use this action first. It generates a unique hash for each documentation resource. This information is used by the second action (Create Modified Files Package) to detect which files have been modified. A milestone file should be generated after you install this add-on and then again after each package is sent to translators.
- **Create Modified Files Package** - This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.
- **Apply Package** - When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open `dita-map-french.ditamap` if the package contains the French translation). Invoking this action will extract the changed files inside the map's directory.

For more information about the Translation Package Builder add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinars/presentation:
Productivity

Smart Autocomplete Add-on (Experimental)

Oxygen XML Editor offers a Smart Autocomplete add-on that provides support for helping writers create content by providing text completions. This can be done in two ways: by using a built-in algorithm, or by using a language model (provided by Open AI®).

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install this add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
2. Select the Smart Autocomplete add-on and click Next.
3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
4. Restart the application.

Result: The Smart Autocomplete side view should be now available.

Use Cases for the Built-in Algorithm

1. Completions with existing project text.
2. You can organize text in some of your project files as a kind of completion proposals library.

Use Cases for the Language Models

Technical content:

1. Completions (note that it is very creative, but not always accurate, so you need to check the proposed content)
2. Automatic markup
3. Keywords extraction

Open AI represents a trademark of the Open AI LLC https://openai.com/api/policies/terms/
4. Summarizing
5. Translation

Non-technical content:
1. Brainstorming ideas
2. Paraphrasing
3. Copywriting
4. Creating commercial ads.

Resources
For more information about the Smart Autocomplete add-on, watch our video demonstration:

https://www.youtube.com/embed/-CGjBvh7-Pc

UI Overview
The core functionality of the Smart Autocomplete add-on is to offer text continuation after you press a space after a word. There are three radio buttons that allow you to select the completion engine:

- **Built-in** - Uses the built-in algorithm *(on page 2553).*
- **Open AI** - Uses the Open AI models *(on page 2554).*
- **None** - Disables the functionality.

If you select the **Auto-insert best proposals** checkbox, the insertion of the text is done automatically. Deselecting this option allows you to choose from a list of proposals displayed in the view.

**Using the Built-in Algorithm**

The built-in algorithm analyzes the set of all XML, HTML, or Markdown files from your project and creates a local index. Once this is selected, you can initiate the indexing of project files by clicking the **Reindex Project** button. The same effect is obtained if you reindex the project files from the **Open/Find Resources** view. When you save one of the indexed files, this will be re-indexed incrementally.

Advantages:
• It is fast and works on your local computer.
• It generates content that you already have in the project.
• You can use it as a kind of text template library. The quality of the completions increase with the size of your text content in the project.

Disadvantages:

• The proposals are not creative.
• There is no semantic search.

Using the Open AI Models

*Open AI GPT3* is the largest commercial AI model available to integrators. It contains about 175 billions weights, and it was trained on a huge corpus of text. Similar to other encoder/decoder language models, the training was done by 'hiding' some words from the input and asking the model to guess the missing word.

**GPT 3**

<table>
<thead>
<tr>
<th>Starting with huge amount of text...</th>
<th>...by masking and guessing missing text</th>
<th>Huge models like:</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image.png" alt="Diagram" /></td>
<td><img src="image.png" alt="Diagram" /></td>
<td><img src="image.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

The resulting language model was able to find semantic connections between words, in some way 'understanding' the meaning of a window of text, while being capable of doing much more than it was trained to do initially (e.g. responding to questions).

Advantages of the Open AI GPT-3 Language Model:

• Semantic awareness
• Extensible
• 'Creative'

Disadvantages:
• Slow due to network latency since content is sent to OpenAI® servers.

![Important:]

Check the license terms of the Open AI platform to make sure your company agrees with sending parts of the edited document to the Open AI.

• Not always factually correct since it uses probabilistic responses.

![Important:]

Always check the generated content. It behaves more like a brain than a database.

To use the GTP-3 language models, choose Open AI for the Engine. The interface then displays the following areas:

• The list of proposals.
• A panel with actions that can transform the selected text from the editor.
• A control panel with three tabs:
  ◦ **Model** - This drop-down allows you to select the Open AI model you intend to use for providing completions. It can be one of the base models, or one you fine-tuned (or trained) from your data. The default selection is text-davinci-001.

  ![Note:]
  
  The base models are named according to the following conventions (they contain one of the following keywords): davinci (signals the most capable model), curie, babbage, and ada.

  ◦ **Fine-tune Jobs** - From this tab, you can start fine-tuned jobs. Once a fine-tuned job has finished, the resulting model is listed in the Model combo box.
  ◦ **API Key** - This tab allows you to configure the Open AI API Key.

### Installing the Open AI API Key

To connect to the Open AI platform, follow these instructions to obtain an API Key:

2. Click on your organization avatar, then choose View API Keys.
3. Click + Create a new secret key.
4. Copy the key to the clipboard.
5. Paste the key into the API Key text field in the Smart Autocomplete view.

You can check that the add-on is connected to Open AI by switching to the Model tab. If the combo box contains a list of model names, the connection was successful. The default selected model is text-davinci-001.
Getting Completions

To get completions while typing content, enter a space and wait for a few seconds. Typing more text cancels the completion request. You can try different models to see different results. You can also try to fine tune a model to get better completions.

Creating a Fine-Tuned Model

In the **Fine-tune Jobs** tab, you can create new models by using a process called fine tuning.

1. Click the **New Fine-tune Job** button at the bottom of the view. A dialog box is displayed.
2. In the resulting dialog box, you can choose to create a model starting from a base one (see the **Base model** combo box) that is trained over the text of XML, TXT, Markdown, or PDF files from the current project, from a specified folder, or from a file that contains a lot of "prompt”/"completion” examples in JSONL format. This file may be created by a tool (or manually) from the training results in better models.
3. Click **Start Fine tune job** to start the job and it will be listed in the **Fine-tune Jobs** panel.
4. To check the job progress, you can click the **Refresh** button (the **Status** column will be updated).
   Another way is to use the **Job Events** action from the contextual menu. Example of a list of events:
   
   Fri Feb 25 08:45:22 EET 2022 info Created fine-tune: ft-jAeo6XJ3dyXF0mchWAD0wWFb
   Fri Feb 25 08:45:30 EET 2022 info Fine-tune costs $11.85
   Fri Feb 25 08:45:30 EET 2022 info Fine-tune enqueued. Queue number: 0
   Fri Feb 25 08:45:34 EET 2022 info Fine-tune started
   Fri Feb 25 08:53:34 EET 2022 info Completed epoch 1/4
   Fri Feb 25 09:00:53 EET 2022 info Completed epoch 2/4
   Fri Feb 25 09:08:10 EET 2022 info Completed epoch 3/4
   Fri Feb 25 09:15:30 EET 2022 info Completed epoch 4/4
   Fri Feb 25 09:15:56 EET 2022 info Completed epoch 4/4
   Fri Feb 25 09:16:00 EET 2022 info Uploaded result file: file-Avrc2wpFB1LKFiR7PFKver4o
   Fri Feb 25 09:16:00 EET 2022 info Fine-tune succeeded

   To cancel a job, use **Cancel** action from the contextual menu.

5. Once a job is finished, you can click **Refresh** in the **Model** tab and you will find the name of the new model in the combo box.

Using XSLT to Create an Open AI Training Set

Suppose you need to fine tune a model to learn to apply markup to your text.

To train or fine tune a base model, you need to create a data set in JSONL format. An Open AI JSONL file contains prompt - completion pairs, each pair on a single line.

```json
{ "prompt": "<prompt text>", "completion": "<sample of generated text>" }
```
For more details about this format, see: https://beta.openai.com/docs/guides/fine-tuning/prepare-training-data.

In the following example, an XSLT stylesheet is used to generate the JSONL file. Prompt-completion pairs are created by putting the plain text together with the marked text from each of these elements.

**prompt**

Pure text without any markup.

**completion**

Text with serialized markup.

First, some constants are defined and then the root matching template that scans a folder that contains DITA topics is created:

```xml
<!-- Method "text" because we generate JSON -->
<xsl:output method="text" omit-xml-declaration="yes"/>

<!-- Paragraphs that are smaller than this limit are processed. -->
<xsl:variable name="limit" select="500"/>
<!-- Open AI recommends adding terminators to the prompt and completion -->
<xsl:variable name="prompt-terminator" select="' ### '"/>
<xsl:variable name="completion-terminator" select="' $$\$'"/>

<xsl:template match="/">
  <xsl:for-each select="collection('file:/C:/path-to-topics-folder')">
    <xsl:call-template name="process-file"/>
  </xsl:for-each>
</xsl:template>

Next, the template that processes each of the topic files is defined. Only the `<p>` and `<li>` elements are selected in this example, and for each of them, a prompt-completion pair is generated.

```xml
<xsl:template name="process-file">
  <xsl:for-each select=".•/*[contains(@class, ' topic/p ') or contains(@class, ' topic/li ')]">
    <xsl:variable name="text" select="oxy:clean(.)"/>
  </xsl:for-each>
  <xsl:variable name="text-with-markup">
    <xsl:apply-templates mode="serialize-markup"/>
  </xsl:variable>
  <xsl:if test="string-length($text)&lt;$limit and
```
Since the format is JSON, the prompt and completion strings need to be cleaned up by escaping the quotes and apostrophes. This function is used from the above template.

```xml
<xsl:function name="oxy:clean">
  <xsl:param name="txt"/>
  <xsl:variable name="apos">'
  </xsl:variable>
  <xsl:variable name="quot">"</xsl:variable>
  <xsl:variable name="txt">
    <xsl:value-of select="replace(normalize-space($txt), $quot, $apos)"/>
  </xsl:variable>
  <xsl:variable name="txt">
    <xsl:value-of select="replace($txt,'\\', '\\')"/>
  </xsl:variable>
  <xsl:sequence select="$txt"/>
</xsl:function>
```

Next, to serialize the markup from a paragraph, all the inlines of interest are matched and the element names and attributes are emitted for each of them:

```xml
<!--
Match the inline elements and serializes them.
-->
<xsl:template match="*|
  contains(@class, ' ui-d/uicontrol ') or
  contains(@class, ' ui-d/menucascade ') or
  contains(@class, ' ui-d/shortcut ') or
  contains(@class, ' topic/i ') or
  contains(@class, ' topic/b ') or
  contains(@class, ' sw-d/filepath ') or
To apply this stylesheet, create an XSLT transformation scenario in Oxygen XML Editor. You can choose any well-formed XML file as the input (the stylesheet scans a folder using the collection function, so this input will be ignored) and specify the output file.

**Actions for Text Refactoring**

Under the list of proposals, there is a toolbar that shows a set of buttons you can use to alter or refactor the selected text from the editor. For example, to transform a paragraph into a list with the summary of ideas, you can select its text, then click the **Ordered Lists** button. The selection will be replaced with a new structured text.

**Oxygen Emmet Plugin**

An **Oxygen Emmet Plugin** is available as an add-on and it provides the means for high-speed coding and editing in **Text** mode or **Author** mode via a content assistance mechanism. It can be used for HTML, XSL, CSS, LESS, and other formats. For example, with the Emmet add-on installed, you can type abbreviations (similar to CSS selectors) and expand them into full-fledged HTML code. The add-on contributes a submenu named **Emmet** in the contextual menu and it contains actions for expanding abbreviations or wrapping content with an expanded abbreviation. The two actions can also be invoked using the **Alt + Shift + E (Ctrl + Shift + E on macOS)** or **Alt + Shift + W (Ctrl + Shift + W on macOS)** keyboard shortcuts.
Quick Installation

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:

![Install Button]

Manual Installation

To manually install this add-on, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the **Show add-ons from** field or select it from the drop-down menu.

   Tip:
   For HTML, CSS, LESS, or XSL files, you can simply right-click anywhere in the editor pane and select **Emmet** from the pop-up menu.

2. Select the **Oxygen Emmet Plugin** add-on and click **Next**.
3. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
4. Restart the application.

**Result:** The Emmet actions will now be available using the keyboard shortcuts or in the **Emmet** submenu (located in the contextual menu of **Text** mode or **Author** mode).

Emmet Actions

The two contributed actions are:

**Expand abbreviation [Alt + Shift + E (Ctrl + Shift + E on macOS)]**

In **Text** mode, after entering an abbreviation, invoking this action will expand a valid abbreviation into a code snippet, depending on the document type.

In **Author mode**, invoking the action opens a dialog box where you can enter an abbreviation. After you click **OK**, a valid abbreviation is expanded into a code snippet, depending on the document type.

Tip:
For HTML, CSS, LESS, or XML-based document types, you can also use **Ctrl + Space** to expand Emmet abbreviations.

**Wrap with abbreviation [Alt + Shift + W (Ctrl + Shift + W on macOS)]**
It opens a dialog box where you can enter an abbreviation and after clicking OK, the abbreviation is expanded with the selected content added in the last element of the generated snippet.

**Abbreviation Expansion Examples**

Here are some examples for HTML:

- **Expand abbreviation** example:

  ```html
  #page>div.logo+ul#navigation>li*5>a{Item $}
  ```

  expands into:

  ```html
  <div id="page">
    <div class="logo"></div>
    <ul id="navigation">
      <li><a href="" title="">Item 1</a></li>
      <li><a href="" title="">Item 2</a></li>
      <li><a href="" title="">Item 3</a></li>
      <li><a href="" title="">Item 4</a></li>
      <li><a href="" title="">Item 5</a></li>
    </ul>
  </div>
  ```

- **Wrap with abbreviation** example:

  If the following content is selected to be wrapped:

  ```html
  About
  News
  Products
  Contacts
  ```

  then

  ```html
  ul>li [title=$#]>*{($#)+img[src=https://www.ex1.com/$#][alt=item$]}
  ```

  expands into:

  ```html
  <ul>
    <li title="About">About<img src="https://www.ex1.com/About" alt="item1"></li>
    <li title="News">News<img src="https://www.ex1.com/News" alt="item2"></li>
    <li title="Products">Products<img src="https://www.ex1.com/Products" alt="item3"></li>
    <li title="Contacts">Contacts<img src="https://www.ex1.com/Contacts" alt="item4"></li>
  </ul>
  ```

You can also use Emmet abbreviations for other XML documents. Here are some examples of expanded abbreviations for DITA:
• prolog>author {AuthorName}

expands into:

```xml
<prolog>
  <author>AuthorName</author>
</prolog>
```

• simpletable>{strow>stentry*4}*4

expands into a 4x4 simple table.

• ul>li*3

expands into an unordered list with 3 list items.

• ol>li[id="item$"]*3

expands into:

```xml
<ol id="ol_gff_bjd_mkb">
  <li id="item1"/>
  <li id="item2"/>
  <li id="item3"/>
</ol>
```

Here are a few CSS examples:

• @f+

expands into:

```css
@font-face {
  font-family: 'FontName';
  src: url('FileName.eot');
  src: url('FileName.eot?#iefix') format('embedded-opentype'),
       url('FileName.woff') format('woff'),
       url('FileName.ttf') format('truetype'),
       url('FileName.svg#FontName') format('svg');
  font-style: normal;
  font-weight: normal;
}
```

• -br

expands into:

```css
-webkit-border-right: ;
-moz-border-right: ;
```
Writer Helper Add-on (Experimental)

Oxygen XML Editor offers an add-on that provides support for helping technical writers. Once the add-on is installed, a **Writer Helper** view is available from the **Window > Show View** menu. Once opened, you can use one of its available tabs to access the functionality.

Quick Installation

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:

[Install]

Manual Installation

To manually install the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste [http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the **Show add-ons from** field.
3. Select the **Writer Helper** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart Oxygen XML Editor.

**Result:** The **Writer Helper** view now be available and can be selected from the **Window > Show View** menu.

Review

You can select folders or files in the **Project** view and start a review session for them. By default, the review is done in random order and all reviewed documents are opened with **change tracking** enabled. During the review process, you can see a list of already reviewed documents and check the status of your progress.

This feature is useful for reviewing a set of documents.
**Similar Content**

You can select folders or files in the **Project** view, then choose a list of elements to check for similarity. Once you start the **Find similar content** processing, information from all XML, HTML, and Markdown files is gathered to determine elements that have similar text content. Once the similar matches are presented, you can click on each of them to show a detailed list of places where the matches are found.

If the **Show similar content for the current file** checkbox is enabled and the similar elements have been found, once you open a document, a results tab will show elements the current document has in common with all other documents that were analyzed.

This feature is useful for finding possible elements that can be reused instead of being copy-pasted between documents.

**Read Aloud**

Select content in the current document and use the **Play** button to listen to how it is read by an operating system-specific narrator.

This feature is useful to review content by listening to it.

**Tips**

You can view a list of editing tips, tuned for technical writers. Each tip might also have a **Mode details** link to open the Oxygen XML Editor user guide.

This feature is useful for discovering productivity tips to help make your editing experience more efficient and productive.

**Resources**

For more information about the Writer Helper add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Editor, watch the following webinar:

- [Webinar: Add-ons You Can Use for Technical Writing](#)

**Development**

**XSpec Helper View Add-on**

Oxygen XML Editor offers an add-on that contributes an **XSpec Test Results** view, that provides the ability to run XSpec test scenarios and view the results directly in the application.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:
Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open the add-on selection dialog box.
2. Paste https://www.oxygenxml.com/InstData/Addons/community/updateSite.xml in the Show add-ons from field (or select it from the drop-down menu).
3. Select the XSpec Helper View and XSpec Framework add-ons (both are required), and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

The add-on contributes a Run XSpec test scenarios button on the main toolbar. Click that button to execute an XSpec file and open its results in the XSpec Test Results view. At this point you can do the following:

- Switch to the XSLT and use the Run buttons in this view to execute a particular scenario.
- For each test, there is also a Show button that selects the corresponding test in the main editing area.
- For failed tests, you can click a particular test to open a diff comparison between the expected and actual results.

For more information, see the details for this Oxygen XSpec Helper View add-on in GitHub.

Saxon XSLT and XQuery Transformer Add-on

Oxygen XML Editor offers an add-on that installs an external Saxon XSLT and XQuery processor and allows you to validate and transform XSLT and XQuery documents with that external processor. The default add-on update site includes versions for Saxon 9.6, 9.7, 9.8, 9.9, 10.8, and 11.2.

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select one of the versions of the Saxon XSLT and XQuery Transformer add-on (9.6, 9.7, 9.8, 9.9, 10.8, or 11.2) and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.
**Result:** When you configure the validation or transformation scenario, you will now have the option to choose the particular Saxon transformer.

**Restriction:**
Debugging XSLT/XQuery transformations based on this engine is **NOT** supported.

### ICU4J Library Add-on

Oxygen XML Editor offers an add-on that provides the entire ICU4J JAR library used for sorting and collations with XSLT processors. The Saxon 9 XSLT processor has an `<xs1:sort>` element that can be used to sort elements based on their text content. If the XML elements contain text in exotic languages, Saxon needs a more powerful sort algorithm and this JAR library adds this capability.

#### Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the **Contribute ICU4J Library** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** The ICU4J library is now contributed to the Oxygen installation directory.

For more information, see the details for this **Contribute ICU4J Library** add-on in GitHub.

### XSD to JSON Schema Converter

Oxygen XML Editor includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The **XSD to JSON Schema** action for invoking the tool can be found in the Tools > JSON Tools menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the **XSD to JSON Schema** action will invoke the tool.

#### Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

[Install]
Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the XSD to JSON Schema add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The XSD to JSON Schema dialog box is now available and can be selected from the Tools > JSON Tools menu.

Converting XSD to JSON Schema

To convert an XML Schema (XSD) to a JSON Schema, follow these steps:

1. Select the XSD to JSON Schema action from the Tools > JSON Tools menu.

   **Step Result:** The XSD to JSON Schema dialog box is displayed:

   ![XSD to JSON Schema Dialog Box](image)

2. In the XSD URL field, choose or enter the URL of the XML Schema document. The conversion supports XSD versions 1.0 and 1.1.
3. In the Output file field, choose the path for the resulting output file.
4. [Optional] You can select the Open in Editor option to open the resulting JSON Schema document in the main editing pane.
5. For the JSON Schema version option, choose the version of the resulting JSON schema. The possible choices are: Draft 4, Draft 6, Draft 7, and Draft 2019-09.
6. [Optional] If you select the **Restrict additional content** option, then `additionalProperties` (for objects) and `additionalItems` (for arrays) will be set to `false` in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

7. [Optional] You can select the **Preserve case of names from the XSD** option if you want the names from the XSD to remain unchanged in the resulting JSON Schema. Otherwise, the default JAXB naming algorithm will be applied (for example, "some.name" is changed to "SomeNAME", or "Some_oth3r_name" is changed to "SomeOth3RName").

8. Click the **Convert** button.

**Result:** The original XSD document is now converted to a JSON Schema document. The resulting JSON Schema will be the specified draft and will contain:

- The `$id` of the schema, generated from XSD `targetNamespace`.
- The `$definitions` section, which declares `complex` and `enum` types.
- The `anyOf` section, which lists possible top-level elements as an array of objects.

**Other Possible Results:**

- If an XSD type extends another type, then its schema is combined with the schema of the base type using the `allOf` keyword.
- If an extension in XSD defines an element with the same name as an attribute in the base, a property named `rest` is generated to avoid name conflicts in JSON.
- If a property of a complex type is a collection property, the schema of the collection items will be wrapped in the JSON array schema.

**Conversion Mappings**

The following table lists the specific conversion mapping details.

<table>
<thead>
<tr>
<th>XML Schema Type</th>
<th>JSON Schema Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>anySimpleType</code></td>
<td>string, number, integer, boolean, null</td>
</tr>
<tr>

<tr>
<td>-----------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td><code>time</code></td>
<td>string with &quot;format&quot;:&quot;time&quot;</td>
</tr>
</tbody>
</table>

**Conversion Limitations**

In most cases, the conversion creates an equivalent schema, but there are some limitations:

- Restrictions/facets are not taken into consideration when converting `(fractionDigits, pattern, totalDigits, whiteSpace, minInclusive, maxInclusive, and the restrictions for length, except enumeration)`. However, extensions and indicators are properly converted `(minOccurs, maxOccurs, group, sequence, choice)`.
- The `<documentation>` element is not converted into `<description>`.
- The `@substitutionGroup` attribute for an element that has no declared type becomes a reference to the element that can substitute it.
- The `@block` attribute is not taken into consideration during the conversion.

**Generating Java Classes from XML Schema**

Oxygen XML Editor includes a tool for generating Java classes from an XML Schema (XSD) file. The **Generate Java classes from XML Schema (XSD)** action for invoking the tool can be found in the **Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the action will invoke the Java class generator tool.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:

![Install](Install)

**Manual Installation**

To manually install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Generate Java classes from XML Schema (XSD)** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** The **Generate Java classes from XML Schema (XSD)** dialog box is now available and can be selected from the **Tools** menu.
Generating Java Classes

To generate Java classes, follow these steps:

1. Select the **Generate Java classes from XML Schema (XSD)** action from the **Tools** menu.

   **Step Result:** The **Generate Java classes from XML Schema (XSD)** dialog box is displayed:

   ![Generate Java Classes from XML Schema (XSD) Dialog Box](image)

   - **Figure 611. Generate Java Classes from XML Schema (XSD) Dialog Box**

2. Choose or enter the **XSD URL** of the XML Schema document.
3. Choose the path for the **Output folder** where the generated files will be stored.
4. [Optional] You can choose the **Package name** for the Java package that will contain the generated source files. If not specified, the name will be generated based on the value of the **@targetNamespace** attribute.
5. [Optional] You can select the **Open in Editor** option to open the **ObjectFactory.java** file in the editor. This java class contains factory methods for all other classes in the package.
6. Click the **Generate** button.

   **Result:** The Java class files will be generated inside the new package, located in the specified output folder.

Generating JSON Schema Documentation

Oxygen XML Editor includes a tool for generating documentation for a JSON Schema file in HTML format.

To generate JSON Schema documentation, select **JSON Schema Documentation** from the **Tools > Generate Documentation** menu. You can also open the tool by using the **Generate Documentation** toolbar button. This opens a dialog box where you can specify the location of the JSON Schema file and HTML output file.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the **JSON Schema Documentation** action will invoke the tool.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** (version 24.1 or newer) to quickly initiate the installation process:
Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the JSON Schema Documentation add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The JSON Schema Documentation dialog box is now available and can be selected from the Tools > Generate Documentation menu.

JSON Schema Documentation Dialog Box

The JSON Schema Documentation dialog box includes the following fields and options:

JSON Schema URL

The URL of the JSON Schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

Output file
The path to the folder where the generated HTML file will be saved.

**Split output into multiple files**

If selected, the application splits the output into multiple files. You can choose between splitting them by component name or location.

**Open in Browser/System Application**

If selected, the generated result is opened in the system application associated with the output file type (HTML).

**Included component details**

This section can be used to specify whether or not the following components are shown in the generated documentation:

- **Annotations** - Displays the annotations (title, description) for each component (property or definition).
- **Constraints** - Displays the schema constraints for each component, according to its type.
- **Properties** - Displays the properties of an Object Schema.
- **Pattern Properties** - Displays the patternProperties of an Object Schema.
- **Enumerations** - Displays the enumerated values, if specified in the schema.
- **Source** - Displays the text schema source for each component.
- **Used By** - Displays the list of all the components that reference the current definition.
- **Composition** - Displays the oneOf, anyOf, and allOf Compositors that are used for combining schemas.
- **Diagram** - Displays the diagram image for each component. The diagrams are generated according to the options specified in the **Schema Design preferences page (on page 198)**. Diagrams are also generated for components within schemas from referenced files.
- **Image Map** - Diagrams will include hyperlinks that navigate to each particular component.
- **Location** - Displays the schema location for each component.

You can click **Generate** at any point to generate the JSON Schema documentation.

**Generated JSON Schema Documentation in HTML Format**

After generating the JSON Schema documentation, it is presented in a visual diagram style with various sections, hyperlinks, and options.
The generated documentation includes a Table of Contents on the left pane with links to particular sections in the right pane. You can collapse or expand details by using the Showing options or the Collapse or Expand buttons.

**OpenAPI Tester**

Oxygen XML Editor includes a testing tool for OpenAPI files. The tool provides the ability to inspect OpenAPI request responses and to ensure that they work as expected. It can be used for OpenAPI 3.x in JSON or YAML format.

To use the tool, select OpenAPI Tester from the Tools > JSON Tools menu. This opens a dialog box where you can specify the location of the OpenAPI file that you want to test.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the OpenAPI Tester action will invoke the tool.
Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the OpenAPI Tester add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The OpenAPI Tester dialog box is now available and can be selected from the Tools > JSON Tools menu.

OpenAPI Tester Dialog Box

Figure 614. OpenAPI Tester Dialog Box

![OpenAPI Tester Dialog Box](image)

After selecting the URL for the OpenAPI document (either local or remote) and clicking OK, the OpenAPI Tester view becomes visible on the right side of the editor. The view can also be opened by selecting OpenAPI Tester from the Window > Show View menu.
The tester loads the selected OpenAPI document and fills in the corresponding fields. The tester fields are as follows:

**URL**

The URL of the OpenAPI file. You can specify the path by using the text field or the **Browse** button. If you specify the path directly in the text field, you need to click the **Reload** button. You can use the **Clear** button if you want to remove all the content from the view.

**Server**

The list of servers defined by the OpenAPI document. The global "servers" array can be overridden on the path level or operation level. If it is not provided or is empty, the server URL defaults to "/".

**Path**

The list of individual endpoints (paths) in the API. The full request URL is constructed as `<server-url>/path`.

**Operation**

The list of HTTP operations supported by the selected path. OpenAPI 3.0 supports get, post, put, patch, delete, head, options, and trace.

**Parameters tab**
The definition of the parameters for the selected operation. OpenAPI 3.0 supports parameters passed via path, query string, headers, and cookies. The required parameters will be marked with a red asterisk. For array parameters, items must be separated by a comma.

**Authorization tab**

The list of available authentication types. The authentication data is persistent and can be removed from the contextual menu.

**Request Body tab**

The media type and the body of the request (if the selected operation allows it). For example, GET will not allow specifying a body since that HTTP method disallows it. Oxygen XML Editor will create a sample request body based on the JSON Schemas defined in the OpenAPI document. Usually, you just need to change a few values for the request to be valid.

**Variables tab**

The list of variables used for server templating (if applicable). Variables are indicated by {curly brackets} in the server URL.

**Send button**

Executes the request by creating a HTTP client with all the information extracted from the view.

**Open response in editor**

If selected, the response will be opened in the main editing pane.

**Response area**

Initially this area is empty. After using the Send button, it presents the message received from the server in response to the request. The expected content type of the message is JSON. The response status and possible errors that may occur are presented right below this area. The status has a green foreground for successful requests and a red foreground otherwise.

**Generating OpenAPI Documentation**

Oxygen XML Editor includes a tool for generating documentation for OpenAPI components in HTML format, including annotations and cross references. The documentation displays information about the servers, paths, components and tags defined in the OpenAPI 3.0 documents and it is presented in a visual diagram style with various sections, hyperlinks, and filtering options.

**Quick Installation**

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install Button]

**Manual Installation**

To manually install it the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the OpenAPI Documentation Generator add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The OpenAPI Documentation dialog box is now available and can be selected from the Tools > Generate Documentation menu.

Generating OpenAPI Documentation

To generate OpenAPI documentation, select OpenAPI Documentation from the Tools > Generate Documentation menu. This opens a dialog box where you can specify the location of the OpenAPI file and the HTML output file.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the OpenAPI Documentation action will invoke the tool.

The OpenAPI Documentation dialog box includes the following fields and options:

OpenAPI URL

The URL of the OpenAPI file. You can specify the path by using the text field or the browsing button ( ).
Output file

The path to the folder where the generated HTML file will be saved.

Split output into multiple files

If selected, the application splits the output into multiple files. You can choose between splitting them by component name or location.

Included component details

This section can be used to specify whether or not details about the following components that belong to internal or imported schemas are shown in the generated documentation:

- **Annotations** - Displays the annotations (title, description) for each component (property or definition).
- **Constraints** - Displays the schema constraints for each component, according to its type.
- **Source** - Displays the text schema source for each component.
- **Location** - Displays the schema location for each component.
- **Used By** - Displays the list of all the components that reference the current definition.
- **Properties** - Displays the properties of an Object Schema.
- **Pattern Properties** - Displays the patternProperties of an Object Schema.
- **Enumerations** - Displays the enumerated values, if specified in the schema.
- **Diagram** - Displays the diagram image for each component. The diagrams are generated according to the options specified in the Schema Design preferences page (on page 198). Diagrams are also generated for components within schemas from referenced files.
- **Composition** - Displays the oneOf, anyOf, and allOf compositors that are used for combining schemas.
- **Image Map** - Diagrams will include hyperlinks that navigate to each particular component.

You can click Generate at any point to generate the OpenAPI documentation.

Generated OpenAPI Documentation in HTML Format

After generating the OpenAPI documentation, it is presented in a visual diagram style with various sections, hyperlinks, and options.
The generated documentation includes a Table of Contents on the left pane with links to particular sections in the right pane. You can collapse or expand details by using the Showing options or the Collapse or Expand buttons.

Others

DocBook Checker Add-on

Oxygen XML Editor offers an add-on that allows you to validate DocBook files. It reports issues such as broken internal and external links, problems with images, or profiling conditions that conflict with profiling preferences.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DocBook Checker add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: A Check DocBook for Completeness action will now be available on the toolbar and in the contextual menu. This action opens a dialog box that offers various validation options for running a completeness check on the current DocBook document.

For more information, see the details for this DocBook Checker add-on in GitHub.

CGM Image Support Add-on

Oxygen XML Editor offers an add-on that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in Author mode, the Oxygen CGM support add-ons need to be installed in Oxygen XML Editor.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install the Oxygen CGM support add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen CGM support add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: You should be able to see CGM images in Author mode.

For more information, see the details about this CGM Support add-on in GitHub.
Tools

Oxygen XML Editor includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view (on page 402).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2899).

Note:
The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 2585) or previewed (on page 2585) also appear in the Refactoring submenu of the contextual menu in the Project view and the DITA Maps Manager.
XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

![XML Refactoring Wizard](image)

**Figure 618. XML Refactoring Wizard**

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

**Scope section**

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 3220) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 3226).

**Filters**
The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation. 
- **Look inside archives** - When selected, the resources inside archives will also be affected.

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

**Troubleshooting:**

If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

**Tip:**

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

**Restriction:**

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

- **Element**
  The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

- **Local name**
  The local name of the affected attribute.

- **Namespace**
  The namespace of the affected attribute.

- **Value**
  The value for the affected attribute.

**Options section**

You can choose between one of the following options for the **Operation mode**:

- **Add the attribute in the parent elements where it is missing**
  Adds the attribute to all instances of the specified parent element.

- **Change the value in the parent elements where the attribute already exists**
  Replaces the value of the already existing attribute in all instance of the specified parent element.

- **Both**
  Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**
Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

- **Element**
  
The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

- **Local name**
  
The local name of the affected attribute.

- **Namespace**
  
The namespace of the affected attribute.

**New element section**

- **Local name**
  
The local name of the new element.

- **Namespace**
  
The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element**
  
The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

- **Attribute**
  
The name of the attribute to be deleted.

**Rename attribute**

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element**
  
The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

- **Attribute**
  
The name of the attribute to be renamed.
New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

Refactoring Operations for Comments

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:
Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

Refactoring Operations for DITA Topics

Change topic ID to file name
Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert DITA 1.3 Maps and Topics to DITA 2.0**

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- **DITA Map changes:**
  - Removes the `@lockmeta` attribute.
  - Removes the `topicset` and `topicsetref` elements.
  - Removes the `anchor` and `anchorref` elements and the `@anchorref` attribute.
  - Migrates the `@navtitle` attribute as a `<navtitle>` element.
  - Migrates the `@title` attribute as a `<title>` element.
  - Converts the `@copy-to` attribute to a `<resourceid>` element.
  - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
  - Converts `topicmeta `<linktext>` to `<linktitle>`. <linktext>
  - Removed `<hasInstance>, `<hasKind>, `<hasNarrower>, `<hasPart>, `<hasRelated>, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>, `<subjectRelHeader>, `<subjectRel>, and `<subjectRole>`.

- **DITA task changes:**
  - Converts the `<substep>` element to a `<step>` element.
  - Converts the `<substeps>` element to a `<steps>` element.

- **DITA topic changes:**
  - Removes the `@type` attribute with the value `fastpath`.
  - Converts the `@alt` attribute to an `<alt>` element.
  - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
  - Removes the `<itemgroup>` element.
  - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
  - Removes the `@domains` attribute.
  - Renames `<sectiondiv>` to `<div>`.
  - Remove `@query` attribute from `<link>` element.
  - Remove `@specentry` attribute from `<stentry>` element.

  Remove the `@spectitle` attribute.

**Convert conrefs to conkeyrefs**

Use this operation to convert `@conref` attributes to `@conkeyref` attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 3043).

**Convert Nested Topics to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))
Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 2972).

**Rename Key**

Use this operation to rename a key. It also updates all references to it.
Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for DITA Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute.

Define keys for all topic references
This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (\texttt{<xref>} or \texttt{<link>}) with a direct reference to another DITA topic or an element with a \texttt{@conref}, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the \textit{Validate and check for completeness} action from the \textit{DITA Maps Manager} toolbar to manually fix those problems. You can enable the \textit{Report duplicate keys} checkbox to also report any keys that are defined more than once.

\textbf{Scope and Filters:}

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

\textbf{Scope}

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the \textit{Project, All opened files, Current DITA map hierarchy}, or just the \textit{Current file}.

\textbf{Filters section}

\textbf{Include files}

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

\textbf{Restrict to known XML file types only}

Excludes non-XML file types from the operation.

\textbf{Look inside archives}

If this option is selected, the scope of the operation will include files inside archives.

\textbf{Refactoring Operations for Elements}

\textbf{Delete element}

Use this operation to delete elements. This operation requires you to specify the following parameter:

\textbf{Element}

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

\textbf{Delete element content}
Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**
Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

- **Local name**
  
  The local name of the *Wrapper element*.

- **Namespace**
  
  The namespace of the *Wrapper element*.

**Wrap element content**

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

- **Local name**
  
  The local name of the *Wrapper element* that will surround the content of the target.

- **Namespace**
  
  The namespace of the *Wrapper element* that will surround the content of the target.
Refactoring Operations for Fragments

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

**XML Fragment**

The XML fragment to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.
Refactoring Operations for **JATSKit**

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these **JATSKit** refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Look inside archives**

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for **Processing Instructions**

**Accept all tracked changes, remove all Oxygen-specific comments and highlights**

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

**Accept all tracked changes**

Accepts all application-specific tracked changes (from elements and attributes).

**Remove comments**

Removes all application-specific comments.

**Remove highlights**
Removes all application-specific highlights.

**Delete processing instructions**

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

**Processing instruction target**

The target name of the processing instructions to delete.

**Note:**

Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

### Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

**Migrate HTML Page Layout Files to v21**

Use this operation to convert custom HTML page layout files (*on page 1622*) that are included in a custom Publishing Template that was created in Oxygen XML Editor version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor version 21.0.

**Migrate HTML Page Layout Files to v22**

Use this operation to convert custom HTML page layout files (*on page 1622*) that are included in a custom Publishing Template that was created in Oxygen XML Editor versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Editor version 22.0.

**Update HTML Pages**

**Attention:**

This operation is only used by Oxygen XML Editor and should not be used manually.

### Additional Notes:

- There are some operations that allow `<ANY>` for the *local name* and *namespace* parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the *Options > Preferences > XML > XSLT-XQUERY > XPath* (*on page 258*) page. This preferences page can be
Custom Refactoring Operations

While Oxygen XML Editor includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Editor will run to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation (such as the name, description, and parameters).

Figure 621. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (on page 841), along with the built-in operations.
After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a safe mode, which implies the following:

- When loading the document:
  - The XInclude mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- When saving the updated XML document:
  - The DOCTYPE will be preserved.

Note:
This can be changed using Saxon extension functions in XSLT (on page 873).

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note:
To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction:
Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (on page 873) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:
1. Create an XQuery Update script (on page 863) or XSLT stylesheet file (on page 868).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: Example descriptor file for an XQuery Update script (on page 866) or Example descriptor file for an XSLT stylesheet (on page 871).
3. Store both files in one of the locations that Oxygen XML Editor (on page 875) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (on page 841).

**Related information**
- Storing and Sharing Refactoring Operations (on page 875)

### Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script (on page 863) or XSLT stylesheet (on page 868) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (on page 863) or XSLT method example (on page 868) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (on page 863) or XSLT stylesheet (on page 868). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

**Note:**

The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (on page 1536) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (on page 1485).

**Note:**

If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML /XSLT-XQuery / XPath preferences page (on page 258).

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 866) or XSLT stylesheet (on page 871).
Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the New document wizard and choose the XML Refactoring Operation Descriptor template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (on page 863) or XSLT stylesheet (on page 868) that is associated with the particular operation through the <script> element.

You can specify a category for your custom operations to logically group certain operations. The <category> element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (on page 842) for that particular operation.

The value of the first <description> element in the <parameters> section will be displayed at the top of the Configure Operation Parameters wizard page (on page 842).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
  - **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.
Note:
The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

Note:
A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

Note:
When writing XPath expressions, you can only use prefixes declared in the `Options > Preferences > XML > XSLT-XQuery > XPath (on page 258)` options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a `QName (on page 3225)` for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.

- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```
Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

`elementLocation`

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

`attributeLocation`

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute" >
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```
elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the @label attribute is displayed in the application as label of the associated combo. The @name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the @allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the @useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the @label attribute is displayed in the application as the label of the associated combo. You can also use the @useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note:

An <attributeParameter> is dependant upon an <elementParameter>. The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```
Note:
All built-in operations are loaded from the \[OXYGEN_INSTALL_DIR]/refactoring folder.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of <image> elements where a deprecated @alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the <image> element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 622. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (on page 2607) that contains the path to the XSLT stylesheet.
Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
exclude-result-prefixes="xs"
xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
version="2.0">
    <xsl:param name="element_localName" as="xs:string" required="yes"/>
    <xsl:param name="element_namespace" as="xs:string" required="yes"/>
    <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
    <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
    <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
    <xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
    <xsl:template match="/*[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]"/>

    <xsl:variable name="attributeToConvert"
select="@*[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

    <xsl:choose>
        <xsl:when test="empty($attributeToConvert)">
            <xsl:copy>
                <xsl:apply-templates select="node() | @*"/>
            </xsl:copy>
        </xsl:when>
    </xsl:choose>
</xsl:stylesheet>
```
Note:
The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (on page 3227) set in the XML Refactoring framework (on page 3221).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.
<description>Converts the specified attribute to an element. The new element will be inserted as first child of the attribute's parent element.</description>

<!-- For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery Update script -->
<!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->

<script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>

<parameters>
  <section label="Parent element">
    <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
      </localName>
      <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
      </namespace>
    </elementParameter>
  </section>

  <section label="Attribute">
    <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
        <description>Name of the attribute to be converted.</description>
      </localName>
      <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
      </namespace>
    </attributeParameter>
  </section>

  <section label="New element">
    <elementParameter>
      <localName label="Name" name="new_element_localName">
        <description>The name of the new element.</description>
      </localName>
      <namespace label="Namespace" name="new_element_namespace">
        <description>The namespace of the new element.</description>
      </namespace>
    </elementParameter>
  </section>
</parameters>
Note:
If you are using an XSLT file, the line with the `<script>` element would look like this:

```xml
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the [DITA Refactoring GitHub sample project](https://github.com/dita-refactoring).

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation (on page 875). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

![Figure 623. Example: XML Refactoring Wizard for a Custom Operation](image)

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (on page 863) in that refactoring operations can only be performed on comments or processing instructions that...
are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
   <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

- **get-content-after-root()** - Returns the content after root as `xs:string`.
  
  For the XML above, the call of this function will return the following string value:

  ```xml
  <!-- comment after root -->
  <?pi after root ?>
  ```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```xml
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  <root>
     <child></child>
  </root> <!-- Inserted comment -->
  ```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```xml
  <!-- comment before root -->
  <?pi before root ?>
  ```
• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<!-- Inserted comment -->
<root>
  <child>
  </child>
</root>
<!-- comment after root -->
```

**XSLT Example:**

To process content after the root node, the XSLT would look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?><xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
  xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
  <xsl:template match="/">
    <!-- The comment content that will be inserted after the root element -->
    <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
  </xsl:variable>
    <!-- Retrieve the content after the root element as is -->
    <xsl:variable name="after-root-content" as="xs:string" select="xrf:get-content-after-root()"/>
    <!-- Update the content after the root element -->
    <xsl:value-of select="xrf:set-content-after-root($after-root-content, $commentAsText)"/>
  </xsl:template>
  <xsl:template match="node() | @*">
    <xsl:copy>
      <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing. To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (on page 144).
- A folder that you specify in the Load additional refactoring operations from text box (on page 269) in the XML Refactoring preferences page (on page 269).

• A folder specified by the XML Refactoring Operations Plugin Extension (on page 2432).
• The refactoring folder from the Oxygen XML Editor installation directory
  ([OXYGEN_INSTALL_DIR]/refactoring/).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (on page 3221) or projects.

After storing custom operations, you can share them with other users by sharing the resources.
Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in
{OXYGEN_INSTALL_DIR}/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The <description> of the <parameters> element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

`${i18n(translation_key)}`

Oxygen XML Editor scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (Options > Preferences) (on page 124), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- An i18n folder located in directories specified through the XML Refactoring Operations Plugin Extension (on page 2432).
- The refactoring/i18n folder from the Oxygen XML Editor installation directory (/OXYGEN_INSTALL_DIR)/refactoring/i18n).

Example: Refactoring Operation Descriptor File with i18n Support

```xml
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor

   xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"

   name="${i18n(Remove_text_content)}"/>

<description>${i18n(Remove_text_content_description)}</description>

<script type="XQUERY_UPDATE" href="remove_text_content.xq"/>

<parameters>

   <description>${i18n(parameters_description)}</description>

   <parameter label="${i18n(Element_name)}" name="element_localName"

      type="NC_NAME">

      <description>${i18n(Element_name_descriptor)}</description>

      <possibleValues>

```
Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (on page 238).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the Tools menu. This action is also available in the contextual menu of the schema Design mode (on page 952). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (on page 242). You can also run the tool from the command line using exported options.

Schema Tab

The first set of options for the Generate Sample XML Files tool are found in the Schema tab.
This tab includes the following options:

**URL**

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the `Browse` drop-down list.

**Namespace**

Displays the namespace of the selected schema.

**Root Element**

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

**Number of instances**

The number of XML files to be generated.
Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the Default Namespace, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click OK at any point to generate the sample XML files.

Options Tab

The Options tab allows you to set specific options for namespaces and elements.

Figure 625. Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:
Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an xs:string with the xs:maxLength facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

⚠️ Important:

If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to \texttt{minOccurs} and \texttt{maxOccurs} facets defined in the XML Schema.

- If the value set here is between \texttt{minOccurs} and \texttt{maxOccurs}, then that value is used.
- If the value set here is less than \texttt{minOccurs}, then the \texttt{minOccurs} value is used.
- If the value set here is greater than \texttt{maxOccurs}, then \texttt{maxOccurs} is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the \texttt{<xs:alternative>} element from XML Schema 1.1. The possible strategies are:

- \textbf{First} - The first valid alternative type is always used.
- \textbf{Random} - A random alternative type is used.

Choice strategy

Used for \texttt{<xs:choice>} or \texttt{<substitutionGroup>} elements. The possible strategies are:

- \textbf{First} - The first branch of \texttt{<xs:choice>} or the head element of \texttt{<substitutionGroup>} is always used.
- \textbf{Random} - A random branch of \texttt{<xs:choice>} or a substitute element or the head element of a \texttt{<substitutionGroup>} is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for \texttt{<xs:choice>} and \texttt{<substitutionGroup>}). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab
Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click OK at any point to generate the sample XML files.

**Advanced Tab**

The **Advanced** tab allows you to set some options regarding output values and performance.

![Generate Sample XML Files Dialog Box (Advanced Tab)](image)

This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.
Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 3198).

Converting Schema to Another Schema Language

The generate/convert schema tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses the Trang multiple format converter to perform the actual schema conversions.

To use this tool, select the Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on macOS)) action from the Tools menu or from the Open with submenu when invoking the contextual menu in the Project view (on page 402). This action opens the Generate/Convert Schema dialog box that allows you to configure various options for conversion.

Figure 627. Generate/Convert Schema Dialog Box

The Generate/Convert Schema dialog box includes the following options:

Input section
Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

**Output section**

Allows you to select the language of the target schema.

**Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**

Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value
and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.

- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element.
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD’s do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the @processContents attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the @processContents attribute of <anyAttribute> elements. The default is skip (corresponding to RELAX NG semantics).

### Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   **Result:** The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page (on page 276)** where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
   - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

   **Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   a. Select the database column you want to configure.
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

   **Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.

### Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. This action opens the **Flatten Schema** dialog box that allows you to configure the operation.
For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

**Note:**
If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

**Options in the Flatten Schema Dialog Box**

The following options are available in the Flatten Schema dialog box:

- **File name**
  The name of the output file.

- **Output directory**
  The path of the output directory where the flattened schema file will be saved.

- **Open the flattened XML Schema file in editor**
Opens the main flattened schema in the editing area after the operation completes.

**Use the XML Catalogs when collecting the referenced XML Schemas**

Enables the imported and included schemas to be resolved through the available *XML Catalogs*(on page 3227).

**Note:**
Changing this option triggers the recalculation of the dependencies graph for the main schema.

**Process the imported XML Schemas resolved through the XML Catalogs**

Specifies whether or not the imported schemas that were resolved through an *XML Catalog*(on page 3227) are also processed.

**Flatten the imported XML Schema(s)**

Specifies whether or not the imported schemas are flattened.

**Note:**
For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

**Tip:**
This function can be executed from an automated command-line script, for more details, see *Scripting Oxygen*(on page 3198).

---

**Generating Java Classes from XML Schema**

Oxygen XML Editor includes a tool for generating Java classes from an XML Schema (XSD) file. The **Generate Java classes from XML Schema (XSD)** action for invoking the tool can be found in the *Tools* menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the action will invoke the Java class generator tool.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in *Oxygen*(version 24.1 or newer) to quickly initiate the installation process:

![Install Button]

**Manual Installation**

To manually install it the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Generate Java classes from XML Schema (XSD) add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The Generate Java classes from XML Schema (XSD) dialog box is now available and can be selected from the Tools menu.

Generating Java Classes

To generate Java classes, follow these steps:

1. Select the Generate Java classes from XML Schema (XSD) action from the Tools menu.

   **Step Result:** The Generate Java classes from XML Schema (XSD) dialog box is displayed:

   ![Generate Java Classes from XML Schema (XSD) Dialog Box]

   **Figure 629. Generate Java Classes from XML Schema (XSD) Dialog Box**

   - Choose or enter the XSD URL of the XML Schema document.
   - Choose the path for the Output folder where the generated files will be stored.
   - [Optional] You can choose the Package name for the Java package that will contain the generated source files. If not specified, the name will be generated based on the value of the @targetNamespace attribute.
   - [Optional] You can select the Open in Editor option to open the ObjectFactory.java file in the editor. This java class contains factory methods for all other classes in the package.
   - Click the Generate button.

   **Result:** The Java class files will be generated inside the new package, located in the specified output folder.
Compiling an XSL Stylesheet for Saxon

As of Saxon 10.6, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a stylesheet export file or SEF). Oxygen XML Editor includes a simple tool called Compile XSL Stylesheet for Saxon (found in the Tools menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

  ```html
  <script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
  <script>
    window.onload = function() {
      SaxonJS.transform(
        stylesheetLocation: "books.sef",
        sourceLocation: "books.xml"
      );
    }
  </script>
  ```

- **Use SEF to run transformations in Oxygen XML Editor** - You can also use a stylesheet export file (SEF) in Oxygen XML Editor to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of those two versions for the Target when you configure the SEF file (on page 2628). When configuring the XSLT transformation, you will specify the SEF file in the XSL URL field (on page 1465).

Compiling an SEF File

The Compile XSL Stylesheet for Saxon tool can be found in the Tools menu and it compiles a specified stylesheet as a JSON or an XML file (stylesheet export file).

If you choose Saxon-JS as the Target (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of .sef by default.

If you choose Saxon-EE, Saxon-PE, or Saxon-HE for the Target, then the compiled stylesheet will be an XML file with a file extension of .xsef by default.

Selecting this tool opens the Compile XSL Stylesheet for Saxon dialog box that allows you to configure some options for conversion.
This dialog box includes the following options:

**XSL URL**

Allows you to select the URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the `Browse` drop-down list.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the `Insert Editor Variables` button, or using the browsing actions in the `Browse` drop-down list.

**Open in Editor**

Select this option to open the resulting stylesheet export file in the main Oxygen XML Editor editing pane.

**Target**

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

**Relocatable**

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URI.

**Set the default namespace for unprefixed element names (`-ns`)**
Can be used to control the `ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefixed element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The `##any` value declares that unprefixed names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The `##html5` value declares that an unprefixed element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 10.6 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Compile**

Use this button to generate the stylesheet export file according the options selected in this dialog box.

**JSON Tools**

Oxygen XML Editor includes some useful tools for converting JSON to and from XML, converting XSD to JSON Schema, and generating JSON instances or a JSON Schema.

**Generating Sample JSON Files from a JSON Schema**

Oxygen XML Editor includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select Generate Sample JSON Files from the Tools > JSON Tools menu. The action opens a dialog box where you can configure a variety of options for generating the files.
Figure 631. Generate Sample JSON Files Dialog Box

The **Generate Sample JSON Files** dialog box includes the following fields and options:

**Schema URL**

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

**Associate schema in the document**

If enabled, the specified schema will be associated with the generated files.

**Output folder**

Path to the folder where the generated JSON instances will be saved.

**File name**

The name of the instance(s) that will be generated. By default, `instance.json` is used.

**Number of instances**

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property value**

You can specify the way the values of the properties are generated. The following options are available:
• *None* - Assigns empty values for properties (a template file will be generated). This is the
default value.
• *Default* - Assigns the name of the property as the value (for strings) or assigns the
specified minimum value (for numbers).
• *Random* - Assigns random values according to schema restrictions.

**Generate optional properties**

If selected, the JSON instance will be generated with optional properties that are defined in the
JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the
JSON schema as `additionalProperties` and additional items that are defined as `additionalItems`
(in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a
`combinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

• *First* - The first defined schema in `oneOf` or `anyOf` will be used.
• *Random* - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected
schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to
1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

**Generating JSON Schema from a JSON File**

Oxygen XML Editor includes a tool for generating a sample JSON Schema from a JSON file. To generate a
sample JSON Schema, select **Generate JSON Schema** from the **Tools > JSON Tools** menu. The action opens a
dialog box where you can configure some options for generating the JSON Schema.
Figure 632. Generate JSON Schema Dialog Box

The **Generate JSON Schema** dialog box includes the following fields and options:

**JSON Document URL**

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the *Browse* drop-down list.

**Output JSON Schema**

The path to the folder where the generated JSON Schema will be saved.

**Open in Editor**

If selected, the generated JSON Schema is opened in the editor.

**JSON Schema version**

The version of the resulting JSON schema. The possible choices are: Draft 4, Draft 6, Draft 7, and Draft 2019-09.

**Extract matching format for strings**

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

**Restrict additional content**

If selected, additionalProperties (for objects) and additionalItems (for arrays) will be set to false in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

**Add default values for simple types**

If selected, the default values (0 for number, "" for string, false for boolean) and examples for strings will be added.
**Make all properties required**

If selected, the generator will mark all the properties as required in the resulting schema.

You can click **Generate** at any point to generate the JSON Schema.

**JSON to YAML Converter**

**Converting JSON to YAML in Oxygen**

Oxygen XML Editor includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **Tools > JSON Tools** menu.

   The **JSON to YAML** dialog box is displayed:

   ![JSON to YAML Dialog Box](image)

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original JSON document is now converted to a YAML document.

**Related Information:**

YAML to JSON Converter *(on page 1137)*
YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Editor includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

The YAML to JSON action for invoking the tool can be found in the Tools > JSON Tools menu.

To convert a YAML document to JSON, follow these steps:

1. Select the YAML to JSON action from the Tools > JSON Tools menu.

   The YAML to JSON dialog box is displayed:

   ![YAML to JSON Dialog Box](image)

   **Figure 634. YAML to JSON Dialog Box**

2. Choose or enter the YAML URL for the document you want to convert.
3. Choose the path of the Output file that will contain the resulting JSON document.
4. [Optional] Select the Open in Editor option to open the resulting JSON document in the main editing pane.
5. Click the Convert button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

JSON to YAML Converter (on page 1137)

JSON to XML Converter

Online JSON to XML Converter

Attention:

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.
Converting JSON to XML in Oxygen

Oxygen XML Editor includes a useful and simple tool for converting JSON files to XML. The JSON to XML action for invoking the tool can be found in the Tools > JSON Tools menu.

To convert a JSON document to XML, follow these steps:

1. Select the JSON to XML action from the Tools > JSON Tools menu.

The JSON to XML dialog box is displayed:

![JSON to XML Dialog Box]

2. Choose or enter the Input URL of the JSON document.
3. Choose the path of the Output file that will contain the resulting XML document.
4. Select the Open in Editor option to open the resulting XML document in the main editing pane.
5. Click the Convert button.

Result: The original JSON document is now converted to an XML document.
Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```json
{
    "personnel": {
        "person": [
            {
                "id": "Big.Boss",
                "name": "boss",
                "given": "Big"
            },
            {
                "email": "chief@oxyxml.com",
                "link": {
                    "subordinates": [
                        "one.worker",
                        "two.worker",
                        "three.worker",
                        "four.worker",
                        "five.worker"
                    ]
                }
            }
        ],
    "id": "personnel-id"
}
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
    <personnel>
        <person>
            <name>Boss</name>
        </person>
    </personnel>
</JSON>
```
• If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```json
[
  {"name": "Boss"},
  {"name": "Worker"}
]
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>
```

• If the name of a JSON property contains characters that are not valid in XML element names (for example, `$`), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```json
{"$id": "personnel-id"}
```

is converted to:

```xml
<_X24_id>personnel-id</_X24_id>
```

Converting XML to JSON in Oxygen

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. The XML to JSON action for invoking the tool can be found in the Tools > JSON Tools menu.

To convert an XML document to JSON, follow these steps:

1. Select the XML to JSON action from the Tools > JSON Tools menu.

   **Step Result:** The XML to JSON dialog box is displayed:

   ![XML to JSON Dialog Box](image)

2. Choose or enter the Input URL of the XML document.
3. Choose the path of the Output file that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is object).
5. Select the Open in Editor option to open the resulting JSON document in the main editing pane.
6. Click the Convert button.

**Result:** The original XML document is now converted to a JSON document.
Figure 638. Example: XML to JSON Operation Result

Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).

- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```
{
  "personnel": {
    "person": [
    ]
  }
}
```

```
{
    "id": "person.one",
    "name": "Boss"
},
{
    "id": "person.two",
    "name": "Worker"
}
```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (e.g. `#text1`, `#text2`). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. `b`, `b#1`, `b#2`).

```
<p>This <b>is</b> an  <b>example</b>!</p>
```

is converted to:

```
{
    "p": {
        "#text": "This ", 
        "b": "is", 
        "#text1": " an ", 
        "b#1": "example", 
        "#text2": "!"
    }
}
```

- If the XML document contains element names that contain hexadecimal codes (for example, if they were escaped during a JSON to XML conversion (on page 1131)), it will be converted to the normal character value in the converted JSON document.

```
<_X24_id>personnel-id</_X24_id>
```

is converted to:

```
{"$id": "personnel-id"}
```

Related Information:

JSON to XML Converter (on page 1131)
XSD to JSON Schema Converter

Oxygen XML Editor includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The XSD to JSON Schema action for invoking the tool can be found in the Tools > JSON Tools menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the XSD to JSON Schema action will invoke the tool.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

![Install](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml)

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the XSD to JSON Schema add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The XSD to JSON Schema dialog box is now available and can be selected from the Tools > JSON Tools menu.

Converting XSD to JSON Schema

To convert an XML Schema (XSD) to a JSON Schema, follow these steps:

1. Select the XSD to JSON Schema action from the Tools > JSON Tools menu.

Step Result: The XSD to JSON Schema dialog box is displayed:
2. In the XSD URL field, choose or enter the URL of the XML Schema document. The conversion supports XSD versions 1.0 and 1.1.

3. In the Output file field, choose the path for the resulting output file.

4. [Optional] You can select the Open in Editor option to open the resulting JSON Schema document in the main editing pane.

5. For the JSON Schema version option, choose the version of the resulting JSON schema. The possible choices are: Draft 4, Draft 6, Draft 7, and Draft 2019-09.

6. [Optional] If you select the Restrict additional content option, then additionalProperties (for objects) and additionalItems (for arrays) will be set to false in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

7. [Optional] You can select the Preserve case of names from the XSD option if you want the names from the XSD to remain unchanged in the resulting JSON Schema. Otherwise, the default JAXB naming algorithm will be applied (for example, "some.name" is changed to "SomeName", or "Some_oth3r_name" is changed to "SomeOth3RName").

8. Click the Convert button.

Result: The original XSD document is now converted to a JSON Schema document. The resulting JSON Schema will be the specified draft and will contain:

- The $id of the schema, generated from XSD targetNamespace.
- The $definitions section, which declares complex and enum types.
- The anyOf section, which lists possible top-level elements as an array of objects.

Other Possible Results:
- If an XSD type extends another type, then its schema is combined with the schema of the base type using the `allOf` keyword.
- If an extension in XSD defines an element with the same name as an attribute in the base, a property named `rest` is generated to avoid name conflicts in JSON.
- If a property of a complex type is a collection property, the schema of the collection items will be wrapped in the JSON array schema.

Conversion Mappings

The following table lists the specific conversion mapping details.

<table>
<thead>
<tr>
<th>XML Schema Type</th>
<th>JSON Schema Representation</th>

</tr>
<tr>
<td>time</td>
<td>string with &quot;format&quot;:&quot;time&quot;</td>
</tr>
</tbody>
</table>

**Conversion Limitations**

In most cases, the conversion creates an equivalent schema, but there are some limitations:

- Restrictions/facets are not taken into consideration when converting (`fractionDigits`, `pattern`, `totalDigits`, `whiteSpace`, `minInclusive`, `maxInclusive`, and the restrictions for length, except `enumeration`). However, extensions and indicators are properly converted (`minOccurs`, `maxOccurs`, `group`, `sequence`, `choice`).
- The `<documentation>` element is not converted into `<description>`.
- The `@substitutionGroup` attribute for an element that has no declared type becomes a reference to the element that can substitute it.
- The `@block` attribute is not taken into consideration during the conversion.
OpenAPI Tester

Oxygen XML Editor includes a testing tool for OpenAPI files. The tool provides the ability to inspect OpenAPI request responses and to ensure that they work as expected. It can be used for OpenAPI 3.x in JSON or YAML format.

To use the tool, select OpenAPI Tester from the Tools > JSON Tools menu. This opens a dialog box where you can specify the location of the OpenAPI file that you want to test.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the OpenAPI Tester action will invoke the tool.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:

Install

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the OpenAPI Tester add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The OpenAPI Tester dialog box is now available and can be selected from the Tools > JSON Tools menu.

OpenAPI Tester Dialog Box

Figure 640. OpenAPI Tester Dialog Box

![OpenAPI Tester Dialog Box](image)
After selecting the URL for the OpenAPI document (either local or remote) and clicking OK, the OpenAPI Tester view becomes visible on the right side of the editor. The view can also be opened by selecting OpenAPI Tester from the Window > Show View menu.

The tester loads the selected OpenAPI document and fills in the corresponding fields. The tester fields are as follows:

**URL**

The URL of the OpenAPI file. You can specify the path by using the text field or the Browse button. If you specify the path directly in the text field, you need to click the Reload button. You can use the Clear button if you want to remove all the content from the view.

**Server**

The list of servers defined by the OpenAPI document. The global "servers" array can be overridden on the path level or operation level. If it is not provided or is empty, the server URL defaults to "/".

**Path**

The list of individual endpoints (paths) in the API. The full request URL is constructed as <server-url>/path.

**Operation**

The list of HTTP operations supported by the selected path. OpenAPI 3.0 supports get, post, put, patch, delete, head, options, and trace.

Figure 641. OpenAPI Tester View
Parameters tab

The definition of the parameters for the selected operation. OpenAPI 3.0 supports parameters passed via path, query string, headers, and cookies. The required parameters will be marked with a red asterisk. For array parameters, items must be separated by a comma.

Authorization tab

The list of available authentication types. The authentication data is persistent and can be removed from the contextual menu.

Request Body tab

The media type and the body of the request (if the selected operation allows it). For example, GET will not allow specifying a body since that HTTP method disallows it. Oxygen XML Editor will create a sample request body based on the JSON Schemas defined in the OpenAPI document. Usually, you just need to change a few values for the request to be valid.

Variables tab

The list of variables used for server templating (if applicable). Variables are indicated by {curly brackets} in the server URL.

Send button

Executes the request by creating a HTTP client with all the information extracted from the view.

Open response in editor

If selected, the response will be opened in the main editing pane.

Response area

Initially this area is empty. After using the Send button, it presents the message received from the server in response to the request. The expected content type of the message is JSON. The response status and possible errors that may occur are presented right below this area. The status has a green foreground for successful requests and a red foreground otherwise.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (pretty-print) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project view or from the Tools menu. This opens the Format and Indent Files dialog box that allows you to configure options for the action.
The Scope section allows you choose from the following scopes:

- **All opened files** - The pretty-print (on page 3224) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - The pretty-print (on page 3224) is performed in the files located at a specified path.

The Options section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print (on page 3224) is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the pretty-print (on page 3224) is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

**Generate Documentation**

Oxygen XML Editor includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.
Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:**
You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** *(on page 402)*. You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 643. XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the
schema by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (on page 1016).
  - **PDF** - The documentation is generated in PDF output format (on page 1019).
  - **DocBook** - The documentation is generated in DocBook output format (on page 1019).
  - **DITA** - The documentation is generated in DITA output format (on page 1019).
  - **Custom** - The documentation is generated in a custom output format (on page 1019), allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as Open in Editor and the result will be opened in Oxygen XML Editor (in the current editor).

**Note:**

To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 124), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the @xml:lang attribute set to the selected language. If you choose a primary language code (for example, en for English), this includes all its possible variations (en-us, en-uk, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.
The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties](#) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
- `xs:all` - Its children will be separated by space characters.
- `xs:sequence` - Its children will be separated by comma characters.
- `xs:choice` - Its children will be separated by `/` characters.

- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the `assert` elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Tip:**
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 3198).

**Related Information:**
Customizing PDF or DocBook Output of Generated XML Schema Documentation (on page 1020)

**Generating Documentation for an XSLT Stylesheet**

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them.
The elements are hyperlinked. To generate documentation in a custom output format (on page 931), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 402). You can also open the tool by using the Generate Documentation toolbar button.

![XSLT Stylesheet Documentation Dialog Box](image)

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

### Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 929).
  - Custom - The documentation is generated in a custom output format (on page 931), allowing you to control the output. Click the Options button to open a Custom format options dialog box (on page 932) where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the
additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the 📂 **Insert Editor Variables** button or the options in the 📧 • **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:**

To set the browser or system application that will be used, **open the Preferences dialog box** ([Options > Preferences](on page 124)), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

**Figure 646. Settings Tab of the XSLT Stylesheet Documentation Dialog Box**
The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: `section`, `sect1` to `sect5`, `emphasis`, `title`, `ulink`, `programlisting`, `para`, `orderedlist`, `itemizedlist`.
  - A subset of DITA elements. The recognized elements are: `concept`, `topic`, `task`, `codeblock`, `p`, `b`, `i`, `ul`, `ol`, `pre`, `sl`, `sli`, `step`, `steps`, `li`, `title`, `xref`.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - DOXSL documentation framework (on page 3221). Supported elements are: `codefrag`, `description`, `para`, `docContent`, `documentation`, `parameter`, `function`, `docSchema`, `link`, `list`, `listitem`, `module`, `parameter`, `template`, `attribute-set`.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a custom format (on page 931) instead of the built-in HTML format (on page 929) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.
Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 3198).

Related Information:
XSLT Stylesheet Component Documentation Support (on page 912)

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 402). You can also open the tool by using the Generate Documentation toolbar button.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.
The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URL File** - The URL of the file to be used for generating the documentation.
  - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

**Note:**
To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 124), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.
Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (on page 1072) by using a custom stylesheet.

**Note:**

The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 402). You can also open the tool by using the **Generate Documentation** toolbar button.

**Figure 648. WSDL Documentation Dialog Box**

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (on page 1071).
  - **Custom** - The documentation is generated in a custom output format (on page 1072), allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:**

To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 124), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.
The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.
Note:
This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
  - **Generate index** - Displays an index with the components included in the documentation.
    - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
    - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

**Tip:**
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 3198).

### Generating JSON Schema Documentation

Oxygen XML Editor includes a tool for generating documentation for a JSON Schema file in HTML format. To generate JSON Schema documentation, select **JSON Schema Documentation** from the **Tools > Generate Documentation** menu. You can also open the tool by using the **Generate Documentation** toolbar button. This opens a dialog box where you can specify the location of the JSON Schema file and HTML output file.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the **JSON Schema Documentation** action will invoke the tool.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:
Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the JSON Schema Documentation add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The JSON Schema Documentation dialog box is now available and can be selected from the Tools > Generate Documentation menu.

JSON Schema Documentation Dialog Box

Figure 650. JSON Schema Documentation Dialog Box

The JSON Schema Documentation dialog box includes the following fields and options:

**JSON Schema URL**

The URL of the JSON Schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Output file**

The path to the folder where the generated HTML file will be saved.

**Split output into multiple files**
If selected, the application splits the output into multiple files. You can choose between splitting them by component name or location.

Open in Browser/System Application

If selected, the generated result is opened in the system application associated with the output file type (HTML).

Included component details

This section can be used to specify whether or not the following components are shown in the generated documentation:

- **Annotations** - Displays the annotations (title, description) for each component (property or definition).
- **Constraints** - Displays the schema constraints for each component, according to its type.
- **Properties** - Displays the properties of an Object Schema.
- **Pattern Properties** - Displays the patternProperties of an Object Schema.
- **Enumerations** - Displays the enumerated values, if specified in the schema.
- **Source** - Displays the text schema source for each component.
- **Used By** - Displays the list of all the components that reference the current definition.
- **Composition** - Displays the oneOf, anyOf, and allOf Compositors that are used for combining schemas.
- **Diagram** - Displays the diagram image for each component. The diagrams are generated according to the options specified in the Schema Design preferences page (on page 198). Diagrams are also generated for components within schemas from referenced files.
- **Image Map** - Diagrams will include hyperlinks that navigate to each particular component.
- **Location** - Displays the schema location for each component.

You can click Generate at any point to generate the JSON Schema documentation.

**Generated JSON Schema Documentation in HTML Format**

After generating the JSON Schema documentation, it is presented in a visual diagram style with various sections, hyperlinks, and options.
The generated documentation includes a Table of Contents on the left pane with links to particular sections in the right pane. You can collapse or expand details by using the Showing options or the Collapse or Expand buttons.

**Generating OpenAPI Documentation**

Oxygen XML Editor includes a tool for generating documentation for OpenAPI components in HTML format, including annotations and cross references. The documentation displays information about the servers, paths, components and tags defined in the OpenAPI 3.0 documents and it is presented in a visual diagram style with various sections, hyperlinks, and filtering options.

**Quick Installation**

You can drag the following Install button and drop it into the main editor in Oxygen (version 24.1 or newer) to quickly initiate the installation process:
Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the OpenAPI Documentation Generator add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The OpenAPI Documentation dialog box is now available and can be selected from the Tools > Generate Documentation menu.

Generating OpenAPI Documentation

To generate OpenAPI documentation, select OpenAPI Documentation from the Tools > Generate Documentation menu. This opens a dialog box where you can specify the location of the OpenAPI file and the HTML output file.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the OpenAPI Documentation action will invoke the tool.

Figure 652. OpenAPI Documentation Dialog Box

The OpenAPI Documentation dialog box includes the following fields and options:
OpenAPI URL

The URL of the OpenAPI file. You can specify the path by using the text field or the browsing button.

Output file

The path to the folder where the generated HTML file will be saved.

Split output into multiple files

If selected, the application splits the output into multiple files. You can choose between splitting them by component name or location.

Included component details

This section can be used to specify whether or not details about the following components that belong to internal or imported schemas are shown in the generated documentation:

- **Annotations** - Displays the annotations (title, description) for each component (property or definition).
- **Constraints** - Displays the schema constraints for each component, according to its type.
- **Source** - Displays the text schema source for each component.
- **Location** - Displays the schema location for each component.
- **Used By** - Displays the list of all the components that reference the current definition.
- **Properties** - Displays the properties of an Object Schema.
- **Pattern Properties** - Displays the `patternProperties` of an Object Schema.
- **Enumerations** - Displays the enumerated values, if specified in the schema.
- **Diagram** - Displays the diagram image for each component. The diagrams are generated according to the options specified in the Schema Design preferences page (on page 198). Diagrams are also generated for components within schemas from referenced files.
- **Composition** - Displays the `oneOf`, `anyOf`, and `allOf` compositors that are used for combining schemas.
- **Image Map** - Diagrams will include hyperlinks that navigate to each particular component.

You can click **Generate** at any point to generate the OpenAPI documentation.

Generated OpenAPI Documentation in HTML Format

After generating the OpenAPI documentation, it is presented in a visual diagram style with various sections, hyperlinks, and options.
The generated documentation includes a Table of Contents on the left pane with links to particular sections in the right pane. You can collapse or expand details by using the Showing options or the Collapse or Expand buttons.

**Canonicalizing Files**

You can select the canonicalization (on page 3219) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.
The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted...
in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

• **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
• **XPath** - The XPath expression provides the fragments of the XML document to be signed.
• **Output** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the output file path where the signed XML document will be saved.
• **Open in editor** - If selected, the output file will be opened in the editor.

**Related Information:**
Digital Signatures Overview (on page 877)

**Signing Files**

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the Sign action from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.
Figure 655. Signature Settings Dialog Box

The following options are available:

Note:
If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 268) where you can configure a valid certificate.

Could not obtain a valid certificate. You must configure a valid certificate.

• **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
• **Transformation Options** - See the Digital Signature Overview (on page 877) section for more information about these options.
- **None** - If selected, no canonicalization (on page 3219) algorithm is used.

- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 3219) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 3219) method is used.

- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 3219) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 3219) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

- **ID** - Provides ID of the XML element to be signed.

- **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (on page 877) for more information.

- **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 877) for more information.

- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.

- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.

- **Output** - Available if the Sign action was selected from the Tools menu. Specifies the path of the output file where the signed XML document will be saved.

- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor.
Verifying Signature

You can verify the signature of a file by selecting the Verify Signature action from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu. The Verify Signature dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

WSDL SOAP Analyzer Tool

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or Tools menu).

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the Tools menu.
- Go to Open with > WSDL SOAP Analyzer in the contextual menu of the Project (on page 402) view.
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
• **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is `http://schemas.xmlsoap.org/soap/envelope/` for SOAP 1.1 or `http://www.w3.org/2003/05/soap-envelope` for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant (on page 3219)** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.

• **Attachments List** - You can define a list of file URLs to be attached to the request.

• **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.

• **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

• **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the **Testing Remote WSDL Files (on page 1075)** section.

---

**Note:**

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

---

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools > 🚀 WSDL SOAP Analyzer**.
2. On the **WSDL File** tab enter the URL of the remote WSDL file.
3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool (on page 1072)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

**XML Schema Regular Expressions Builder Tool**

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

![Figure 657. XML Schema Regular Expressions Builder Dialog Box](image)

The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space** (**Command + Space on macOS**).

**Error display area**
If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (→) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the Available expressions table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous Category combo box. You can add an expression in the Regular expressions editor by double-clicking the expression row in the table. You will notice that in the case of Character categories and Block names, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The Insert button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.

The regular expression builder cannot be used to insert regular expressions in the Grid mode (on page 354) or schema Design mode (on page 355). Accordingly, the Insert button will be not available if the current document is edited in these modes.

**Note:**

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

Large File Viewer

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle
opening these huge export files, some having sizes exceeding one gigabyte, because all of the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an out of memory error (OutOfMemoryError) that would require either increasing the Java heap memory with the -Xmx startup parameter or decreasing the total number of lines in the file.

The powerful Large File Viewer is available from the Tools menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the open document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the open file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Editor options. See Encoding for non-XML files (on page 168).

Figure 658. Large File Viewer

Large File Viewer components:
• The menu bar provides menu driven access to all the features and functions that are available in Large File Viewer:

File > Open

Opens files in the viewer (also available in the contextual menu).

File > Exit

Closes the viewer.

Edit > Copy

Copies the selected text to clipboard (also available in the contextual menu).

Find > Find

Opens a reduced Find dialog box that provides some basic search options, such as:

- **Case sensitive** - When selected, operations are case-sensitive.
- **Regular Expression** - When selected, allows you to use any regular expression in Perl-like syntax (on page 446).
- **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

Help > Help

Provides access to the User Manual.

• The status bar provides information about the current file path, the Unicode representation of the character at the cursor position and the line and column in the open document where the cursor is located.

⚠️ **Attention:**

For faster computation the Large File Viewer uses a fixed font (plain, monospace font of size 12) to display characters. The font is not configurable from the Preferences page (on page 124).

ℹ️ **Tip:**

The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

**Hex Viewer**

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the Hex Viewer that is available on the Tools menu. It has two panels: the characters are rendered in the right panel and the bytes of each
character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

**Figure 659. Hex Viewer**

To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

**Standalone SVG Viewer**

Oxygen XML Editor includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.
You can browse for and open any SVG file that has the .svg or .svgz extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view (on page 402) and selecting Open with > SVG Viewer.

**Actions Available in the SVG Viewer**

The following actions are available in the SVG Viewer:

**Zoom in**

To zoom in on an image, use any of the following methods:

- Scroll forward with the mouse wheel.
- Select Zoom in from the contextual menu.
- Use the **Ctrl + I (Command + I on macOS)** keyboard shortcut.

**Zoom out**

To zoom out on an image, use any of the following methods:

- Scroll backward with the mouse wheel.
- Use the **Ctrl + O (Command + O on macOS)** keyboard shortcut.
- Select Zoom out from the contextual menu.

**Rotate**

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on macOS)** shortcut.
- Select Rotate from the contextual menu. This rotates the image exactly 90 degrees clockwise.
Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the Ctrl + T (Command + T on macOS) keyboard shortcut.
- Select Refresh from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the Arrow Keys on your keyboard.
- Use the Shift + Left-Click + Drag shortcut.

Pan

To pan an image, click and drag the image with your mouse.

Related Information:

Editing SVG Files (on page 1251)

Tree Editor

The Tree Editor is used for editing the content of a document displayed as an XML tree. The workspace offers the following functional areas:

- **Main menu** - Provides access to all the features and functions available in Oxygen XML Editor Tree Editor.
- **Toolbar** - Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.
- **Editor panel** - Easy editing of structured mark-up documents. Each token has an associated icon for easier visual identification.
- **Message panel** - Displays messages returned from user operations.
- **Model view** - Shows the detailed information about the attribute or element that you are working on.
- **All Elements panel** - Presents a list of all defined elements that can be inserted within your document.

The tree editor does not offer entity support. Entities are not presented with a special type of node in the tree and new entity nodes cannot be inserted in the document.

Compare Files Tool

The built-in Compare Files tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffFiles.exe).
Two-Way Comparisons

The Compare Files tool can be used to compare the differences between two files or XML fragments.

**Compare Files**

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the Perform File Differencing button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2684) for the operation.
4. You can also use the 🗻 Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the Ignore nodes by XPath text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

**Figure 662. Two-Way Differences**

[XML code snippet]

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 288), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the × Close (Ctrl + W (Command + W on macOS)) button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:
• Use the navigation buttons on the toolbar (or in the **Compare** menu).
• Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
• Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the toolbar *(on page 486)* and in the various menus *(on page 490)* (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  
  Rejects the change on the particular side and preserves the particular content on the other side.

**Two-Way Diff Algorithms**

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
• **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The `<` character
  - The `/>` sequence of characters
  - The name of an attribute inside an XML tag
  - The `=` sign
  - The `"` character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)

- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Three-Way Comparisons**

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.
Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the Three-Way Comparison button on the toolbar and select the base (original) file in the Base field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

3. To highlight the differences, click the Perform File Differencing button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2684) for the operation.

5. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (original) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

### Highlighting Colors
The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 288), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the toolbar (on page 486) and in the various menus (on page 490) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- Append left change to right and Append right change to left
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- Copy change from left to right and Copy change from right to left
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- Remove change
  
  Rejects the change on the particular side and preserves the particular content on the other side.

### Three-Way Diff Algorithms

Oxygen XML Editor offers the following three-way diff algorithms to compare files:
• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).

• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author comparison mode.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Second-Level Comparisons**

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a **syntax-aware comparison** (on page 2685), meaning that it looks for identical tokens. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

**Figure 665. Second-Level Diff Comparison**

![Image](image1.png)

**Note:**

If a modified text fragment contains XML markup (such as processing instructions, XML comments, CDATA, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

**Figure 666. Word Level Comparison**

![Image](image2.png)
To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

**Figure 667. Character Level Comparison**

**Author Visual Mode**

The **Compare Files** tool includes an **Author** comparison mode that displays the files in a visual mode similar to the **Author** editing mode in **Oxygen XML Editor/Author**. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool’s **Text** or **Author** comparison mode, it detects the **Initial Edit Mode** in the **Document Type Association** configuration (on page 141) and the mode the files were last opened in **Oxygen XML Editor/Author**.

**Note:**

This mode is not available if the **Enable file comparison in Author mode** option (on page 286) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button (on page 488) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).
Author Mode Algorithms

The visual **Author** comparison mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons

The visual **Author** comparison mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Related information

Files Comparison Preferences Page (on page 286)

Compare Directories Tool (on page 494)
Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (\texttt{diffFiles.bat} on Windows, \texttt{diffFiles.sh} on macOS and Linux). To specify the files to compare, you can pass command-line arguments using the following construct: \texttt{diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]}.

If three files are specified, the tool will start in the \textit{3-way comparison mode (on page 477)}. If only two files are specified, the tool will start in the \textit{2-way comparison mode (on page 474)}. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the \texttt{-ext} argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type \texttt{diffFiles.bat --help} in the command line.

\textbf{Example:}

To do a 3-way comparison, the command line might look like this:

\textbf{Windows}

\begin{verbatim}
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
\end{verbatim}

\textbf{Tip:} If there are spaces in the path names, surround the paths with quotes.

\textbf{Linux}

\begin{verbatim}
diffFiles.sh home/file1 home/file2 home/basefile
\end{verbatim}

\textbf{macOS}

\begin{verbatim}
diffFiles.sh documents/file1 documents/file2 documents/basefile
\end{verbatim}

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your \texttt{.gitconfig} file and then you can simply start the tool from the command line.

To integrate the \textbf{Compare Files} tool with your Git client, follow this procedure:
1. Use one of the following methods to instruct your Git client to use the *Oxygen Compare Files* tool:

- **Manual Configuration** - Locate your Git user-specific configuration file (.gitconfig) and edit it with a text editor (for example, in Windows, the .gitconfig file is most likely located in your user home directory). Add (or replace) the following lines:

```diff
[diff]
tool = oxygendiff
[merge]
tool = oxygendiff
[difftool "oxygendiff"]
cmd = '"\[pathToOxygenInstallDir\]/diffFiles.exe" -ext $REMOTE $LOCAL $LOCAL'
[mergetool "oxygendiff"]
cmd = '"\[pathToOxygenInstallDir\]/diffFiles.exe" -ext $LOCAL $REMOTE $BASE $MERGED trustExitCode = true
[difftool]
prompt = false
```

**Note:**
For macOS, the cmd lines would start with something like: sh "/Applications/Oxygen XML Editor/diffFiles.sh". For Linux, the cmd lines would start with something like: sh "/Oxygen XML Editor/diffFiles.sh".

- **Command Line Configuration** - To automatically configure the .gitconfig file, you can run the following commands from a command line:

```bash
git config --global diff.tool oxygendiff
git config --global difftool.oxygendiff.cmd '"\[Oxygen install dir\]/diffFiles.exe" -ext $REMOTE $LOCAL $LOCAL'

git config --global merge.tool oxygendiff

git config --global mergetool.oxygendiff.cmd '"\[Oxygen install dir\]/diffFiles.exe" -ext $LOCAL $REMOTE $BASE $MERGED trustExitCode = true
```

**Tip:**
On Redhat 7, the following command would work, where the whole command is quoted and then inside that, the path to diffFiles.sh is quoted:

```bash
[difftool "oxygendiff"]
cmd = '""/home/user/Oxygen XML Editor 21/diffFiles.sh"" -ext $REMOTE $LOCAL $LOCAL'
[mergetool "oxygendiff"]
cmd = '""/home/user/Oxygen XML Editor 21/diffFiles.sh"" -ext $LOCAL $REMOTE $BASE $MERGED trustExitCode = true
```
git config --global mergetool.oxygendiff.trustExitCode true

Note:
For macOS, the Oxygen file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the Compare Files tool and see a comparison of changes for a particular file, run the following command from a command line:

```bash
git difftool [PathToFile]
```

Tip:
If the file you want to compare has conflicts, you can start the Compare Files tool as a merge conflict resolution tool by running the following command:

```bash
git mergetool [PathToFile]
```

For more information about the Git difftool syntax, see [https://git-scm.com/docs/git-difftool](https://git-scm.com/docs/git-difftool).

For more information about the Git mergetool syntax, see [https://git-scm.com/docs/git-mergetool](https://git-scm.com/docs/git-mergetool).

How to Integrate the File Comparison Tool with Sourcetree

The file comparison tool can be integrated with Sourcetree so that you can use it to compare changes. The advantages of doing this include:

- The Oxygen Compare Files tool presents the files side-by-side and makes it much easier to determine real changes.
- The Oxygen Compare Files tool includes XML comparison algorithms.
- The Oxygen Compare Files tool includes various options for configuring the comparison.
- The Oxygen Compare Files tool allows you to navigate through changes.

To integrate the Compare Files tool with Sourcetree, follow this procedure, depending on your operating system:

**Windows**

1. In Sourcetree, go to Tools > Options.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   - External Diff Tool - Select Custom.
   - Diff Command - Enter the path of the Oxygen diffFile.exe file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
• **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
• **Merge Tool** - Select Custom.
• **Diff Command** - Enter the path of the *Oxygen diffFile.exe* file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
• **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL$BASE $MERGED`.

4. Click OK.

**Result:** In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting External Diff from the contextual menu, Actions menu, or Ctrl+D.

**macOS**

1. In Sourcetree, go to Sourcetree > Preferences.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   • **External Diff Tool** - Select Custom.
   • **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "Applications/Oxygen XML Editor/diffFiles.sh"`).
   • **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL$BASE $MERGED`.
   • **Merge Tool** - Select Custom.
   • **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "Applications/Oxygen XML Editor/diffFiles.sh"`).
   • **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL$BASE $MERGED`.
4. Close the preferences dialog box.

**Result:** In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting External Diff from the contextual menu or Actions menu.

**Toolbar and Contextual Menu Actions of the Compare Files Tool**

The toolbar of the Compare Files tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

**Figure 669. Compare Toolbar**

The following actions are available:

**Algorithm**

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):
• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
• **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** comparison mode.
• **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** comparison mode.
• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
• **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** comparison mode.
• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page (on page 286)** where you can configure various options.

**Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when in the **Author** comparison mode.

**Format and Indent Both Files** *(Ctrl + Shift + P (Command + Shift + P on macOS))*
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when in the Author comparison mode.

**Note:**

When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

### Tags Display Mode

Allows you to select the amount of markup to be displayed in the Author visual comparison mode (on page 481). You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Block Tags without Element Names, Inline Tags, Partial Tags, or No Tags.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Copy All Changes from Left to Right**
Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

**Ignore Nodes by XPath**

You can use this text field to enter an XPath expression (on page 1999) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

**Note:**

If an XPath expression is specified in the Ignore nodes by XPath option (on page 288) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

**Base**

Available for three-way comparisons (on page 477). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

**Left-Side (Source) File**

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

**Save**

Saves the changes made in the source (left-side) file.

**Reload**

Reloads the source (left-side) file.

**Close**

Closes the source (left-side) file.

**Right-Side (Target) File**

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.
Save
Saves the target (right-side) file.

Reload
Reloads the target (right-side) file.

Close
Closes the target (right-side) file.

Compare Files Tool Menus
The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Source > Open
Browses for a file that will be displayed in the left panel.

Source > Open URL
Browses for a remote file that will be displayed in the left panel.

Source > Open File from Archive
Browses an archive for a file that will be displayed in the left panel.

Source > Reload
Reloads the file in the left panel.

Source > Save
Saves the changes made to the file in the left panel.

Source > Save As
Allows you to choose a destination to save the file in the left panel.

Source > Close
Closes the file in the left panel.

Target > Open
Browses for a file that will be displayed in the right panel.

Target > Open URL
Browses for a remote file that will be displayed in the right panel.

Target > Open File from Archive
Browses an archive for a file that will be displayed in the right panel.
Target >  Reload
    Reloads the file in the right panel.

Target >  Save
    Saves the changes made to the file in the right panel.

Target >  Save As
    Allows you to choose a destination to save the file in the right panel.

Target >  Close
    Closes the file in the right panel.

Base >  Open
    Browses for a file that will be compared with both files in a three-way comparison (on page 477).

Base >  Open URL
    Browses for a remote file that will be compared with both files in a three-way comparison (on page 477).

Base >  Open File from Archive
    Browses an archive for a file that will be compared with both files in a three-way comparison (on page 477).

Save Results as HTML (Available in Text mode only)
    Generates an HTML file that contains detailed information about the comparison result. See an example of what the generated report look like in the Generate HTML Report for Directory Comparison topic (on page 511).

Close (Ctrl + W (Command + W on macOS))
    Closes the application.

Edit Menu

Cut
    Cut the selection from the currently focused editor panel to the clipboard.

Copy
    Copy the selection from the currently focused editor panel to the clipboard.

Paste
    Paste content from the clipboard into the currently focused editor panel.

Select all
    Selects all content in the currently focused editor panel.

Undo
Undo changes in the currently focused editor panel.

Redo

Redo changes in the currently focused editor panel.

Find Menu

Find/Replace

Perform find/replace operations in the currently focused editor panel.

Find Next

Go to the next match using the same options as the last find operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on macOS))**
Jumps to the last change.

**First Change (Ctrl + B (Command + B on macOS))**
Jumps to the first change.

**Copy All Changes from Right to Left**
Copies all changes from the file in the right panel to the file in the left panel.

**Copy All Changes from Left to Right**
Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Right to Left**
Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy Change from Left to Right**
Copies the selected difference from the file in the left panel to the file in the right panel.

**Show Word Level Details**
Provides a word-level comparison of the selected change.

**Show Character Level Details**
Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))**
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:**
When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Options Menu**

**Preferences**
Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**
Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.
Reset Global Options
Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options
Allows you to import an options set that you have previously exported.

Export Global Options
Allows you to export the current options set to a file.

Help Menu

Help (F1)
Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help
If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem
Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the com.oxygenxml.report.problems.url system property. The report is sent in XML format through the report parameter of the POST HTTP method.

Support Center
Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Directories Tool
The Compare Directories tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffDirs.exe).
Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffDirs.bat` on Windows, `diffDirs.sh` on macOS and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct:

```
 diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

**Example:**

To do a comparison between two directories, the command line would look like this:

**Windows**

```
 diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:**

If there are spaces in the path names, surround the paths with quotes.

**Linux**

```
 diffDirs.sh home/documents1 home/documents2
```

**macOS**

```
 diffDirs.sh documents1 documents2
```
Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.

3. You can also use the **Diff Options** button to access the **Directories Comparison** preferences page (on page 289) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.

2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, select the **Look in archives** option (on page 290) in the **Directories Comparison** preferences page.

3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An X symbol, when a file or a folder exists in only one of the compared directories.
- A ≠ symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the **Directories Comparison / Appearance** preferences page (on page 290). You can double-click lines marked with the ≠ symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press Enter) on a line with a pair of files, Oxygen XML Editor starts a file comparison (on page 474) between the two files, using the **Compare Files** tool.

**Related information**

- Compare Files Tool (on page 474)
- Compare Directories Script (on page 3208)
Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the Compare Directories tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 671. Compare toolbar

| Include files: * | Exclude files: IDG_Store | Exclude folders: CVS_root

## Toolbar Actions

- **Perform Directories Differencing**
  
  Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**
  
  Opens the Compare Files tool (on page 474) that allows you to compare the currently selected files.

- **Copy Change from Right to Left**
  
  Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

- **Copy Change from Left to Right**
  
  Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

- **Binary Compare**
  
  Performs a byte-level comparison on the selected files.

- **Diff Options**
  
  Opens the Directory Comparison preferences page (on page 289) where you can configure various options.

- **Show Only Modifications**
  
  Displays a more uncluttered file structure by hiding all identical files.

- **Save Results as HTML**
  
  Generates an HTML file that contains detailed information about the comparison result.

## File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out
all JPEG and GIF image files, edit the Exclude files filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

**Contextual Menu Actions**

⚠️ *Perform Files Differencing*

Opens the Compare Files tool *(on page 474)* that allows you to compare the currently selected files.

🖥️ *Binary Compare*

Performs a byte-level comparison on the selected files.

⬅️ *Copy Change from Right to Left*

Copies the selected difference from the file in the right panel to the file in the left panel.

➡️ *Copy Change from Left to Right*

Copies the selected difference from the file in the left panel to the file in the right panel.

**Open**

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

**Open in System Application**

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the Compare Directories tool from the Tools menu in Oxygen XML Editor.

**Show in Explorer**

Opens the default file browser for your particular operating system with the selected file highlighted.

**Compare Directories Tool Menus**

The menus in the Compare Directories tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

**File Menu**

_emails* *Save Results as HTML*

Generates an HTML file that contains detailed information about the comparison result. See an example of what the generated report look like in the Generate HTML Report for Directory Comparison topic *(on page 511).*

**Close (Ctrl + W (Command + W on macOS))**
Closes the application.

**Compare Menu**

 ![Perform Directories Differencing](image)

**Perform Directories Differencing**

Looks for differences between the two directories displayed in the left and right side of the application window.

 ![Perform Files Differencing](image)

**Perform Files Differencing**

Opens the **Compare Files** tool *(on page 474)* that allows you to compare the currently selected files.

 ![Copy Change from Right to Left](image)

**Copy Change from Right to Left**

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

 ![Copy Change from Left to Right](image)

**Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Options Menu**

 **Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

 **Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

 **Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

 **Import Global Options**

Allows you to import an options set that you have previously exported.

 **Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

 **Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

 **Use Online Help**
If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Editor Support Center web page in a browser.

**Compare Images**

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: GIF, JPG, JPEG, PNG, and BMP.

**Compare Directories Against a Base (3-Way) Tool**

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select [3] **Compare Directories Against a Base (3-way)** from the Tools menu.

   **Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.
2. Select the file sets to be compared:
   - **Base directory** - This is the original (base) file set before any modifications were made by you or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.
3-Way Directory Comparison and Merge Tool

**Figure 673. Comparison and Merge Tool**

The 3-way directory comparison and merge tool includes the following information, features, and actions:

**Number of Changes and Conflicts**

The first thing you see in the top-left corner of the tool is the grand total of all the changes made by others, changes made by you, and the number of conflicts.

**Filter Buttons**

In the top-right corner you can use the toggle buttons to filter the list of modifications:

- **Show all files**
  
  Use this button to show all modified and unmodified files, as well as conflicts.

- **Show only files modified by you and others**
  
  Filters the list to show all files that have been modified, including conflicts.

- **Show only files modified by others**
  
  Filters the list to only show the files that were modified by others.

- **Show only files modified by you**
  
  Filters the list to only show the files that were modified by you.
Show only conflicting files

Filters the list to only show files that contain conflicts.

List of Files Panel

This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

Tip:

If the solution proposed in the Merge Action column for any particular file is not satisfactory, you can change it directly in that column (even if that file is not selected) without automatically re-triggering the comparison (except for in certain cases where re-triggering the comparison is necessary).

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels

If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

Note:

If Oxygen XML Editor does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Editor to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:
**File Path**

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

**Close**

Closes the file comparison panel.

**Algorithm Drop-down Menu**

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page (on page 286)** where you can configure various options.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

**Tags Display Mode**

Allows you to select the amount of markup to be displayed in the **Author** visual mode. You can choose between: **Full Tags with Attributes**, **Full Tags**, **}
Block Tags, Block Tags without Element Names, Inline Tags, Partial Tags, or No Tags.

Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:
A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on macOS))
Jumps to the first change.

Left-Side File (Your changes)
Above the panel you can see the file path and the following two buttons:

Save
Saves changes made to the file.

Reload
Reloads the file.

**Right-Side File (Changes made by others)**

Above the panel you can see the file path and the following two buttons:

- **Reload**
  
  Reloads the file.

**Displaying Changes in the File Comparison Panels**

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

**Figure 674. File Comparison Panels**

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 288), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Direct Editing Actions in the File Comparison Panels**

In addition to selecting merge actions from the drop-down menus in the Merge Action column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document (Save button or Ctrl+S) or when you click the Perform File Differencing button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
Copies the content of the selected change from the right side and appends it on the left side.

**Copy change from right to left**

Replaces the content of a change in the left side with the content of the change in the right side.

**Remove change**

Removes the change from the left side.

Anytime you save manual changes (Save button or Ctrl+S), the selection in the Merge Action column in the top panel automatically changes to Use merged and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the Merge Action drop-down menu.

**Open Merged Files**

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

**Applying Changes**

When you click the Apply button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the Merge Action drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click Apply, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click Apply, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
- **Cancel** - You can click the Cancel button to go back to the merge tool to resolve the conflicts individually.

**Canceling Changes**

If you click the Cancel button at the bottom of the merge tool, all the changes you made in the tool will be lost.

**Author Visual Mode**

The Comparison and Merge tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's Text or Author mode, it
detects the Initial Edit Mode in the Document Type Association configuration (on page 141) and the mode the files were last opened in Oxygen XML Editor/Author.

Note:
This mode is not available if the Enable file comparison in Author mode option (on page 286) is not selected in the Diff > Files Comparison preferences page.

This visual mode includes unique features such as a Tags Display Mode drop-down button (on page 2712) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the Track Changes feature (although the Track Changes feature is not available in the comparison tool).

Figure 675. File Comparison Tool - Author Mode

Author Mode Algorithms

The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.
Author Mode Second-Level Comparisons

The visual Author mode automatically performs a second-level comparison for the XML Fast and XML Accurate algorithms. After the first comparison is finished, the second-level comparison is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Related information
Compare Directories Tool (on page 494)
Compare Files Tool (on page 474)

Generate HTML Report for Directory Comparison

The Generate HTML report for directory comparison tool can be used to generate a report in the form of an HTML file that contains the results of a directory comparison (for either 2-way or 3-way comparisons). The Generate HTML report for directory comparison action for invoking the tool can be found in the Tools menu. It opens a dialog box where you can specify the directories to compare as well as some other options.

Figure 676. Generate HTML Report for Directory Comparison Dialog Box

The Generate HTML report for directory comparison dialog box contains the following options:

Base directory

Specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison. This field should be left empty for 2-way comparisons.
First directory

Specifies the path of the first directory to be included in the comparison.

Second directory

Specifies the path of the second directory to be included in the comparison.

Diff options

Specifies which option set to use for generating the comparison report. If you choose Use the current settings from Preferences, the options set in the Directories Comparison preferences page (on page 289) and the include/exclude filter options in the Compare Directories tool (on page 497) are taken into account when generating the comparison result. You can also click the Diff options button to open the Directories Comparison preferences page where you can see or modify the current settings. If you choose Use the default settings, the default values for all settings are used.

Generate additional file comparison reports

Generates further comparison reports for all non-binary modified file pairs and provides links to them in the main report (in the middle cells of the results table). See the example below (on page 2719). These additional file comparison reports are saved to a directory that will have the same parent directory and the same name as the output file provided, suffixed by "-OXY-FC-REPORTS". The links created in the main report are relative to this directory. If the main HTML report is later copied or moved to another location, to retain full functionality in the browser, the directory with the additional file comparison reports must also be copied/moved to the same location.

Note:
Generating additional file comparison reports could significantly increase the execution time. A progress tracker for the whole operation is available.

Output file

Specifies the path for an output file to save the comparison results file.

Open in Browser/System Application

Opens the comparison results file in the browser or system application that is associated with HTML files.

After clicking the Generate report button, a report in the form of an HTML file is generated with details about the comparison results.

Syncro SVN Client (Deprecated)

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to Tools > SVN Client.

⚠️ Attention:
The Syncro SVN Client that comes bundled with Oxygen XML Editor is considered deprecated as of version 21.0.

Main Window

This section explains the main window of Syncro SVN Client.

Views

The main window consists of the following views:

- **Repositories view (on page 2810)** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view (on page 2815)** - Allows you to manage with ease the content of the working copy.
- **History view (on page 2830)** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view (on page 2836)** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view (on page 2837)** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view (on page 2839)** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel (on page 2843)** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view (on page 2843)** - Displays two images side by side.
- **Properties view (on page 2843)** - Displays the SVN properties of a resource under version control.
• **Console view (on page 2845)** - Displays information about the currently running operation, similar with the output of the Subversion command-line client.

• **Dynamic Help view (on page 2845)** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

### SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

#### File Menu

**New submenu:**

**New File**

This operation creates a new file as a child of the selected folder from the **Repositories view (on page 2810)** tree or the **Working Copy view (on page 2815)** tree, depending on the view that was last used. Note that for the **Working Copy view (on page 2815)**, the file is added to version control only if the selected folder is under version control.

**New Folder(Ctrl + Shift + F (Command + Shift + F on macOS))**

This operation creates a new folder as a child of the selected folder from the **Repositories view (on page 2810)** tree or the **Working Copy view (on page 2815)** tree, depending on the view that was last used. Note that for the **Working Copy view (on page 2815)**, the file is added to version control only if the selected folder is under version control.

**New External Folder (Ctrl + Shift + W (Command + Shift + W on macOS))**

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2850), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:**
You can specify a particular revision of the external item by using a *peg revision (on page 2852)* at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.
The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository where the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server that has the `svn:externals` property versioned.

**Important:**
To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:**
Syncro SVN Client does not support definitions of local relative external items.

**Open (Ctrl + O (Command + O on macOS))**
This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the Repositories view (on page 2810), Working Copy view (on page 2815), History view (on page 2830), or Directory Change Set view (on page 2835), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on macOS). Note that opening folders is available only for folders selected in the Working Copy view (on page 2815).

**Open with (Ctrl + Shift + O (Command + Shift + O on macOS))**
Displays the **Open with** dialog box for specifying the editor where the selected file is opened. If multiple files are selected only external applications can be used to
open the files. This action works on any file selection from **Repositories view** *(on page 2810)*, **Working Copy view** *(on page 2815)*, **History view** *(on page 2830)*, or **Directory Change Set view** *(on page 2835)*, depending on the view that was last used to invoke it.

**Show in Explorer/Show in Finder**

Opens the parent directory of the selected working copy file and selects the file.

![Save](Save.png)

**Save (Ctrl + S (Command + S on macOS))**

Saves the local file currently opened in the editor or the **Compare** view.

**Save as**

Saves any file selected in the **Repositories**, **History**, or **Directory Change Set** view.

**Copy URL Location (Ctrl + Alt + U (Command + Alt + U on macOS))**

Copies the URL location of the resource currently selected in the **Repositories** view to clipboard.

![Copy to](Copy_to.png)

**Copy to**

Copies the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

**Note:**

This action can also be used from **History** and **Directory Change Set** views to recover older versions of a repository item.

**Move to (Ctrl + M (Command + M on macOS))**

Moves the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

**Rename (F2)**

 Renames the resource currently selected, either in **Repositories** or **Working copy** view.

**Delete (Delete)**

Deletes the resource currently selected either, in **Repositories** or **Working copy** view.

**Locking:**

- **Scan for locks (Ctrl + L (Command + L on macOS))** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see **Scanning for locks** *(on page 2751)*.
• Lock (Ctrl + K (Command + K on macOS)) - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2752).

• Unlock (Ctrl + Alt + K (Command + Alt + K on macOS)) - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

Show SVN Properties (Ctrl + P (Command + P on macOS))

Opens the Properties view (on page 2843) and displays the SVN properties for a selected resource from Repositories view (on page 2810) or Working Copy view (on page 2815), depending on the view that was last used to invoke it.

Show SVN Information (Ctrl + I (Command + I on macOS))

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2768).

Exit (Ctrl + Q (Command + Q on macOS))

Closes the application.

Edit Menu

Undo (Ctrl + Z (Command + Z on macOS))

Undo edit changes in the local file that is currently opened in the editor or the Compare view.

Redo (Ctrl + Y (Command + Y on macOS))

Redo edit changes in the local file that is currently opened in the editor or the Compare view.

Cut (Ctrl + X (Command + X on macOS))

Cut selection from the local file that is currently opened in the editor view or the Compare view to clipboard.

Copy (Ctrl + C (Command + C on macOS))

Copy selection from the local file that is currently opened in the editor or the Compare view to clipboard.

Paste (Ctrl + V (Command + V on macOS))

Paste selection from clipboard into the local file that is currently opened in editor or the Compare view.

Find/Replace (Ctrl + F (Command + F on macOS))
Perform find and replace operations in the local file that is currently opened in the editor or the Compare view.

**Find Next (F3)**

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

**Find Previous (Shift + F3)**

Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

**Repository Menu**

**New Repository Location (Ctrl + Alt + N (Command + Alt + N on macOS))**

Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

**Figure 679. Add SVN Repository Dialog Box**

If the Validate repository connection option is selected, the URL connection is validated before being added to the Repositories view.

**Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on macOS))**

Context-dependent action that allows you to edit the selected repository location using the Edit SVN Repository dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on macOS))**

Context-dependent action that allows you to change the selected repository revision using the Change the Revision to Browse dialog box. It is active only when a repository location root is selected.

**Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on macOS))**

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

**Refresh (F5)**
Refreshes the resource selected in the Repositories view.

Check out (Ctrl + Alt + O (Command + Alt + O on macOS))

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see Check out a working copy (on page 2741).

Export

Opens the Export dialog box (on page 2805) that allows you to configure options for exporting a folder from the repository to the local file system.

Import:

Import folder (Ctrl + Shift + L (Command + Shift + L on macOS))

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2804).

Note:

The difference between the Import folder and Share project actions is that the latter also converts the selected directory into a working copy.

Import Files (Ctrl + Shift + I (Command + Shift + I on macOS))

Imports the files selected from the files system into the selected folder in the repository.

Working Copy Menu

Working Copies Manager (on macOS)

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes: All Files, Modified, Incoming, Outgoing, or Conflicts.

Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

Synchronize (Ctrl + Shift + S (Command + Shift + S on macOS))
Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 283) is selected.

**Update (Ctrl + U (Command + U on macOS))**
Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

**Update to revision/depth**
Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2809) section.

**Commit**
Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

**Update all (Ctrl + Shift + U (Command + Shift + U on macOS))**
Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

**Commit all**
Commits all the resources with outgoing changes. It is disabled when Incoming mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

**Revert (Ctrl + Shift + V (Command + Shift + V on macOS))**
Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2759) for more information.

**Edit conflict (Ctrl + E (Command + E on macOS))**
Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2757).

**Mark Resolved (Ctrl + Shift + R (Command + Shift + R on macOS))**
Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2760).

**Mark as Merged (Ctrl + Shift + M (Command + Shift + M on macOS))**

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2760) section for more information about how you can solve the pseudo-conflicts.

**Override and Update**

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2759) section.

**Override and Commit**

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2761).

**Mark as copied**

You can use this action to mark an item from the working copy as a copy of another item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

**Mark as moved**

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

**Mark as renamed**

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

**Add to "svn:ignore" (Ctrl + Alt + I (Command + Alt + I on macOS))**

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the svn:ignore property in
the parent directory of the resource. Read more about this in the Ignore Resources Not Under Version Control (on page 2747) section.

**Add to version control (Ctrl + Alt + V (Command + Alt + V on macOS))**

Allows you to add resources that are not under version control. For further details, see Add Resources to Version Control (on page 2745) section.

**Remove from version control**

Schedules the selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

**Clean up (Ctrl + Shift + C (Command + Shift + C on macOS))**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

**Expand All (Ctrl + Alt + X (Command + Alt + X on macOS))**

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

**Collapse all (Ctrl + Alt + Z (Command + Alt + Z on macOS))**

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking an expanded folder.

**Compare Menu**

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on macOS))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:**

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**History Menu**
Show History (Ctrl + H (Command + H on macOS))

Displays the history for an SVN resource at a given revision. The resource can be one selected from the Repositories view, Working Copy view, or from the Affected Paths table from the History view, depending on which view was last focused when this action was invoked.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2837), along with the history of the file in the History view.

Repositories

This operation is available for any resource selected from view, Working Copy view, History view or Directory Change Sets view, depending on which view was last focused when this action was invoked.

Revision Graph (Ctrl + G (Command + G on macOS))

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section Revision Graph (on page 2845). This operation is available for any resource selected in the Repositories view or Working Copy view.

Tools Menu

Share project

Allows you to share a new project (on page 2739) using an SVN repository. The local project is automatically converted into an SVN working copy.

Branch / Tag

Allows you to copy the selected resource from the Repositories view or Working Copy view to a branch or tag into the repository. To read more about this operation, see the section Creating a Branch / Tag (on page 2770).

Merge (Ctrl + J (Command + J on macOS))

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section Merging (on page 2772).

Switch (Ctrl + Alt + W (Command + Alt + W on macOS))

Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for external items. To read more about this action, see the Switching the Repository Location (on page 2789) section.

Relocate
Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the Relocate a Working Copy (on page 2791) section.

Create patch (Ctrl + Alt + P (Command + Alt + P on macOS))

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see the section about patches (on page 2794).

Working copy format

This submenu contains the following two operations:

- **Upgrade**
  
  Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

- **Downgrade**

  Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

  **Note:**

  SVN 1.7 working copies cannot be downgraded to older formats.

  See the section Working Copy Format (on page 2822) to read more about this subject.

Options Menu

- **Preferences**

  Opens the Preferences dialog box.

- **Menu Shortcut Keys**

  Opens the Menu Shortcut Keys preferences page (on page 294), where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

- **Global Run-Time Configuration**

  Allows you to configure SVN general options, that should be used by all the SVN clients you may use:
• **Edit ‘config’ file** - In this file you can configure various SVN client-side behaviors.
• **Edit ‘servers’ file** - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

**Export Options**

Allows you to export the current options to an XML file.

**Import Options**

Allows you to import options you have previously exported.

**Reset Options**

Resets all your options to the default ones.

**Reset Authentication**

Resets the Subversion authentication information.

**Window Menu**

**Show View**

Allows you to select the view you want to bring to front.

**Show Toolbar**

Allows you to select the toolbar you want to be visible.

**Enable flexible layout**

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

**Reset Layout**

Resets all the views to their default position.

**Help Menu**

**Help (F1)**

Opens the Help dialog box.

**Use online help (selected by default)**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Show Dynamic Help view**

Displays the Dynamic Help view.
Report Problem

Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

Support Center

Opens the Support Center web page in a browser.

About

Opens the About dialog box.

SVN Main Toolbar

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

Check out

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

Synchronize

Synchronizes the current working copy with the repository.

Update All

Updates all resources of the working copy that have an older revision that repository.

Commit All

Commits all resources of working copy that have a newer version compared to that of the repository.

Refresh

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the Working Copy view.

Compare

The selected resource is compared with:

- The BASE revision, when the selected resource is:
  - Locally modified and the All Files view mode is currently selected (no matter if there are incoming changes).
  - Locally modified and there are no incoming changes when any other view mode is selected.
• The remote version of the same resource, when remote information is available after a 
  Synchronize operation (only when one of Modified, Incoming, Outgoing and Conflicts 
  view modes is selected).
• The working copy revision, when the selected resource is from the History view.

Show History
Displays the history of the selected resource (from the Working Copy or Repository views) in the 
History view.

Show Annotation
Displays the annotations of the selected resource. The selected resource can be in the Working 
Copy or the History views.

Revision Graph
Displays the revision graph of the selected resource. The selected resource can be in the 
Working Copy or the Repositories views.

Enable/Disable flexible layout
Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move 
and dock the internal views to adapt the application to various viewing conditions and personal 
requirements.

Status Bar
The status bar of the Syncro SVN Client window displays important details of the current status of the 
application. This information is available only in the Working Copy view.

Figure 680. Status bar

The status bar is composed of the following areas:

• The path of the currently processed file from the current working copy (during an operation such as 
  Check out or Synchronize) or the result of the last operation.
• The current status of the following working copy options:
  ◦ Show ignored files ( ).
  ◦ Show deleted files ( ).
  ◦ Process svn:externals definitions ( ).
  The options for ignored and deleted files are switched on and off from the Settings menu (on page 
2821) of the Working Copy panel:
• The format of the currently loaded working copy.
• The current numbers of incoming changes (👍), outgoing changes (👎) and conflicting changes (➡️).
• A progress bar for the currently running SVN operation and a button (⛔️) that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.

Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Editor supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the Repositories view (on page 2810).

To create a repository location, use the 📜 New Repository Location action that is available in the Repository menu, the Repositories view toolbar, and in the contextual menu. This action opens the New Repository Location dialog box, which prompts you for the URL of the repository (on page 2850) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2852) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Editor tries to contact the server to get the content of the repository for displaying it in the Repositories view (on page 2810). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the ⏪ Stop button from the toolbar of the view.

To edit a repository location, use the 📜 Edit Repository Location action that is available in the Repository menu and in the contextual menu. This action opens the Edit Repository Location dialog box, which prompts you for the URL of the repository (on page 2850) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2852) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the ✗ Remove Repository Location action that is available in the Repository menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.
The order of the repositories can be changed in the **Repositories** view at any time with the **Up** arrow and **Down** arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the **Change the Revision to Browse** action that is available in the **Repository** menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the **Repositories** view (*on page 2810*). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository tree. Also, this revision number is used for all the operations executed directly from the **Repositories** view (*on page 2810*).

### Authentication

Five protocols are supported: **HTTP**, **HTTPS**, **SVN**, **SVN + SSH** and **FILE**. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is selected, the credentials are stored in the Apache Subversion™ default directory:

- **Windows** - %HOME%\Application Data\Subversion\auth. Example: C:\Documents and Settings\John\Application Data\Subversion\auth
- **Linux and macOS** - $HOME/.subversion/auth. Example: /home/John/.subversion/auth

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Editor for the change to take effect.

**Tip:**

The **FILE** protocol is recommended if the SVN repository and Oxygen XML Editor are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.
After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the **committer** in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.
Share a Project

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the
Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is
automatically converted to a working copy and added under Syncro SVN Client management. The Share
project action is available in the Tools menu and the contextual menu of the Repositories view.

Figure 683. Share Project Dialog Box

The following options can be configured in the Share project dialog box:

Project

The location of the project folder (on page 2850) on the local disk by using the text box or the
Browse button. This folder should not be empty or already under version control.

Important:

By default, the SVN system only imports the content of the specified folder, and not the
root folder itself. Therefore, it is recommended to use the Browse button to select the
project folder so that the client will automatically append the name of it to the specified
URL.

URL

The new location of the project (on page 2850) (inside the repository) that will be used to
access it.
Format

The SVN format of the working copy. You can choose between SVN 1.8 or SVN 1.7.

Share files matching global ignore patterns

When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The global-ignores property in the SVN configuration file (on page 2850).
- The File name ignore patterns option (on page 284) in the SVN > Working Copy preferences page (on page 283).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the SVN configuration file (on page 2850).

Defining a Working Copy

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.
A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy administrative directory. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the pristine copy or the BASE revision of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others’ work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

**Check Out a Working Copy**

*Check out* means to make a copy of a project from a repository to your local file system. This copy is called a working copy. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional `.svn` directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the **Repositories** view and select the *Check out* action from the contextual menu, the toolbar, or the **Repository** menu.
The following options can be configured in the **Check out** dialog box:

**URL**

The location of the repository directory ([on page 2850](#)) to be checked out.

**Note:**

To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a **peg revision** ([on page 2852](#)) at the end (for example, URL@rev1234).

**Revision**

You can choose between the **HEAD** or **Other** revision. If you need to check out a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box ([on page 2743](#)).

**Check out to**

Specify the location where you want to check out ([on page 2850](#)) the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

**Important:**

By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the check out location so that the client will automatically append the name of the remote directory to the path of the selected directory.
Warning:
The destination directory should be empty. If files exist, they are skipped (left unchanged) by the check out operation and displayed as modified (on page 2817) after the operation has finished. Also, the destination directory must not already be under version control.

Format

The SVN format of the working copy. You can choose between SVN 1.8 or SVN 1.7.

Depth

The depth is useful if you want to check out only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the sparse checkouts (on page 2809) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

When selected, external items are ignored in the check out operation. This option is only available if you choose the Recursive (infinity) depth.

After a check out, the new working copy is added to the list in the Working Copy view (on page 2815) and loaded automatically.

History Dialog Box

The History dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as the Check Out dialog box (on page 2741) or the Branch / Tag dialog box (on page 2770). It presents information about revision, commit date, author, and commit comment.
The initial number of entries in the list is 50. Additional revisions can be added to the list using the **Get next 50** and **Get all** buttons. The list of revisions can be refreshed at any time with the **Refresh** button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the **Compare with previous version** action, available in the contextual menu.

### Use an Existing Working Copy

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to the Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section **Import resources into the repository** (on page 2804). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the **Working Copies Manager** toolbar button (on macOS) in the **Working Copy** view (on page 2815).

   **Step Result:** This action opens the **Working copies list** dialog box.

2. Click the **Add** button.
3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

**Note:**
For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Click the OK button.

The selected working copy is loaded and presented in the Working Copy view *(on page 2815).*

**Notice:**
You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

**Manage Working Copy Resources**

This section explains how to work with the resources that are displayed in the Working Copy view.

**Edit Files**

You can edit files from the Working Copy view *(on page 2815)* by double clicking them or by right clicking them and choosing Open from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the Working Copy view *(on page 2815).* The asterisk marks the files that have local modifications that were not committed to the repository.

**Add Resources to Version Control**

To share new files and folders (created in your working copy), add them to version control using the Add to version control option from the Working Copy view *(on page 2815).*

You can easily spot resources not under version control by the unversioned ( ![unversioned](https://example.com/unversioned) ) icon displayed in the Local file status column. Resources scheduled for addition are displayed with this added ( ![added](https://example.com/added) ) icon in the Working Copy view and are added in the repository after you commit them.
Note:
Do not make a confusion between ⬇ and ⬆ icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are scheduled for addition with history.

When you use the Add to version control option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you commit your changes (on page 2763), the resource is presented in the commit dialog box, but not selected. When you commit and unversioned resource, it is automatically added under version control before starting the commit operation.

Figure 687. Add to Version Control Dialog Box

Note:
Ignored (ï) items can also be added under version control.

The Depth column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

Note:
The initial value of the Depth field can have the following values, depending on the listing mode of the items in the working copy view (on page 2821):
When you add unversioned or ignored directories, the initial value of the Depth field also depends on the state of the Show unversioned directories content and Show ignored directories content options. If these options are selected, the value is based on the listing mode of the items in the working copy view. When they are not selected, the value is empty.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the config file of the Subversion configuration directory.

**Note:**
This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

- **No ignore** - when you select this option, file-name patterns defined to ignore unversioned resources do not apply. Resources that are located inside an unversioned directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

**Note:**
This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore unversioned resources in one of the following locations:

- In the config file of the Subversion configuration directory (the global-ignores option from the miscellany section).
- In the Oxygen XML Editor options (open the Preferences dialog box (Options > Preferences) (on page 124) and go to SVN > Working copy > Application global ignores).

Each of the above two options is activated only when you select an item that can have the option applied.

**Ignore Resources Not Under Version Control**

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, *.obj, *.class, *.lst, or output folders used to store temporary
files. Whenever you commit changes (on page 2763), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the Add to svn:ignore action in the contextual menu of the Working Copy view (on page 2815).

In the Add to svn:ignore dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- * - Matches any string of characters of any size, including the empty string.
- ? - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: *.txt.

The action Add to svn:ignore adds a predefined Subversion property called svn:ignore to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the Working Copy view. The ignored resources are represented with gray icons.

Delete Resources

The Delete action is available in the contextual menu of the Working Copy view (on page 2815). When you delete an item from the working copy, it is marked as deleted (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as missing (ивания) in your working copy. You can decide what you want to do with a missing item:

- In the case of a commit, any missing item is first automatically deleted and then committed.

Note:

Not any missing item can be committed as deleted, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition (▲) previously, since this item does not exist in the repository, but you can use the Delete action instead.

- If you want to recover missing items, either update (on page 2762) the items themselves or one of their parent directories. This fetches their latest version from the repository.
You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

Note:
It is recommended that you resolve conflicts manually to avoid losing any important remote modifications.

Finally, you can change your mind and revert (on page 2759) the deleted items to their initial, pristine, state.

Copy Resources

You can copy resources from various locations of the working copy. You select them in the Working Copy view (on page 2815) and then use Copy to from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the Copy to action is available only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Editor performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

Note:
- If you copy an item to a directory that is not under version control (on page 2817) (unversioned or ignored), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains external (on page 2817) items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the external items, use the Update operation on the copied directory.

In the Copy to dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For versioned items, you can select Ignore resource history to copy them without their history (similar to a simple file system copy).

Note:
The Copy to dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the working copy settings (on page 2821) are taken into account.

In the Commit dialog box, only the directory in question will appear without its children.
Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the **Working Copy view (on page 2815)** and choose the **Move to** action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as *deleted*.

**Note:**

*External* items cannot be moved using the **Move to** action, because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item and use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:**

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The **Rename** action is available in the contextual menu of the **Working Copy view (on page 2815)** and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as *deleted*.

**Note:**

*External* items cannot be renamed using the **Rename** action because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item, then use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:**

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Lock / Unlock Resources

The idea of version control is based on the **copy-modify-merge** model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.
The copy-modify-merge model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a lock-modify-unlock model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user’s working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.

### Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the [Working Copy view](on page 2815) by selecting one or more resources, then right-clicking them and choosing the Scan for Locks action from the contextual menu.

![Locked Items Dialog Box](image)

The **Locked items** dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

- 🚪 - Appears when one of the following conditions apply:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the [Repositories](view) view.

- 🚪 - Displayed after you have locked a file from the current working copy.
- 🗝️ A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).
- 🗝️ A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the Unlock button.

Related Information:
- Working Copy Locks (on page 2819)
- Repository Locks (on page 2810)

### Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the Repositories view.

**Note:**

You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The Lock dialog box allows you to write a comment when you set a lock or when you steal an existing one. Note that you should steal a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

### Unlocking a File

A file can be unlocked from the contextual menu of the Working Copy view (on page 2815). A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

### Synchronize with Repository

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the Incoming and Outgoing modes of the Working Copy view (on page 2815) was designed for, to help you send and receive modifications from the repository.

The Incoming and Outgoing modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.
The view presents the status of the working copy resources against the BASE revision after a **Refresh** operation. You can view the state of the resources versus a repository HEAD revision by using the **Synchronize** action from the **Working Copy** view *(on page 2815)*.

### View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the **Open in compare editor** action from the contextual menu.

The text files are compared using a built-in **Compare view** *(on page 2839)* that uses a line differencing algorithm or a specified external diff application (if such an application is set in the **SVN Diff preferences page** *(on page 284)*). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a *diff pseudo-conflict*. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the **SVN preferences page** and select the **Allow unversioned obstructions** option *(on page 282)*.

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the **Compare** view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the **Working Copy** view *(on page 2815)*.
At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- **Incoming changes** - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- **Outgoing changes** - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- **Conflicting changes** - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the Compare View toolbar (on page 2840) or in the Compare menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called **Perform files differencing**. After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all**
**non-conflicting changes from right to left** action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files, while disregarding the changes in the number of white spaces between words or lines, there is an option available in the **SVN Preferences** (on page 281) that allows you to enable or disable the white space ignoring feature of the compare algorithm.

**Conflicts**

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

**Real Conflicts vs Mergeable Conflicts**

There are two types of conflicts:

- **real conflict** (icon in **Name** column) - Syncro SVN Client considers the following resource states to be real conflicts:
  - **conflicted** state - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict (icon in **Local file status** column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict (icon in **Local properties status** column) is reported when a property’s value was modified both locally and remotely.
  - **tree conflicted** state (icon in **Local file status** column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
  - **obstructed** state (icon in **Local file status** column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.

- **pseudo-conflict** (icon in **Name** column) - A file is considered to be in **pseudo-conflict** when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the **pseudo-conflict** marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.
Note:

- A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).
- ![folder] and ![text] icons are presented only when one of the following view modes is selected: **Modified, Incoming, Outgoing, Conflicts**.
- The ![folder] icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

### Content Conflicts vs Property Conflicts

A **Content conflict** appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<<<< filename
your changes
=====
code merged from repository
>>>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

- **filename.ext.mine** - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.
- **filename.ext.rOLDREV** - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
- **filename.ext.rNEWREV** - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get **filename.ext.r* files also**.

A **Property conflict** is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named **filename.ext.prej** is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.
Edit Real Content Conflicts

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the **Compare** view (the built-in file comparison tool) or with an **external diff application** *(on page 281)*. Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The **Compare** view (or the external diff application *set in Preferences* *(on page 281)*) is opened with the **Edit Conflict** action, which is available on the contextual menus of the **Working Copy** view *(on page 2815)* for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If the **Show warning dialog when edit conflicts** option *(on page 285)* is selected, you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, =========, >>>>>>>) with the original local version of the file that preceded the update operation. If you click the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension .sync.bak to the file as stored on the SVN server. If you click the **Cancel** button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:

- **Save**
  
  Saves the modifications of the local version of the file displayed in the left side of the view.

- **Perform Files Differencing**

  Looks for differences between the two files displayed in the left and right side panels.

- **Ignore Whitespaces**

  Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

- **Synchronized scrolling**

  Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

- **Format and Indent Both Files** *(Ctrl + Shift + P (Command + Shift + P on macOS))*

  Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.
Note:
When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:
A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on macOS))
Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, =======, >>>>>>>) with the original local version of the file before running the update action that created the conflict. After that, the differences between this original local version and the repository version are displayed in the Compare view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the Compare view you should work on the local working copy file after the update operation without running the action Edit Conflict. If you decide that you want to edit the conflict version directly after running the action Edit Conflict you have to work on the .sync.bak file.
If you did not finish editing the conflicts in a file at the first run of the action **Edit Conflict** you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

**Revert Your Changes**

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

**Note:**

By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view** ([on page 2839](#)) and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar** ([on page 2840](#)). After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.
In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:**
If you want to roll-back out of your working copy changes that have already been committed to the repository, see Merge Revisions (on page 2777).

### Merge Conflicted Resources

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the Properties view (on page 2843). Before you can commit you must mark as resolved the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must
be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

**Drop Incoming Modifications**

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action *Mark as merged* proves to be useful in this case too. After opening the conflicting files with **Compare view (on page 2839)**, **Editor (on page 2836)** or editing their properties in the **Properties** view and deciding that your file can be committed in the repository replacing the existing one, you should use the *Mark as merged* action. When you want to override completely the remote file with the local file you should run the **Override and commit** action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the **Compare** view and only after to update and commit.

**Tree Conflicts**

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
- It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:
Figure 691. Resolve a tree conflict

- **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.
- **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

**Update the Working Copy**

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to update your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from [Working Copy view](on page 2815). It updates the selected resources to the last synchronized revision (if remote information is available) or to the HEAD revision of the repository.

There are three different kinds of incoming changes:

- **Non-conflicting** - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.
- **Conflicting, but auto-mergeable** - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)
- **Conflicting** - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.
If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Editor allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the Update to revision/depth action from the Working Copy view (All Files view mode) or the Update to revision action from the History view (on page 2830) contextual menu.

If you select multiple files and folders and then you perform an Update operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an Override and update action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

**Send Your Changes to the Repository**

Sending the changes you made to your working copy is known as committing the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The Commit action sends the changes from your local working copy to the repository. The Commit dialog box presents all the items that you can commit.
Enter a message to associate with the commit, or choose a previous message from the **Previous messages** list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: **added**, **modified** (content or properties), **replaced**, and **deleted**. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, deselect it.

**Attention:**

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being **unversioned** or **missing** and these items are handled automatically:

- **Unversioned** items are added under version control.
- **Missing** items are deleted.
Note:
If the Show unversioned directories content option is not selected, the Commit dialog box does not display the items inside an unversioned directory.

Unversioned or missing items are not selected by default in the Commit dialog box, unless you have selected them explicitly when issuing the commit command.

Note:
In some cases, items that have one of the above states are not presented in the Commit dialog box. For example:

- Items that have been added or replaced previously, but now are presented as missing after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the Delete action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

Note:
Due to dependencies between items, when you select or clear an unversioned (-files) or added (-files) item in the Commit dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double-clicking a file in the Commit dialog box, or by right-clicking and selecting the Show Modifications action from the contextual menu. This option is available to review only file content changes, not property changes.

The Local file status column indicates the actual state of the items and the Local properties status column indicates whether or not the properties of an item are modified.

The Lock information column is displayed if at least one of the files in the Commit dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:
• **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

**Note:**
This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

• **Keep locks** - selecting the **Keep locks** option preserves any locks you set on various files.

**Note:**
This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item that can have the option applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the **Update** action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

**Committing to Multiple Locations**

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding **external** items.

If items to be committed belong to different **external** definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow (↑) if they are **external** definitions. The working copy root directory is never decorated and is not presented if there are no **external** items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

**Note:**
When an **external** directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for **external** files.

The sets of items belonging to **external** definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of **externals**. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.
**Integration with Bug Tracking Tools**

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the Commit dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following SVN properties (on page 2769) that must be set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the Commit dialog box (on page 2763) will display a text field for entering the bug ID. It must contain the string %BUGID%, which is replaced with the bug number on commit.
- **bugtraq:label** - A string property that sets the label for the text field configured with the bugtraq:message property.
- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring %BUGID% which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.
- **bugtraq:warnifnoissue** - A boolean property with the values true/yes or false/no. If set to true, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.
- **bugtraq:number** - A boolean property with the value true or false. If this property is set to false, then any character can be entered in the bug ID text field. If the property is set to true or is missing then only numbers are allowed as the bug ID.
- **bugtraq:append** - A boolean property. If set to false, then the bug ID is inserted at the beginning of the commit message. If yes or not set, then it is appended to the commit message.
- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID’s must be matched in the groups of the regular expression string (for example, [Ii]ssue #?\(d+\)). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, Issue #123 or resolves issue 123). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern Issue #XXX and issue #890, #789 inside a log message you could use the following strings:
  
  ◦ [Ii]ssue #?\(d+\),(, ?#?\(d+\))+
  ◦ \(\d+\)
The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tool can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the `bugtraq:url` property was filled in with the URL of the bug tracking system and this URL includes the `%BUGID%` substring as specified above in the description of the `bugtraq:url` property then the History view (on page 2830) presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.

**Obtain Information for a Resource**

This section explains how to obtain information for a SVN resource:

**Request Status Information for a Resource**

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the Synchronize action from the Working Copy view (on page 2815) comes in handy. The Working Copy view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the Show SVN Information action. This action is available from the File menu or the contextual menu of the Working Copy, Repositories, History, or Directory Change Set views, or from the Revision Graph dialog box. The SVN Information dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the Copy action.
Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2810), Working Copy view (on page 2815), Revision Graph (on page 2845), or Directory Change Set view (on page 2835). From the Working copy view you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Related Information:
History View (on page 2830)

Management of SVN Properties

In the Properties view (on page 2843) you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision-dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the Working Copy view (on page 2815) and run the Show properties action from the contextual menu. The Properties view (on page 2843) will show the local properties for the resource in the working copy. Once the Properties view is visible, it will always present the properties of the currently selected resource. There are actions available in the Properties view toolbar (on page 2844) that allows you to add, change, and delete the properties.

If you choose the Add a new property action, a new dialog box will appear that contains the following:

• Name - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as svn:ignore, svn:externals, svn:needs-lock, etc.)
• Current value - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by selecting the Set property recursively checkbox.

If you want to change the value for a previously set property, you can use the Edit property action, which will display a dialog box with the following information:

• Name - Property name (cannot be changed).
• Current value - The current value (can be changed).
• Base value - The value of the property, if any, from the resource in the pristine copy (cannot be changed).
If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box where you can also choose if the property will be removed recursively.

There is a **Refresh** action in the Properties view (on page 2843) that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

**Branches and Tags**

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a **branch**. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (**trunk**).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as **tagging**. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a **tag** and a **branch**. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

**Create a Branch / Tag**

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the Working Copy view (on page 2815) or Repositories view (on page 2810), or from the contextual menu of the Repositories view.
You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the HEAD revision. The branch will be created very quickly, as the repository will make a *cheap* copy.
- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from the **History** dialog box (on page 2743). This type of branch will also be created very quickly.
- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:
• **Into repository’s directory** - The URL of the parent directory *(on page 2850)* of the new branch or tag.

**Note:**

*Peg revisions* have no effect for this operation since it is used to send information to the repository.

• **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the Repositories or Working copy view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

**Merging**

At some stage during the development process, you will want to merge the changes made on a *branch* back into the *trunk*, or vice-versa. The *merge* is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the *diff* concept.

**Note:**

A *branch* is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A *branch* always begins life as a *copy of something* (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

The ➔ **Merge** action is available in the Tools menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the *merge* operation will be performed on the entire working copy.
The four types of merging are as follows:

- **Merge revisions** *(on page 2776)* - Port changes from one branch to another. Note that the trunk can also be considered a branch, in this context.
- **Synchronize branch** *(on page 2778)* - Fetch all the changes made on a parent branch (or the trunk) to a child branch.
- **Reintegrate a branch** *(on page 2780)* - Merge a branch back to its parent branch (can also be the trunk).
- **Merge two different trees** *(on page 2782)* - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check:

**Perform pre-merge best practices checks of the working copy target** *(on page 2774)* - When selected, the SVN Client checks if the working copy target item is ready for the merge operation and displays the **pre-merge checks** wizard page.
Remember:
It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the merge does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.

Important:
The above recommendation becomes mandatory when reintegrating a branch (on page 2772).

Pre-Merge Checks
Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By selecting the Perform pre-merge best practices checks of the working copy target option in the first page of the Merge wizard, the Pre-merge checks wizard page is displayed to give you a summary of the verified conditions.

Figure 695. Pre-Merge Checks Wizard Page

The following conditions are checked in this operation:

No local modifications
The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

**Tip:**
If this condition fails, you should commit or revert the local modifications before merging.

**No switched children**

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and *subtree mergeinfo*.

**Tip:**
If this condition fails, you should switch back all the children before merging.

**Complete working copy tree**

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and *subtree mergeinfo*.

**Tip:**
If this condition fails, you should change the sticky depth of the working copy item receiving the merge to *infinity* value.

**No mixed revisions**

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

**Tip:**
If this condition fails, you should update the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

- ✔️ **(Successful)** - The condition is fulfilled successfully.
- ⚠️ **(Warning)** - The condition is not fulfilled, but it is not mandatory.
- 🚨 **(Error)** - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).
Tip:
For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

Important:
After solving any of the warnings or errors, it is recommended that you perform the pre-merge checks again to make sure your new changes are valid.

Merge Revisions

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, suppose you know that a problem has been fixed by committing revisions 17, 20, and 25 on branch B1. These changes are also needed in branch B2. Thus, to merge them, you need a working copy of the B2 branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu Tools > Merge.
   The Merge wizard is opened.
2. Select the Merge revisions option.
3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.
   
   a. Click the Next button.
   
   If the Perform pre-merge best practices checks of the working copy target option is selected, the Pre-Merge Checks wizard page (on page 2774) is displayed.

   Note:
   If errors are found you need to solve them before proceeding.

4. Click the Next button.
   The Merge revisions wizard page is displayed.
5. In the Merge from (URL) text box, enter the URL of the branch or tag (on page 2850) that contain the changes that you want to duplicate in your working copy.
   You may also click the Browse button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   Note:
   If the URL belongs to a different repository than the working copy, the Ignore ancestry / Disable merge tracking option (in the Merge Options wizard page (on page 2785)) will be selected.
automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2788).

Tip:
You can also specify a peg revision (on page 2852) at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the HEAD revision is assumed.

6. In the Revisions to merge section, choose between the all revisions and specific revision(s) options.

- all revisions - The operation will include all eligible revisions that were not yet merged.
- specific revision(s) - You can specify one or more individual revisions and/or revision ranges. Also, you can mix forward ranges (for example, 1-5), backward ranges (for example, 20-15), and subtract specific revisions from a range (for example, 1-5, -3).

Note:
If using the Subversion command-line client, a revision range of the form 1-5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.

Attention:
The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10-HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

Tip:
If you want to perform a reverse merge and roll-back your working copy changes that have already been committed to the repository, use the negative revisions notation (for example, -7) or backward revision ranges (for example, 20-10).

a. If you click the History button, the History dialog box (on page 2743) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to configure the options (on page 2785) for your merge, click the Next button. The Merge Options wizard page (on page 2785) is displayed that allows you to configure options for the operation.
Warning:
If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

8. Click the Merge button.
The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2787) after making major changes.

Note:
The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the trunk itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a synchronize merge, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized. Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses merge tracking to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

Important:
It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the synchronize merge, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the trunk since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:
1. Go to **Tools > Merge**.
   The Merge wizard is opened.
2. Select the **Synchronize branch** option.
3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Click the **Next** button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks wizard page (on page 2774)** is displayed.

   ![Note]
   If errors are found you need to solve them before proceeding.

4. Click the **Next** button.
   The **Synchronize branch** wizard page is displayed.
5. In the **Parent branch (URL)** text box, enter the URL of the branch where you created your branch (on page 2850). This means that the URL must belong to the same repository as your working copy that was created from the child branch.
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   ![Tip]
   You can also specify a **peg revision (on page 2852)** at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the **HEAD** revision is assumed.

6. Optionally, if you want to **configure the options (on page 2785)** for your merge, click the **Next** button.
   The **Merge Options wizard page (on page 2785)** is displayed that allows you to configure options for the operation.

   ![Note]
   The Ignore ancestry / Disable merge tracking option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Click the **Merge** button.
   The merge operation is performed.

   If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.
It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2787) after making major changes.

Note:
The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Reintegrate a Branch

Prerequisites:
There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
- The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
- The working copy must not contain the following:
  - Local modifications.
  - A mixture of revisions (all items must point to the same revision).
  - Sparse directories (all directories must be of infinity depth).
  - Switched items.
- The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.

Tip:
You can use the pre-merge checks option (on page 2774) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the Reintegrate a branch option.

This method uses the merge-tracking features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.
To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu Tools > Merge.
   The Merge wizard is opened.
2. Select the Reintegrate a branch option.

3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.
   a. Click the Next button.
      If the Perform pre-merge best practices checks of the working copy target option is selected, the Pre-Merge Checks wizard page is displayed.

4. Click the Next button.
   The Reintegrate a branch wizard page is displayed.
5. In the Child branch (URL) text box, enter the URL of the child branch to be reintegrated.
   This means that the URL must belong to the same repository as your working copy that was created from the parent branch.
   You may also click the Browse button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

6. Click the Next button.
   The Merge Options wizard page is displayed that allows you to configure options for the operation.

   i Tip:
   You can also specify a peg revision at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

   Note:
   Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.
Note: Since a reintegrate merge is so specialized, most of the merge options are not available, except for those in the File Comparison category.

6. Click the Merge button.
   The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2787) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Merge Two Different Trees**

This merge type is useful when you need to duplicate changes from one child branch (for example, CB1) to another child branch (CB2) from the same parent branch. The SVN client will calculate the changes necessary to get from the HEAD revision of the parent branch (or the trunk) to the HEAD revision of one of its child branches (CB1), and apply those changes to your working copy of the other branch (CB2). The result is that the latter child branch (CB2) will also include the changes made on the original child branch (CB1), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support merge tracking.

Note: If the server does not support merge-tracking, then this is the only way to merge a branch back to its parent.

1. Go to menu Tools > Merge.
   The Merge wizard is opened.
2. Select the option Merge two different trees.
3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.
a. Click the Next button.
   If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page (on page 2774) is displayed.

   **Note:**
   - If errors are found you need to solve them before proceeding.

4. Click the Next button.
   The **Merge two different trees** wizard is displayed.

5. In the From (starting URL and revision) section, enter the URL of the first branch (on page 2850).
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   **Tip:**
   - If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

   **Note:**
   - If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the **Merge Options** wizard page (on page 2785)) will be selected automatically (and you cannot change this). This is because the **Subversion client cannot track changes between different repositories** (on page 2788).

   **Tip:**
   - You can also specify a **peg revision** (on page 2852) at the end of the URL (for example, `URL@rev1234`). By default, the **HEAD** revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.
   - **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
   - **other revision** - Use this option to input a specific revision number and avoid losing recent commits. You can use the **History** button to see a list of all revisions.

7. In the To (ending URL and revision) section, enter the URL of the second branch (on page 2850).
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.
Tip:
If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

Attention:
The URL must point to the same repository as the one in the From (starting URL and revision) field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

Tip:
You can also specify a peg revision (on page 2852) at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between HEAD revision and other revision.
   - HEAD revision - This is the default selected revision.
   - other revision - Use this option if you want to enter a previous revision. You can use the History button to see a list of all revisions.

9. Optionally, if you want to configure the options (on page 2785) for your merge, click the Next button. The Merge Options wizard page (on page 2785) is displayed that allows you to configure options for the operation.

Warning:
If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

10. Click the Merge button.
    The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2787) after making major changes.
Note:
The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Options

Here is the list of options that can be used when merging:

Figure 696. Merge Wizard - Advanced Options

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
  - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
  - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and subtree mergeinfo.
  - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
  - **File children only (files)** - Merges only the child files.
  - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).
• **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is not selected, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, deselecting the option replaces one of the files with the other one, and selecting it merges their contents.

**Note:**
If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories.

• **Force deletion of modified or non-versioned items, if necessary** - If not selected, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.

• **Only record the merge (block revisions from getting merged)** - Available when the Ignore ancestry / Disable merge tracking option is not selected. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to select this option for two possible reasons:
  ◦ You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
  ◦ You want to prevent one or more particular changes from being fetched in subsequent merges.

• **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.

• **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
Ignore whitespace changes - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

Note:
Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

Ignore all whitespaces - Ignores all types of whitespace changes.

Test merge - Performs a dry run of the merge operation, allowing you to preview it without actually performing the merge. In the Console view you will see a list of the working copy items that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the Merge conflicts dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

The options to resolve a conflict are as follows:
• **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
• **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
• **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
• **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).

### Additional Notes About the Merge Operation

#### Sub-tree Merges

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid **sub-tree mergeinfo**. **Sub-tree mergeinfo** is the **mergeinfo** recorded to describe a **sub-tree merge**. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about **sub-tree merges** or **sub-tree mergeinfo** except that the complete record of merges to a branch may not be contained solely in the **mergeinfo** on the branch root and you may have to look to any **sub-tree mergeinfo** to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

#### Merging from Foreign Repositories

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, **merge-tracking** is not supported for merges from foreign repositories.

---

**Note:**

When performing merges from repositories other than the one corresponding to the target item (from the working copy), the **Ignore ancestry / Disable merge tracking** option (on page 2786) in the **Merge Options** wizard page (on page 2785) will be selected automatically (and you cannot change this).

#### General Merge Recommendations

As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth **infinity**).
- Switched items.
**Important:**
This recommendation becomes mandatory when performing a *reintegrate merge (on page 2780)* operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

**Remember:**
The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Switch the Repository Location

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the **Working Copy view (on page 2815).**

**Note:**
*External* items cannot be switched using this action. Instead, change the value of the `svn:externals` property set on the parent directory of the external item and update the parent directory.

#### Figure 698. Switch Dialog Box

The following options can be configured in the **Switch** dialog box:

- **Switch to URL**
The new location in the same repository (on page 2850) you are switching to.

**Tip:**
You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a peg revision (on page 2852) at the end (for example, URL@rev1234).

**Note:**
For items that are already switched (on page 2817) that you want to switch back, the proposed URL is the original location of the item.

**Revision**

The specific version of the location that you are switching to.

**Depth - (This option is applicable only for directories)**

- **Current depth**
  Obeys the depths registered for the directories in the working copy that are to be switched.

- **Recursive (infinity)**
  Switches the location of the selected folder and all of its files and folders.

- **Immediate children (immediates)**
  Switches the location of the selected folder and its child files and folders without recursing subfolders.

- **File children only (files)**
  Switches the location of the selected folder and its child files.

- **This folder only (empty)**
  Switches the location of the selected folder (no child files or folders are included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the switch operation. This option is only available if you choose the **Current depth** or **Recursive (infinity)** depth.

**Change the working copy item to the specified depth**

Changes the sticky depth on the directory in the working copy.

**Ignore ancestry**

When not selected, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If selected, the SVN does not check for a common ancestry.
Relocate a Working Copy

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to the new URL of the repository (on page 2850).

**Note:**

*Peg revisions* have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

**Note:**

*External* items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the **Relocate** action (the URL is not updated). To relocate these items, change the value of the `svn:externals` property for each external item (set on their parent directories). For example, if an external item is defined as `externalDir http://host/path/to/repo/to/dir` and the repository was moved to another server (`host2`) and its protocol changed to `https`, then the value of the property needs to be updated to `externalDir https://host2/path/to/repo/to/dir`.

**Tip:**

If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

Patches

This section explains how to work with patches in Syncro SVN Client.

What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in the **Unified Diff format**, but it can also use the **Git format** (on page 2803).

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:
- **Two revisions of a version item** - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- **Two different versioned items from the repository** - the items are remote and you need to specify a revision for both.

**Warning:**
The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

### Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the **Create patch** wizard, use the **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified, Incoming, Outgoing**, or **Conflicts** modes.

**Figure 699. Create Patch Wizard - Local Items**
Create Patch from Local Modifications

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items that have a local file status of unversioned or ignored, and in some cases missing or obstructed (on page 2817).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.
2. Select the Create patch from local modifications option in the dialog box.
3. Optionally, if you want to configure the options (on page 2801) for your patch, click the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.
4. Click the Create patch button.
   If the patch is applied on a folder of the working copy and that folder contains unversioned files (on page 2817), this step of the wizard offers the option of selecting the ones that will be included in the patch.

![Create Patch Dialog Box - Add Unversioned Resources](image)

The patch is created and stored in the path specified in the Output section of the Options page (on page 2801) or in the default location.
Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu **Tools > Create patch.**
   This opens the **Create patch** wizard.
2. Select the **Create patch against a specific revision** option in the dialog box.
3. Click the **Next** button.
   The second step of the wizard is opened:

   **Figure 701. Create Patch Wizard - Step 2**

4. Select the **revision to create patch against.**
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History button (on page 2743)** to display a list of the item revisions.
5. Optionally, if you want to configure the options (on page 2801) for your patch, click the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.
6. Click the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2801) or in the default location.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

Tip:
If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2796) instead.

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.
2. Select the Create patch between two revisions of an item option in the dialog box.
3. Click the Next button.
   The second step of the wizard is opened:

   **Figure 702. Create Patch Wizard - Step 2**

   ![Create Patch Wizard - Step 2](image)

4. Select the starting and ending revisions in the From and To sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can click the History button (on page 2743) to display a list of the item revisions.
Note:
The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

Tip:
If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the From section and the older version in the To section.

5. Optionally, if you want to configure the options (on page 2801) for your patch, click the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The Options wizard page is displayed.
6. Click the Create patch button.
The patch is created and stored in the path specified in the Output section of the Options page (on page 2801) or in the default location.

Create Patch Between Two Repository Items
This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

Tip:
To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2852) at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.
2. Select the Create patch between two repository items option in the dialog box.
3. Click the Next button.
   The second step of the wizard is opened:
4. Select the starting and ending URLs (on page 2850) and revisions in the From and To sections. You can select between the HEAD revision and a specific revision number. For the other revision option, you can click the History button (on page 2743) to display a list of the item revisions.

**Important:**
Both URLs must point to items from the same repository.

**Note:**
If you use a peg revision in the URL field, anything specified in the other revision field is ignored.

5. Optionally, if you want to configure the options (on page 2801) for your patch, click the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values. The Options wizard page is displayed.

6. Click the Create patch button.
The patch is created and stored in the path specified in the Output section of the Options page (on page 2801) or in the default location.
Generating a Patch - Remote Items

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the Create patch wizard, use the Create patch action from the Tools menu.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

Tip:
If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2796) instead.

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.
2. Select the Create patch between two revisions of an item option in the dialog box.
3. Click the Next button.
   The second step of the wizard is opened:
4. Select the starting and ending revisions in the **From** and **To** sections.
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2743) to display a list of the item revisions.

   **Note:**
   The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

   **Tip:**
   If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want to configure the options (on page 2801) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
   The **Options** wizard page is displayed.

6. Click the **Create patch** button.
   The patch is created and stored in the path specified in the **Output** section of the **Options page** (on page 2801) or in the default location.

### Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.
The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.
2. Select the **Create patch between two repository items** option in the dialog box.
3. Click the **Next** button.
   The second step of the wizard is opened:

   ![Create Patch Wizard - Step 2](image)

4. Select the starting and ending **URLs (on page 2850)** and revisions in the **From** and **To** sections.
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2743) to display a list of the item revisions.

   **Important:**
   Both URLs must point to items from the same repository.
5. Optionally, if you want to configure the options (on page 2801) for your patch, click the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values. The Options wizard page is displayed.

6. Click the Create patch button. The patch is created and stored in the path specified in the Output section of the Options page (on page 2801) or in the default location.

Patch Options

Figure 707. Create Patch Wizard - Options
Patch Section

Depth - (This option is applicable only for directories)

Current depth
The depth of recursing the folder for creating the patch is the same as the depth of
that same folder in the working copy (available only when generating patches that
contain changes from the working copy).

Recursive (infinity)
The patch is created on all the files and folders contained in the selected folder.

Immediate children (immediates)
The patch is created only on the child files and folders without recursing
subfolders.

File children only (files)
The patch is created only on the child files.

This folder only (empty)
The patch is created only on the selected folder (no child file or folder is included in
the patch).

Ignore content of added files
When selected, the patch file does not include the content of the added items. This option
corresponds to the --no-diff-added option of the svn diff command.

Ignore content of delete files
When selected, the patch file does not include the content of the deleted items. This option
corresponds to the --no-diff-deleted option of the svn diff command.

Treat copied files as newly added
When selected, copied items are treated as new, rather than comparing the items with their
sources. This option corresponds to the --show-copies-as-adds option of the svn diff
command.

Include files having a binary MIME type
When selected, the application is forced to compare items that are considered binary file types.
This option corresponds to the --force option of the svn diff command.

Ignore properties
When selected, differences in the properties of items are ignored. This option corresponds to the
--ignore-properties option of the svn diff command.

Properties only
When selected, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the `--properties-only` option of the `svn diff` command.

**Note:**
The **Ignore properties** and **Properties only** options are mutually exclusive.

**Notice ancestry**
If selected, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the `--notice-ancestry` option of the `svn diff` command.

**Files Comparison Section**

**Ignore line endings**
If selected, the differences in line endings are ignored when the patch is generated. This option corresponds to the `--ignore-eol-style` option of the `svn diff` command.

**Ignore whitespaces**
If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** (`--ignore-space-change`) - Ignores changes in the amount of whitespaces or changes to their type (for example, when changing the indentation or changing tabs to spaces).

  **Note:**
  Whitespaces that are added or removed are still considered to be changes.

- **Ignore all whitespaces** (`--ignore-all-space`) - Ignores all types of whitespace changes.

**Output Section**

**Save as**
The patch will be created and saved in the specified file.

**Use Git extended diff format**
When selected, the patch is generated using the *Git* format. This option corresponds to the `--git` option of the `svn diff` command.

**Working with Repositories**
This section explains how to locate and browse SVN repositories in Syncro SVN Client.
Importing Resources Into a Repository

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for using an existing working copy (on page 2744).

The Import folder and Import Files actions are available from the Import submenu of the Repository menu or of the contextual menu in the Repositories view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The Import folder action opens the Import folder dialog box.

You can configure the following options:

Folder

Specify the local folder (on page 2850) by using the text box or the Browse button. This folder should not be empty or already under version control.

Important:

By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the Browse button to select the local folder so that the client will automatically append the name of it to the specified URL.

URL

Specify the repository location (on page 2850) that will be used to access the folder to be imported.

Note:

Peg revisions have no effect for this operation since it is used to send information to the repository.
Attention:
If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

Depth

Recursive (infinity)
Imports all the files and folders contained in the selected folder.

Immediate children (immediates)
Imports only the child files and folders without recursing subfolders.

File children only (files)
Imports only the child files.

This folder only (empty)
Imports only the selected folder (no child file or folder is included).

Share files matching global ignore patterns
When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The global-ignores property in the SVN configuration file (on page 2850).
- The File name ignore patterns option (on page 284) in the SVN > Working Copy preferences page (on page 283).

Enable automatic properties/Disable automatic properties
Enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the SVN configuration file (on page 2850).

Note:
This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the auto-props section). Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Exporting Resources From a Repository
This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.
The **Export** dialog box is similar to the **Check out** dialog box:

**Figure 709. Export from Repository Dialog Box**

![Export from Repository Dialog Box](image)

You can configure the following options:

**URL**

Specify the source directory from the repository *(on page 2850)* by using the text box or the **Browse** button.

**Tip:**

To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* *(on page 2852)* at the end (for example, `URL@rev1234`).

**Note:**

The content of the selected directory from the repository and not the directory itself will be exported to the file system.

**Revision**

You can choose between the **HEAD** or **Other** revision. If you need to export a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box.

**Export to**

Specify the location where you want to export *(on page 2850)* the repository directory by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.
Important:
By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the export location so that the client will automatically append the name of the remote directory to the path of the selected directory.

Warning:
The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

**Depth**

**Recursive (infinity)**
Exports all the files and folders contained in the selected folder.

**Immediate children (immediates)**
Exports only the child files and folders without recursing subfolders.

**File children only (files)**
Exports only the child files.

**This folder only (empty)**
Exports only the selected folder (no child file or folder is included).

**Ignore "svn:externals" definitions**
When selected, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

**EOL style**
Defines the end-of-line (EOL) marker that should be used when exporting files that have the value or the svn:eol-style property set to native. You can choose between the following styles:

- **Default** - It uses the system-specific end-of-line marker.
- **CRLF** - The Windows-specific end-of-line marker (carriage return - line feed).
- **LF** - The Unix / macOS-specific end-of-line marker (line feed).
- **CR** - The macOS 9 (or older)-specific end-of-line marker (carriage return).

**Ignore keywords**
When selected, the export operation does not expand the SVN keywords found inside the files.
Copy / Move / Delete Resources From a Repository

Once you have a location defined in the Repositories view (on page 2810), you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The Copy to and Move to action allows you to copy and move individual or multiple resources to a specific directory from the HEAD revision of the repository.

Figure 710. Copy/Move Items in Repository

The dialog box used to copy or move items allows you to browse the HEAD revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The Source section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision that will have one or more items copied, allowing you to also choose another revision.
**Note:**
Since only items from the HEAD revision can be moved, the **Revision** options are not presented for the **Move to** action.

**Note:**
When you copy a single item while browsing a revision other than **HEAD**, the **Revision** options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.

### Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the **Check out** action from the **Repositories view** (on page 2811)) and then recursively update only the needed directories (using the **Update** action from the **Working Copy view** (on page 2823)). Each directory then has a depth set to it, with four possible values:

- **Recursive (infinity)** - Updates all descendant directories and files recursively.
- **Immediate children (immediates)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (files)** - Updates the directory, including only child files without the child directories.
- **This folder only (empty)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the **Working Copy view** (on page 2815) with a marker corresponding to each depth value, in the top left corner, as follows:

- **Recursive (infinity)** - This is the default value and it is has no mark. The directory has no limiting depth.
- **Immediate children (immediates)** - The directory is limited to direct child directories (without contents) and files.
- **File children only (files)** - The directory is limited to direct child files only.
- **This folder only (empty)** - The directory has *empty* depth set.
A depth set on a directory means that some operations process only items within the specified depth range. For example, Synchronize on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the SVN Information dialog box and in the tooltip displayed when hovering a directory in the Working Copy view.

Syncro SVN Client Views

The main working area occupies the center of the application window, which contains the most important views:

- Repositories View (on page 2810)
- Working Copy View (on page 2815)
- History View (on page 2830)
- Console View (on page 2845)

The other views that support the main working area are also presented in this section.

Repositories View

The Repositories view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

If no connections to your repository are available, you can add a new repository location (on page 2736). Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- **Date** - Date when the resource was last modified.
- **Revision** - The revision number at the time the resource was last modified.
- **Author** - Name of the person who made the last modification on the resource.
- **Size** - Resource size on disk.
- **Lock information** - Information about the lock status of a file. When a repository file is locked by a user the icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
  - **Owner** - The name of the user who created the lock.
  - **Date** - The date when the user locked the file.
  - **Expires on** - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
  - **Comment** - The message attached when the file was locked.
- **Type** - Contains the resource type or file extension.
Figure 711. Repositories View

The Repositories view’s toolbar contains the following buttons:

- **New Repository Location** - Allows you to enter a new repository location by means of the Add SVN Repository dialog box.

- **Move Up** - Move the selected repository up one position in the list of repositories in the Repositories view.

- **Move Down** - Move the selected repository down one position in the list of repositories in the Repositories view.

- **Collapse all** - Collapses all repository trees.

- **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.

- **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The Repositories view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:

- **New Repository Location** (Ctrl + Alt + N (Command + Alt + N on macOS))
Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

![Add SVN Repository Dialog Box](image)

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

**Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on macOS))**

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on macOS))**

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

**Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on macOS))**

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

**Open**

Opens the selected file in the Editor view in read-only mode.

**Open with**

Displays the **Open with** dialog box to specify the editor where the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

**Save as**

Saves the selected files locally, as they are in the browsed revision.

**Refresh (F5)**

Refreshes the resource selected in the **Repositories** view.

**Check out (Ctrl + Alt + O (Command + Alt + O on macOS))**

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see Check out a working copy (on page 2741).

Branch/Tag
Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the Creation and management of Branches/Tags (on page 2770) section.

Share project

Allows you to share a new project (on page 2739) using an SVN repository. The local project is automatically converted into an SVN working copy.

Import:

**Import folder (Ctrl + Shift + L (Command + Shift + L on macOS))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2804).

**Note:**
The difference between the Import folder and Share project actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on macOS))**

Imports the files selected from the file system into the selected folder in the repository.

Export

Opens the Export dialog box (on page 2805) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show History (Ctrl + H (Command + T on macOS))**

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))**

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2837), along with the history of the file in the History view.

**Revision Graph (Ctrl + G (Command + G on macOS))**

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see Revision Graph (on page 2845). This operation is available for any resource selected in the Repositories view or Working Copy view.

**Copy URL Location (Ctrl + Alt + U (Command + Alt + U on macOS))**

Copies to clipboard the URL location of the selected resource.

**Copy to**
Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (HEAD), to allow restoring previous versions of an item.

**Move to (Ctrl + M (Command + M on macOS))**

Moves to a specified location the currently selected resource(s).

**Rename (F2)**

Renames the selected resource.

**Delete (Delete)**

Deletes selected items from the repository via an immediate commit.

**New Folder (Ctrl + Shift + F (Command + Shift + F on macOS))**

Allows you to create a folder in the selected repository path (available only for folders).

**Locking**

The following options are available only for files:

- **Lock (Ctrl + K (Command + K on macOS))**
  
  Allows you to lock certain files that need exclusive access. For more details on the use of this action, see Locking a file (on page 2752).

- **Unlock (Ctrl + Shift + K (Command + Shift + K on macOS))**

  Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

- **Show SVN Properties (Ctrl + Shift + P (Command + Shift + P on macOS))**

  Brings up the Properties view (on page 2843) displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

- **Show SVN Information (Ctrl + I (Command + I on macOS))**

  Provides additional information for the selected resource. For more details, go to Obtain information for a resource (on page 2768).

**Assistant Actions**

When there is no repository configured, the **Repositories** view mode lists the following two actions:

**Figure 713. Repositories View Actions**

- **Add a new repository**

  Add a new repository to work on or to checkout a new working copy from it.

- **Checkout a new working copy**

  You can start using Syncro SVN Client by checking out a new working copy.
Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Repositories view. These operations behave in the same way with the Copy to/Move to operations.

Working Copy View

The Working Copy view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- Settings menu.

If you click any of the view modes (All Files, Modified, Incoming, Outgoing, Conflicts), the information displayed changes as follows:

- ![All Files](#) - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

---

**Figure 714. Working Copy View - All Files View Mode**
• 🔄 **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:
  ◦ Incoming modification from repository:
    • 🔄 - File content or properties modified remotely.
    • 🔄 - New file added remotely.
    • 🔄 - File deleted remotely.
  ◦ Outgoing modification to repository:
    • 🔄 - File content or properties modified locally.
    • 🔄 - New file added locally.
    • 🔄 - File deleted locally.
  ◦ 🔄 **Pseudo-conflict state** - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.
  ◦ 🔄 **Real conflict state** - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

**Figure 715. Working Copy View - Modified View Mode**

- 🔄 **Incoming** - The resource tree presents only incoming changes.
- 🔄 **Outgoing** - The resource tree presents only outgoing changes.
- 🔄 **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).
The following columns provide information about the resources:

- **Name** - Resource name. Resource icons can have the following decorator icons:
  
  - Additional status information:
    
    - **Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
    
    - **External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
    
    - **Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of the Switch action (on page 2789) executed from the contextual menu of the Working Copy view.
    
    - **Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the Add to `svn:ignore` action.
  
  - Current SVN depth of a folder:
    
    - **Immediate children (immediates)** (a variant of sparse checkout (on page 2809)) - The directory contains only direct file and folder children. Child folders ignore their content.
    
    - **File children only (files)** (a variant of sparse checkout (on page 2809)) - The directory contains only direct file children, disregarding any child folders.
    
    - **This folder only (empty)** (a variant of sparse checkout (on page 2809)) - The directory discards any child resource.

**Note:**

- Any folder not marked with one of the depth icons, has recursive depth (*infinity*) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Editor presents *unversioned* and *ignored* folders with empty depth when **Show unversioned directories content** or **Show ignored directories content** options are not selected.

- **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
  
  - **** - Resource is *not under version control* (*unversioned*).
  
  - **□** - Resource is being *ignored* because it is not under version control and its name matches a file name pattern defined in one of the following places:
• global-ignores section in the SVN client-side config file (on page 2733).

⚠️ **Attention:**
If you do not explicitly set the global-ignores runtime configuration option (either to your preferred set of patterns or to an empty string), Subversion uses the default value.

• Application global ignores option (on page 284) of Oxygen XML Editor.
  • The value of a svn:ignore property (on page 2747) set on the parent folder of the resource being ignored.
    ◦ ▶ - Marks a newly created resource, scheduled for addition to the version control system.
    ◦ ▶ - Marks a resource scheduled for addition, created by copying a resource already under version control and inheriting all its SVN history.
    ◦ ▶ - The content of the resource has been modified.
    ◦ R - Resource has been replaced in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
    ◦ ▶ - Resource is deleted (scheduled for deletion from Repository upon the next commit).
    ◦ I - The resource is incomplete (as a result of an interrupted check out or update operation).
    ◦ I - The resource is missing because it was moved or deleted without using an SVN-aware application.
    ◦ C - The contents of the resource is in real conflict state (on page 2755).
    ◦ R - Resource is in a name conflict state.
    ◦ C - Resource is in tree conflict state after an update operation because:
      • Resource was locally modified and incoming deleted from repository.
      • Resource was locally scheduled for deletion and incoming modified.
    ◦ C - Resource is obstructed (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).

• 🌐 Local properties status - Marks the resources that have SVN properties, with the following possible states:
  ◦ ● - The resource has SVN properties set.
  ◦ ○ - The resource properties have been modified.
  ◦ ◯ - Properties for this resource are in real conflict (on page 2755) with property updates received from the repository.

• Revision - The current revision number of the resource.
• Date - Date when the resource was last time modified on the disk.
• BASE Revision - The revision number of the pristine version of the resource.
• BASE Date - Date when the pristine version of the resource was last time committed in the repository.
• Author - Name of the person who made the last modification on the pristine version of the resource.
• 🌐 Remote file status - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
  ◦ ▶ - Resource is newly added in repository.
  ◦ ▶ - The content of the resource has been modified in repository.
- ❎ - Resource was replaced in repository.
- ⌛ - Resource was deleted from repository.

- 🌐 Remote properties status - Resources marked with the 🌐 icon have incoming modified properties from the repository.
- Remote revision - Revision number of the resource latest committed modification.
- Remote date - Date of the resource latest modification committed on the repository.
- Remote author - Name of the author who committed the latest modification on the repository.

- ⚒️ Lock information - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the 🌐 symbol. To clear the locked state of a folder, use the **Clean up** action.

**Note:**
Users can lock only files.

The following lock states are displayed:
- no lock - the file is not locked. This is the default state of a file in the SVN repository.

- remotely locked (stalk) - shown when:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the Repositories view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:**
To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to break or steal the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- locked (stalk) - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.
Note:
Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not stolen or broken).

- **stolen** (🔒) - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.
- **broken** (⛔) - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

Note:
To remove the stolen or broken states from your working copy files, you have to Update them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- **Lock type** - current file lock state
- **Owner** - the name of the user who created the lock
- **Date** - the date when the user locked the file
- **Expires on** - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- **Comment** - the message attached when the file was locked

• **Size** - Resource size on disk
• **Type** - Contains the resource type or file extension

Note:
The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.

The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Editor is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the Working Copy view.
- **Working Copies Manager (macOS)** - Opens a dialog box that displays the working copies Oxygen XML Editor is aware of. In this dialog box, you can add existing working copies or remove those
you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Editor warns you that the selected directory is not under version control.

Note: Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

Working Copy Settings

The Settings button from the toolbar of the Working Copy view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.

  Note: If this option is not selected, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except All Files.

- **Show ignored items** - Displays the ignored resource when All Files mode is selected.
- **Show ignored directories content** - Displays the content of ignored directories when All Files mode is selected.

  Note: Although ignored items are not presented in the Modified, Incoming, and Conflicts modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when All Files mode is selected. All other modes always display deleted resources, disregarding this option.

- **Tree / Compressed / Flat** - Affect the way information is displayed inside the Modified, Incoming, Outgoing, and Conflicts view modes.

- **Configure columns** - Allows you to customize the structure of the Working Copy view data. This action opens the following dialog box:
The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width, and enabled/disabled state from the installation of the application.

### Working Copy Format

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the **When loading an old format working copy** option (on page 283).

To change how working copy formats are handled, open the Preferences dialog box (Options > Preferences) (on page 124), go to **SVN > Working copy**, and configure the options in the **Administrative area** (on page 283) section.

**Note:**

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.
Refresh a Working Copy

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the Working Copy view and when you switch between Oxygen XML Editor and other applications.

The Working Copy view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

Working Copy View Contextual Menu Actions

The contextual menu in the Working Copy view contains the following actions:

- **Edit conflict (Ctrl + E (Command + E on macOS))**
  
  Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2757).

- **Open in Compare Editor (Ctrl + Alt + C (Command + Alt + C on macOS))**
  
  Displays changes made in the currently selected file.

- **Open (Ctrl + O (Command + O on macOS))**
  
  Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on macOS, etc).

- **Open with…**
  
  Submenu that allows you to open the selected resource either with Oxygen XML Editor or with another application.

- **Show in Explorer/Show in Finder**
  
  Opens the parent directory of the selected working copy file and selects the file.

- **Expand All (Ctrl + Alt + X (Command + Alt + X on macOS))**
  
  Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

- **Refresh(F5)**
  
  Re-scans the selected resources recursively and refreshes their status in the working copy view.

- **Synchronize (Ctrl + Shift + S (Command + Shift + S on macOS))**
  
  Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 283) is selected.
Update (Ctrl + U (Command + U on macOS))

Updates the selected resources to the HEAD revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2809) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

Revert (Ctrl + Shift + V (Command + Shift + V on macOS))

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from the Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2759) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2759) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2761).

Mark Resolved (Ctrl + Shift + R (Command + Shift + R on macOS))

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2760).

Mark as Merged (Ctrl + Shift + M (Command + Shift + M on macOS))

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2760) section for more information about how you can solve the pseudo-conflicts.

Create patch (Ctrl + Alt + P (Command + Alt + P on macOS))

Allows you to create a file containing all the differences between two resources, based on the svn diff command. To read more about creating patches, see the section about patches (on page 2794).

Compare with:
• **Latest from HEAD (Ctrl + Alt + H (Command + Alt + H on macOS))** - Performs a 3-way diff operation between the selected file and the HEAD revision from the repository and displays the result in the Compare view. The common ancestor of the 3-way diff operation is the BASE version of the file from the local working copy.

• **BASE revision (Ctrl + Alt + C (Command + Alt + C on macOS))** - Compares the working copy file with the BASE revision file (the so-called pristine copy).

• **Revision (Ctrl + Alt + R (Command + Alt + R on macOS))** - Displays the History view that contains the log history of that resource.

• **Branch/Tag** - Opens the Compare with Branch/Tag dialog box that allows you to specify another file from the repository (on page 2850) (To URL field) to compare with the working copy file. You can specify the revision of the repository file by choosing between HEAD revision or specific Other revision.

**Tip:**
To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a peg revision (on page 2852) at the end (for example, URL@rev1234).

• **Each other** - Compares two selected files with each other.

These compare actions are available only if the selected resource is a file.

**Replace with:**

• **Latest from HEAD** - Replaces the selected resources with their versions from the HEAD revision of the repository.

• **BASE revision** - Replace the selected resources with their versions from the pristine copy (the BASE revision).

**Note:**
In some cases it is impossible to replace the currently selected resources with their versions from the BASE/HEAD revision:

• For the Replace with BASE revision action, the resources being unversioned or added have no BASE revision, and thus cannot be replaced. However, they will be deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders.

• For the Replace with latest from HEAD action, you must be aware that there are cases when resources will be completely deleted or reverted to the BASE revision and then updated to a HEAD revision to avoid conflicts. These cases are:
The resource is unversioned, added, obstructed, or modified.
The resource is affected by a `svn:ignore` or `svn:externals` property that is locally added on the parent folder and not yet committed to the repository.

Show History (Ctrl + H (Command + H on macOS))
Displays the History view where the log history for the selected resource will be presented. For more details about resource history, see the sections about the resource history view (on page 2830) and requesting the history for a resource (on page 2769).

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))
Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2837), along with the history of the file in the History view.

Revision Graph (Ctrl + G (Command + G on macOS))
This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see Revision Graph (on page 2845).

Copy URL Location (Ctrl + Alt + U (Command + Alt + U on macOS))
Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied
You can use this action to mark an item from the working copy as a copy of another item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved
You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Mark as renamed
You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Copy to
Copies the currently selected resource to a specified location.

Move to (Ctrl + M (Command + M on macOS))
Moves the currently selected resource to a specified location.

**Rename (F2)**

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

**Delete (Delete)**

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

**New:**

- **New File** - Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.

- **New Folder (Ctrl + Shift + F (Command + Shift + F on macOS))** - Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.

- **New External Folder (Ctrl + Shift + W (Command + Shift + W on macOS))** - This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2850), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:**

You can specify a particular revision of the external item by using a peg revision (on page 2852) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository where the `svn:externals` property is versioned.
- `/` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `//` - Relative to the root URL of the server that has the `svn:externals` property versioned.

**Important:**

To change the target URL of an external definition, or to delete an external item, do the following:
1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:**
Syncro SVN Client does not support definitions of local relative external items.

---

### Add to "svn:ignore" (Ctrl + Alt + I (Command + Alt + I on macOS))

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the Ignore Resources Not Under Version Control (on page 2747) section.

### Add to version control (Ctrl + Alt + V (Command + Alt + V on macOS))

Allows you to add resources that are not under version control. For further details, see Add Resources to Version Control (on page 2745) section.

### Remove from version control

Schedules the selected items for deletion from the repository upon the next commit. The items are not removed from the file system after committing.

### Clean up (Ctrl + Shift + C (Comman + Shift + Cd on macOS))

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

### Locking:

- **Scan for locks (Ctrl + L (Command + L on macOS))** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under version control. For more details see Scanning for locks (on page 2751).
- **Lock (Ctrl + K (Command + K on macOS))** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2752).
- **Unlock (Ctrl + Alt + K (Command + Alt + K on macOS))** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).
Show SVN Properties (Ctrl + P (Command + P on macOS))

Brings up the Properties view (on page 2843) and displays the SVN properties for the selected resource.

Show SVN Information (Ctrl + I (Command + I on macOS))

Provides additional information for the selected resource from the working copy. For more details, go to Obtain information for a resource (on page 2768).

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Working Copy view. These operations behave in the same way with the Copy to/Move to operations.

Also, files and folders can be added to the file tree of the view as unversioned resources by drag and drop operations from other applications (for example, from Windows Explorer or macOS Finder). In this case, the items from the file system are only copied, without removing them from their original location.

Attention:

When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as missing in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

Assistant Actions

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the All Files view mode lists the following two actions:

Figure 717. All Files Panel

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Check out a new working copy" /></td>
<td>You can start using Syncro SVN Client by checking out a new working copy.</td>
</tr>
<tr>
<td><img src="image" alt="Add a working copy" /></td>
<td>If you already have a working copy on disk, you can add it to Syncro SVN Client and start to work.</td>
</tr>
</tbody>
</table>

For Modified, Incoming, Outgoing, Conflicts view modes, the following actions may be available, depending on the current working copy state in various contexts:

- ![Synchronize with Repository](image) - Available only when there is nothing to present in the Modified and Incoming view modes.
- ![Switch to Incoming](image) - Selects the Incoming view mode.
- ![Switch to Outgoing](image) - Selects the Outgoing view mode.
• ☢️ **Switch to Conflicts** - Selects the **Conflicts** view mode.

• ⚠️ **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.

• 📘 **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

**History View**

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from Repositories view (on page 2810), Working Copy view (on page 2815), Revision Graph (on page 2845), or Directory Change Set view (on page 2835). From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The view consists of four distinct areas:

• The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author's name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource that has the history displayed - a bold font revision.
- The last revision where the content or properties of the resource were modified - blue font revision.

**Note:** Both font highlights may be applied for the same revision.

• The complete commit message for the selected revision.

• A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.

• The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:

  ◦ ➡️ - A newly created resource.
  ◦ ➡️ - A newly created resource, copied from another repository location.
  ◦ ➡️ - The content-properties of the resource were modified.
  ◦ ➡️ - Resource was replaced in the repository.
  ◦ ➡️ - Resource was deleted from the repository.
You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the Group by date button from the toolbar.

**History Filter Dialog Box**

The History view does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed in the History view by selecting one of several options presented in the History dialog box that is displayed when you invoke the Show History action.
Figure 719. History Filters Dialog Box

Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the History view has two buttons for extending the set of revisions presented in the view: Get next 50 and Get all.

History Filter Field

When only the history entries that contain a specified substring need to be displayed in the History view, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the Find label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the History view. When you click the Search button, the filter action is executed and the content of the table is updated.

History View Contextual Menu Actions

The History view contains the following contextual menu actions:

Compare with working copy

Compares the selected revision with your working copy file. It is available only when you select a file.

Open
Opens the selected revision of the file into the Editor. This is available only for files.

**Open with**

Displays the Open with dialog box to specify the editor where the selected file will be opened.

**Get Contents**

Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The *BASE* version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the *BASE* version, even if the contents is from an older version from history.

**Save as**

Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).

**Note:**

This action can be used to resurrect deleted items also.

**Revert changes from this revision**

Reverts changes that were made in the selected revisions. The are reverted only in the working copy and do not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is available when the resource history was launched for a local working copy resource.

**Note:**

For items displayed in the *Affected Paths* section that were *added*, *deleted*, or *replaced*, this action has no effect because such changes are considered to be changes to the parent directory. To revert these types of changes, follow these steps:

1. Request the history for the parent directory.
2. Identify the revision that contains the changes you want to revert.
3. Invoke the action on that revision.

**Warning:**

There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the *Affected Paths* section. In this case, the action does not proceed and an error message is displayed. For example, the selected
item in the **Affected Paths** section is from a different repository location than the working copy item that has the history displayed.

**Update to revision**

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

**Check out**

Checks out a new working copy of the directory that has the history presented, from the selected revision.

**Export**

Opens the Export dialog box ([on page 2805](#)) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))**

Opens the **Show Annotation** dialog box that computes the annotations for a file and displays them in the **Annotations** view ([on page 2837](#)), along with the history of the file in the **History** view.

**Change**

Allows you to change commit data for a file:

- **Author** - Changes the name of the SVN user that committed the selected revision.
- **Message** - Changes the commit message of the selected revision.

When two resources are selected in the **History** view, the contextual menu contains the following actions:

**Compare revisions**

When the resource is a file, the action compares the two selected revisions using the **Compare** view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

**Revert changes from these revisions**

Similar to the `svn merge` Command, it merges two selected revisions into the working copy resource. This action is only available when the resource history was requested for a working copy item.

For more information about the **History** view and its features, see the [Request history for a resource](#) and [Using the resource history view](#) sections.
Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

Figure 720. Directory Change Set View

The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right-side list of the view performs a diff operation between that revision and the previous one for the same file.

The contextual menu of the right side list contains the following actions:

- **Compare with previous version**
  
  Performs a diff operation between the selected revision in the list and the previous one.

- **Open**
  
  Opens the selected revision in the associated editor type.

- **Open with**
Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

**Save as**

Saves the selected file as it was in the selected revision.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision.

![Note:](image)

This action can be used to resurrect deleted items also.

**Check out**

Checks out a new working copy of the selected directory, from the selected revision.

**Export**

Opens the Export dialog box (on page 2805) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show Annotation** (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2837), along with the history of the file in the History view.

**Show SVN Information** (Ctrl + I (Command + I on macOS))

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2768).

**Editor Panel of SVN Client**

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in the File Types preferences panel (on page 297).

The internal editor can be accessed either from the Working copy view (on page 2815) or from the History view (on page 2830). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.

After editing the content of the file in an internal editor you can save it to disk by using the Save action from the File (on page 2721) menu or the Ctrl + S (Command + S on macOS) key shortcut. After saving your file you can see the file changed status in the Working Copy view (on page 2815).
If the internal editor associated with a file type is not the XML Editor, then the encoding set in the preferences for Encoding for non XML files (on page 168) is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

Annotations View

Sometimes you need to know not only what was changed in a file, but also who made those changes. The Annotations view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the Show Annotation action, which is available in the History menu, and from the contextual menu of the following views: Repositories view (on page 2810), Working copy view (on page 2815), History view (on page 2830), and Directory Change Set view (on page 2835).

This action opens a dialog box that allows you to configure some options for showing the annotations.

![Show Annotation Options Dialog Box](image)

Once you have configured the options and click OK, the Annotations view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to see the revision where the line was last modified. The same revision is highlighted in the History view and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the Annotations view corresponding to that revision are highlighted. Therefore, the Annotations view,
History view, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

**Figure 722. Annotations View**

The following options can be configured in the **Show Annotation** dialog box:

**From Revision Section**

Select the revision to have the annotation computed. If you click the History button, the **History** dialog box (on page 2743) is displayed, which allows you to select a revision.

**To Revision Section**

Select the ending revision by choosing between the HEAD revision or specify it in the Other text box. If you click the History button, the **History** dialog box (on page 2743) is displayed, which allows you to select a revision.

**Encoding**

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file. Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

**Ignore MIME type**

If selected, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

**Ignore line endings**

If selected, the differences in line endings are ignored when the annotation is computed.

**Ignore whitespaces**
If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

  ![Note]
  Whitespace that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

  ![Tip]
  Selecting any of these ignore options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and click **OK**, the annotations will be computed and the **Annotations** view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

![Note]
If the file has a very long history, the computation of the annotation data can take a long time to process.

**Compare View**

In the Oxygen XML Editor, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in **Compare** view. This view is automatically opened if you select two files and use the **Compare with > Each Other** action in the contextual menu.
At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a line differencing algorithm. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a Refresh operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the Synchronize operation, you can examine the exact differences between your local file and the HEAD revision file.
- You can use the Compare view from the History view to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see View Differences (on page 2753).

**Compare View Toolbar**

The toolbar of the Compare view contains the operations that can be performed on the source and target files.
The following actions are available:

**Algorithm**

The algorithm to be used for performing a comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** comparison mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Save action**

Saves the content of the left editor when it can be edited.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Format and Indent Both Files** *(Ctrl + Shift + P (Command + Shift + P on macOS))*

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:**

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**
Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Ignore Nodes by XPath**

You can use this text field to enter an XPath expression (on page 1999) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

**Note:**

A change block groups one or more consecutive lines that contain at least one change.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.
Most of these actions are also available from the Compare (on page 2721) menu.

**Image Preview**

You can view your local files by using the built-in Image Preview component. The view can be accessed from the Working copy view (on page 2815) or from the Repository view (on page 2810). It can also be used from the History view (on page 2830) to view a selected revision of a image file.

Only one image file can be opened at a time. If an image file is opened in the Image preview and you try to open another one it will be opened in the same window. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the Image Preview panel using the actions from the contextual menu, you can scale the image at its original size (1:1 action) or scale it down to fit in the view's available area (Scale to fit action).

**Compare Images View**

The images are compared using the Compare Images view. This view is automatically opened if you select two image files and use the Compare with > Each Other action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: GIF, JPG / JPEG, PNG, BMP.

**Properties View**

The properties view presents Apache Subversion™ properties for the currently selected resource from either the Working Copy view or the Repositories view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

*Figure 725. Properties View*
The table includes four columns:

- **State** - Can be one of the following:
  - *(empty)* - Normal unmodified property (same current and base values)
  - *(asterisk)* - Modified property (current and base values are different)
  - *(plus sign)* - New property
  - *(minus sign)* - Removed property
- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

### svn:externals Property

The **svn:externals** property can be set on a folder or a file. In the first case, it stores the URL of a folder from another repository (on page 2827). In the second case, it stores the URL of a file from another repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and external file:

- The path to the external file must be in a working copy that is already checked out. While external directories can place the external directory at any depth and it will create any intermediate directories, external files must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the external file will be inserted into (inter-repository external files are not supported).
- While commits do not descend into an external directory, a commit in a directory containing an external file will commit any modifications to the external file.

The difference between a normal versioned file and an external file is that external files cannot be moved or deleted (the **svn:externals** property must be modified instead. However, external files can be copied).

An external file is displayed as an X in the switched status column.

### Toolbar / Contextual Menu

The properties view toolbar and contextual menu contain the following actions:

- ✚ **Add a new property** - This button invokes the *Add property* dialog box where you can specify the property name and value.
- ✉ **Edit property** - This button invokes the *Edit property* dialog box where you can change the property value and also see its original(base) value.
- ✗ **Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
- ⌛ **Refresh** - This action will refresh the properties for the current resource.
## Console View

The **Console View** shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the **SVN User Manual**.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

- **Clear**
  Erases all the displayed messages.

- **Lock scroll**
  Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the *Preferences (on page 281)* page. By default, this value is set to 100.

## Dynamic Help View

**Dynamic Help view** is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

## Revision Graph of an SVN Resource

The history of an SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the **Revision graph** action available on the right-click menu of an SVN resource in the *Working Copy view (on page 2815)* and the *Repository view (on page 2810)*.
In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who created the revision of that node, the revision number, the date of creation, the commit message, the modification type and the affected paths (on page 2743).

The types of nodes used in the graph are:

**Added resource**

The icon for a new resource added to the repository and a green background.

**Copied resource**

The icon for a resource copied to other location (for example, when an SVN tag is created and a green background).

**Modified resource**

The icon for a modified resource and a blue background.

**Deleted resource**

The icon for a resource deleted from the repository and a red background.

**Replaced resource**
The icon for a resource removed and replaced with another one on the repository and an orange background.

**Indirect resource**

The icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory where a resource was modified and a gray background. The *Modification type* field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

**Simplified graph**

Lists only the changes applied directly to the directory;

**Complete graph**

Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

**Figure 727. Revision Graph of a Directory (Direct Changes)**
The Revision graph toolbar contains the following actions:

- **Save as image**
  
  Saves the graphical representation as image. For a large revision graph you have to set more memory in the startup script *(on page 339)*. The default memory size is not enough when there are more than 100 revisions that are included in the graph.

- **Show/Hide indirect modifications**
  
  Switches between simplified and complete graph.

- **Zoom In**
  
  Zooms in the graph.

- **Zoom Out**
  
  Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

- **1:1 Reset scale**
  
  Resets the graphical scale to a default setting.

- **Print**
  
  Prints the graph.

- **Print preview**
Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

**Open**

Opens the selected revision in the editor panel. Available only for files.

**Open with**

Opens the selected revision in the editor panel. Available only for files.

**Save as**

Saves the file that had the revision graph generated, based on the selected node revision.

**Copy to**

Copies to the repository the item whose revision graph is displayed, using the selected revision.

![Note:]

This action can be used to resurrect deleted items also.

**Compare with HEAD**

Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

**Show History**

Displays the history of the resource in the History view (on page 2830). Available for both files and directories.

**Check out**

Checks out (on page 2741) the selected revision of the directory. Available only for directories.

**Export**

Opens the Export dialog box (on page 2805) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the **Compare** for comparing the two revisions corresponding to the selected nodes. If the resource that had the revision graph built is a folder then the right-click menu displayed for a two nodes selection also contains the **Compare** action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the Directory Change Set (on page 2835) view.

![Attention:]

Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.
Oxygen XML Editor SVN Preferences

The options used in the SVN client are saved and loaded independently from the Oxygen XML Editor options. However, if Oxygen XML Editor cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the Global Runtime Configuration submenu of the Options menu. These actions, Edit 'config' file and Edit 'servers' file, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.

Entering Local Paths and URLs

The Oxygen XML Editor includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Editor provides support in these text boxes to make it easier to specify these paths and URLs.

Local Item Paths

The text boxes used for specifying local item paths support the following:

- **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
- **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form `~/[/...]/`, where `~` is the user home directory.
- **Path Validation** - Oxygen XML Editor validates the path as you type and invalid text becomes red.
- **Drag and Drop** - You can drag files and folders from the file system or other applications and drop them into the text box.
- **Automatic Use of Clipboard Data** - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

Repository Item URLs

- **Local Repository Paths** - You can use local paths (absolute or relative) to access local repositories. When you use the Browse button, the Oxygen XML Editor will convert the file path to a `file://` form of URL, provided that the location is a real repository.
  - **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
  - **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form `~/[/...]/`, where `~` is the user home directory.
- **Peg Revisions** - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can use peg revisions at the end of the URLs (on page 2852) (for example, `URL@rev1234`).
Note:
If you try to use a peg revision number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL http://host/path/inside/repo/item@100, the item name is considered to be item@100.

Tip:
You can even use peg revisions with local repository paths. For example, C:\path\to\local\repo@100 will be converted to file:///C:/path/to/local/repo@100 and the Repository browser will display the content of the local repository as it is at revision 100.

• URL Validation - Oxygen XML Editor validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the Browse button to convert them to valid URLs.
• Drag and Drop - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid file:// type URLs.
• Automatic Use of Clipboard Data - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to file:// type URLs.

Note:
The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the Repositories view.

Technical Issues
This section contains special technical issues found during the use of Syncro SVN Client.

Authentication Certificates Not Saved
If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the Subversion configuration folder (write access to Subversion folder and all its subfolders). Usually, it is located in the following locations:

• Windows: [HOME_DIR]\AppData\Roaming\Subversion
• macOS and Linux: [HOME_DIR]/.subversion
Updating Newly Added Resources

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

![Figure 729. Incoming Changes](image)

Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

**Update ancestor directories recursively**

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

**Update selected files only (leave ancestor directories empty)**

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to empty in your working copy, thus subsequent Synchronize operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the Update to revision/depth action (on page 2824) from the working copy view.

Accessing Old Items from a Repository

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a peg revision is needed.

A Subversion repository tracks any change made to its items by using revisions, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a peg revision comes in handy. A peg revision is nothing more than a normal revision, but the difference between them is
made by their usage. Many of the Subversion commands also accept a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision regarding the used command).

**Example:**

To illustrate an example, consider the following:

- A new repository file *config* was created, identified by the URL [http://host.com/myRepository/dir/config](http://host.com/myRepository/dir/config).
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.

To access a specific version of the file identified by the [http://host.com/myRepository/dir/config](http://host.com/myRepository/dir/config) URL, you need to use a corresponding revision (the operative revision):

- If a revision number is used that is lower than 10, an error is triggered, because the file has not been created yet.
- If a revision number is used that is between 10 and 19, the specific version you are interested in would be obtained.

**Note:**

Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision where the file is modified, it has the same content across all revisions generated in the repository until another revision where it is modified again.

At this point, the file is deleted, creating revision 20. Now, no version of the file can be accessed because it no longer exists in the latest repository revision. This is due to the fact that Subversion automatically uses the [HEAD](https://subversion.apache.org/docs/commands.html#HEAD) revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10-19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If you use a revision number greater than 19, this will also trigger an error.

Continuing the example, suppose that at revision 30, a directory called *config* is created in the same repository location as the deleted file. This means that the new directory will be identified by the same repository address: [http://host.com/myRepository/dir/config](http://host.com/myRepository/dir/config). If you only use this URL in any Subversion command, you will access the new directory. You will also access the same directory if you use any revision number equal to or greater than 30 as peg revision. However, if you are interested in accessing an old version of the previously existing file, then you must use one of the revisions that existed (10-19), as a peg revision, similar to the previous case.
Checksum Mismatch Error

A *Checksum Mismatch* error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).

   **Note:**
   If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.

2. Identify the current depth *(on page 2817)* of that directory.

3. Update the parent directory using the *Update to revision/depth* action that is available from the contextual menu or the *Working copy* menu. For the *Depth* option, select *This folder only (empty)*.

   **Warning:**
   If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking *OK* the contents of the directory will be erased and the directory is be marked as having an *empty depth* *(on page 2817)*.

5. Once again, update the same directory using the *Update to revision/depth* action. This time, for the *Depth* option, select the depth that was previously identified in step 2.

6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

External Tools

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. Oxygen XML Editor offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, open the *Preferences* dialog box *(Options > Preferences)* *(on page 124)* and go to *External Tools* *(on page 292)* (or select *Configure* from the *Tools > External Tools* menu).
The External Tools preferences page (on page 292) presents a list of the external tools that have been configured. Once a tool has been configured (on page 292), you can open it by selecting it from the Tools > External Tools menu or from the ▶ External Tools drop-down menu on the toolbar (the Tools toolbar needs to be selected in the Configure Toolbars dialog box (on page 365)). You can also assign a keyboard shortcut (on page 294) to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Editor, the Save all files before calling external tools option (on page 202) (in the Save preference page) should be selected so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon ( ■ ) and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon ( ▶ ).

Note:

Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

Example: Integrating the Ant Tool

This is an example procedure for integrating the Ant build tool into Oxygen XML Editor:

1. Download and install Apache Ant (on page 3218) on your computer.
2. Test your Ant installation from the command-line interface in the directory where you want to use Ant from. For example, run the clean target of your build.xml file C:\projects\XMLproject\build.xml:
   ```
   ant clean
   ```
3. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to External Tools (or select Configure from the Tools > External Tools menu).
4. Click the New button to create a new external tool entry and enter the following information:
   - Name - For example, Ant tool.
   - Working directory - For example, C:\projects\XMLproject.
   - Command line - For example, "C:\projects\XMLproject\ant.bat" clean.
5. Click OK to add the new tool to the list of external tools.
6. Run the tool from Tools > External Tools > Ant tool. You can see the output in the system console:
   ```
   Started: "C:\projects\XMLproject\ant.bat" clean
   Buildfile: build.xml
   clean:
   ```
[echo] Delete output files.
[delete] Deleting 5 files from C:\projects\XMLproject

BUILD SUCCESSFUL
Total time: 1 second
21. Troubleshooting

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor.

Related Information:

Loading Large Documents (on page 469)
External Tools (on page 2854)

Display Problems on Linux or Solaris

Problem
I experience display problems (such as screen freezes) on Linux or Solaris.

Cause
This is possibly a rendering problem with the off-screen pixmap support.

Solution
Add the following startup parameter (on page 339): -Dsun.java2d.pmoffscreen=false.

Out of Memory on External Processes

Problem
Oxygen XML Editor throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause
The amount of allocated memory might be insufficient.
Solutions

- Open the Preferences dialog box (Options > Preferences) (on page 124), go to XML > PDF Output > FO Processors, and increase the value of the Memory available to the Apache FOP option (on page 262).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:
FO Processors Preferences (on page 261)
Custom Engines Preferences (on page 259)
External Tools Preferences (on page 292)
How to Enable Debugging for FO Processor Transformations (on page 1529)

Too many nested apply-templates calls Error When Running a Transformation

Problem

I'm getting the error message Too many nested apply-templates calls when I try to transform my DocBook file to HTML using default Oxygen XML Editor DocBook to HTML transformation scenario.

Cause

Most likely, this is the result of a masked stack overflow error.

Solution

Try setting a new VM option with the value -Xss4m. You can also try to slowly increase this to larger values (e.g. -Xss5m or -Xss6m). Note that this consumes memory on a per thread basis (Oxygen XML Editor can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Editor without memory.

Related Information:
Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor (on page 339)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.

Cause

A possible cause is that the application needs more memory to run properly.
Solutions

• You can increase the maximum amount of memory available to Oxygen XML Editor by setting the `-Xmx` parameter in a configuration file (on page 339) that is specific to the platform that runs the application.

⚠️ **Attention:**

The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

• When installed on a multiple user environment, each instance of Oxygen XML Editor will be allocated the amount stipulated in the memory value. To avoid degrading the general performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

⚡️ **Note:**

When starting Oxygen XML Editor from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM (but not more than 1 GB for 32-bit distributions or 4 GB for 64-bit distributions).

When starting Oxygen XML Editor from a command-line script, the default maximum memory is 1 GB for 32-bit distributions or 4 GB for 64-bit distributions.

Performance Issues when Using Oxygen XML Editor with Remote Desktop

**Problem**

When trying to run Oxygen XML Editor in a Remote Desktop Protocol (RDP) environment, the performance is slow and choppy.

**Cause**

Running a standalone version of Oxygen XML Editor over a slow RDP connection may result in performance issues.

**Solution**

As a workaround, you try to run Oxygen XML Editor as an Eclipse plugin when working with a slow RDP connection.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.
Address Family Not Supported by Protocol Family

Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to true, by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor installation folder (may need admin access).
2. Restart Oxygen XML Editor.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is true.

Application Reports Errors During Startup After Installing a New Version

Problem

Sometimes, after installing a new version of Oxygen XML Editor, various errors are reported when the application starts.

Cause

This problem may occur if you install the application in a folder where an older version of the application was previously installed. Especially on macOS, there is a possibility for older resources and libraries from the previous application to remain in the installation folder and break the functionality of the newer version of the application.

Solution

Close the application and completely uninstall it (on page 122), then install it again. The user-specific settings are saved in a separate folder in the user home directory so they will not be lost.

- On macOS, you can move the entire application installation folder to the Trash, then re-install.
- On Linux and Windows, you can uninstall using the facilities provided by the installer (on page 122), then re-install.
If you intentionally want to load extra Java libraries with Oxygen XML Editor, you have the following choices:

- If the libraries are necessary for XSLT transformations, each XSLT transformation scenario has an Extensions button that allows you to reference the libraries directly from the transformation scenario.
- If the libraries are necessary for database connections, you can configure them when you define the data sources.
- You can add a plugin in Oxygen XML Editor that contributes libraries to the global libraries list. The plugin can be distributed as an add-on. An example of such a plugin can be found here: https://github.com/oxygenxml/oxygenxml.xlsx.import.
- In the Oxygen XML Editor lib folder, there is a file called libraries.list. You can edit that file and add the names of the extra libraries present in the folder. You can also choose to delete that libraries.list completely if you want to inhibit the libraries checking completely.

**Application Takes Several Minutes to Start**

**Problem**

Oxygen XML Editor seems to take an abnormally long amount of time to start.

**Cause**

Some anti-virus software can cause Java applications, such as Oxygen XML Editor, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

**Solution**

A possible solution is to add the Oxygen XML Editor folder to the list of exceptions in the anti-virus software settings.

**Archive Distribution Fails to Run on macOS 10.12 (Sierra)**

**Problem**

For versions prior to 18.1, the classic archive distributions of Oxygen XML Editor (.zip or .tar.gz) fail to run on macOS 10.12 (Sierra).

**Cause**

This happens because the archives get quarantined and macOS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Editor was already installed when you upgraded to macOS 10.12 (Sierra), there are no problems.

**Solution**

If Oxygen XML Editor was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Editor installation directory or the individual applications. To resolve this issue, follow these steps:
1. Open a *Terminal* window and change the directory to the folder where Oxygen XML Editor is located.

2. Run the following command:

   ```bash
   xattr -dr com.apple.quarantine oxygen/
   ```

   where "oxygen" is the actual name of the Oxygen XML Editor directory.

   If Oxygen XML Editor is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with `sudo`. You will then be prompted to enter your password.

**Cannot Connect to SVN Repository from Repositories View**

**Problem**

I cannot connect to an SVN repository from the *Repositories* view of SVN Client. How can I find more details about the error?

**Solution**

First check that you entered the correct URL of the repository in the *Repositories* view. Also, check that an SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command-line SVN client from CollabNet.

If you try to access the repository with an `svn+ssh` URL, also check that an SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository, generate logging files on your computer and send them to support@oxygenxml.com. For generating the logging files, follow these steps:

1. Create a text file called `logback.xml` in the application installation folder with the following content:

```xml
<configuration>
    <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
        <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
        <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
            <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
            <minIndex>1</minIndex>
            <maxIndex>20</maxIndex>
        </rollingPolicy>
        <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
            <maxFileSize>12MB</maxFileSize>
        </triggeringPolicy>
    </appender>
    <encoder>
        <pattern>%r %marker %p [%t] %c - %m%n</pattern>
    </encoder>
</configuration>
```
2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the logback.xml file because it might cause performance issues if you leave it in the installation folder.

**Important:**
The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the logback.xml file when you are done with the procedure.

**Result:** The resulting logging files are named oxygen.log and oxygen#.log.qz (for example, oxygen.log, oxygen1.log.gz, oxygen2.log.gz, etc.) and are located in the Desktop\oxygenLog folder.

**Cannot Uninstall Oxygen XML Editor in Windows**

**Problem**
When I try to uninstall Oxygen XML Editor in Windows, I get an error that says it cannot find the files.log file.

**Cause**
The install4j installer that is used by Oxygen XML Editor creates the files.log file during the installation process. If you cannot uninstall the product, then most likely something went wrong with this file during the installation process.

**Solution**
To solve this, simply reinstall the software in the same directory as the current installation. This will automatically uninstall the old version or overwrite it with a clean install. You should then be able to uninstall this new installation.
Compatibility Issue Between Java and Certain Graphics Card Drivers

**Problem**

Under certain settings, a compatibility issue can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled.

**Solution**

If you encounter this problem, update your graphics card driver. Another possible workaround is, open the **Preferences** dialog box (**Options > Preferences**) (on page 124), go to **Appearance > Fonts**, and set the value of the **Text antialiasing** option (on page 134) to **ON**.

---

**Note:**

If this workaround does not resolve the problem, set the **Text antialiasing** option (on page 134) to other values.

---

Crash at Startup on Windows with an Error About the nvogl32.dll File

**Problem**

I try to start Oxygen XML Editor on Windows but it crashed with an error message about ‘*Fault Module Name: nvogl32.dll*’. What is the problem?

**Cause**

It is most likely an OpenGL driver issue.

**Solution**

This can be avoided by creating an empty file called **opengl32.dll** in the Oxygen XML Editor install folder (if you start Oxygen XML Editor with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder **bin** of the home folder of the Java virtual machine that runs Oxygen XML Editor (if you start Oxygen XML Editor with the **oxygen.bat** script). The home folder of the Java virtual machine that runs Oxygen XML Editor is the value of the **java.home** property that is available in the **System properties** tab of the **About** dialog box (**Help > About**).

Crash in Java Runtime Thread

**Problem**

I encounter consistent crashes in one of the Java runtime threads (for example, **AWT-EventQueue**, **Java2D Queue Flusher**, or **C2 CompilerThread**).

**Cause**

This is usually caused by unknown errors somewhere in the implementation of the Java Runtime.
Solution

Although this does not guarantee that it will solve the problem, you could try updating the Java Runtime Environment (JRE) that comes bundled with Oxygen XML Editor to the latest supported version.

⚠️ Important:
You should only use a version of Java 8.

Windows/Linux

1. Download the latest Java 8 JRE from here: [http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html](http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html). Download the JRE in the .tar.gz format with the same architecture as your Oxygen XML Editor installation (x86=32bit / x64=64bit).
2. Navigate to the Oxygen XML Editor installation folder and rename the jre folder to jre.old (you will need admin privileges if it is installed in Program Files).
3. Unpack the .tar.gz and rename the extracted folder to jre.
4. Move that folder to the Oxygen XML Editor installation folder.
5. Verify the paths in the jre folder. The path of the JRE bin folder should be: oxygen/jre/bin.
6. Start Oxygen XML Editor and check the Java version in Help > About > System properties. The java.runtime.version should be match the one you unpacked.

macOS

2. Extract the archive contents in a location of your choice (for example, Downloads). You will end up with a folder named something like this: jrel.8.0.181.jre (depending on the version).
3. Move or rename the JRE that was bundled with Oxygen XML Editor. The bundled JRE folder (jre.bundle) is located inside a hidden folder named .install4j (in the Oxygen XML Editor installation folder), so you cannot see it in the Mac Finder. Thus, you need to move or rename it via the command line.

For example, if you have Oxygen XML Editor deployed in the Applications folder, the command should look similar to this:

```sh
mv "~/Applications/Oxygen XML Editor/.install4j/jre.bundle"
"~/Applications/Oxygen XML Editor/.install4j/jre.bundle.old"
```

4. Move the unpacked JRE folder from the location where you extracted it in the second step to a folder named .install4j/jre.bundle inside the Oxygen XML Editor installation direction.

For example, if you have Oxygen XML Editor deployed in the Applications folder, the command should look similar to this:

```sh
mv "~/Downloads/jrel.8.0.181.jre"/Applications/Oxygen XML Editor/.install4j/jre.bundle"
```
The default bundled JRE should now be successfully replaced by the newer one.

5. Start Oxygen XML Editor and check the Java version in Help > About > System properties. The java.runtime.version should be match the one you unpacked.

**Damaged File Associations on macOS**

**Problem**

After upgrading macOS and Oxygen XML Editor, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

**Cause**

The upgrade damaged the file associations in the LaunchService Database on your macOS machine.

**Solution**

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
   ```

7. Restart Finder with the following command:

   ```
   killall Finder
   ```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor icon.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Editor, the file associations should work correctly.

**Details to Submit in a Request for Technical Support Using the Online Form**

**Problem**

What details should I add to my request for technical support on the online form in the product website?
Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate log files and attach them to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 53) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate the Oxygen XML Editor log files, follow these steps:

1. Create a text file called logback.xml in the application installation folder, with the following content:

```xml
<configuration>
  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
      <minIndex>1</minIndex>
      <maxIndex>20</maxIndex>
    </rollingPolicy>
    <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
      <maxFileSize>12MB</maxFileSize>
    </triggeringPolicy>
    <encoder>
      <pattern>%r %marker %p [%t] %c - %m%n</pattern>
    </encoder>
  </appender>
  <root level="debug">
    <appender-ref ref="R2"/>
  </root>
</configuration>
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the logback.xml file because it might cause performance issues if you leave it in the installation folder.

**Important:**
The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the logback.xml file when you are done with the procedure.

**Result:** The resulting log files are named oxygen.log and oxygen#.log.gz (for example, oxygen.log, oxygen1.log.gz, oxygen2.log.gz, etc.) and are located in the Desktop\oxygenLog folder.

**Dialog Boxes Cannot Be Resized on Mac**

**Problem**

When using Oxygen XML Editor on macOS Big Sur, dialog boxes (for example the Find/Replace or Preferences dialog box) cannot be resized.

**Cause**

This is caused by an issue with resizing dialog boxes in Oxygen XML Editor on macOS Big Sur (and possibly later versions) causing crashes if the main application is in full screen mode.

**Solution**

Until this limitation is resolved in a future Oxygen XML Editor version, dialog boxes cannot be maximized or resized on macOS Big Sur.

**DITA Map Transformation Fails (Cannot Connect to External Location)**

**Problem**

DITA map (on page 3220) transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the the Proxy preferences page (on page 301)

**DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)**

**Problem**

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.
Cause

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the `Output` tab, select a local directory for `Temporary files directory` and `Output directory`).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor (on page 2858). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.

• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 3131).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2943). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 3220), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to \[fop] \[ERROR\. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

How to Enable Debugging for FO Processor Transformations (on page 1529)
DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
 .......... 
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table. 
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table. 
(See position 179:-1)
[fop]  at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]  at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
 .......... 
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and look at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2899)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent:
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2899) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and search for the unresolved ID references (for example: `unique_4_Connect_42_wrongID`).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2899)) to find the original DITA topic where the table was generated.

Related Information:

How to Enable Debugging for FO Processor Transformations (on page 1529)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.
Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip:

It is a good practice to validate the DITA map (on page 3220) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2943). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

DITA Map CHM (Compiled HTML Help) Transformation (on page 3101)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip:

It is a good practice to validate the DITA map (on page 3220) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2943). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.
Handshake Failure Error When Accessing an HTTPS (SSL) Resource

Problem

When attempting to access an HTTPS (SSL) resource, I receive a `handshake_failure` error.

Cause

The issue is most likely due to the limitation of Java cryptography capabilities.

Solution

A solution might be to download and deploy `Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 (for Java 8)`.

**Warning:**

It is possible that this may not be legal in your country. Be advised that you bare legal responsibility for activating unlimited strength Java cryptography capabilities, so you must have the legal right to use such cryptography (consult your export/import control counsel or attorney to determine the exact requirements for your jurisdiction).

To deploy it in Oxygen XML Editor, unpack the downloaded zip archive and move the two jar files (`local_policy.jar` and `US_export_policy.jar`) from `UnlimitedJCEPolicyJDK8` to the following directory, overwriting existing files:

- **Windows** - `{OXYGEN_INSTALL_DIR}/jre/lib/security`
- **Linux** - `{OXYGEN_INSTALL_DIR}/jre/lib/security`
- **macOS** - `{OXYGEN_INSTALL_DIR}/jre.bundle/Contents/Home/jre/lib/security`

Hunspell Spell Checker is Unusable on Your Platform Error

Problem

When trying to use the **Check Spelling** option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session**.

Cause

There are instances where Oxygen XML Editor determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).
Solution

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor.
2. Open the %APPDATA%/com.oxygenxml folder and look for a file called something like HunspellCrashGuard*.txt. Delete that file.
3. Restart Oxygen XML Editor.

High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display (for example, some GUI components are too small).

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

Windows with Java 8 - You can use the com.oxygenxml.hidpi.scaling custom system property (on page 336) to force a specific scaling setting. For example: -Dcom.oxygenxml.hidpi.scaling=1.5 for 150% scaling.

Windows/Linux/MacOS with OpenJDK 11 or later - You can use the sun.java2d.uiScale Java system property to instruct Java to use a particular scaling factor:

-Dsun.java2d.uiScale=1.5

High Resolution Scaling Issues on Linux

Problem

On Linux bundled with Oracle OpenJDK 11 or newer, Oxygen XML Editor does not automatically scale high-resolution images when using the system's scaling settings.

Cause

This happens because Java 11 (and higher) does not detect the system scaling setting for HiDPI displays on Linux operating system.

Solution

In the Oxygen XML Editor installation folder, create a new file named custom_commons.vmoptions. Inside the file, manually add -Dsun.java2d.uiScale=2. This command instructs Java to use 2x (200%) scaling.
Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.

2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.

3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf]`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip:

It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.
Increasing the Memory for the Ant Process

Problem

The Ant build process runs out of memory.

Solution

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments](on page 3119).

Java Virtual Machine (JVM) Crash on macOS

Problem

Oxygen XML Editor crashed the Java virtual machine or it could not start up on my macOS computer due to a JVM crash.

Cause

Usually it is an incompatibility between the JVM and a native library of the host system. More details are available in the crash log file generated by macOS and reported in the crash error message.

Solution

If this happens, it is best to send a copy of the logs via email to support@oxygenxml.com. Usually, the operating system will offer a prompt that allows you to see the logs. If not, you should be able to find the logs in the Console app (Applications > Utilities, under ~/Library/Logs/DiagnosticReports. They are usually named JavaApplicationStub*.crash/.hang.

JPEG CMYK Color Space Issues

Problem

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

Solution

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the \{OXYGEN_INSTALL_DIR\}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.
Keyboard Language Resets to Default on Windows

Problem

In Windows, I have set a specific language for my keyboard and while using Oxygen XML Editor, it keeps getting reset to the default language.

Cause

When multiple languages are enabled in Windows, the default shortcut key combination for switching the input language is **Left Alt + Shift**. Trying to use various shortcuts in Oxygen XML Editor that involves combinations of those two keys is probably resetting your input language to the default setting if you press those two keys without a third combination.

Solution

You can change the Windows shortcut keys that are assigned to the input language by going to the control panel and searching for the **Switch input languages** option. For example, in Windows 10, go to **Control Panel > Language > Advanced Setting**. In the **Switching input methods** section, click on **Change language bar hot keys**. Click the **Change Key Sequence** button. This opens a dialog box that allows you to switch the shortcut keys for the input language or keyboard layout.

Keyboard Shortcuts Do Not Work At All

Problem

The keyboard shortcuts listed in the **Menu Shortcut Keys preferences page (on page 294)** do not work.

Cause

Usually this happens when a special keyboard layout is set (in the operating system) that generates non-standard characters. For example, an extended Greek layout will generate special characters that are not present in the default Greek layout. This causes the Java virtual machine that runs the application to receive unexpected key codes.

Solution

Reset the keyboard layout to the standard layout for your particular language.

Keyboard Shortcuts Result in Unexpected Behavior

Problem

In some rare cases, using certain keyboard shortcuts listed in the **Menu Shortcut Keys preferences page (on page 294)** result in something different than what is listed in that preferences page.
**Cause**

This is usually caused by the operating system intercepting the keyboard shortcut. For example, certain applications or hardware drivers intercept certain keyboard shortcuts by default. Another example is if you have multiple input sources configured, the operating system might intercept shortcuts if they match the ones used to change between the input sources.

**Solution**

Assign a different keyboard shortcut for the particular action in the Menu Shortcut Keys preferences page (on page 294) or refer to documentation for your operating system or hardware equipment to see if there are options to change the behavior.

**Mac Touch Bar Function Keys Do Not Work**

**Problem**

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor.

**Causes**

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor.

**Solution**

To enable the Touch Bar function keys for Oxygen XML Editor, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.

**Keyboard no Longer Works After Inserting Accented Characters on Mac**

**Problem**

The macOS has a method for inserting accented characters that is triggered by holding a key and then selecting the desired character from a contextual menu. When using this method in macOS 10.14 (Mojave) to insert accented characters in Oxygen XML Editor, the keyboard can no longer be used unless I restart the application.

**Causes**

This problem is caused by some sort of incompatibility issue with Java 8 and macOS 10.14 (Mojave).

**Solution**

To prevent this problem, you should use an Oxygen XML Editor distribution that includes OpenJDK 17.
1. Uninstall Oxygen XML Editor:
   a. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Therefore, you should make a backup of any data you want to keep.
   b. Remove the application by manually deleting the installation folder and all its contents.

2. Reinstall Oxygen XML Editor using the distribution that includes OpenJDK:
   a. Go to the Oxygen Download page.
   b. In the macOS tab, click on the macOS 10.11 and later (Includes OpenJDK 17) link to download this particular distribution.
   c. Follow the instructions to install the downloaded installation package.

**Server Signature Mismatch Error**

**Problem**

I receive an error indicating that the current license was already activated on a License Server or that the License Server’s Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Server Signature) is sent to the Oxygen XML Editor servers, which in turn will sign the license key. The Server Signature is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your Server Signature does not match, there are several possible causes:

**Possible Cause 1**

The license key was moved to a new server that hosts your license server.

**Solution**

Revert to your previous configuration.

**Possible Cause 2**

A new network interface was changed, added, or activated in the server that hosts your license server.

**Note:**

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

**Solution**

If reverting is not possible, contact the Oxygen support team.
**Possible Cause 3**

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

**Solution**

The server simply needs to always be restarted from the same location.

**MSXML 4.0 Transformation Issues**

**Problem**

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

**Cause**

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

**Solution**

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

**Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive**

**Problem**

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: 

*Navigation to the web page was canceled.*

**Cause**

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

**Solution**

As a workaround, copy the CHM file on your local system and view it there.
Out Of Memory Error When Opening Large Documents

Problem

I am trying to open a file larger than 100 MB in Oxygen XML Editor, but it runs out of memory (OutOfMemoryError).

Solution

You should make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 200) is less than the size of your document. This will enable the optimized support for large documents. If that fails and you still get an Out Of Memory error you should increase the memory available to Oxygen XML Editor (on page 2858).

Other tips:

- Make sure that you close other files before opening the large file.
- You can set the default editing mode in the Preferences dialog box (on page 171). The Text editing mode uses less memory than other editing modes.
- If the file is too large for the editor to handle, you can open it in for viewing in Large File Viewer (on page 2676).

Problem With Shortcut

Problem

When browsing for files (using the file browser) on Windows with Java 8u202, I get a warning with the title of Problem With Shortcut and the following message:

The drive or network connection that the shortcut 'X.lnk' refers to is unavailable.

Cause

This message is triggered by the file browser from Java 8u202 (which is bundled with Oxygen XML Editor version 21.0 and later). This message usually appears if you have broken shortcuts on your Windows Desktop.

Note:

The message may appear multiple times (once for each broken desktop shortcut).

Solution

The only way to avoid this issue with Java 8u202 is to remove (or move) the broken shortcuts from the Windows Desktop, especially shortcuts that point to locations that you do not have access to (e.g. inaccessible network locations) or shortcuts to files/folders that no longer exist.
Tip:
Alternatively, you can download and install the distribution of Oxygen XML Editor that is bundled with OpenJDK. It is named **Windows 64-bit (Includes OpenJDK)** and can be found on the **Download** page for Oxygen XML Editor at [http://oxygenxml.com](http://oxygenxml.com).

**Rectangular Selection Feature Does Not Work On Windows**

**Problem**

When trying to use the *Rectangular Selection feature (on page 530)* on Windows using both the keyboard and mouse, releasing the **Alt** key shifts the focus to the main menu instead of entering the edit mode.

**Cause**

This seems to be an issue caused by something that was changed in Java 8u172.

**Solution**

A workaround is to use **Shift** or **Ctrl** along with **Alt** and release them simultaneously.

**References Outside the Main DITA Map Folder**

**Problem**

A reference to a DITA topic, *map*, or binary resource (for example, an image) that is located outside of the folder where the main *DITA map (on page 3220)* is located leads to problems when publishing the content using the DITA Open Toolkit.

**Cause**

DITA-OT often has trouble resolving references that are outside the directory where the published *DITA map* is found. By default, it does not even copy the referenced topics to the output directory.

**Solution**

To solve this, try one of the following solutions:

- Create another *DITA map* that is located in a folder path above all referenced folders and reference the original *DITA map* from this new map. Then transform this *DITA map* instead.
- Edit the transformation scenario and in the **Parameters** tab, change the value of the **fix.external.refs.com.oxygenxml** parameter to **true**. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.
Important:
The fix.external.refs.com.oxygenxml parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Editor or using the transform script.

• For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

Important:
This method is recommended for transformation scenarios that use an external DITA-OT.

Saxon 9.7 Transformer Issues

Problem
I have upgraded to Oxygen XML Editor version 19.0 (which comes bundled with Saxon 9.7) and I am experiencing issues when trying to use the Saxon 9.7 transformer. Is it possible to use the Saxon 9.6 transformer with Oxygen XML Editor version 19.0 or later?

Solution
There is a plugin available that can be installed and it allows you to use Saxon 9.6. To install it, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Select the default update site from the drop-down menu (https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml).
3. Select the Saxon 9.6 XSLT and XQuery Transformer plugin and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the transformation scenario, you will now have the option to choose the Saxon 9.6 transformer.

Scroll Function of my Notebook Trackpad is Not Working

Problem
I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Editor.
Problem

My file was created with another application and it contains special characters (such as é, ©, ®, etc.) but Oxygen XML Editor displays a square for these characters.

Solution

You must set a font that is able to render the special characters in the Font preferences (on page 133). If it is a text file, you must also set the encoding used for non XML files (on page 168). If you want to set a font that is installed on your computer but that font is not accessible in the Font preferences, this means the Java virtual machine is not able to load the system fonts (probably because it is not a True Type font). It is a problem of the Java virtual machine and a possible solution is to copy the font file in the [JVM_DIR]/lib/fonts folder. [JVM_DIR] is the value of the property java.home that is available in the System properties tab of the About dialog box that is opened from menu Help > About.

Problem

The TocJS transformation of a DITA map (on page 3220) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element <frame name="contentwin" src="concepts/about.html">.
6. Replace "concepts/about.html" with "index.html".

Text Rendering Issues on macOS

Problem
On macOS, I sometimes encounter issues there text is not rendered properly. For example, when tags are displayed in Author mode, sometimes the tag icon is rendered over the top of text (hiding the text) and sometimes text flows outside of code blocks.

Cause
This is an uncommon error that cannot be fixed in current versions.

Solution
Open the Preferences dialog box (Options > Preferences) (on page 124), go to Editor > Edit modes > Author, and deselect the Fast text layout option (on page 177).

Wrong Words are Highlighted when Searching in a User Manual

Problem
When I do a keyword search in the User Manual that is included with the Oxygen XML Editor application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word.

Cause
This does not happen when Oxygen XML Editor runs with a built-in Java virtual machine that was installed by Oxygen XML Editor in a subfolder of the installation folder (for example, on Windows and Linux when installing Oxygen XML Editor with the installation wizard specific for that platform). However, when Oxygen XML Editor runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word.

Solution
To see the highlight the exact matched word, it is recommended to install the application with the specific installation wizard for your platform (available only for Windows and Linux).
XML Document Takes a Long Time to Open

Problem

Oxygen XML Editor takes a long time to open an XML document.

Cause

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

Solution

If the content is on a single line, you can speed up loading by selecting the Format and indent the document on open option (on page 204) (in the Format preferences page).

If the document is very large (above 30 MB), make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 200) (in the Open preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (OutOfMemoryError) you can increase the memory available to Oxygen XML Editor. (on page 2858)

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the XSLT Debugger perspective (on page 3223), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (on page 256) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the Editor perspective (on page 3223) and make sure the Open in Browser/System Application option (on page 1474) is selected.
- Run the transformation in the XSLT Debugger perspective (on page 3223), save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Chrome).
22.

DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.
- The DITA Style Guide Best Practices for Authors.
- Various sample DITA topics and maps can be found in the [OXYGEN_INSTALL_DIR]/samples/dita folder.
- Webinar: Getting Started with DITA Using Oxygen
Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor. Oxygen XML Editor makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor

To create a DITA topic (on page 2963):

1. Select File > New or click the New button on the toolbar.

   **Step Result:** The New Document Wizard (on page 368) is displayed:
2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

**Note:**
If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.

4. Click **Create**.

**Result:** Your document is opened in the editor. Eventually, you will need to add a reference to it in your DITA map (on page 2892).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents (on page 34) also apply to DITA topics. Oxygen XML Editor also provides additional specific
DITA-related support for working with DITA topics (on page 2961), their associated DITA maps (on page 2897), and for creating DITA output (on page 3082).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 3220). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor

To create a map (on page 2915):

1. Select File > New or click the New button on the toolbar.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2899). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

![Figure 731. DITA Maps Manager View](image)
Adding Existing Topics to a Map in Oxygen XML Editor

There are several ways to add a topic reference to a map (on page 2919). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (on page 2899) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

Step Result: This opens the Insert Reference dialog box (on page 2925) with all of the required fields already filled in for you.

Figure 732. Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select Insert and close to add a reference to your topic in the map.
5. Save the DITA map.

Adding New Topics to a Map in Oxygen XML Editor

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map (on page 2919), follow these steps:
1. In the **DITA Maps Manager** *(on page 2899)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(on page 2964)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(on page 2964)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** *(on page 2964)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   **Note:**
   The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the **DITA > Topics** preferences page *(on page 273)* into account. When the option is deselected, a unique ID is generated.

   **Step Result:** The new topic is now referenced (as a `<topicref>` in the **DITA map**) at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.
Adding Submaps in Oxygen XML Editor

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 2916). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 2916):

1. Right-click the parent DITA map in the DITA Maps Manager view (on page 2899) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (on page 2925) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select Insert and close to add a reference to your submap in the main map.
4. Save the main DITA map.

Validating a Map in Oxygen XML Editor

Just as it is with your individual topics, it is important to validate your maps (on page 2943). Oxygen XML Editor provides a validation function for DITA maps that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 2899).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 2944).

2. Select any of the various options you want to check.
3. Click Check to run the validation process.

Publishing Your Topics in Oxygen XML Editor

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 3082) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By
default, Oxygen XML Editor uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 2899).

   **Step Result:** This opens the Configure Transformation Scenario(s) dialog box (on page 1548).

   **Figure 733. Configure Transformation Scenarios Dialog Box**

   - Edit
   - Duplicate
   - Remove
   - Associated scenarios
     - DITA Map WebHelp Responsive
   - Save and close
   - Apply associated (1)
   - Cancel

2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click Edit.

4. Click Apply associated.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.
DITA Projects

Once you have a basic understanding of DITA and how to work with DITA topics and maps, you probably want to create a DITA project to organize and manage your planned content/resources (on page 399). Oxygen XML Editor includes a Project view (on page 402) that helps you organize your projects and offers a variety of helpful project-related features and makes it easy to share your projects with other members of your team.

Tip:

There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the Framework templates > DITA folder in the New Project wizard: (on page 399)

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates, custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a Readme.html file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

Working with Projects in DITA

Oxygen XML Editor provides the ability to organize your DITA resources in projects, the same as with other XML-related files. This helps you manage and organize your files and projects allow you to perform batch operations (such as validation and transformation) over multiple files or to use Main Files support to rename or move DITA resources (on page 3183) while updating the references to them. You can also share your project settings and transformation/validation scenarios (on page 415) with other users.
To learn how to create a new project from a template and how add resources and manage it, see Creating a New Project (on page 399).

To help you get more familiar with how to use projects in DITA, there are two DITA-specific sample project templates available when using the New Project action (available, for example, from the Project menu):

- **DITA Project With Editing Customizations** - This sample DITA project imposes custom general settings and an editing behavior using a DITA framework extension. More details can be found in the project's Readme.html file.
- **Sample DITA Project** - This sample DITA project is a best practice example that shows how DITA content can be organized to provide a scalable and flexible project structure. More details can be found in the project's Readme.html file.

**Resources**

For more information about working with DITA projects, see our webinar: Working with DITA in Oxygen - Quick Start with the DITA Startup Project.

**Related information**

Using Projects to Group Documents (on page 398)

**Working with DITA Maps**

In the DITA standard architecture you create documents by collecting topics into maps.

**DITA Maps**

A **DITA map (on page 3220)** organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor provides support for creating (on page 2915) and managing DITA maps (on page 2918) through the DITA Maps Manager (on page 2899).

There are also specialized types of DITA maps, such as a **bookmap (on page 3218)**, which is intended for creating the structure of a book.

**Submaps**

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 2916) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 2899) provides support for easily creating and managing submaps.

**Opening a DITA Map**

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 2899) or in the XML Editor. Use any of the following methods to open a map:
To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).

To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.

Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.

If you open a file with the .ditamap or .bookmap extension (from the Project view (on page 402) or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the DITA Maps Manager.

Note:
If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting Always ask for the When opening a map option in the DITA preferences page (on page 270).

To open a map in the DITA Maps Manager, you can right-click a map file in the Project view (on page 402) and select Open with > DITA Maps Manager.

If you have a DITA map file open in the XML editor, you can open it in the DITA Maps Manager by right-clicking the title tab and selecting Open in DITA Maps Manager View.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 2943). To support this, Oxygen XML Editor provides an Edit Properties dialog box (on page 2934) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 2943) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.

Related information

DITA Map Document Type (Framework) (on page 1361)
DITA Map Author Mode Actions (on page 2949)
DITA Maps Manager

Oxygen XML Editor provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a tree or table of contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

![Figure 734. DITA Maps Manager View](image)

Each node is displayed with an icon representing the type of DITA resource. For example, a DITA Map is displayed with an icon, a DITA Topic is displayed with , a DITA Task is displayed with , etc. Any node that has processing-role="resource-only" set in its properties is displayed with a gray dot in the bottom-right corner of the icon ( )

Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select Open).
- If you open a file with a .ditamap or .bookmap extension (from the Project view (on page 402) or a system browser), a dialog box is opened that offers you the choice of opening it in the DITA Maps Manager or the XML editor.
Note:
If you select the **Do not show the dialog again** option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting the **Always ask** choice for the **When opening a map** option in the DITA preferences page (on page 270).

- Right-click a map file in the **Project view** (on page 402) and select **Open with > DITA Maps Manager**.
- If you have a **DITA map** file open in the XML editor, you can right-click the title tab and select **Open in DITA Maps Manager View**.

By default, when a map is opened in the **DITA Maps Manager**, its index is automatically refreshed. You can disable this feature by deselecting the **Refresh index when opening a map in DITA Maps Manager** option (on page 298) in the **Open/Find Resource** preferences page.

**Submap Nodes**

If your **root map** (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the **DITA Maps Manager**, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Tip:
If you want to be able to edit submaps when the main (root/parent) map is open in the **DITA Maps Manager**, go to **Options > Preferences > DITA > Maps** and select the **Allow referenced submaps to be edited** option (on page 271).

**Moving Nodes in the DITA Maps Manager**

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the **Ctrl** or **Shift** key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

**Copy**

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the **Ctrl** key. The mouse pointer changes to a **+** symbol to indicate that a copy operation is being performed.

**Move**
Select the nodes you want to move and drag and drop them in the appropriate place.

**Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)**

You can move nodes between child and parent nodes by using the **Promote (Alt + LeftArrow)** and **Demote (Alt + RightArrow)** operations.

**DITA Maps Manager Toolbar**

The toolbar includes the following actions (also available in the **DITA Maps** menu) and their availability depend on the nodes that are selected:

- **New DITA Map**
  
  Opens the **New Document wizard** ([on page 368](#)) that you can use to create a new DITA map document.

- **Open Drop-down Menu**
  
  You can use this drop-down menu to open new **DITA maps** or to reopen recently viewed maps. The drop-down menu contains the following:

  - List of recently viewed **DITA maps** that can be selected to reopen them.
  - **Clear history** - Clears the history list of the recently viewed **DITA maps**.
  - **Open** - Allows you to open the map in the **DITA Maps Manager** ([on page 2899](#)). You can also open a map by dragging it from the file system explorer and dropping it into the **DITA Maps Manager** ([on page 2899](#)).
  - **Open URL** - Displays the **Open URL** dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the **Browse for remote file** drop-down menu.

- **Save (Ctrl + S (Meta + S on macOS))**
  
  Saves the current **DITA map**.

- **Validation drop-down menu**
  
  This drop-down menu contains options for validating the current map. The following options are available:

  - **Validate and Check for Completeness**
    
    Opens the **DITA Map Completeness Check** dialog box where you can configure options for checking the validity and integrity ([on page 2943](#)) of the map.

  - **Validate**
Validates the current map that is open in the **DITA Maps Manager** using the associated validation scenarios.

**Configure Validation Scenario(s)**

Use this option to **configure validation scenarios and their associations (on page 798)**.

**Apply Transformation Scenario(s)**

Applies the **DITA Map transformation scenario (on page 1433)** that is associated with the current map.

**Configure Transformation Scenario(s)**

Opens the **Configure Transformation Scenarios(s) dialog box (on page 1548)** where you can edit or create transformation scenarios or **associate a DITA Map transformation scenario (on page 1490)** with the current map.

**Open Map in Editor with Resolved Topics**

Opens the **DITA map** in the main editor area with content from all topic references expanded in-place. Referenced content is presented as read-only by default. To edit it, you must use the **Edit Reference contextual menu action** to open the source topic that contains the referenced content.

If you want to edit the referenced topics directly without having to open the source document, go to **Options > Preferences > Editor > Edit Modes > Author** and select the **Allow referenced content to be edited option (on page 179)**. Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.

**Tip:**

If you want to print the expanded content, you should consider changing selecting + **Print ready** from the **Styles drop-down menu on the toolbar**.

**Open Map in Editor**

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

**Note:**

You can also use this action to open referenced **DITA maps** in the **Editor**.

**Link with Editor**

Toggles the synchronization between the file path of the current editor and the selected topic reference in the **DITA Maps Manager** view. If enabled, it results in the following types of synchronizations:
• If you select a topic tab in the main editing area and it is referenced in the map currently opened in the **DITA Maps Manager**, the reference to that topic is selected in the **DITA Maps Manager**.

• If you have a map opened in both the **DITA Maps Manager** and the main editor, selecting the map tab in the main editing area opens that map in the **DITA Maps Manager**.

• If you have a map opened in both the **DITA Maps Manager** and the main editor (Author mode) and, selecting one or more *topicrefs* in the **DITA Maps Manager** will also select the same *topicrefs* in the main editor.

• If you have a map opened in both the **DITA Maps Manager** and the main editor (Author mode) and, selecting one or more *topicrefs* in the main editor will also select the same *topicrefs* in the **DITA Maps Manager**.

---

**Settings**

**Show extended toolbar**

Toggles whether or not the extended toolbar will be displayed in the **DITA Maps Manager** toolbar.

**Show context toolbar**

Toggles whether or not the **Context option (on page 2903)** will be displayed in the **DITA Maps Manager** toolbar.

**Show topic titles**

Toggles how topics are presented in the **DITA Maps Manager**. If selected, the title of each topic is shown. Otherwise, the file path (value of the *@href* attribute) for each topic is shown.

**Show key reference values**

Toggles how key references are presented in the **DITA Maps Manager**. If selected, the value of the *@keyref* attribute for each key reference is shown.

**Root Map Drop-down menu**

The drop-down menu displayed after **Context** can be used to specify the **DITA root map (on page 3225)** that Oxygen XML Editor uses to define a hierarchical structure of submaps and to establish a **key space (on page 3222)** that defines the keys that are propagated throughout the entire map structure. For more information, see **Selecting a Root Map (on page 2916)**.

**Choose Root Map Drop-down menu**

You can use this drop-down menu to browse for **root maps** with the following choices:

- **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local **root map**.
- **Browse for remote file** - Displays the **Open URL** dialog box (on page 387) that allows you to select a remotely stored **root map**.
Browse for archived file - Displays the Archive Browser (on page 2008) that allows you to browse the content of an archive and choose a root map.

Browse Data Source Explorer - Opens the Data Source Explorer (on page 2015) that allows you to browse the data sources defined in the Data Sources preferences page (on page 276).

Tip:
You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

Search for file - Displays the Find Resource dialog box (on page 426) to search for a root map.

Profiling/Conditional Text Drop-down Menu

You can use this drop-down menu to select and apply a defined profiling condition set (on page 3144) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- Show Profiling Colors and Styles - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (Options > Preferences) (on page 124) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

- Show Profiling Attributes - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.

- Show Excluded Content - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 539) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

- Profiling Settings - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 675) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

The following additional actions are displayed in the toolbar when the Show extended toolbar option is selected in the Settings menu:

Insert Topic Reference

Opens the Insert Reference dialog box (on page 2925) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.
**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor, the *DITA map* is updated automatically.

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box (on page 2934)*.

**Edit Attributes**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the *Attributes View in Author Mode (on page 627)* topic.

**Delete**

Deletes the selected node.

**Move Up**

Moves the selected node up within the *DITA map* tree.

**Move Down**

Moves the selected node down within the *DITA map* tree.

**Promote** *(Alt + LeftArrow)*

Moves the selected node up one level to the level of its parent node.

**Demote** *(Alt + RightArrow)*

Moves the selected node down one level to the level of its child nodes.

**Contextual Menu of the DITA Maps Manager**

**Root Map**

The following actions can be invoked from the contextual menu on the *root map (on page 3225)* of an opened *DITA map* (many of them are also available in the *DITA Maps* menu):

**Open Map in Editor**

For complex operations that cannot be performed in the simplified *DITA Maps Manager* view (for instance, editing a relationship table) you can open the map in the main editing area.

**Open Map in Editor with Resolved Topics**

Opens the *DITA map* in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.
Export DITA Map

Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes an Export as Zip archive option that allows you to package the DITA map as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the DITA maps.

Add to Review Task

This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2527). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Show Feedback Comments Manager

Opens the Feedback Comments Manager view. This view is for those who use Oxygen Feedback to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in Oxygen XML Editor.

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2934).

Fast Create Topics

Opens the Fast Create Topics dialog box (on page 2966) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3220).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2963).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2925) topic.
• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 2925)* topic.

• **Key Reference** - Opens an *Insert Key Definition* dialog box that allows you to insert a targeted key definition (on page 2934) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an *Insert Key Definition* dialog box that allows you to define a key and a value inside a keyword (on page 2933).

• A set of actions that open the *Insert Reference* dialog box (on page 2925) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

---

**Search References**

Searches all references to the current topic in the entire *DITA map (on page 3220)*. It also reports references that are defined as related links in relationship tables. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder.

---

**Refactoring submenu**

The following actions are available from this submenu when invokes from a root map:

**Rename resource**

Allows you to change the name of a resource linked in the edited *DITA map (on page 2921)* and you have the option of updating all the references to the renamed DITA resource. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited *DITA map (on page 2921)* and you have the option of updating all the references to the moved DITA resources. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Rename Key**
Use this operation to rename a key. It also updates all references to it.
Note that it does not work on DITA 1.3 key scopes.

Convert to Concept
Use this operation to convert a DITA topic (of any type) to a DITA
Concept topic type (for example, Topic to Concept).

Convert to General Task
Use this operation to convert a DITA topic (of any type) to a DITA
General Task topic type (for example, Task to General Task). A
DITA General Task is a less restrictive alternative to the Strict Task
information type.

Convert to Reference
Use this operation to convert a DITA topic (of any type) to a DITA
Reference topic type (for example, Topic to Reference).

Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA
Task topic type (for example, Topic to Task).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA
Topic (for example, Task to Topic).

Convert to Troubleshooting
Use this operation to convert a DITA topic (of any type) to a DITA
Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs
Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions
For your convenience, the last 5 XML Refactoring tool operations (on
page 840) that were finished or previewed will also appear in this
submenu.

XML Refactoring
Opens the XML Refactoring tool wizard (on page 840) that presents
refactoring operations to assist you with managing the structure of
your XML documents.

Find/Replace in Files
Opens the Find/Replace in Files dialog box (on page 436) that allows you to find
and replace content across multiple files.

Check Spelling in Files
Allows you to spell check multiple files (on page 459).

Paste

Allows you to paste content from the clipboard into the *DITA map*.

**Paste Before**

Paste the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

**Paste After**

Paste the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

Expand All

Allows you to expand the entire *DITA map* structure.

Collapse All

Allows you to collapse the entire *DITA map* structure.

**Editable Child Nodes**

The following actions are available when the contextual menu is invoked on an editable child node of a *DITA map* (submaps need to be opened in the *DITA Maps Manager* to access these actions since they are in a read-only state in the parent map):

**Note:**

If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.

Add to Review Task

This action can be used to add the selected documents to a task in the *Content Fusion Tasks Manager* view. *Oxygen Content Fusion* is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2527). To fully take advantage of all of the benefits and features of *Content Fusion*, your organization will need an *Oxygen Content Fusion Enterprise Server*. For more information, see the *Oxygen Content Fusion* website.

Edit Properties

Opens the *Edit Properties* dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box* (on page 2934).
Fast Create Topics

Opens the Fast Create Topics dialog box (on page 2966) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3220).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2963).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2925) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2925) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2934) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2933).
- A set of actions that open the Insert Reference dialog box (on page 2925) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2963).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2925) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2925) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2934) (for example, to target a resource such as an image or external link).
• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2933).

• A set of actions that open the Insert Reference dialog box (on page 2925) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2963).

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2925) topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2925) topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2934) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2933).

• A set of actions that open the Insert Reference dialog box (on page 2925) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Search References

Searches all references to the current topic in the entire DITA map (on page 3220). It also reports references that are defined as related links in relationship tables. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder.

### Refactoring submenu

The following actions are available from this submenu:

**Convert Markdown to DITA Topic (Available for Markdown documents)**
Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (on page 3027).

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map (on page 2921) and you have the option of updating all the references to the renamed DITA resource. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 2921) and you have the option of updating all the references to the moved DITA resources. If you have enabled Main Files support (on page 3183), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Extract to New DITA Map**

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.
Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 840) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 840) that presents refactoring operations to assist you with managing the structure of your XML documents.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 436) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 459).
Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the **DITA map**.

Paste Before

Pastes the content of the clipboard (only if it is a part of the **DITA map**) before the currently selected **DITA map** node.

Paste After

Pastes the content of the clipboard (only if it is a part of the **DITA map**) after the currently selected **DITA map** node.

Delete

Deletes the currently selected node from the **DITA map**.

Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the **Also remove all descendants** option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have enabled Main Files support ([on page 3183](#)), it also searches for references in the DITA maps added to the Main Files folder.

Organize

Allows you to organize the **DITA map** with the several submenu actions:

- ↑ Move Up - Moves the selected node up within the **DITA map** tree.
- ↓ Move Down - Moves the selected node down within the **DITA map** tree.
- ≧ Promote (**Alt + LeftArrow**) - Moves the selected node up one level to the level of its parent node.
- ≦ Demote (**Alt + RightArrow**) - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire **DITA map** structure.

Collapse All
Allows you to collapse the entire DITA map structure.

Other Nodes

The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

**Open Map in Editor (available when invoking on a submap)**

Opens the currently selected DITA map in the editor.

**Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)**

Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

*Edit Attributes (only available for relationship table nodes)*

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 627) topic.

**Edit Profiling Attributes (only available for relationship table nodes)**

Allows you to change the profiling attributes (on page 668) defined on the selected node.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Creating a Map

To create a DITA map (on page 3220), subject scheme map (on page 3226), bookmap (on page 3218), or other types of DITA maps, follow these steps:

1. Use the New Document wizard (on page 368) to start creating your map.

    **Tip:**

    If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2899)) and selecting New from the Append Child, Insert Before, or Insert After submenu.
2. Select one of the DITA Map templates from the Framework templates folder.
3. Click the Create button.
4. Select whether you want to open the map in the DITA Maps Manager (on page 2899) or the Editor.
5. Save the map using the Save button on the toolbar of the DITA Maps Manager view (on page 2899).

Related Information:
Customizing Profiling Values with a Subject Scheme Map (on page 3153)
Managing DITA Maps (on page 2918)

Selecting a Root Map

Oxygen XML Editor allows you to select a root map (on page 3225) (a main DITA map (on page 3220)) that defines a hierarchical structure of submaps and establishes a key space (on page 3222) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:

- The easiest method is to use the Context drop-down menu (on page 2903) in the DITA Maps Manager (on page 2899) toolbar to select the appropriate root map.
- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.
- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

Creating DITA Submaps

You can break up a large DITA map (on page 3220) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 2919), except you choose a map rather than a topic to create or add. When adding a submap
to a map make sure that you use a `<mapref>` element or a `<topicref>` element with the `@format` attribute set to `ditamap`. In most cases, Oxygen XML Editor takes care of this for you.

### Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.

2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New** or **Insert Before > New**.

   **Step Result:** This opens a New DITA file dialog box (on page 2963) that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file should have a `.ditamap` file extension).

4. Click **Create** to insert the submap.

You can manage and move submaps the same as you would with topics. They can also be expanded and you can navigate their content in the **DITA Maps Manager** when the root (main) DITA map is open, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab.

**Tip:**

If you want to be able to edit submaps when the main (root/parent) map is open in the **DITA Maps Manager**, go to **Options > Preferences > DITA > Maps** and select the **Allow referenced submaps to be edited** option (on page 271).

### Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a **bookmap** (on page 3218) to organize your topics into a book. A DITA **bookmap** is a specialized type of map, intended for creating output that is structured like a book. A **bookmap** allows you to add book-specific elements such as `<frontmatter>`, `<part>`, `<chapter>`, `<appendix>`, and `<backmatter>` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the **DITA documentation** for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor.

To create a book in DITA using a **bookmap**, follow these steps:
1. Create a new *bookmap* (on page 2917) *(File > New > Framework templates > DITA Map > map > Bookmap)*. If you want the *bookmap* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the *DITA Maps Manager* (on page 2899)) and selecting *New* from the *Append Child, Insert Before,* or *Insert After* submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a *bookmap*, or children to a section, right-click the *bookmap* or section icon and choose any of the reference actions in the *Append child* menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the *DITA documentation* to fully understand the structure of a DITA *bookmap* and where to create each element.

3. Create special elements such as an *index* (on page 2941) and *table of contents* (on page 2941). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. *Add topics* (on page 2919) to your chapters to add content to your book. You may find it easier to manage if you use *submaps* (on page 2916) to create the content of your chapters. This keeps your *bookmap* from becoming long and difficult to manage.

### Managing DITA Maps

You may want to manage your *DITA maps* (on page 3220) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage *DITA maps* and resources.

For more information about the *DITA Maps Manager* view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

### Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:
• By dragging and dropping topics within the DITA Maps Manager (on page 2899).
• By highlighting a topic in the DITA Maps Manager (on page 2899), holding down the Alt key, and pressing the arrow keys.
• By showing the extended DITA Maps Manager (on page 2899) toolbar (click the ☰. Settings icon on the DITA Maps Manager (on page 2899) toolbar and select the extended toolbar) and then using the node moving buttons (↑↓←→) on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 2899), you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor supports both approaches.

A DITA map (on page 3220) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the <topicref> element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The Insert Reference dialog box (on page 2925) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

• Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
• If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (on page 2899) toolbar.

Select Insert Reference from the DITA Maps menu.

**Dragging and Dropping a File into the DITA Maps Manager**

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 2899). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The Project view (on page 402).
- The Open/Find Resource view (on page 422).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.

**Adding a New Topic to a Map**

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 2899), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 2964) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2964) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2964) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

**Note:**

The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 273) into account. When the option is deselected, a unique ID is generated.
Step Result: The new topic is now referenced (as a `<topicref>`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

Adding Multiple Skeleton Topics at Once

Oxygen XML Editor includes a feature in the DITA Maps Manager (on page 2899) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3220).

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 2966).

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2899), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press the Delete or Backspace key on your keyboard.
- Highlight the topic and click the ✗ Delete button on the DITA Maps Manager (on page 2899) extended toolbar.

Related Information:
Fast Create Multiple DITA Topics (on page 2966)

Moving and Renaming Resources

You can move or rename resources referenced in your DITA project on disk directly from Oxygen XML Editor and you have the option of updating all the references to the moved or renamed resources. If the resources are referenced in the DITA map, you can do this from the DITA Maps Manager view (on page 2899). You can also move and rename resources (DITA topics, maps, or other resources such as folders, images, HTML files, audio, video, text files, Markdown documents) from the Project view (on page 402). If you have enabled
Main Files support (on page 3183), you will also have the option to update all the references to the moved or renamed resource.

**Moving or Renaming DITA Resources (Topics or Maps)**

To move or rename resources (such as topics, maps, or other referenced non-DITA resources) referenced directly in the DITA map, use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 2899):

**Refactoring > Move resource**

This action allows you to change the location of a resource linked in the edited DITA map using the Move resource dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map (preserving its completeness).
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited DITA map (on page 3220) using the Rename resource dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map (preserving its completeness).
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

**Note:**

If a root DITA map (on page 3225) is not defined, the move and rename actions are executed in the context of the current DITA map.

**Moving or Renaming Resources and Updating the References to Them Using the Project View**

To move or rename DITA (topics, maps) or non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming.
Resources in the Project View (on page 412). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on resources while also updating all the references to them, use the following sets of procedures:

1. Enable Main Files support and add your root DITA map (on page 3225) to the Main Files folder by following the procedure found here: How to Enable Main Files Support in DITA (on page 3183).
2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 3184).

Related Information:
Main Files Support in DITA (on page 3183)
Finding Resources Not Referenced in DITA Maps (on page 2923)

Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps (on page 3220). To assist you with organizing project resources, Oxygen XML Editor includes the Find Unreferenced Resources action, that searches for such resources.

To perform this search, open the DITA map in the DITA Maps Manager (on page 2899), invoke the contextual menu on the map, and select the Find Unreferenced Resources action. It can also be selected from the DITA Maps menu. This action opens the Find Unreferenced Resources dialog box, shown below.
Figure 735. Find Unreferenced Resources Dialog Box

The Find Unreferenced Resources dialog box includes the following options:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to Add maps to the list or Remove them.

- **Folders** - Provides a list of folders to be included in the search and allows you to Add or Remove specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.

- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:**

In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the Find button, if the search operation finds unreferenced resources, they are displayed in the Results panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click
its result and select Remove from Disk. If you want to see the resource before deciding what to do with it, you can right-click its result and select Show in Explorer.

Inserting References in DITA Maps

A DITA map (on page 3220) may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the Insert Reference dialog box (on page 2925).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

Insert Reference Dialog Box

The Insert Reference dialog box allows you to insert and configure references in DITA maps (on page 3220). There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the Insert Reference dialog box, use one of the following methods:

- Select Reference, Reference to the currently edited file, or any of the other specific reference actions that are available from the Append Child, Insert Before, and Insert After submenus when invoking the contextual menu in the DITA Maps Manager (on page 2899).
  - To insert the reference as a child of the current node, select the reference from the Append Child submenu.
  - To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the Insert After submenu.
  - To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the Insert Before submenu.

Note:
The content of these submenus depends on the node that is selected in the DITA map tree when the contextual menu is invoked. For example, if the selected node is a topic reference (<topicref>), its possible child nodes include the following elements: <anchorref>, <chapter>, <keydef>, <mapref>, <topicgroup>, <topichead>, <topicref>, <topicset>, and <topicsetref>.

- Click the Insert Reference button on the DITA Maps Manager extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select Insert Reference from the DITA Maps menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the Reference or Reference to the currently edited file actions, a Reference type drop-down list is displayed at the top of the Insert Reference dialog box and you can select the type of reference you want
to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the Append Child, Insert Before, and Insert After submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling.

**Target Tab**

![Insert Reference Dialog Box - Target Tab](image)

The Target tab of the Insert Reference dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the Look in drop-down list, browsing buttons, or file window in this section. You can use the Files of type drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.
ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note:**

If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a `<navref>` element requires a `@mapref` attribute instead.

Keys Tab

**Figure 737. Insert Reference Dialog Box - Keys Tab**

The Keys tab allows you to use and define keys (on page 2932) for indirect referencing. For more information, see Working with Keys in DITA (on page 3028). This tab includes the following:

**Define keys**

Use this text field to define the `@keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `@keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the Target tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the Choose key reference button to access the list of keys that are already defined in the current root map (on page 3225).
Attributes Tab

**Figure 738. Insert Reference Dialog Box - Attributes Tab**

The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

**Collection type**

This drop-down list allows you to select the @collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

**Type**

Allows you to select a @type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

**Scope**

This property corresponds to the @scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Scope
checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

Format

This property corresponds to the @format attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Format checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

Processing Role

This drop-down list allows you to set the @processing-role attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

The Metadata tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: <navtitle>, <linktext>, <shortdesc>, <keyword>, <indexterm>). The metadata elements are inserted inside a <topicmeta> element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.
Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 3225) references a DITA subject scheme map (on page 3226) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 3224) configuration values for the profiling attributes (on page 187), those values are used.
- If Oxygen XML Editor defines global-level (on page 3221) configuration values for the profiling attributes (on page 187), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text (on page 3135).

**Finalizing Your Insert Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:**
You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

**Related Information:**
DITA Profiling / Conditional Text (on page 3135)
Working with Keys in DITA (on page 3028)
Inserting Topic Headings

The `<topichead>` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `<topicref>` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 2899).
- Open the **DITA map** in the XML editor (on page 2898) and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 2925) that allows you to easily insert a `<topichead>` element. A **Navigation title** (@navtitle attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

![Insert Topic Heading Dialog Box](image)

**Figure 741. Insert Topic Heading Dialog Box**

Related Information:

Insert Reference Dialog Box (on page 2925)

Inserting Topic Groups

The `<topicgroup>` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `<topicgroup>` can contain other `<topicgroup>` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `<topicgroup>` and its children.

You can set the collection-type of a container `<topicgroup>` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).
You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view (on page 2899)**.
- Open the **DITA map in the XML editor (on page 2898)** and select the [Insert Topic Group] action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group dialog box (on page 2925)** that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type, Type, Scope, Format**, etc.)

**Figure 742. Insert Topic Group Dialog Box**

![Insert Topic Group Dialog Box](image)

**Related Information:**
- **Insert Reference Dialog Box (on page 2925)**

### Defining Keys in DITA Maps

DITA uses **keys (on page 3028)** to insert content that may have different values in various circumstances. **Keys provide the means for indirect referencing in DITA.** This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the **main (root) map (on page 3225)**. This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a **keyword**.
- Key with a target (for example, to target a resource such as an image or external link).
The following example is a DITA map (on page 3220) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "./OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="url_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
  <keydef keys="url_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>
```

**Note:**
The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

**Key Definition with a Keyword Value**

To define a key with a value inside a *keyword*, follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2916) that will contain all of your key definitions and reference the submap in your main (root) map (if you don’t already have one created).
2. Open that map in the DITA Maps Manager (on page 2899).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition with Keyword from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the Key field.
5. Enter the key's value in the **Keyword** field.
6. Click **Insert and close**.

**Tip:**
If you need to profile the key or add other attributes, you can right-click the key definition in the **DITA Maps Manager**, select **Edit properties**, and configure them in the **Profiling** tab or **Attributes** tab, respectively.

### Key Definition with a Target

To insert a **targeted key definition** (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2916) that will contain all of your key definitions and reference the submap in your **main (root) map** (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** (on page 2899).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the **Append Child**, **Insert Before**, or **Insert After** submenu (depending on where you want to insert the **key definition** in the **DITA map**). This opens an **Insert Key Definition** dialog box.
4. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
5. Go to the **Target** tab and select a target resource (such as an image or external link).

**Tip:**
You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

6. Once you are done configuring the **targeted key definition**, click **Insert and close**.

### Edit Properties Dialog Box

The **DITA Maps Manager view** (on page 2899) includes a feature that allows you to view and edit the properties of a selected node. The **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a **DITA map** (on page 3220) document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.
Note:

If you select multiple sibling nodes and invoke the **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in **DITA maps** or topics. You can also use it to modify the title of **root maps** (on page 3225).

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a **root map** (on page 3225), only the **Attributes**, **Metadata**, and **Profiling** tabs are accessible and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

**Target Tab**

![Edit Properties Dialog Box - Target Tab](image)

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**
You can browse for and select the source target file by using the Look in drop-down list, browsing buttons, or file window in this section. You can use the Files of type drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding @href attribute of the target element.

**Note:**

If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a <navref> element requires a @mapref attribute instead.

**Keys Tab**

The Keys tab allows you to use and define keys (on page 2932) for indirect referencing. For more information, see Working with Keys in DITA (on page 3028). This tab includes the following:

**Define keys**

Use this text field to define the @keys attribute for the target.

**Key scopes**
Use this text field to define or edit the value of a `@keyscope` attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the ![Choose key reference](image) button) to select a key that is already defined in the root map ([on page 3225](#)).

**Attributes Tab**

The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a root map ([on page 3225](#)), the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**. However, if the title of the map contains elements other than plain text, the title is not editable and cannot be changed using this dialog box (you would need to open the DITA map in the main editor to edit the title).

**Navigation title**

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:
This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

**Tip:**
You can also select the Prefer navigation title for topicref rendering option in the DITA preferences page (on page 271) to always enforce the use of the @navtitle value rather than selecting this Lock option on individual topics.

### Collection type

This drop-down list allows you to select the @collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

### Type

Allows you to select a @type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

### Scope

This property corresponds to the @scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Scope checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

### Format

This property corresponds to the @format attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Format checkbox for the Always fill values for attributes option in the DITA preferences page (on page 271).

### Processing Role

This drop-down list allows you to set the @processing-role attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

### Other attributes table
This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 747. Edit Properties Dialog Box - Metadata Tab**

<table>
<thead>
<tr>
<th>Target</th>
<th>Keys</th>
<th>Attributes</th>
<th>Metadata</th>
<th>Profiling</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Metadata tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**

**Figure 748. Edit Properties Dialog Box - Profiling Tab**

The Profiling tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:
• If your root map (on page 3225) references a DITA subject scheme map (on page 3226) that defines values for the profiling attributes, those values are used.
• If your project defines project-level (on page 3224) configuration values for the profiling attributes (on page 187), those values are used.
• If Oxygen XML Editor defines global-level (on page 3221) configuration values for the profiling attributes (on page 187), they are used.
• Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 3135).

Note:
If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

• Keep - Preserves the current attribute values.
• Change Now - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

Finalizing Your Modifications
Once you click OK, all your changes are applied to the target node.

Related Information:
DITA Profiling / Conditional Text (on page 3135)
Working with Keys in DITA (on page 3028)
Generating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (on page 2897). In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a bookmap (on page 2917) (as in the example below). For more information about the `<toc>` element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```xml
<bookmap>
  ......
  <frontmatter>
    <booklists>
      <toc href="chapter1.dita"/>
    </booklists>
  </frontmatter>
  ......
</bookmap>
```

Creating an Index in DITA

In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic:** In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.
- **In the `<topicref>` element in a map that references the topic:** This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.
- **In the body of a topic:** In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic of the topic header, create the elements as you normally would in Oxygen XML Editor (on page 2969). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a bookmap (on page 3218), you need to add an `<indexlist>` element to the `<backmatter>` of the book.
1. Open your bookmap (on page 2917) in the DITA Maps Manager (on page 2899).
2. Right-click the bookmap and select Append Child > Backmatter. The Insert Reference dialog box (on page 2925) appears.
3. Click Insert and Close to insert the backmatter element.
4. Right-click the <backmatter> element and create a <booklists> element using Append Child > Book Lists.
5. Use the same steps to create an <indexlist> element.

**CAUTION:**
Adding index entries and an <indexlist> to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

### Resolving Topic References Through an XML Catalog

There are situations where you want to resolve references with an XML Catalog (on page 3227):

- You customized your DITA map (on page 3220) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor. The DITA Maps Manager view (on page 2899) will solve the displayed topic refs through the added XML catalog URI mappings. The resolution through the XML catalog URI mappings are done only for reference values starting with the urn: prefix.

To add an XML catalog to the DITA framework (on page 3221), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (on page 826).
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (on page 140).
4. Go to the Catalogs tab (on page 164).
5. Click on the + Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action (on page 775) for the changes to take effect.

**Note:**
You could also add your created catalog to the list of global catalogs in the XML Catalog preferences (on page 235) page.
Adding a Custom URI Resolver to Oxygen XML Editor

You can use the `XMLUtilAccess.addPriorityURIResolver(URIResolver)` API to add your own priority URI resolver from a Workspace Access plugin (on page 2465), allowing you to take control over how topic references in a DITA map are located or how references in DITA topics are resolved.

Publishing a DITA Map with References Resolved Through the XML Catalog

If you are publishing a DITA map that contains references to topics that need to be resolved through the XML catalog support in Oxygen XML Editor, you must enable the `fix.external.refs.com.oxygenxml` parameter in the Parameters tab of the transformation scenario configuration dialog box.

Chunking DITA Topics

By default, when a DITA map (on page 3220) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the `<topicref>` that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `@toc` and `@collection-type` attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the `@collection-type` attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 2899). To set the `@toc` and `@chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon  in the DITA Maps Manager (on page 2899) to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 3220) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:
1. In the DITA Maps Manager view (on page 2899), make sure that the tab that holds your root map (on page 3225) is selected and that the Context selection is set either to the name of your root map or to <current map>.

2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click Reload (F5).

3. Click the Validate and Check for Completeness button from the Validation drop-down menu on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 2944).

4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.

5. Select any other options you want to check.

6. Click Check to run the validation process.

Result: A dialog box is displayed showing the progress of the operation. You can click the Run in Background button to close this dialog box so that you can continue working while the operation continues in the background and the progress would continue in the information ribbon at the bottom of the application.

Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an @href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 787)*.
Note:
If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources
Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set (on page 3135) before validation. You can choose between the following options:

- From the current condition set - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 2899). Clicking the Details icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- From all available condition sets - For each available condition set, the map content is filtered using that set before validation.
- From the associated transformation scenario - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- Other DITAVAL files - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 323) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 3225) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.
For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `<copy-to>` attribute set:

```xml
<topicref href="topic.dita" />
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will **report** a warning if there is a topic referenced twice and none of the reference-type elements has a `<copy-to>` attribute set or both of them have the `<copy-to>` attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita" />
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `<keys>` attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes *key scopes (on page 3060)* into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
    <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 3060)* on the second occurrence.

**Report unreferenced key definitions**

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the *Use DITAVAL filters* option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:
• Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
• Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

• If a row has fewer cells than the number of columns detected.
• For a `CALS` table, if a cell has a vertical span greater than the available rows count.
• For a `CALS` table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
• For a `CALS` table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
• For a `CALS` table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
• For a `CALS` table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 187) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 323) button, or the browsing actions in the Browse drop-down list.

**Export settings**

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

**Import settings**

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

**Check**
Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

**Tip:**
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen *(on page 3198).*

**Related information**

DITA Maps Manager *(on page 2899)*

### DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant *(on page 3219).*

**DITA Map Toolbar and Menu Actions**

When a DITA map is opened in **Author** mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  
  Opens a New DITA file dialog box *(on page 2963)* where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box *(on page 2925)* where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  
  Opens the Reuse Content dialog box *(on page 3045)* that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  
  Opens the Insert Reference dialog box *(on page 2925)* that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  
  Opens the Insert Reference dialog box *(on page 2925)* that allows you to insert a topic group at the cursor position.
**Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

**Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

**Move Up**

Moves the selected node up one position on its same level.

**Move Down**

Moves the selected node down one position on its same level.

**Promote (Alt + LeftArrow)**

Moves the selected node up one level to the level of its parent node.

**Demote (Alt + RightArrow)**

Moves the selected node down one level to the level of its child nodes.

**DITA Map Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

**Add File to Review Task**

This action can be used to add the current document to a task in the **Content Fusion Tasks Manager** view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2527). To fully take advantage of all of the benefits and
features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2934).

**Cut (Ctrl + X (Command + X on macOS))**

Removes the currently selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on macOS))**

Places a copy of the currently selected content in the clipboard.

**Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 3220). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 2903) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an <xref> that points to that element. If no elements with an ID value are found, a message
will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 2903) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA Map framework:

- ![Insert New DITA Resource](image)
  
  Opens a New DITA file dialog box (on page 2963) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- ![Insert Topic Reference](image)
  
  Opens the Insert Reference dialog box (on page 2925) where you can configure a topic reference and inserts it at the current position within the map.

- ![Insert Key Definition with Keyword](image)
  
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- ![Reuse Content](image)
  
  Opens the Reuse Content dialog box (on page 3045) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- ![Insert Topic Heading](image)
  
  Opens the Insert Reference dialog box (on page 2925) that allows you to insert a topic heading at the cursor position.

- ![Insert Topic Group](image)
Opens the **Insert Reference** dialog box *(on page 2925)* that allows you to insert a topic group at the cursor position.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `&#<decimal value>` - e.g. `&#65`
- `&<decimal value>` - e.g. `&#65`
- `#<hexadecimal value>` - e.g. `#x41`
- `&#<hexadecimal value>` - e.g. `&#x41`

**Relationship Table > Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

**Search References**

Finds the references to the `@href` or `@keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current **DITA map** (opened in the **DITA Maps Manager view** *(on page 2899)*). The current topic/map reference element must have an `@href` or `@keys` attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the **DITA map** *(on page 3220)* that contains the definition of the key with the element that defines that key selected.

**Select submenu**
This submenu allows you to select the following:

**Element**
Selects the entire element at the current cursor position.

**Content**
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**
Selects the entire parent element at the current cursor position.

---

**Text submenu**

This submenu contains the following actions:

**To Lower Case**
Converts the selected content to lower case characters.

**To Upper Case**
Converts the selected content to upper case characters.

**Capitalize Sentences**
Converts to upper case the first character of every selected sentence.

**Capitalize Words**
Converts to upper case the first character of every selected word.

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

---

**Note:**
The content marked as deleted with change tracking (on page 3226) is ignored when counting words.

---

**Convert Hexadecimal Sequence to Character** (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 463). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:
Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 466).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow)**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow)**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element (Alt + Shift + D (Ctrl + Alt + D on macOS))**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent block elements (on page 3218) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Ctrl + E (Command + E on macOS))**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the **Position cursor between tags** option (on page 212) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option (on page 212) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with `[tag]`** (**Ctrl + ForwardSlash** (**Command + ForwardSlash on macOS**))

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the Track Changes (on page 3226) support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the Tracked Change (on page 3226) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all Tracked Changes (on page 3226) in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the Tracked Change (on page 3226) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all Tracked Changes (on page 3226) in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3226). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Highlight**
  Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

- **Add Comment**
  Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).
Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 664).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on macOS))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**
  Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 640) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 176) where you can configure various options with regard to the Author editing mode.
Floating Contextual Toolbar for DITA

Oxygen XML Editor includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The floating contextual toolbar is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).

DITA Map Drag/Drop Actions

Dragging a file from the Project view (on page 402) or DITA Maps Manager view (on page 2899) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a `<topicref>` element, `<chapter>`, `<part>`, etc.) at the drop location.

Opening a Topic from a DITA Map in Author Mode

If a DITA map is open in the Author visual editing mode, you can open a referenced topic by clicking the icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

Tip:
For information about customizing Author mode actions for a particular framework (on page 3221) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 2145) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 2145)

Opening a DITA Map With Topic Content Resolved

It is possible to open a DITA map in the main editor with all the content from the referenced topics resolved and presented in one document. To do this, select the DITA map in the DITA Maps Manager view and click the Open Map in Editor with Resolved Topics toolbar button. This opens the DITA map in the main editor area with content from all topic references expanded in-place.

Content from the resolved topics that is referenced using a `@conref` or `@conkeyref` attribute is presented as read-only by default. To edit it, you must use the Edit Reference contextual menu action to open the source topic that contains the referenced content.

Editing Referenced Content Directly

If you want to edit the referenced content directly without having to open the source document, go to Options > Preferences > Editor > Edit Modes > Author and select the Allow referenced content to be edited option (on page 179). The referenced content becomes editable in-place and saving the document will save all other modified topics.
Things to be Aware of When Enabling This Option:

- The references become editable only if the referenced topics are the root elements. If, for example, in the DITA map, there are references directly to subtopics embedded in a larger topic, those references will not be editable.
- If the content is stored in a CMS, you need to deselect the Local files only option (on page 179) to edit such remote referenced topics directly but this feature might not function properly with remote resources (it depends on the capabilities of the CMS connector).
- Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.
- When modified topics are saved, the Only modified content option in the Options > Preferences > Editor > Edit Modes > Author > Serialization page (on page 196) is ignored.
- The toolbar has two DITA map-specific actions for inserting topic references and all DITA topic-specific actions that can be used to make changes in the referenced DITA topics.
- The content completion and schema-aware insertion strategies work in each referenced topic according to their respective schema.
- The contextual menu presents the relevant actions in each referenced topic.
- Validation works for each individual referenced topic but only if it contains modifications.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `<p>`, `<ol>`, and `<simpletable>`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.
Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `<task>` element specifies that a block of content contains the description of a task.
- A `<codeblock>` element specifies that a block of text consists of programming code.
- A `<uicontrol>` element specifies that a word is the name of a control in a computer GUI.
- The `@platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`<wintitle>`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `<audience>` element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor provides a number of tools to help you create topic structures:

- **Content Completion Assistant (on page 3219)** - Shows you which elements can be created at the current position.
- **Model view (on page 545)** - Shows you the complete structure supported by the current element.
Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.

Related information

- Getting Started with DITA (on page 2889)
- DITA Topics Document Type (Framework) (on page 1337)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- **Topic** - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- **Task** - For procedural information such as how to use a dialog box.
- **Concept** - For general, conceptual information such as a description of a product or feature.
- **Reference** - For reference information.

Oxygen XML Editor also supports numerous other specialized topic types that you will find templates for in the various folders in the **New DITA file dialog box** (on page 2964). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and **DITA map** (on page 3220) types such as Glossentry, Troubleshooting, **Bookmap** (on page 3218), and **Subject Scheme Map** (on page 3226).

To create a new DITA topic and add a reference to it in your **DITA map** (on page 3220), follow these steps:

1. In the **DITA Maps Manager** (on page 2899), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** (on page 2964) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** (on page 2964) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
- **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box (on page 2964)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:**
The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the DITA > Topics preferences page (on page 273) into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

**New DITA File Dialog Box**

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.
Figure 751. New DITA File Dialog Box

The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 375).

The New DITA file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip:
You can use the text filter field at the top of the dialog box to search for a specific template.
Title

Depending on the selected file template, the value of the **Title** field is set in:

- The `<title>` element of a DITA topic file. The `<title>` element needs to be the first child of the root element.
- The `<glossterm>` element of a *Glossentry* file.

**New Topics Preferences**

Pressing this button opens the DITA New Topics preference page (*on page 273*).

**Save as**

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

**Create**

When you click this button, a reference (`<topicref>`) to the new topic is added to the current DITA map and the new topic is opened in the editor.

**Related Information:**
- Getting Started with DITA (*on page 2889*)
- Adding Topics to a DITA Map (*on page 2919*)
- Working with Markdown Documents in DITA (*on page 3026*)
- Fast Create Multiple DITA Topics (*on page 2966*)

**Fast Create Multiple DITA Topics**

The DITA Maps Manager (*on page 2899*) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (*on page 3220*). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

**Note:**

The Fast Create Topics feature works for the following types of local and remote resource protocols: *file, http, https, ftp, ftps*.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.
The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (Tab or Space). Topic references will be created in the *DITA map* according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules *(on page 273)* for how those file names will be generated.

**Tip:**

If you have added a file name prefix or suffix to the properties file *(on page 378)* for DITA document templates, the generated file name will include that prefix or suffix.
File name prefix

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 378) for DITA document templates, the prefix you enter here will override the one from the properties file.

File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 378) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

Tip:

You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 2972).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

Create

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip:

You can easily change the order of the topics in the DITA map (on page 2918) at a later time,

Adding Topics to a DITA Map (on page 2919)
Converting DITA Topics to Another Type (on page 2972)
Editing DITA Topics

Oxygen XML Editor provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents also apply to DITA topics. Oxygen XML Editor also provides extensive additional support specifically for DITA.

Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** *(on page 2899)* (or right-click the topic and select **Open**).
- Double-click the file in the **Project view** *(on page 402)* (or right-click the file and select **Open**).
- If you have a **DITA map** *(on page 3220)* opened in the XML editor, you can click the image icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an **XML format** *(on page 34)*, although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor provides a graphical view of your topics in **Author mode** *(on page 354)*. Your topics will likely open in **Author** mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author** mode, just click **Author** at the bottom left of the editor window to switch to this mode.

**Author** mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author** mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to **Text mode** *(on page 353)*. You, or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author** view (though there are some exceptions) and cannot be edited directly in the **Author** view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press **Alt+Enter** to bring up the attribute editor. Alternatively, you can use the **Attributes view (on page 627)** to edit attributes.

**Tip:**
You can select **Hints** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the **Selecting and Combining Multiple CSS Styles (on page 2145)** section.

### Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor has a number of **Content Completion Assistant (on page 3219)** features.

- **The Enter key:** In **Author** mode, the **Enter** key does not create line breaks, it brings up the **Content Completion Assistant** to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element `<p>` in DITA) and tools insert the line breaks in the output and on-screen.

  ![Content Completion Assistant](image)

  **Figure 753. Content Completion Assistant**

The **Content Completion Assistant** not only suggests new elements you can add. If you press **Enter** at the end of a **block element (on page 3218)** (such as a paragraph) it suggests creating a new element of the same type. If you press **Enter** in the middle of a **block element**, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting **Enter** twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.
To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the Model view (on page 545) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

**Tip:**
You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 2145) section.

**DITA Editing Actions**

A variety of actions are available in the DITA framework (on page 3221) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

**Note:**
The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 3003), the contextual menu also includes various general Author mode contextual menu actions (on page 759).
Converting DITA Topics to Another Type

Oxygen XML Editor includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for DITA

The following conversion operations are available:

- **Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))**
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2899))**
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the **Strict Task** information type.

- **Convert to Reference**
  Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

- **Convert to Task**
  Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

- **Convert to Topic**
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Methods for Accessing the DITA Conversion Refactoring Operations**

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2899)), go to the **Refactoring** submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select **XML Refactoring** from the **Tools** menu (or from the **Refactoring** submenu when you right-click one or more documents in the **Project view (on page 402)** or the DITA Maps Manager view (on page 2899)). Then select whichever operation is appropriate for your needs.

**XML Refactoring Wizard Dialog Box**

When you select any of the operations, Oxygen XML Editor proceeds to the XML Refactoring Wizard. If you used the **Multiple Documents At Once Method (on page 2973)**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.

- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method (on page 2973)**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
Warning:
It is always recommended to use the Preview button to make sure the operation is not going to do something unexpected and after you click the Finish button, any Undo action will only revert changes on the current document.

Finish
When you use the Finish button, behind the scenes Oxygen XML Editor maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

Handling Special Characters When Generating New File Names
For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Å is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

\[OXYGEN_INSTALL_DIR\]/frameworks/dita/refactoring/utils/character-map.xsl.

Converting To and From DITA Specialization Document Types
If you use your own DITA specialization document type (on page 3178), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):
   \[OXYGEN_INSTALL_DIR\]/frameworks/dita/refactoring/.

   Note: The stylesheets for converting entire files (from one type to another) are located in the dita-files-conversion-stylesheets folder. Each of these conversion operations has a stylesheet with the word entrypoint at the end of its name. Edit the appropriate entrypoint.xsl file (for example, to modify the Convert to Task operation, edit the convert-resource-to-task-entrypoint.xsl file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
a. Modify the values of the declared root-element, public-literal-target, and system-literal-target variables to match your specialization's DTD information.
b. Modify the value of the declared schema-location variable to match the location of your specialization's XML schema.
c. Modify the value of the declared xml-model-location variable to match your Relax NG specialization.

3. For the Convert Nested Topics to New Topics and Convert Sections to New Topics operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the [OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/utils/dita-formats.xsl stylesheet with your own values for the DOCTYPE or xml-model.

4. If you want to change the name of the operation that will be displayed in Oxygen XML Editor, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: 
      [OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/ (for example, for the Convert to Task operation, it is convertResource2Task.xml).
   b. Edit that XML file and change the name attribute to match whatever you want to be displayed for that operation (for example, name="Convert to My DocType").

5. Save your changes to all modified files.
6. Restart Oxygen XML Editor

Result: You should now see your changes when accessing the conversion operations (on page 2973).

Tip:
You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (on page 856).

Editing DITA Topics (on page 2969)
Refactoring XML Documents (on page 840)

Working with Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:
1. Place the cursor in the position you want the graphic to be inserted.

2. Select the ![Insert Image](image) action. The ![Insert Image](image) dialog box appears.

**Figure 754. Insert Image Dialog Box**

3. Configure the options in this dialog box and click **Insert**.

The **Insert Image** dialog box includes the following options and features for inserting images into a DITA document:

**Location**

Use this option to specify a URL for the image as the value of an `@href` attribute inside the `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the ![Browse](image) drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a `@keyref` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the root map (on page 3225) of the current DITA map. You can use the ![Choose Key](image) Reference button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map.

**Note:**

If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the
Change Root Map link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.

**Figure title**

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>`.

**Alternate text**

Use this text box to insert an `<alt>` element inside the `<image>`.

**Size**

Use this section to configure the Width and Height of the image, or Scale the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

**Layout**

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

**Preview**

The Preview box shows a thumbnail of the selected image so that you can see a preview of the image before clicking Insert.

### Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the Project view (on page 402) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```xml
<image href="../images/image_file.png"/>
```

**Tip:**

To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

### Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 2975) to the `<fig>` element.

**Note:**

The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`. 
Note:
The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

Floating Images in DITA Topics for PDF or XHTML Output

Oxygen XML Editor provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p><image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
  
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

Figure 755. Image Floated to the Right

Searching for References to Images

You can search for all references to an image by selecting `Search References` from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.
Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view and drop them into your documents (or copy and paste them).

Table 54. Supported Media Types

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:
1. Place the cursor at the location where you want the media resource.

2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.

   ![Insert Media Dialog Box](Image)

   **Note:**
   You can also drag media files from your system explorer or the Project view (on page 402) and drop them into your documents (or copy and paste them). Note that this method will bypass the Insert Media dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

3. Configure the options in this dialog box and click Insert.

   The Insert Media dialog box includes the following options:

   **Location**

   Use this option to specify a URL for the media resource as the value of a @data attribute inside the <object> element. You can type the URL of the resource you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

   **Key**

   Use this option to insert the selected key as the value of a @datakeyref attribute inside the <object> element. All keys that are presented in the dialog box are gathered from the root map (on page 3225) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.
Note:
If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.

Type
Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the URL field (on page 2980). You can manually change the type, but keep in mind that in the publishing stage the object element is converted to an HTML5 element (on page 2981) based upon the type selected here. You can choose between: audio, video, or iframe.

Size
Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a @width and @height attribute, respectively. For audio clips, only the Width can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

Attention:
• On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

Result in Output: In the publishing stage, the object element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

• Videos - The object element is converted to an HTML5 video element.
• Audio Clips - The object element is converted to an HTML5 audio element.
• Embedded HTML Frames - The object element is converted to an HTML5 iframe element.

Tip:
There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select Copy embed code), you can then paste the contents of the clipboard in the URL field (on page 2980) and the Type (on page 2981) will automatically be set on iframe, while the Width and Height (on page 2981) will be populated according to the detected size, and an allowfullscreen parameter will
automatically be added (set the value of this parameter to true to allow videos to play in full screen mode once the document is converted to XHTML output).

**Inserting Media in HTML Outputs That Do Not Support Embedded Media**

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. Edit the DITA transformation scenario (on page 3108) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the Parameters tab (on page 3114) and click the New button to add a new parameter.
3. For the Name, enter: com.oxygenxml.xhtml.linkToMediaResources.
4. For the Value, enter: true.
5. Click OK and continue on to run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Working with Images in DITA Topics (on page 2975)

How to Add Video and Audio Objects in DITA WebHelp Output (on page 1674)

**Image Maps in DITA**

Oxygen XML Editor includes support for image maps in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.
Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape.
Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**
Use this button to create a duplicate of the currently selected shape.

**Delete**
Use this button to delete the currently selected shape.

**Undo**
Use this button to undo the last action.

**Redo**
Use this button to redo the last action that was undone.

**Show/Hide Numbers**
Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**
Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**
Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**
Use this button to send the currently selected shape back one layer.

**Send Shape to Back**
Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**
Use this slider to zoom the image in or out in the main image pane.

**Image Pane**
This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:
Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to Polygon or Free Form shapes.

- **Remove Point**
  Removes the current point from Polygon or Free Form shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (on page 3075) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an `<xref>` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor (on page 3075).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 2987) in Author mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:
1. Right-click the image and select **Image Map Editor**.

   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( ◐ New Rectangle, ◐ New Circle, or ◐ New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (*on page 2983*) to adjust its layer and color, or to perform other editing actions.

   **Tip:**

   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (*on page 2985*). For example, the easiest way to remove a point is to right-click the point and select ◐ Remove Point.

4. With the shape selected, use one of the linking options (*on page 2986*) in the ◐ Link drop-down menu to select a target resource (or enter its path in the Target (*on page 2986*) text field).

5. (Optional) Enter a Description (*on page 2986*) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

   - **Image Map Editor** - Click this button to open the **Image Map Editor**.
   - **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 758. Image Map Details**

![Image Map Details](image.png)
How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 2983)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 2983) (1️⃣, 2️⃣, 3️⃣, 4️⃣).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

DITA `imagemap` Element Specifications

Working with Images in DITA Topics (on page 2975)

Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- DITA Simple table model (on page 2989) - This is the most commonly used model for basic tables.
- CALS table model (OASIS Exchange Table Model) (on page 2990) - This is used for more advanced functionality.
• **DITA Choice table model** (on page 2993) - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.

• **DITA Properties table model** (on page 2995) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

### Inserting a Simple Table Model

To insert a Simple DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table Model.

**Figure 759. Insert Table Dialog Box - Simple Model**

![Insert Table Dialog Box - Simple Model](image)

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:**
The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**
If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**
Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (**@colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **@colwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the **@colwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **@colwidth** attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (**@colwidth** attribute). Entering content into a cell changes the rendered width dynamically.
If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the **pt** unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: **pt** (points), **cm** (centimeters), **mm** (millimeters), **pi** (picas), **in** (inches).

**Frame**

Allows you to specify a value for the **@frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a **@conref**, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the **@conref** target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators (**@rowsep** attribute). The allowed values are: **0** (no separator) and **1** (include separators).

**Column separator**

Specifies whether or not to include column separators (**@colsep** attribute). The allowed values are: **0** (no separator) and **1** (include separators).

**Alignment**

Specifies the alignment of the text within the table (**@align** attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**
The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

![Note:](image)
The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode (on page 354)**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 761. CALS Table in DITA**

![Sample CALS Table with Fixed Width](image)

**Inserting a Choice Table Model**

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the DITA menu), or select **choicetable** from the **Content Completion Assistant (on page 3219)**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.
The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

### Column widths

Allows you to specify the type of properties for column widths (**@colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **@relcolwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, **relcolwidth="1* 2* 3***"** causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **@relcolwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **@relcolwidth** attribute is **1**.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

### Frame

Allows you to specify a value for the **@frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
• top - A border will be added to the top frame.
• topbot - A border will be added to the top and bottom frames.
• bottom - A border will be added to the bottom frame.
• sides - A border will be added to the side frames.
• -dita-use-conref-target - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a <step> element).

Inserting a Properties Table Model

To insert a Properties table within a <refbody> element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (on page 3219). The Insert Table dialog box appears. Select Properties for the table Model.

Figure 763. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

Table Size

Allows you to choose the number of Rows and Columns for the table.

Generate table header
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a **Properties** table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 627) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on macOS))** (on page 2999) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 2999).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode (on page 353)**.

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a **Smart Paste feature (on page 613)** that preserves certain style and structure information when pasting content.

**Tip:**

When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

**Related Information:**

- **Editing Tables in Author Mode (on page 683)**
DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- CALS table model (on page 2997)
- Simple table model (on page 2997)
- Choice table model (on page 2998)
- Properties table model (on page 2998)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (@colwidth attribute) or the text alignment (@align attribute). Although they appear as part of the Author mode (on page 354), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 764. CALS Table in DITA

Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 765. DITA Simple Table
Choice Table Model Layout

A Choice table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetables>` element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting `choicetable` from the Content Completion Assistant (on page 3219) (within a `<step>` element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Figure 766. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting `properties(wizard)` from the Content Completion Assistant (on page 3219) (within a `<refbody>` element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 767. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 3220) with the Validate and Check for Completeness action, if the Report table layout problems option (on page 2948) is selected in the DITA Map Completeness Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
• The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
• The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
• The value of the `<cols`, `<rowsep`, or `<colsep` attributes are not numeric.
• The `<namest`, `<nameend`, or `<colname` attributes point to an incorrect column name.

Simple or Choice Tables
A row has fewer cells than the number of table columns.

Editing Table Properties in DITA
To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Table Properties` (Ctrl + T (Command + T on macOS)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:
Some properties allow the following special values, depending on the context and the current properties or values:

• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model
For a CALS table model, the Table properties dialog box includes four tabs of options:

• Table tab - The options in this tab apply to the entire table.
• Row tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• Column tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• Cell tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (\texttt{align} attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**

The \texttt{justify} value cannot be rendered in \textbf{Author} mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the \texttt{char} attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

**Vertical alignment (Available in the Row and Cell tabs)**
Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (@valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Edit Table Properties for a Simple, Choice, or Properties Table Model**

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
• none - No border will be added.
• all - A border will be added to all frames.
• top - A border will be added to the top frame.
• topbot - A border will be added to the top and bottom frames.
• bottom - A border will be added to the bottom frame.
• sides - A border will be added to the side frames.
• -dita-use-conref-target - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:
Adding Tables in DITA Topics (on page 2988)
Editing Tables in Author Mode (on page 683)

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

• Embed MathML directly into a DITA topic. You can use Insert > \( \Sigma \) Insert Equation from the contextual menu to insert a MathML equation. Clicking on the equation will open a MathML Editor where you can edit the code.
• Reference an external MathML file as an image, using the \( \square \) Insert Image action that is available on the DITA toolbar (or from the DITA > Insert menu).

Publishing Notes:

• MathML equations contained in DITA topics can be published out-of-the-box in PDF using the DITA PDF transformation scenario.
• The DITA Map PDF - based on HTML5 & CSS transformation scenario (on page 1768) support MathML equations (on page 1947).
• For details about HTML output, see How to View MathML Equations in HTML Output (on page 1709).
• For other publishing formats, you might need to employ additional customizations for handling MathML content.
Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

```xml
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
  <title>Test equation</title>
  <body>
    <p>
    <foreign outputclass="embed-latex">
      L' = \sqrt{1 - \frac{v^2}{c^2}}
    </foreign>
    </p>
  </body>
</topic>
```

2. If you want Oxygen XML Editor to properly present the LaTeX equation when editing in the Author visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support. You can download and copy the plugin folder `latex-images-support` to the Oxygen XML Editor plugins folder, then restart Oxygen XML Editor.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/oxygenxml/dita-latex.

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 3219).

DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

**Link Actions Drop-Down Menu**

The following link actions are available from this menu:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 3075) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 3220) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 3074).

**File Reference**

Opens the File Reference dialog box (on page 3075) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 3074).

**Web Link**

Opens the Web Link dialog box (on page 3075) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 3074).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (on page 3076) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 3074).

**Tip:** You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search.
using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens the **File Reference** dialog box *(on page 3076)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see *Linking in DITA Topics (on page 3074)*.

Related Link to Web Page

Opens the **Web Link** dialog box *(on page 3076)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see *Linking in DITA Topics (on page 3074)*.

**Insert Image**

Opens the **Insert Image** dialog box *(on page 2975)* that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the **Insert Media** dialog box *(on page 2979)* that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in **Author** mode so that it can be played directly from there.

**Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

- **Insert Section**
  
  Inserts a new `<section>` element in the document, depending on the current context.

- **Insert Concept**
  
  Inserts a new `<concept>` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  
  Inserts a new `<task>` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.
Insert Topic
Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference
Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph
Inserts a new paragraph at current cursor position.

Reuse Content
This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 3045) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (`@conref`) (on page 3046), content key references (`@conkeyref`) (on page 3048), or key references to metadata (`@keyref`) (on page 3051).

Insert step or list item
Inserts a new list or step item in the current list type.

Insert Unordered List
Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List
Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort
Sorts cells or list items in a table.

Insert Table
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a `block element` (on page 3218)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).
### Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

### Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

### Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

### Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

### Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### DITA Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

#### Add File to Review Task

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2527). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.
Edit Attributes

Displays an in-place attributes editor (on page 630) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes (on page 668) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 3220). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box (on page 2903) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an <xref> that points to that element. If no elements with an ID value are found, a message
will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context combo box** *(on page 2903)* points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a **block element** *(on page 3218)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:**
  
  If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

- **Insert Image**

  Inserts an image reference *(on page 719)* at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**

  Opens a **Choose Media** dialog box *(on page 747)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.
Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 749).

Insert Note

Inserts a new <note> element at the current cursor position.

Insert Code Block

Inserts a new <codeblock> element at current cursor position.

Insert Menu Cascade

Inserts a new <menucascade> element at current cursor position.

Insert Paragraph

Inserts a new <p> (paragraph) element at current cursor position.

Insert Section

Inserts a new <section> element in the document, depending on the current context.

Insert Topic

Inserts a new <topic> element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- &#<decimal value>- e.g. &#65
- '&#<decimal value>- e.g. &##65
- #<hexadecimal value>- e.g. #x41
- &#x<hexadecimal value>- e.g. &#x41

Style submenu

This submenu includes the following text styling actions:

Bold

Emphasizes the selected text by surrounding it with a <b> (bold) tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with an <i> (italic) tag. You can use this action on multiple non-contiguous selections.

Underline
Emphasizes the selected text by surrounding it with a `<u>` (underline) tag. You can use this action on multiple non-contiguous selections.

**Subscript**

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Code**

Surrounds the selected text with a `<codeph>` tag.

**UI Control**

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

**Filepath**

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the Other Actions submenu provides access to the other actions):

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at the cursor position or multiple rows in a selection.

- **Insert Columns**
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the Cross Reference (xref) dialog box (on page 3075) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 3220) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 3074).

File Reference

Opens the File Reference dialog box (on page 3075) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 3074).

Web Link
Opens the **Web Link** dialog box *(on page 3075)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. For more information, see Linking in DITA Topics *(on page 3074)*.

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box *(on page 3076)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3074)*.

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box *(on page 3076)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3074)*.

**Related Link to Web Page**

Opens the **Web Link** dialog box *(on page 3076)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3074)*.

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:
When invoked on a single selection, an ID is generated for the selected element at the cursor position.

When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**
The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

### Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**

  This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box (**on page 3045**) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (**on page 3046**), content key references (@conkeyref) (**on page 3048**), or key references to metadata (@keyref) (**on page 3051**).

- **Push Current Element**

  Opens the **Push current element** dialog box (**on page 3054**) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**

  This action is available for elements with a @conref or @conkeyref attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see **Reuse Content Dialog Box** (**on page 3045**).

- **Replace Reference with Content**

  Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.

2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.

2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the Replace selection with content reference option is selected in the dialog box, the selection will be replaced with a content reference (@conref). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (@conref and @conrefend). For more information, see Creating a Reusable Content Component (on page 3057).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 3058).

**Search References (Ctrl + Shift + G (Command + Shift + G on macOS))**

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 3220) (opened in the DITA Maps...
Manager view (on page 2899)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 769. Search References to Ancestors Dialog Box

Tip: If you are invoking the action on an image, see Searching for References to Images (on page 2978) for details about what will be reported.

Find Similar Topics

Opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keywords>, and <indexterm> elements. It is helpful for quickly finding related topics that can be added as related links.

Show Key Definition

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 3220) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 3219).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.
Select submenu

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with change tracking (on page 3226) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 463). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed
of 2 to 4 hexadecimal characters and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} will be converted to \texttt{E}
- \texttt{0x0125} to \texttt{ĥ}
- \texttt{265} to \texttt{ɥ}
- \texttt{2190} to \texttt{←}

Note:
For more information about finding the hexadecimal value of a character, see \textit{Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 466)}.

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

\begin{itemize}
  \item \texttt{Toggle Comment}
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
  \item \texttt{Move Up (Alt + UpArrow)}
  Moves the current node or selected nodes in front of the previous node.
  \item \texttt{Move Down (Alt + DownArrow)}
  Moves the current node or selected nodes after the subsequent node.
  \item \texttt{Split Element (Alt + Shift + D (Ctrl + Alt + D on macOS))}
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.
  \item \texttt{Join Elements}
  Joins two adjacent block elements (on page 3218) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.
  \item \texttt{Surround with Tags (Ctrl + E (Command + E on macOS))}
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
\end{itemize}
If the **Position cursor between tags** option *(on page 212)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

If the **Position cursor between tags** option *(on page 212)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’** *(Ctrl + ForwardSlash (Command + ForwardSlash on macOS))*

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA-related Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**
Use this operation to convert @conref attributes to @conkeyref attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Generate IDs**

Use this operation to automatically generate unique IDs for elements.

**Attributes Refactoring Actions**
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**
Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**
Allows you to change an attribute into an element.

**Delete attribute**
Allows you to remove one or more attributes.

**Rename attribute**
Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allows you to delete elements.

**Delete element content**
Allows you to delete the content of elements.

**Insert element**
Allows you to insert new elements.

**Rename element**
Allows you to rename elements.

**Unwrap element**
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

### Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

- **Insert XML fragment**
  
  Allows you to insert an XML fragment.

- **Replace element content with XML fragment**
  
  Allows you to replace the content of elements with an XML fragment.

- **Replace element with XML fragment**
  
  Allows you to replace elements with an XML fragment.

### Review submenu

This submenu includes the following actions:

- **Track Changes**
  
  Enables or disables the *Track Changes (on page 3226)* support for the current document.

- **Accept Change(s) and Move to Next**
  
  Accepts the *Tracked Change (on page 3226)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

- **Accept All Changes**
  
  Accepts all *Tracked Changes (on page 3226)* in the current document.

- **Reject Change(s) and Move to Next**
  
  Rejects the *Tracked Change (on page 3226)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

- **Reject All Changes**
  
  Rejects all *Tracked Changes (on page 3226)* in the current document.

- **Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3226)*. The comment will appear in a callout and a tooltip when
hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the Review view (on page 664).

**Manage IDs submenu**

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

**Rename in**

 Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**

 Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 831) dialog box, this scope will be used instead.
Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 831).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on macOS))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on macOS))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on macOS))**
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (on page 640) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 176) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 770. DITA Floating Contextual Toolbar

The floating contextual toolbar is automatically displayed when editing DITA documents in various situations, including:
• When a `<p>`, `<li>`, or `<shortdesc>` element has a selection inside, the floating toolbar includes actions such as **Bold**, *Italic*, _Underline_, a Link submenu, and more.

• When an `<image>` or `<xref>` element is selected:
  ◦ If the element has an `@href` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  ◦ If the element has a `@keyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.

• When an `<object>` element is selected:
  ◦ If the element has a `@data` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  ◦ If the element has a `@datakeyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.

• When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.

• When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.

• When a `<ul>` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.

• When an `<ol>` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.

• When an `<li>` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.

• When a `<row>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).

• When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).

• When a `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the Project view (on page 402) or DITA Maps Manager view (on page 2899) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 402) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).
Working with Markdown Documents in DITA

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the DITA topic will look after conversion. Likewise, the XDITA tab in the Preview pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the Preview pane.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager. The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.
• **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

• **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

![Figure 771. Convert Markdown to DITA Topic Dialog Box](image)

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Editor is about to make.
Convert

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

Tip:
Oxygen XML Editor comes with a sample ditamap project for converting Markdown to DITA. Go to the Project view (on page 402), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

Converting Multiple Markdown Documents to DITA

Oxygen XML Editor offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats, including Markdown to DITA. For more information and instructions for installing the add-on, see Batch Documents Converter Add-on (on page 2533).

DITA-Related Markdown Syntax

For a list of Markdown rules and syntax examples that are specific to DITA, see the Markdown DITA Syntax Reference.

Working with Keys in DITA

DITA uses keys to insert content that may have different values in particular circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a various ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.
**Defining Keys in DITA Maps**

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the *main (root) map (on page 3225).* This makes it easier to manage since they’re all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a `<keyword>`. To define this type of key, follow these instructions: *Key Definition with a Keyword Value (on page 2933).*
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: *Key Definition with a Target (on page 2934).*

**Using Keys for Values**

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see *Working with Variable Text in DITA (on page 3058).*

**Assigning Keys to Topics**

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `<topicref>` element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `<topicref>` element in its *DITA map (on page 3220)*) is to use the **Keys** tab in the **Edit Properties** dialog box (on page 2936). In the **DITA Maps Manager (on page 2899)**, invoke the contextual menu on the topic that will have the key assigned and select **Edit Properties**. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can **create a link (on page 3074)** to it using `<xref keyref="feature.quick-heat">`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it **in a map to create a reference to a topic (on page 2919)** by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to **insert a content reference (on page 3040)**. In this case, the content reference uses the key to locate the topic to pull content from. It uses a `@conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure">`. In this example, `feature.quick-heat` is the key,
and preheat-procedure is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

**Assigning Keys to Graphics**

You can assign a key to an image (using a map to point to the image file (on page 2934)) and then insert the image using the key (on page 2975).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

**Working with a Glossary of Terms in DITA**

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 3225). The actual glossary terms are small *glossary entry* topics that are referenced in the glossary map. You can add links to the glossary terms (on page 3031) in the output and you can even define abbreviated forms (on page 3032) for terms that have an acronym or some other type of abbreviation.

**How to Create a Glossary of Terms in Oxygen XML Editor**

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. **Create a new submap (on page 2917)** for your glossary and embed it in your main map.

2. Create a glossary entry topic (<glossentry>) for each glossary term. The <glossentry> element may contain numerous optional glossentry elements, but every glossentry topic must contain a <glossterm> and <glossdef> element. The <glossterm> is the name of the term while the <glossdef> is its definition.

Here is an simple example:
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>

The easiest way to create a glossentry topic in Oxygen XML Editor:

a. Click the New file wizard button on the toolbar.
b. Type glossentry in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the glossref element. This element requires a @keys attribute. Please make sure the @print attribute is set to yes to show the glossary also in the PDF output.

```xml
<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

   **Step Result:** This opens the Insert Reference dialog box (on page 2925).

b. Go to the Keys tab and enter a name in the Define keys field.
c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.
d. Click Insert and Close.

**Tip:**
You could also group multiple glossentry topics into a single collection by using the glossgroup element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the term element (or abbreviated-form element as described in the next section (on page 3032)) with a @keyref attribute that references the corresponding key specified in the glossref. Of course, the glossref points to the glossentry topic where the glossary term is defined.

```xml
<term keyref="gloss_ddl"/>
```
In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the **DITA Reusable Components view** *(on page 3063)*, go to the **Keys** tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.

### Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```xml
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: [http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc](http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc)

Reusing DITA Content

Reusing content is one of the key features of DITA and DITA provides several methods for reusing content. Oxygen XML Editor provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 3036).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 3037) (conref, conkeyref, coderef). A conref (content reference) (on page 3038) creates a direct reference to a specific element of another topic. A conkeyref (content key reference) (on page 3040) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A coderef references an external file that contains literal code.

Oxygen XML Editor provides support for all of these mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Editor can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component (on page 3056) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 3058), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. Key Scopes (or scoped keys) (on page 3060) allow you to reuse topics with variable content depending on the
particular context and it maximizes reuse possibilities for keys. *Branch Filtering (on page 3062)* allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the **DITA Reusable Components view (on page 3063)** can be quite helpful. It collects all of the keys and reusable components that are defined in the *root map (on page 3225)* and presents them in a dynamic table where you can easily locate and insert references to them.

**Reuse Actions in Oxygen XML Editor**

Oxygen XML Editor includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the **DITA menu**, and some are available on the toolbar.

- **Reuse Content**
  
  This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box (on page 3045)** that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (**@conref**) (on page 3046), content key references (**@conkeyref**) (on page 3048), or key references to metadata (**@keyref**) (on page 3051).

- **Push Current Element**
  
  Opens the **Push current element dialog box (on page 3054)** that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
  
  This action is available for elements with a **@conref** or **@conkeyref** attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (**@conref/@conkeyref** and **@conrefend** attributes). For more information, see **Reuse Content Dialog Box (on page 3045)**.

- **Replace Reference with Content**
  
  Replaces the referenced fragment (**@conref** or **@conkeyref**) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (**hrefs**), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (`keyref`, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `<xref>` or `<link>` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference (`conref`). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (`conref` and `conrefend`). For more information, see **Creating a Reusable Content Component** (on page 3057).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see **Inserting a Reusable Content Component** (on page 3058).

**Resources**

For more information about reusing strategies in DITA, see the following resources:

- **Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies**
- **Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies**

**Related information**

- **Working with Keys in DITA** (on page 3028)
Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map is opened in the DITA Maps Manager.
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on macOS) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      • Open the other map in the DITA Maps Manager, right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
      • Right-click the topic in the Project view (or the file system), select Copy, switch to the DITA Maps Manager view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
3. If your topic uses a key reference, set up the appropriate key definition in your map.
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action on the toolbar in the DITA Maps Manager.
**Reuse Topics Using Author Mode Editor**

1. **Open the DITA map (on page 2897)** in the **Author mode editor**.
2. **Add a reference to an existing topic by dragging it from the Project view (on page 402)** (or the file system) and dropping it in the desired location in the DITA map opened in **Author mode**. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.
3. If your topic uses a key reference (on page 3028), set up the appropriate key definition in your map (on page 2932).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can **add a relationship table to your map (on page 3080)**.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this **validation**, click the Validate and Check for Completeness action (on page 2943) on the toolbar in the DITA Maps Manager.

**Displaying Multiple References to the Same Topics**

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2899), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.

**Working with Content References**

The DITA content reference feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA @conref or @conkeyref attributes.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
• *Arbitrary content references* - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a `@conref` or `@conkeyref` attribute to an element in the local document. The `@conref` or `@conkeyref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (Options > Preferences) (on page 124), go to Editor > Edit modes > Author, and deselect the Display referenced content option (on page 179).

**Note:**
A reference also displays tracked changes (on page 3226) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select Edit Reference.

**Tip:**
To search for references made through a direct content reference, use the Search References action from the contextual menu.

- DITA Reusable Components View (on page 3063)

### Creating a DITA Content Reference

**DITA Content Reference**

A DITA content reference, or `conref`, is one of the main content reuse features of DITA (on page 3033). It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.
Assigning an **ID** to the Referenced Content

To add an **id** to a DITA element in a topic, place the cursor on the element and select **Edit Attributes** from the contextual menu (or simply press **Alt+Enter**) to open the in-place attribute editor *on page 630*. Enter **id** as the **Name** of the attribute and a value of your choice in the **Value** field. You can also use the **Attributes view** *on page 627* to enter a value in the **id** attribute.

**Note:**
The element may already have an **id**, since in some cases, Oxygen XML Editor automatically generates an **ID** value when the **id** attribute is created.

Creating a Content Reference

To create a content reference (**conref**), follow these steps:

1. Make sure the element you want to reference has an **ID** assigned to it *on page 3039*.
2. In **Author mode** *on page 354*, place the cursor at the location where you want the reused content to be inserted.
3. Select the **Reuse Content** action on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content** dialog box *on page 3045* is displayed.
4. In the **Location** field of the **Reuse Content** dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) to have their content inserted, and verify the content in the **Preview** pane. The **id** value of the element that you select is automatically added to the **Reference to (conref)** field.
6. Make any other selections you need in the **Reuse Content** dialog box *on page 3045*. If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the **id** value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an **ID** attribute. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option** *on page 181* is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (**conref**) using copy/paste actions, follow these steps:
1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 3067) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor Create Reusable Component (on page 3057) and Insert Reusable Component (on page 3058) actions (available in the DITA menu and the Reuse submenu of the contextual menu). They handle the details of creating an ID and conref and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also insert reusable content using content key references (on page 3040). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 3053), the conref push mechanism (on page 3054), variable text (on page 3058), key scopes (on page 3060), and branch filtering (on page 3062).

- Working with Reusable Components (on page 3056)
- Working with Content References (on page 3037)

Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or @conkeyref, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism (on page 3038) that uses keys (on page 3028) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a conref, a conkeyref requires that the element to be reused has an id attribute. It also requires the topic that contains the reusable content to be assigned a key (on page 3028) in a map. As with all uses of keys, you can substitute multiple maps or use profiling (on page 3135) to create multiple definitions of keys in a single map. This allows the same @conkeyref to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.
Creating a Content Key Reference

To create a content key reference (@conkeyref), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an ID assigned to it.
2. In Author mode (on page 354), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 3045) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.
5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The @id value of the element that you select is automatically added to the Reference to (conkeyref) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 3048). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the @id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

Note:
If you are using Text mode (on page 353), when you insert a @conkeyref attribute, after you enter the first quote (@conkeyref=), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 181) is selected in the Schema-Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (@conkeyref) using copy/paste actions, follow these steps:
1. In the **DITA Maps Manager view** *(on page 2899)*, make sure that the **Context combo box** *(on page 2903)* points to the correct map that stores the keys.

2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager *(on page 2899)*, select **Edit Properties**, and enter a value in the **Keys** field.

3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.

4. Place the cursor at a location where the copied element will be valid.

5. Select the **Paste as Content Key Reference** action from the **Paste Special** submenu from the contextual menu.

### Other Ways to Reuse Content

- You can use the **Components tab** in the **DITA Reusable Components view** *(on page 3067)* to easily insert content key references.
- You can also insert reusable content using content references (**conref**) *(on page 3038)*.
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as **code references** *(on page 3053)*, the **conref push mechanism** *(on page 3054)*, **variable text** *(on page 3058)*, **key scopes** *(on page 3060)*, and **branch filtering** *(on page 3062)*.

**Related Information:**

- Reuse Content Dialog Box *(on page 3045)*
- DITA Reusable Components View *(on page 3063)*
- Creating a DITA Content Reference *(on page 3038)*
- Editing DITA Content References *(on page 3042)*
- Working with Reusable Components *(on page 3056)*
- Working with Content References *(on page 3037)*

**Editing DITA Content References**

When you reference reusable content using a **@conref** or **@conkeyref** attribute, by default, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the **Edit** icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.

Oxygen XML Editor also includes some actions that allow you to quickly edit existing content references.

When the element that contains a content reference (**@conref** or **@conkeyref**) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a **@conref** or **@conkeyref** attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details.
Replace Reference with Content

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for gid attributes.

Replace All References with Content

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for gid attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

Converting Conrefs to Conkeyrefs

Oxygen XML Editor includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

Single Document Method
With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the **DITA Maps Manager (on page 2899)**), go to the **Refactoring** submenu, and choose **Convert conrefs to conkeyrefs**.

### Multiple Documents At Once Method

Select **XML Refactoring** from the **Tools** menu (or from the **Refactoring** submenu when you right-click a document in the **Project view (on page 402)** or the **DITA Maps Manager view (on page 2899)**). Then select **Convert conrefs to conkeyrefs** from the **DITA** section and click **Next**.

Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method (on page 3044)**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method (on page 3043)**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

- **Preview**
  
  You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

  **Warning:**
  
  It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

- **Finish**
  
  When you use the **Finish** button, the operation will be processed and all **content references** will be converted to **content key references** (either all **content references** in the current document or all **content references** in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the **DITA Map (on page 3220)**, so you still need to manually define each key in your **DITA map (on page 2932)**.
Reuse Content Dialog Box

The Reuse Content dialog box provides a mechanism for reusing content fragments. DITA @conref, @conkeyref, and @keyref attributes can be used to insert references to reusable content. The @conref attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The @conkeyref attribute uses keys (on page 3028) to locate the content to reuse rather than direct references to the topic that contains the reusable content. The @keyref attribute also uses keys (on page 3028) and can be used to indirectly reference metadata that may have different values in various circumstances.

Note:
For a conref or conkeyref, to reference the content inside a DITA element, the source element must have an @id attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA @conref and @conkeyref attributes, go to https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html.

Note:
For the purposes of using a @keyref, keys are defined at map level and referenced afterward. For more information about the DITA @keyref attribute, go to https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html.

Oxygen XML Editor displays the referenced content (on page 595) of a DITA content reference if it can resolve it to a valid resource. If you use URLs instead of local paths in your XML documents and your DITA-OT transformation needs an XML Catalog (on page 3227) to map the URIs to local paths, you need to add the catalog in Oxygen XML Editor (on page 826). If the URIs can be resolved, the referenced content is displayed in Author mode and in the transformation output.

In Author mode, a reference to reusable content (@conref, @conkeyref, or @keyref) can easily be inserted at the cursor position by using the Reuse Content dialog box. It can be opened with any of the following methods:

- Click the Reuse Content action on the main toolbar.
- In the contextual menu of the editing area, go to Reuse > Reuse Content.
- Go to DITA > Reuse Content.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor will insert a @conref, @conkeyref, or @keyref.
If you select **Location** for the content source, a *content reference* (`@conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (`@conkeyref`) or a *key reference* (`@keyref`).

**Content Reference (`@conref`) Options Using the Reuse Content Dialog Box**

**Figure 772. Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)**

![Reuse Content Dialog Box](image)

Choose the content source

**Choose the content source Section**

When **Location** is selected for the content source, a *content reference* (`@conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

**Select an element from the content source Section**
Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor automatically fills this text field with the value of the @conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conref range.
Content Key Reference (@conkeyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3225) (you can also select one from the drop-down list in the Key field).

Note:
If the current DITA map is not selected as the root map, no keys will be listed.

Tip:
You can also use the DITA Reusable Components view (on page 3063) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2916).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 3220) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a **content key reference** (@conkeyref), select the key that contains the content you want to reference. Notice that the file path is shown in the Href column. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @conkeyref, you need to select a key that does have a value (file path) in the Href column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a **content key reference** has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a @conkeyref:
Select an element from the content source Section

Show elements of type
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table
Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane
Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane
Displays the source code of the element to be referenced.

Reference details Section

Reference type
The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that conkeyref value is automatically selected.

Reference to
Oxygen XML Editor automatically fills this text field with the value of the @conkeyref attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)
You can select this option to define a @conref attribute to be used as a fallback to determine the content reference relationship if the specified conkeyref cannot be resolved.

Reference to range end (conrefend)
If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conkeyref range.
Key Reference to Metadata (@keyref) Options Using the Reuse Content Dialog Box

Figure 775. Insert Key Reference Options

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3225) (you can also select one from the drop-down list in the **Key** field).

**Note:**

If the current DITA map is not selected as the root map, no keys will be listed.

**Tip:**

You can also use the DITA Reusable Components view (on page 3063) for similar purposes.
The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2916).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 3220) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a key reference to metadata (@keyref), select the key you want to reference. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @keyref, you need to select a key that does not have a value (file path) in the Href column.

After you select a key, click OK to return to the Reuse Content dialog box.

When a key that references metadata has been selected, the Reuse Content dialog box offers the following additional options for inserting a @keyref.
Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

Reference to

Oxygen XML Editor automatically fills this text field with the value of the @keyref attribute to be inserted.

Element name

Oxygen XML Editor automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click Insert or Insert and close, the configured content reference is inserted into your document.

Tip:

You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

DITA Reusable Components View (on page 3063)
Working with Content References (on page 3037)

Working with Code References

Code References

The DITA `<coderef>` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `<coderef>` is processed, the referenced code file is imported and delimiting characters (such as `<` or `&`) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.
Example of using a Coderef

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 3220), the conref push will be processed during the publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario where a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.
This dialog box allows you to configure the following options for the conref push action:

**Choose the target resource**

Allows you to select a Location URL or a Key for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that can be replaced by, or pushed before/after, the current element, according to the push action.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

- **replace the target element**
  
  The target element will be replaced with the current element content.

  On the technical side, the value of the @conaction attribute in the current element will be set to `push replace` and the @conref or @conkeyref attribute will be set to the specified reference.

- **push before**
The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the Preview panel to view the content that will be pushed and the Source panel to see the XML code for the content to be pushed. After you click OK, the conref push mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

**Resources**

For more information about the conref push mechanism and other advanced DITA profiling concepts, watch our Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies.

**Related information**
The DITA Style Guide Best Practices for Authors: The Conref Push Technique

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an ID. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Editor allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component (on page 3057) and Insert Reusable Component (on page 3058) actions.

Related Information:
DITA Reusable Components View (on page 3063)

Creating a Reusable Content Component

Oxygen XML Editor makes it easy to create a reusable component from existing topic content.

Note:
To ensure that the topic file that contains the reusable component is a valid container for the reusable content component, Oxygen XML Editor attempts to use the same schema information in the current topic for the file that contains the reused component. If it cannot create a valid instance of the reused content file with this approach, the application creates a specialized topic type automatically. This specialization is designed to make sure that the content is compatible with the topic type that it is created from. You can make changes to the configuration file (\OXYGEN_INSTALL_DIR\frameworks\dita\reuse\reuse_configuration.properties) or override it from a framework extension to control if the created reusable component file should be based on the currently edited topic or it should be an automatically created DITA specialization topic.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component (or place the cursor inside an element you want to reuse).
2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. The Create Reusable Component dialog box is displayed.
3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This is used as a description for the reusable component, but is not part of the reused content. It is just to help you identify the reusable content and will not become part of your output.
5. If the Replace selection with content reference option is selected, the selection in the current topic will be replaced with a content reference (@conref) that points to the new reusable component. If multiple elements are selected (for example, multiple steps or list items), the selection is replaced with a content reference range (@conref and @conrefend).
6. Select a file name and location to save the topic containing the reusable component and click Save. It is considered best practice to save or store reusable components in an area set aside for that purpose.
A file is created that contains one reusable component. You can reference the reused content in other topics by using a content reference (on page 3038) or content key reference (on page 3040). Also, if the Replace selection with content reference option was selected, Oxygen XML Editor replaces the selected content with a content reference that will be displayed in your current topic with a gray background and it can only be edited in the source file (the new reusable component). To edit the source file, click the Edit Content icon at the beginning of the content reference.

**Inserting a Reusable Content Component**

Oxygen XML Editor includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 3057).

**CAUTION:**

This action is only designed to insert reusable components created using the Oxygen XML Editor Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA @conref to insert the content, and creates a parent element for the @conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the @conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. The Insert Reusable Component dialog box is displayed.
3. Locate the reusable content file that you want to insert its content.
4. If you select Content reference in the Insert as drop-down list, the action will add a @conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click Insert to perform the action.

**Working with Variable Text in DITA**

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.
For example, you might have a sentence like this:

The quick-heat feature allows [product-name] to come up to temperature quickly.

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the @product profiling attribute, as in the following example:

```
<p>The quick-heat feature allows <ph product="basic">Basic Widget</ph>
<ph product="pro">Pro Widget</ph>
to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```

When the content is published, the value defined in the product key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 2932) into a document in Oxygen XML Editor Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor feature you prefer):
**DITA Reusable Components View Method**

Use the [DITA Reusable Components view](on page 3063) to insert a variable reference to the defined key (on page 2932). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Editor will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

**Code Template Method**

Add the source code pattern of the defined key (on page 2932) to a code template (on page 217) so that it appears in the list of proposals in the Content Completion Assistant (on page 3219). For example, the code pattern could be something like `<ph keyref="product">` for defined *product* key.

**Reuse Content Dialog Box Method**

Use the [Reuse Content](on page 3045) action on the main toolbar to open the Reuse Content dialog box (on page 3045). Use the Key option to select a key that is defined as a variable (key reference to metadata) (on page 3051) and Oxygen XML Editor will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

**Manual Method**

Manually insert the `@keyref` attribute using the attributes editor as follows:

1. Press `Enter` and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
2. Select [Edit Attributes](on page 630) from the contextual menu (or simply press `Alt+Enter`) to bring up the attributes editor (on page 630).
3. In the Name field, select `keyref`.
4. In the Value field, select or enter the name of the defined key (on page 2932).

Related Information:
- DITA Reusable Components View (on page 3063)
- Defining Keys in DITA Maps (on page 2932)

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called Key Scopes (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map (on page 3220), but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating
system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

**How to Use Key Scopes in Oxygen XML Editor**

To use DITA 1.3 key scopes in Oxygen XML Editor, follow these steps:

1. **Define the keys (on page 3028)** to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the **DITA Maps Manager (on page 2899)** and select `Edit properties`
   b. In the **Keys tab (on page 2936)**, enter a value (or multiple values) in the **Key scopes** field.
   c. Click **OK** to save your changes.
3. Save the DITA map.

**Result:** In the **DITA Maps Manager (on page 2899)**, you can now see the key scopes in brackets and when you open each topic reference.

![Figure 778. Key Scopes in DITA Maps Manager](image)

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the **DITA map**, the scoped keys will be reflected in the published content.

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the [DITA 1.3 Key Scopes - Next Generation of Reuse](https://example.com) blog post.
- You can also watch our [DITA 1.3 video tutorial](https://example.com) to see how key scopes can be used in Oxygen XML Editor.
- For more information about key scopes and other advanced DITA reuse concepts, watch our Webinar: [Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies](https://example.com).

**Related information**

- [Working with DITA 1.3 Branch Filtering (on page 3062)](https://example.com)
- [Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse](https://example.com)
- [Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)](https://example.com)
Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called Branch Filtering that enables you to set filtering conditions for specific branches of a DITA map (on page 3220). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.). Therefore, it would be helpful if you could reference the same topic twice within the same map, each time using different filters. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Editor

To use DITA 1.3 branch filtering in Oxygen XML Editor, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 269).
2. Assuming you have already defined your profiling attributes (on page 670), create a DITAVAL filter file (on page 3159).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 2899) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (on page 2899) and when you transform the DITA map, filtered content will be reflected in the published output.

Figure 779. Branch Filtering in DITA Maps Manager

![DITA Maps Manager screenshot showing branch filtering example]
Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Branch Filtering - Next Generation of Reuse* blog post.
- You can also watch our *DITA 1.3 video tutorial* to see how branch filtering can be used in Oxygen XML Editor.
- For more information about branch filtering and other advanced DITA reuse concepts, watch our Webinar: *Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies*.

DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large number of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map (on page 3225)* and presents them in a side view where you can easily locate and insert references to them. It recollects the keys anytime the *root map is changed (on page 2916)* or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from **Window > Show View**. By default, it appears in the bottom-right section of the editor.

**Tip:**
You can also assign a keyboard shortcut to open the view using the **Menu Shortcut Keys** preference page (on page 294).

It includes the following tabs:

- **Keys (on page 3064)** - Displays all the keys that are defined in the *root map (on page 3225)* and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

- **Components (on page 3067)** - Displays all the reusable components found in the *root map (on page 3225)* and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor looks for any *topicref* in the *root map (on page 3225)* that is marked as *resource-only* and then looks for elements with an assigned *id* attribute value. This tab includes a search field, some filtering options, and some simple links and
contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

- **Media (on page 3070)** - Displays all images referenced as keys in the root map along with all images found in the user-defined working sets.

### Keys Tab

The **DITA Reusable Components** view collects all the *keys* that are defined in the current *root map (on page 3225)* and displays them in the **Keys** tab. This tab has two view modes. The default *tiles* style view mode and a *table* style view mode.

#### Tiles Mode

The default *tiles* mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the *@keys* attribute), followed by its description and/or *@href* value, then followed by the name of the DITA map file where the key is defined.

*Figure 780. DITA Reusable Components View - Keys Tab (Default tiles mode)*

![Image](image-url)

#### Table Mode

You can switch to a *table* style display mode by selecting the **Table mode** toggle action from the **Settings** menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in the **Description** column, while keys that are defined with a value in an *@href* attribute have that href value listed in the **Href** column.
Both display modes in the **Keys** tab include a variety of features and options:

### Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

### Sorting

**Tiles Mode:** In the default *tiles* display mode, to sort the keys alphabetically in ascending order, select **Sort by key name** from the 🌐, **Settings** menu.

**Table Mode:** In the *table* display mode, the following columns can be sorted by clicking the heading:

- **Key** - The name of the key (the value of the `@keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
- **Definition Location** - The name of the **DITA map (on page 3220)** where the key is defined.

### Double-Click Mechanism

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `@href` value, it is inserted as a **cross reference link (xref)** (**on page 3074**).
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a **variable reference (ph)** (**on page 3058**).

### Drag and Drop Mechanism
You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an @href value, it is inserted as a cross reference link (xref) (on page 3074).
- If the selected key is a reference to an image, it is inserted as an <image> element.
- If the selected key does not have an associated @href, it is inserted as a variable reference (ph) (on page 3058).

**Contextual Menu Actions**

**Insert as Link**

Inserts a cross reference link (xref) (on page 3074) to the selected key at the current cursor position or surrounding the current selection.

**Insert as Variable**

Inserts a variable reference (ph) (on page 3058) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an <image> element.

**Insert as Keyref**

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a @keyref attribute and its value set to the selected key.

**Rename Key**

Opens a refactoring wizard (on page 844) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

**Notes:**

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

**Go to Definition**

Opens the DITA map where the key is defined.

**Search References**

Searches for all references to the selected key in the entire DITA map structure.

**Group by Definition Location (Available in Table mode only)**
A toggle action that can be used to group (and sort) all the keys based on the value in the **Definition Location** column.

**Settings Menu**

This menu includes the following options:

**Filtering Options**

- **Show all** - Shows all defined keys found in the current root map (on page 3225).
- **Show only variables** - Filters the keys to show only those defined as variable references (on page 3058).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the *table* and *tiles* display modes.

**Components Tab**

The **DITA Reusable Components** view collects all the topics from the current root map (on page 3225) that are marked as *resource-only*, then collects the reusable components from those topics, and displays them in the **Components** tab. To set a topic as *resource-only*, the `<topicref>` in the DITA map file must have a `@processing-role` attribute set like this:

```xml
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The **DITA Reusable Components** view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an *ID* specified. These reusable components are displayed in the **Components** tab along with the file name and the specific names of the elements that contain an *ID* attribute.
The **Components** tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (* or ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the Components tab to a compact visualization mode. When switched to Compact mode, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**

You can use this action force a re-indexing of the reusable components.

**Show Elements of Type**

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

**Source File(s)**
You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

**Double-Click Mechanism**

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (`conkeyref`) (on page 3040).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (`conref`) (on page 3038).

**Drag and Drop Mechanism**

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (`conkeyref`) (on page 3040).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (`conref`) (on page 3038).

**Hover and Click Actions**

If you hover over a component shown in the preview window, you have access to the following link actions:

**Insert**

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (`conkeyref`) (on page 3040). Otherwise, it is inserted as a content reference (`conref`) (on page 3038).

**Open**

Opens the source file that contains the reusable component.

**Contextual Menu Actions**

**Insert Content Reference**

Inserts the component as a content reference (`conref`) (on page 3038) at the current cursor position or replaces the current selection.

**Insert Content Key Reference**
Inserts the component as a content key reference (conkeyref) (on page 3040) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

**Go to Definition**

Opens the source file that contains the reusable component.

**Search References**

Searches for all references to the selected component in the entire DITA map (on page 3220) structure.

**Media Tab**

The Media tab displays all media resources (images, audio, video) referenced as keys in the current root map along with all audio, image, and video resources found in user-defined working sets (on page 3071).

**Figure 783. DITA Reusable Components View - Media Tab**

The Media tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific media resource key or file names in the list of available resources.

**Resource Type Filter**

You can quickly show resources of a specific type by clicking one of the type buttons (Images, Audio, Video, Others).
Settings Menu

This menu includes the following options:

Sort by date

Sorts the presented resources based on both the date when they were last modified and the date they were created.

Configure working sets

Use this option to define folders where the media resources will be gathered. The Media tab will include audio, image, and video resources collected from the current root map as well as media resources located in the folders defined as active working sets. The working sets are defined at project level so that they can be easily shared with others. To save working sets in the global user-specific settings instead, in the Preferences > Project Level Settings page you can uncheck the Save DITA media working sets at project level checkbox.

Reload

Refreshes the list of displayed media resources. This is useful if resources were recently added in the searched folders.

Double-Click Mechanism

You can double-click any media resource in the list to add a reference to it.

Drag and Drop Mechanism

You can drag a media resource from the list and drop it in the main editor to add a reference to it.

Contextual Menu Actions

Insert As Image Reference

Inserts an image reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

Insert As Audio Reference

Inserts an audio reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

Insert As Video Reference

Inserts a video reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

Insert As Embedded Reference
Inserts as an embedded reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

**Insert as Link**

Inserts a link to the resource, either as a DITA `<xref>` or `<link>`, depending on the cursor position.

**Insert as Variable**

Inserts a variable reference (on page 3058) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

**Insert as Keyref**

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with an `@keyref` attribute and its value set to the selected key.

**Preview**

Shows the selection in an Image Preview side view.

**Open in System Application**

Opens the default system editor/viewer associated with the resource type.

**Show in Explorer/Finder**

Opens the default file browser at the specific folder where the resource is located.

Items in the Media tab are presented in the following order:

- Key definitions are always presented first, in document order.
- Resources defined and collected from working sets are sorted alphabetically by name, for each folder separately.

**Related Information:**

- Working with Content References (on page 3037)
Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A DITA map (on page 3220) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (on page 2938).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `<xref>` element. The destination of the link can be expressed directly using the `@href` attribute or indirectly using the `@keyref` attribute. If you use the `@keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps. To add related links, select Related Link to Topic, Related Link to File, or Related Link to Web Page from the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu).

Tip:

You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.
Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The DITA Maps Manager (on page 2899) provides a way to validate all the links in the documents that are included in the map (on page 2943). This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map (on page 3220), you set the appropriate value of the @collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the @collection-type attribute.

Note:

Publishing scripts determine when and how to create hierarchical links. The @collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the @linking attribute.

To add the @collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the @linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the <xref> element. The destination of the link can be expressed directly by using the @href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the <related-links> element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 3028) to create either inline links or related links (with the @keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.
Links based on keys require two pieces:

- **Key Definition** - Assigns a key to a topic so that other topics can link to it. For more information, see [Defining Keys in DITA Maps (on page 2932)](#).
- **Key Reference** - Created in an `<xref>` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `<topicref>` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

**Inserting a Link in Oxygen XML Editor**

To insert a link in **Author mode (on page 354)**, use the actions available in the ![Link](on page 354) drop-down menu from the toolbar (or the ![Link](on page 354) submenu in the contextual menu or **DITA** menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the [Cross Reference (xref) dialog box (on page 3077)](#) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **Location** for the target, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](on page 3077) button to use the [Choose Key dialog box (on page 3077)](#).

**Web Link**

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **URL** for the target resource, the link is expressed in an `@href` attribute. If
you select **Key** for the target, keys will be used to express the link in a [@keyref](#) attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](#) button to use the **Choose Key** dialog box (on page 3077).

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box (on page 3077) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a **related-links** element.

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a **related-links** element. If you select **Location** for the target, the link is expressed in an [@href](#) attribute. If you select **Key** for the target, keys will be used to express the link in a [@keyref](#) attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](#) button to use the **Choose Key** dialog box (on page 3077).

**Related Link to Web Page**

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a **related-links** element. If you select **URL** for the target resource, the link is expressed in an [@href](#) attribute. If you select **Key** for the target, keys will be used to express the link in a [@keyref](#) attribute. You can select a key from the drop-down list or click the ![Choose Key Reference](#) button to use the **Choose Key** dialog box (on page 3077).
Cross Reference (xref) Dialog Box

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.

Figure 784. Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select Location for the target, the link is expressed in an @href attribute.

Key

If you select Key for the target, keys will be used to express the link in a @keyref attribute. You can use the Choose Key Reference button to open the Choose
Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3225) (you can also select one from the drop-down list in the Key field).

Tip:
You can also use the DITA Reusable Components view (on page 3063) for similar purposes.

Figure 785. Choose Key Dialog Box

The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2916).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keywords> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an @href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 3220) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.
**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

**Preview Pane**

Displays the content that will be referenced.

**Source Pane**

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

---

**Tip:**

You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

---

**Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference**

Oxygen XML Editor also includes support for inserting cross reference links with simple copy/paste or drag/drop actions ( additionally, you can insert them using the **Paste as Link** or **Paste as Link (keyref)** actions found in the **Paste Special** submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an **@id** attribute or a **<topicref>**. Also, the location in the document where you paste or drop the link must be valid, although as long as the **Smart paste and drag and drop option (on page 181)** is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Editor automatically tries to populate certain attributes based on detected values. The **@format**, **@scope**, and **@type** attributes are populated if their corresponding options are selected in the **Inserting Links** section of the DITA Topics preferences page (on page 274). Even if their corresponding options are not selected, the **@format** and **@scope** attributes are populated if their detected values are different than the default values.

---

**Note:**

For the sake of performance, the **@type** attribute is never automatically computed in the following cases:
• When using drag/drop or copy/paste actions from the DITA Maps Manager view (on page 2899) or from the Keys tab of the DITA Reusable Components view (on page 3063).

• When using the Paste as Link or Paste as Link (keyref) actions to paste a topic reference that was copied from the DITA Maps Manager view (on page 2899) and its <topicref> elements do not have the @type attribute defined.

Typically, cross reference links are inserted with an @href attribute, but it is also possible to insert them with a @keyref attribute using the Paste as Link (keyref) contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps:

1. In the DITA Maps Manager view (on page 2899), make sure that the Context combo box (on page 2903) points to the correct map that stores the keys.

2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2899), select Edit Properties, and enter a value in the Keys field.

3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a <topicref> from a DITA map.

4. Place the cursor at a location, where you want to insert the link.

5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:
1. If the map is currently open in the DITA Maps Manager (on page 2899), double-click the map icon (_mapped) to open the map in Author mode. If it opens in Text mode, click Author at the bottom left to switch to Author mode.

2. Move the insertion point inside the map root element (usually `<map>`, but it might be `<bookmap>`, or another specialization of the `<map>` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the map root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the map root element.

3. Select the Insert Relationship Table action on the toolbar or from the Relationship Table submenu of the contextual menu.

   The Insert Relationship Table dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click Insert.

5. Enter the type of the topics in the header of each column.

   The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the @type attribute of each `<relcolspec>` element to a value such as concept, task, or reference. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the @type attribute in the Attributes view (on page 627). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (on page 2963) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row/Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column/Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 2899) or the Project (on page 402) view into the appropriate cell in the relationship table.

   See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.

    Relationship tables are also displayed in the DITA Maps Manager view (on page 2899), along with the other elements in its DITA map.
You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 2899).
- Select the relationship table in the DITA Maps Manager (on page 2899) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 2899).

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 3220) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor using a transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the DITA Open Toolkit registry or from the list of free plugins (on page 3170) on the Oxygen XML Editor GitHub account.

⚠️ Warning:
Keep in mind that there could be instances where there are differences between what you see in Author mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain advanced constructs such as
DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor also includes a special Run DITA-OT Integrator that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

A variety of transformations scenarios are available for DITA maps:

- **Built-in transformation scenarios** allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.

**Important:**

If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1560) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1642).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 3220) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2899) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 3108)** - This tab contains a set of built-in publishing templates (on page 1603) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1642).
- **Parameters Tab (on page 3114)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page ) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab (on page 3115)** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab (on page 3116)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 3118)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 3120)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

General Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- `default.language`
This parameter is used if the language is not detected in the DITA map. The default value is en-us.

clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

editlink.remote.ditamap.url

Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

editlink.web.author.url

This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the editlink.ditamap.edit.url, editlink.remote.ditamap.url, and editlink.web.author.url parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

force.unique

When set to true (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.
webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the @class attribute can be used to exclude specific HTML elements from indexing. For example, the div.not-indexed value will not index all <div> elements that have a @class attribute with the value of not-indexed. Use a comma separator to specify more than one element.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url
Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the `DITA map`, appended to this base URL value).

**webhelp.sitemap.change.frequency**

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

**webhelp.enable.html.fragments.cleanup**

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to true (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to false, the transformation will fail if at least one HTML fragment is not well-formed.

**webhelp.fragment.after.body**
This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.main.page**

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.topic.page**

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use **webhelp.fragment.after.search.input.main.page** instead.

**webhelp.fragment.after.search.input.main.page**

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.topic.page**

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
This document is not relevant for the task at hand.
This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use **webhelp.fragment.before.search.input.main.page** instead.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.topic.page**

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.search.page**

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.terms.page**

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.footer**

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.
webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.topic.page
This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.search.page**

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**
This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.publication.toc
This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.content**

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.content**

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.feedback**

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.feedback**

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toc**

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toc**

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all
of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each  &lt;section&gt; within the current topic that
contains an @id attribute and the section corresponding to the current scroll position is
highlighted. The default value is yes.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default
value is yes.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings,
  and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when
the user hovers over its link in the table of contents. This parameter controls whether or not this
tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.activated.on.click**

When this parameter is activated (set to yes), clicking an item in the top menu will expand the
submenu (if available). You can then click on a submenu item to open the item (topic). You can
click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a
menu item displays the menu content.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The
default value is 3. A value of 0 means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles,
sections with titles, index term groups). The possible values are collapsed or expanded (default
value).
Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

- **webhelp.pdf.link.url**
  Specifies the target URL for the PDF link component.

- **webhelp.pdf.link.text**
  Specifies the text for the PDF link component.

- **webhelp.pdf.link.icon.path**
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- **webhelp.show.pdf.link**
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output.
  Allowed values are: yes (default) and no.

- **webhelp.pdf.link.anchor.enabled**
  Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with **xsl:fo** customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:
• **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.

• **Prince Print with CSS** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).

• **Antenna House Formatter** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1(formatter/)](http://www.antennahouse.com/antenna1(formatter/)).

### How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (on page 2899) toolbar.

2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (on page 3108) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

![Figure 787. DITA Map to PDF Templates](image-url)
In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
- **css.processor.type** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors preferences page**.
- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

### Customizing the Output

For information about customizing the output, see [CSS-based DITA to PDF Customization](page 1768).

### Related Information:

- [Editing a Transformation Scenario](page 1545)
- [Configure Transformation Scenario(s) Dialog Box](page 1548)
- [Oxygen PDF Chemistry User Guide](page 1768)
**DITA Map PDF - based on XSL-FO Transformation**

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (on page 3220)* to PDF output.

**Creating a DITA Map PDF - based on XSL-FO Transformation Scenario**

To create a *DITA Map PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the *DITA Maps Manager (on page 2899)* toolbar.
2. Select *DITA Map PDF - based on XSL-FO* and click the **Edit** button (or use the **Duplicate** button if your framework (on page 3221) is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - **show.changes.and.comments** - If set to *yes*, user comments, replies to comments, and tracked changes are published in the PDF output.
   - **customization.dir** - Specifies the path to a customization directory.
   - **editlink.present.only.path.to.topic** - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Related Information:**
- XSL FO-based DITA to PDF Customization (on page 1986)

**DITA Map MS Office Word Transformation**

Oxygen XML Editor comes bundled with a transformation scenario that allows you to convert *DITA maps (on page 3220)* to Microsoft Office Word documents. It utilizes the *DITA to Word plugin created by Jarno Elovirta*. This plugin contains a Word document named **Normal.docx** (located in: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:**
You can make general modifications to the **Normal.docx** template file to alter the published output.

**Configuring the Transformation Scenario**

To configure a *DITA Map to MS Office Word* transformation scenario, follow these steps:

1. Open the DITA map in the *DITA Maps Manager (on page 2899)*.
2. Click the **Configure Transformation Scenario(s)** button from the *DITA Maps Manager (on page 2899)* toolbar.
3. Select **DITA Map MS Office Word**.

4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - **dotx.file** - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
   - **core.xsl** - Specifies the path to a core metadata stylesheet.
   - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
   - **document.xsl** - Specifies the path to a main document stylesheet.
   - **comments.xsl** - Specifies the path to a comments stylesheet.
   - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
   - **footnotes.xsl** - Specifies the path to a footnote stylesheet.
   - **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
   - **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

**Related Information:**
- [Editing a Transformation Scenario](on page 1545)
- [Configure Transformation Scenario(s) Dialog Box](on page 1548)
- [Migrating MS Office Documents to DITA](on page 3190)

### DITA Map CHM (Compiled HTML Help) Transformation

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Editor needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Editor automatically detects if **HTML Help Workshop** is installed and uses it.

**Note:**

**HTML Help Workshop** might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.
Changing the Output Encoding

Oxygen XML Editor uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Editor has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the `Configure Transformation Scenario(s)` (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**

The format of the `htmlhelp.locale` parameter is LL-CC, where LL represents the language code (en, for example) and CC represents the country code (US, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to yes to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
  - `map2hhcImpl.xsl` - This file is used to compile the table of contents.
  - `map2hhpImpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.
DITA Map Kindle Transformation

Oxygen XML Editor requires KindleGen to generate Kindle output from DITA maps (on page 3220). To install KindleGen for use by Oxygen XML Editor, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a DITA map in the DITA Maps Manager view (on page 2899).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

DITA Map Zendesk Publishing

Restriction:
This feature is only available in the Enterprise edition of Oxygen XML Editor.

Oxygen XML Editor includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the Zendesk Help Center.

1. Start Oxygen XML Editor and open a DITA map in the DITA Maps Manager view (on page 2899).
2. Click the Configure Transformation Scenario(s) button.
3. Create a new DITA-OT transformation scenario and choose the Zendesk Help Center transformation type.
4. Go to Parameters tab and set the following parameters:

   **Host**
   The URL reference to the Zendesk Help Center (for example, https://your-domain.zendesk.com).

   **Username**
   The username (e-mail address) for the account used to upload the content.

   **API Token**

   **Article category**
   The name of the category where the articles are uploaded. The category needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-
Article section

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tll4_kk.

Create article draft

This setting controls whether the articles should be published (if the value is false) or saved as drafts (if the value is true). The default value is false.

Permission group name

The name of the Zendesk permission group that controls who edits and publishes articles: https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups.

5. Save the changes and run the transformation.

For more information about publishing content to the Zendesk Help Center, watch our video demonstration:

https://www.youtube.com/embed/QZ_9Fk_LOk8

Run DITA-OT Integrator Transformation

Oxygen XML Editor comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 3224). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1548).

Attention:
The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 269).

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 1548) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1555)).
3. Select the **Run DITA-OT Integrator** transformation scenario. If the **integrator** is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.

4. **Apply the scenario (on page 1548)**.

5. Check the **Results** panel at the bottom of the application to make sure the build was successful.

6. Restart Oxygen XML Editor with your normal permissions.

---

**Related Information:**

- **Installing a DITA-OT Plugin (on page 3166)**
- **Integrating a DITA Specialization (on page 3178)**

---

**DITA Topic Transformation Scenarios**

Oxygen XML Editor includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s) dialog box (on page 1548)**.

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with **xsl:fo** customizations. Another advantage of this transformation scenario is that you can use the same **customization CSS (on page 1814)** or **publishing template (on page 1783)** that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected **context DITA map (root map) (on page 2903)** so that keys and references are properly resolved (the detected context map is set as the value of the **args.root.map** parameter (this can be changed in the **Parameters** tab). It also automatically detects the currently **applied profiling condition set (on page 3144)** to be used as the default filtering option in the transformation scenario (this can be changed in the **Filters** tab).

The transformation scenario also supports a parameter named **args.enable.root.map.key.processing** that can be used to specify whether or not the values for **@keyref** and **@conkeyref** attributes within the transformed topics are resolved. The possible values are:
no - This means that the values for all `@keyref` and `@conkeyref` attributes are ignored in the transformation. This results in lower processing times.

yes - This means that the values for any `@keyref` and `@conkeyref` attributes found in the transformed topic are processed and resolved using the value of the `args.root.map` parameter.

auto - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.

- DITA PDF - based on XSL-FO - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

---

Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the `Configure Transformation Scenario(s)` button on the DITA Maps Manager toolbar (on page 2901). The `Configure Transformation Scenario(s)` dialog box (on page 1548) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.

2. Select the transformation scenario you want to run and click Apply Associated. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor while the transformation is running. If there are errors or warnings, Oxygen XML Editor displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor opens the output in the appropriate application.

3. To rerun the same scenario again, click the `Apply Transformation Scenario(s)` button.

Creating or Editing a DITA-OT Transformation

Creating a DITA-OT Transformation Scenario

To create a DITA-OT Transformation scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the New button and select DITA-OT Transformation.

• Go to Window > Show View and select Transformation Scenarios to display this view. Click the New Scenario drop-down menu button and select DITA-OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options** (on page 3224) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 3221) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
Editing a DITA-OT Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1548) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks (on page 3221) are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario (on page 1547).

**Result:** This will open an Edit scenario configuration dialog box (on page 1545) that contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**
- Creating a DITA-OT Plugin (on page 3162)
- Installing a DITA-OT Plugin (on page 3166)
- DITA Open Toolkit Documentation

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1603). You can use one of them to publish your documentation or as a starting point for a new publishing template.
Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor scans the locations specified in the DITA > Publishing preferences page (on page 275) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.
Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1644) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 275) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1791). Clicking this button will open a template package configuration dialog box (on page 3111) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template’s image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 275) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXw08
Template Package Configuration Dialog Box

The Save template as button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1791). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the Save template as button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map...
**WebHelp Responsive** (on page 1435) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1449). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default **HTML Page Layout Files** (on page 1622) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map** **WebHelp Responsive** (on page 1435) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1449)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

**Figure 790. Template Package Configuration Dialog Box**

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA-OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 791. FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor.

XEP

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:
• XEP was configured as an external FO Processor in the FO Processors option page (on page 261).
• The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
• XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor installation directory.

Antenna House

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

• Environment variable set by Antenna House installation (the newest installation version will be used).
• Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. Edit the transformation scenario.
2. Open the Parameters tab (on page 3114).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

- FO Processors Preferences (on page 261)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1526)

Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:
• A simple text field for simple parameter values.
• A combo box with some predefined values.
• A file chooser and an editor variable (on page 323) selector to simplify setting a file path as the value of a parameter.

Note:
To input parameter values at runtime, use the ask editor variable (on page 325) in the Value column.

Below the table, the following actions are available for managing parameters:

New
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 323) button or the Browse button. You can also use the Open in editor button to open the specified file in the editor panel.

Unset
Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template
Transformation parameters that are defined in an Oxygen Publishing Template (on page 1783) descriptor file are displayed in italics. After creating a publishing template (on page 1791) and adding it to the templates gallery (on page 1644), when you select the template in the Templates tab (on page 3108), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:
DITA Open Toolkit Documentation

Feedback Tab (DITA-OT Transformations)
When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1783), either as an HTML fragment extension point (on page 1613) or as a transformation parameter (on page 1612) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

### Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 3220), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 323) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

**Note:**

If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 3114)), the filters are combined (neither file takes precedence over the other).

**Use profiling condition set**

Sets the profiling condition set (on page 3144) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.
Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Editor will attempt to use the dita.bat executable script (dita.sh for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected,
the transformation will run as an ANT process. Also, when this option is selected, other options (Custom build file, Build target, Ant Home) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**

Even when this option is selected, the dita.bat (dita for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the fix.external.refs parameter is enabled in the Parameters tab, the transformation is started as an ANT process instead of using the executable.

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 3114) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 323) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as -diagnostics).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 265).

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

**Note:**

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError).

For example, if it is set to -Xmx2g, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an -Xmx value in this field, by default the application
will use a maximum of 512 megabytes when used with the 32-bit Java Virtual Machine and one gigabyte with the 64-bit Java Virtual Machine.

Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 3222) files or additional class paths) to be used by the transformer.

Tip:
You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1464) or edit an existing one (on page 1545), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

Figure 794. Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the  

[Insert Editor Variables](on page 323) button, or the  

[Browse] button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  

[Insert Editor Variables](on page 323) button, or the  

[Browse] button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the  

[Insert Editor Variables](on page 323) button, or the  

[Browse] button.

---

**Note:**

If the [DITA map](on page 3220) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

---

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  

[Insert Editor Variables](on page 323) button, or the  

[Browse] button.

---

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML
file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options (on page 275) preferences page that contains options to control the display of the console output received from the publishing engine.

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

• Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor allows you to set parameters (on page 3114) on a transformation scenario and you can save and share them with others (on page 1555). You can also use the $ask editor variable (on page 325) in the Parameters tab to instruct Oxygen XML Editor to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.

• If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (on page 3124). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor provides full editing and debugging support from XSLT and CSS stylesheets (on page 2102), which you can use to modify transformation code.

• You can also write your own transformation code (and execute it using a custom build file (on page 3124)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

• WebHelp - For information about customizing WebHelp output, see the WebHelp Output section (on page 1559).

• PDF - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1986).

Publishing Customizations

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:
1. Copy the bundled DITA-OT folder (usually OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 3166).

2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor at anytime without affecting the publishing system.

3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

Customizing XHTML-based Output

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 3106), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that as long as it is set to yes, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For more information, see: https://blog.oxygenxml.com/topics/creating-simple-dita-open-toolkit.html. A list with all DITA-OT XSLT extension points can be found here: http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html.

Customizing WebHelp-based Output

The DITA-OT that comes bundled in Oxygen XML Editor includes specific plugins that provide the ability to publish DITA content to WebHelp Responsive (on page 1560) output.

For information about customizing WebHelp Responsive output, see Customizing WebHelp Responsive Output (on page 1642).

Customizing PDF-based Output

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1986).

There is also a book called DITA For Print that contains details about how to customize various aspects.

Customizing PDF Output with CSS

Oxygen XML Editor also includes a transformation scenario called DITA Map PDF - based on HTML5 & CSS (on page 3097) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 3220) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with
xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1814).

**Related Information:**
DITA Open Toolkit Documentation

---

**Using a Custom Build File**

You can use a *Custom Build File* to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the [Configure Transformation Scenario(s)](on page 1548) action to open the Configure Transformation Scenario(s) dialog box (on page 1548).
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** (on page 3118) tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
  <!-- The DITA-OT default build file-->
  <import file="build.xml"/>
  <target name="dist">
    <!-- You could run your script here -->
    <!--<exec></exec>-->  
    <!--Call the DITA-OT default target-->  
    <antcall target="init"/>
  </target>
</project>
```

**Note:**
If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor, it is located in the \[OXYGEN_INSTALL_DIR\]/tools/ant directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Ant lib directory.

---

**Adding a Watermark in DITA Map to XHTML Output**

To add a watermark to the XHTML output of a DITA map (on page 3220) transformation, follow these steps:
1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```css
body {
    background-image: url(MyWatermarkImage.png);
}
```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to `yes`.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:
Adding a Watermark to PDF Output (on page 1990)

Adding Syntax Highlights for Codeblocks in the Output

*Syntax Highlighting* makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the `@outputclass` attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the `<codeblock>` element in the editor and in the Attributes view, click on the Value cell for the `@outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
• language-lua  
• language-perl  
• language-php  
• language-python  
• language-ruby  
• language-sql  
• language-xml  
• language-xquery

Attention:
It is recommended that you do not add inline elements in the codeblocks when using this @outputclass attribute, as it may lead to improper highlighting.

Tip:
Starting with version 24.0, the language values can also be set without using the language-prefix.

Example:

This codeblock:

```xml
<codeblock outputclass="language-xml">
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would result in this in the output:

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Publishing with a DITA-OT Project File

The **DITA Open Toolkit** project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s)** dialog box (on page 1548):
• **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.

• **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

• `project.file` - Specifies the path to the project file.

• `dita-ot.dir` - Specifies the directory where DITA-OT, used in transformation is installed.

• `additional.args` - Specifies the additional arguments used in transformation.

• `deliverable.id` - Specifies the id of the deliverable. This parameter is only available in the **Publish DITA-OT Project (select deliverable)** transformation.

**Related Information:**
DITA Open Toolkit Project *(on page 3173)*

### Dynamic Word/Excel/HTML/Markdown to DITA Converter

**Restriction:**
This feature works with no restrictions if the publishing process is done using Oxygen XML Editor/Author. However, if the publishing process is done from a command line, this feature requires an Oxygen Publishing Engine license.

The publishing engine has support to dynamically convert various types of non-DITA resources to DITA while publishing. To enable this support for a particular resource that is referenced in a DITA map, you must specify one of the following values for the `@format` attribute on the `<topicref>` element:

**Word to DITA (word-to-dita)**

*Microsoft Word* documents that are referenced in the DITA map using the `word-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing. Image references and internal links are preserved.

**Example:**

```xml
<topicref href="sample.docx" format="word-to-dita"/>
```

**Excel to DITA (excel-to-dita)**

*Microsoft Excel* documents that are referenced in the DITA map using the `excel-to-dita` format attribute get dynamically converted to DITA topics that contain one or more tables during publishing.

**Example:**

```xml
<topicref href="sample.xlsx" format="excel-to-dita"/>
```
**HTML to DITA** *(html-to-dita)*

HTML documents that are referenced in the DITA map using the `html-to-dita` format attribute get dynamically converted to DITA topics during publishing.

Example:

```xml
<topicref href="sample.html" format="html-to-dita"/>
```

**Markdown to DITA** *(markdown)*

Markdown documents that are referenced in the DITA map using the `markdown` format attribute get dynamically converted to DITA topics during publishing using the support for Markdown bundled with the publishing engine by default.

Example:

```xml
<topicref href="sample.md" format="markdown"/>
```

**Markdown to DITA** *(markdown-to-dita)*

Markdown documents that are referenced in the DITA map using the `markdown-to-dita` format attribute get dynamically converted to DITA topics during publishing using the special conversion plugin provided by Oxygen XML Editor. The `markdown-to-dita` format conversion is more flexible than the built-in `markdown` conversion, allowing the conversion of Markdown documents that do not have consistent heading levels.

Example:

```xml
<topicref href="sample.md" format="markdown-to-dita"/>
```

**Troubleshooting DITA Transformation Problems**

This section contains some topics to help you troubleshoot DITA transformation issues.

**DITA Map Transformation Fails (Cannot Connect to External Location)**

**Problem**

*DITA map* *(on page 3220)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the *Proxy preferences page* *(on page 301)*.
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

**Solution**

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the **Output** tab, select a local directory for **Temporary files directory** and **Output directory**).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
• Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.

• You can increase the memory available to Oxygen XML Editor (on page 2858). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.

• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter `logger org.apache.tools.ant.listener.ProfileLogger` in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.

• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 3131).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2943). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 3220), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.
DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException: C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler (Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent (ContentHandlerProxy.java:375)
```
Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the @colspec attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter clean.temp to no.
2. Run the transformation, open the topic.fo file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2899)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2899) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor, and search for the *unresolved ID references* (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2899)) to find the original DITA topic where the table was generated.

Related Information:

How to Enable Debugging for FO Processor Transformations (on page 1529)
DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip:

It is a good practice to validate the DITA map (on page 3220) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2943). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

DITA Map CHM (Compiled HTML Help) Transformation (on page 3101)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.
Tip:
It is a good practice to validate the DITA map (on page 3220) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2943). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 3101)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 2943) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2899) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1490).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 548) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - Severity - The first column displays the following icons that indicate the severity of the problem:
     • Informational - The transformation encountered a condition of which you should be aware.
     • Warning - The transformation encountered a problem that should be corrected.
     • Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - Info - Click the See More icon to open a web page that contains more details about DITA-OT error messages.
   - Description - A description of the problem.
   - Resource - The name of the transformation resource.
   - System ID - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Troubleshooting DITA Transformation Problems (on page 3128)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

Oxygen XML Editor includes a Attributes and Condition Sets preferences page (on page 188) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 3153) or DITAVAL file (on page 3157).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (@product, @platform, @audience, @rev, @props, and @otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the @platform profiling attribute:

```
<section platform="windows">
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 3136) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 3139)).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even
a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 3142) (for information about sharing them, see Sharing Condition Set Configurations (on page 3144)).

Resources

For more information about DITA profiling, see the following resources:

- Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies
- Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 3142).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.

   Tip:
   For less technical users who do not want to create attribute specializations in DTD/XML Schema, you may want to use profiling attribute groups (on page 3151) instead (use an existing profiling attribute with sub-attributes).

2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition Sets.

   Information:
   The Profiling Attributes section (on page 188) is used to define the attributes and their values. For DITA documents, the default attributes are included (@audience, @platform, @product, @props, @otherprops, and @rev), but if a Subject Scheme Map (on page 3153) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Document type**

Select the document type *(framework (on page 3221)).*

Tip:

You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).

The columns are as follows:
**Value** - The attribute value. You can also define profiling attribute groups using the following format: `ParentAttrValue(SubAttrValue1 SubAttrValue2)`. For more information, see [Conditional Profiling Attribute Groups](on page 3151).

**Label** - You can specify a label for the attribute value that will be rendered as its name in various components in [Author mode](Edit Profiling Attributes dialog box (on page 3139), [Condition Set](Condition Set dialog box (on page 3142), [Profiling](Profiling tab in the Edit Properties dialog box (on page 2939), [DITA Maps Manager](on page 2899)). If the Label is not specified, the Value will be used as its rendered name.

**Description** - A description for the attribute value that will be displayed in this table.

### Single value

Select this option if you want the attribute to only accept a single value.

### Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between _space_, _comma_, and _semicolon_, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the [Profiling Attributes](Configuration dialog box) configuration dialog box.

5. Click **Apply** to save the changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](on page 610) in **Author mode**, the [Attributes view](on page 627), or in the source code in **Text mode**. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the [Edit Profiling Attributes](action) action (from the contextual menu in **Author mode**) on the new value, the [Profiling Values Conflict](dialog box) dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the [Attributes and Condition Sets](preferences page) preferences page where you can edit the profiling configuration.

**Note:**

If the **Allow contributing extra profiling attribute values** option (on page 189) is not selected in the [Attributes and Condition Sets](preferences page) preferences page, the [Profiling Values Conflict](dialog box) dialog box will never appear, so this automatically adding value not be possible.
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 3224) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 415).

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.
You can apply defined DITA profiling attributes (on page 3136) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 2899), select **Edit Properties** from the contextual menu, go to the **Profiling** tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the **Edit Profiling Attributes** dialog box.

**DITA Elements**

To profile specific XML elements in Author mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the breadcrumb (on page 602) or Outline (on page 539) view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the **Attributes** view (on page 627) to set the profiling attributes on the element at the current cursor position.

**Figure 797. Edit Profiling Attributes Dialog Box**

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.
The attributes and values that appear in the dialog box are determined as follows:

- If your root map (on page 3225) references a DITA subject scheme map (on page 3226) that defines values for the profiling attributes (on page 3153), those values are used. Oxygen XML Editor collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2899) (or set as the root map (on page 2916)). In the image above (on page 3140) (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.

- If you have defined profiling attribute values (on page 3136) for the DITA document type in the Attributes and Condition Sets preferences page (on page 188) and you store them at project-level (on page 3224), those values are displayed in the dialog box.

- If you have defined profiling attribute values (on page 3136) for the DITA document type in the Attributes and Condition Sets preferences page (on page 188) and you store them at global-level (on page 3221), those values are displayed in the dialog box.

- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the Show Profiling Attributes option (on page 679) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

![Figure 798. Profiling Attribute Value Form Control Pop Up](image)
Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

   **Information:**

   The Profiling Condition Sets section (on page 189) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

   **Step Result:** In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type *(framework (on page 3221)) that has profiling attributes defined.*

**Use DITAVAL file**

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a DITAVAL file *(on page 3157).* You can specify the path by using the text field, its history drop-down, the *Insert Editor Variables* *(on page 323)* button, or the browsing actions in the *Browse* drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this
particular condition set. If you have defined a lot of profiling attributes, you can use the 
**filter** text field to search for specific conditions.

**Shortcut key**

You can click the **Choose** button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.

4. Click **Apply** to save the condition set.

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** (on page 3224) at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see **Sharing a Project - Team Collaboration** (on page 415).

**Related Information:**

- Applying Profiling Condition Sets in DITA (on page 3144)
- Creating and Editing Profiling Attributes in DITA (on page 3136)
- Applying Profiling Attributes in DITA (on page 3139)
- Showing and Filtering Profiled Content in DITA (on page 3146)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 3149)

### Applying Profiling Condition Sets in DITA

All defined **Profiling Condition Sets** (on page 3142) are available as shortcuts in the `راع` **Profiling / Conditional Text** toolbar menu (on page 679). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline view** (on page 539), and **DITA Maps Manager** view (on page 2899). Your selection will also be used as the **default condition set** (on page 3161) in transformation scenarios (this can be changed in the **Filters** tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:
### Spray painting

**Short Description:** When paint is applied using a spray nozzle, it is referred to as spray painting.

**Context:**

The garage is a good place to spray paint.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Audience [novice]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move the car out of the garage to avoid getting paint on it.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Audience [expert]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place newspaper, cardboard, or a drop-cloth on the garage floor.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Audience [expert]</th>
<th>Other [prop2]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place the object to be painted on the covered area.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Audience [expert]</th>
<th>Other [prop1]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the directions on the paint can to paint the object.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Audience [novice]</th>
<th>Other [prop1]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Let the paint dry thoroughly before you move the object.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.
This is how the document looks in Author mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

Related Information:

Creating and Editing Profiling Condition Sets in DITA (on page 3142)
Creating and Editing Profiling Attributes in DITA (on page 3136)
Applying Profiling Attributes in DITA (on page 3139)
Showing and Filtering Profiled Content in DITA (on page 3146)
Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 3149)

Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager (on page 2899) toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager (on page 2899). You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page (on page 190).

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager (on page 2899). You can specify
whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 187).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager (on page 2899), and the Outline (on page 539) view. When this option is selected and a condition set is selected in this drop-down menu (on page 3147), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 3147), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 188).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 2899) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 3147) to access a dialog box that presents all of them.

Profiling Settings

Opens the Attributes and Condition Sets preferences page (on page 188) where you can add and edit profiling attributes and condition sets.

Figure 800. Example: Profiling Controls in Author Mode

<table>

</tr>
<tr>
<td>• Inspect the general state of the mower. Use a ratchet to</td>
</tr>
<tr>
<td>tighten any loose bolts;</td>
</tr>
<tr>
<td>• Lubricate the gears of the manual lawn mower;</td>
</tr>
</tbody>
</table>

If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

![Figure 801. Profiling Attribute Value Form Control Pop Up](image)

Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- ■ - The topic reference contains profiling attributes.
- □ - The topic reference inherits profiling attributes from its ancestors.
- ☑ - The topic reference contains and inherits profiling attributes.
- -(hyphen) - The topic reference neither contains nor inherits profiling attributes.
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode and the DITA Maps Manager (on page 2899) so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode and excluded nodes are grayed-out or hidden in the DITA Maps Manager (on page 2899).
Figure 803. Example: Profiling Colors and Styles in Author Mode

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- **Refill the oil**:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;

- **Sharpen the blades**:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Use an electric grinder or an electric file, grind the length of the blade until it is sharp;

- **Check the electric cable for any signs of wear. Replace it if worn**;

- **Clean the mower’s underside for debris**;

- **Inspect the general state of the mower. Use a ratchet to tighten any loose bolts**;

- **Lubricate the gears of the manual lawn mower**;

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles option** from the Profiling / Conditional Text toolbar drop-down menu.
2. Select **Profiling Settings** from the Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the Attributes and Condition Sets preferences page.
3. Go to the Colors and Styles preferences page to configure the colors and styling for the profiling attributes.
4. Go to the Attributes preferences page to configure how you want the profiling attributes to appear in Oxygen XML Editor.

**Result:** The styling is now applied in the Author editing mode, the Outline view, and in the DITA Maps Manager view. Also, to help you more easily identify the profiling you want to apply in
the current context, the styling is applied in the Edit Profiling Attributes dialog box (on page 670) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 804. Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File (on page 3160) topic.

Showing and Filtering Profiled Content in DITA (on page 3146)

Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.
Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor:

1. Open the **Preferences** dialog box (Options > Preferences) (on page 124) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition sets.

2. To add new attributes and values, click the **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

   **Step Result:** In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the **Document type**, **Attribute name**, and **Display name**.

   For information about the **Profiling Attribute** configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 3136).

4. Click the **New** button at the bottom of the attribute values table.

5. In the **Value** field of the resulting dialog box, define groups using the following format:

   **ParentAttrValue(SubAttrValue1 SubAttrValue2). For example:**

   ```xml
   support(L1 L2 L3)
   ```

6. Click **OK** and **Apply** to save and apply the changes.

Using Conditional Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 3157) the values. For example, suppose the company described in the example in the Overview section (on page 3151) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```xml
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 3142) to filter content in Author mode or during the transformation stage to filter content in the output (on page 3161) and content profiled with the \texttt{L1} and \texttt{L2} values would be included while content with the \texttt{L3} value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (\texttt{L1}, \texttt{L2}, \texttt{L3}) by simply excluding the \texttt{support} value (since \texttt{L1}, \texttt{L2}, and \texttt{L3} are subcategories of it).

DITA 1.3 Specifications: Conditional Processing Values and Groups

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 3226) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map (main DITA map (on page 3225)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the @type attribute needs to be set to subjectScheme for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:
1. Use the **New Document wizard** (on page 368) to create a new **Subject Scheme** document (Framework templates > DITA Map > map > Subject Scheme).

2. Use the controls in **Author** mode to define the hierarchical tree of values for your **subject scheme** (see the Author mode example below (on page 3155)) or switch to **Text** mode and define it there if you prefer (see the Text mode example below (on page 3156)).

---

**Note:**

The pre-defined subject scheme template includes Navigation Titles (<navtitle> element). This element is not required, but if you use it, the text that you enter for the <navtitle> will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor (on page 3157). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor.

3. Bind the particular attribute to the key you define for the tree of values using the `<attributedef>` and `<subjectdef>` elements inside the `<enumerationdef>` element. Notice that in the examples below (on page 3155), the `audience` attribute is bound to the `audienceKey` value.

---

**Tip:**

By default, attributes can accept multiple values, but you can use `outputclass="single_value"` to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor with radio buttons instead of checkboxes. For example:

```xml
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

You can also define a specific set of possible attribute values for a specific attribute name that is set on a specific element name. For example, you can define a specific set of `@outputclass` attribute values only for the `<image>` element:

```xml
<enumerationdef>
  <elementdef name="image"/>
  <attributedef name="outputclass"/>
  <subjectdef keyref="imgOutputClassValuesKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 3155)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor (on page 3157).

5. Save your **subject scheme** file.
6. Reference your *subject scheme* in the highest level of map (*main DITA map (on page 3225)*) that will use the set of profiling values and set its type to *subjectScheme*. The easiest way to do this is:
   a. With your *subject scheme* file opened in the editor, go to the *DITA Maps Manager* view, right-click the *main DITA map*, and select **Append Child > Reference to the currently edited file**.
   b. In the **Insert Topic Reference** dialog box, go to the **Attributes** tab and in the **Type** field, enter or select *subjectScheme*.
   c. Click the **Insert and Close** button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a *DITAVAL file to filter or flag (on page 3157)* the entire tree of values. For example, suppose one of the values for the *audience* attribute in a hierarchical subject scheme is *surgeon* and it has two subordinate values of *neuro-surgeon* and *plastic-surgeon* (see the examples below (on page 3155)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a *condition set (on page 3142)* to filter content in *Author* mode or during the transformation stage to filter content in the output (*on page 3161*) and the *neuro-surgeon* and *plastic-surgeon* values would be excluded by the filter since the subject scheme defines them as subordinate values of the *surgeon* value.

Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (*therapist*, *oncologist*, *physicist*, *radiologist*, *surgeon*, and so on). The *audience* attribute is bound to the *audienceKey* value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (*props* and *otherprops*) so that they won't be available in the various places where *profiling attributes are presented in Oxygen XML Editor (on page 3157)*.

Example using Author mode controls:
Figure 805. Subject Scheme Author Mode Controls

Subject Scheme

A scheme that defines audience user values

Example code in Text mode:

```xml
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
</subjectScheme>
```
Where the Profiling Attributes are Available in Oxygen XML Editor

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor collects all the profiling values from the subject scheme map (on page 3226) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2899) (or set as the root map (on page 2916)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 187)):

- The Profiling tab of the Edit Properties dialog box (on page 2939).
- The Edit Profiling Attribute dialog box (on page 3140).
- The inline profiling controls in Author mode (on page 3147).
- The proposals for the attribute values in the Content Completion Assistant (on page 3219).

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

- Filtering Profiling Values with a DITAVAL File (on page 3157)
- DITA 1.3 Specifications: Subject Scheme Maps

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.
DITAVAL Filtering Use-Case

Suppose that a medical publication uses the *audience* profiling attribute to profile the content for the following types of users: 
*therapist*, *physician*, and *surgeon*. Suppose that in the output, you want to exclude any content that is profiled as *surgeon* value for the *@audience* attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as *surgeon*:

```xml
<val>
<prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main *DITA map (on page 3220)* and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as *surgeon*.

DITAVAL Filter File Editor in Author Mode

The *Author* editing mode in Oxygen XML Editor offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

![DITAVAL File Editor in Author Mode](image)

Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:
• **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `@foreground-conflict-color` and `@background-conflict-color` attributes.

• **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, and `@background` attributes.

• **Flag** - Inserts a `<revprop>` element that identifies a value in the `@rev` attribute that should be flagged in some manner. The allowed actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, `@background`, and `@changebar` attributes.

See the [DITAVAL Element Specifications](https://dita-ot.org/dita-v1.3/docs/index.html) for more details about the allowed filters and flags.

**How to Create a DITAVAL Filter File**

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITA** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

**Result:** The DITAVAL filter file can now be used for all of the following:

• To apply a reference to the DITAVAL file in a **Profiling Condition Set** using the **Use DITAVAL File** option in the **Condition Set** configuration dialog box ([on page 3142](https://dita-ot.org/dita-v1.3/docs/index.html)).

• You can use the **Import from DITAVAL** option in the **Attributes and Condition Sets** preferences page ([on page 188](https://dita-ot.org/dita-v1.3/docs/index.html)) to use the DITAVAL file to define profiling attributes.

• You can use the DITAVAL file to apply the filters to the output by specifying the **DITAVAL file in the transformation scenario** ([on page 3117](https://dita-ot.org/dita-v1.3/docs/index.html)).

• You can use the filter file in the **DITA Map Completeness Check** dialog box ([on page 2944](https://dita-ot.org/dita-v1.3/docs/index.html)) when validating your **DITA map** ([on page 3220](https://dita-ot.org/dita-v1.3/docs/index.html)).

• DITAVAL files are also used when working with the DITA 1.3 **Branch Filtering** mechanism. For more details, see: **Working with DITA 1.3 Branch Filtering** ([on page 3062](https://dita-ot.org/dita-v1.3/docs/index.html)).

• You can define the colors and styles to be used for rendering profiled condition sets ([on page 3160](https://dita-ot.org/dita-v1.3/docs/index.html)) in **Author** mode and the **DITA Maps Manager** ([on page 2899](https://dita-ot.org/dita-v1.3/docs/index.html)) view by using a **Flag** filter in the DITAVAL file.

Styling the Rendering of Profiled Content Using a DITAVAL File

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file to define your profiling condition set.
2. In Author mode, define the filters for your condition set.
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

Result: Test your changes by opening profiled content in Author mode or the DITA Maps Manager and use the options in the Profiling / Conditional Text drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a Flag on a Filter to define the styling for a condition set like this:

```
[DITAVALE Filter file]
Filter exclude @product = editor\$clipse

Filter flag @product = editor
    style = bold
    color = maroon
    background = silver
```

will render the styling of the profiled content in Author mode to look like this:

```
Some text
```

and will render the styling in the DITA Maps Manager view to look like this:
Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set (on page 3144) into account during the transformation, as defined in the Filters tab (on page 3116) when creating a DITA transformation (on page 1490). You can also specify a DITAVAL file (on page 3157) that defines filters for your profiled content.

Conditional Processing to Generate Multiple Deliverables

By default, the content of most elements is included in all output media. Within maps and topics, elements can specify the delivery targets to which they apply.

Within maps, topic references can use the @deliveryTarget attribute to indicate the delivery targets to which they apply. Within topics, most elements can use the @deliveryTarget attribute to indicate the delivery targets.

If a referenced topic should be excluded from all output formats, set the @processing-role attribute to resource-only instead of using the @deliveryTarget attribute. Content within that topic can still be referenced for display in other locations.

@deliveryTarget

The intended delivery target of the content, for example html, pdf, or epub. This attribute is a replacement for the now deprecated @print attribute.
The `@deliveryTarget` attribute is specialized from the `@props` attribute. It is defined in the `deliveryTargetAttDomain`, which is integrated into all OASIS-provided document-type shells. If this domain is not integrated into a given document-type shell, the `@deliveryTarget` attribute will not be available.

The `@deliveryTarget` attribute is processed the same way as any other conditional processing attribute. For example, `<topicref deliveryTarget="html5 epub" href="example.dita"/>` uses two values for `@deliveryTarget`. A conditional processing profile can then set rules for `@deliveryTarget` that determine whether the topic is included or excluded when the map is rendered as HTML5 or EPUB.

**DITA Open Toolkit Support**

The *DITA Open Toolkit* is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT plugin (on page 3224), and how to use an external instance of the DITA Open Toolkit.

**Related Information:**

- DITA Open Toolkit Documentation

**DITA-OT Plugins**

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor already has lots of plugins pre-installed but you can also install additional plugins (on page 3224) or create your own.

**Creating a DITA-OT Plugin**

Oxygen XML Editor provides the ability to install additional DITA Open Toolkit plugins (on page 3166) that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the `plugins` folder located in your DITA-OT directory (for example, if you are using DITA 3.7.0, the path would look like this: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin`).

2. Create a `plugin.xml` file in that same folder. This file will contain the extension points for the `plugin`. For example, references to the XSLT stylesheets that will be used to style the output.
You can easily create this file by using the DITA-OT Plugin new document template that is included in Oxygen XML Editor (from the New document wizard (on page 368) you can find this template in Framework templates > DITA > plugin.

**Example:**

```xml
<plugin id="org.metadita.specialization.music">
  <feature extension="dita.specialization.catalog.relative">
    file="catalog-dita.xml"/>
  <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
  <feature extension="dita.xsl.html5" file="xsl/music2xhtml.xsl"/>
</plugin>
```

**Tip:**
Oxygen XML Editor includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: [http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).

3. Install the newly created DITA-OT plugin (on page 3166) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 3104) from the Apply Transformation Scenario(s) (on page 1433) or Configure Transformation Scenario(s) dialog box (on page 1548).

**Note:**
If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 3166).

**Related Information:**
- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 3167)

**Example: Creating a DITA-OT Plugin for Embedding Video Resources**

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 3224), this topic uses an example of creating an XSLT customization plugin that provides support for referencing
video and audio content using the DITA `<object>` element and then publishing to HTML and PDF output formats. This plugin ([com.oxygenxml.media](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html)) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Editor, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA-OT plugins folder (`DITA-OT-DIR/plugins/`).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

   **Note:**
   You can easily create this file by using the DITA-OT Plugin template that is included in Oxygen XML Editor (from the New document wizard ([on page 368](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html)) you can find this template in Framework templates > DITA > plugin).

   **Example: Media Plugin File**

   ```xml
   <plugin id="com.oxygenxml.media">
     <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
     <feature extension="package.support.email" value="support@oxygenxml.com"/>
     <feature extension="package.version" value="21.0"/>
     <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
     <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
   </plugin>
   ```

   The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

   You can find other DITA-OT plugin extension points here: [http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

   **Tip:**
   You can use the Find/Replace in Files action ([on page 436](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html)) to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA codeblock element. Since a DITA `<object>` element has the `@class` attribute value - `topic/object`, you can take part of the class attribute value (`topic/object`) and search the DITA-OT resources for a similar stylesheet. The search might find the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/xsl/xslhtml/dita2htmlImpl.xsl`. 
You can use it as a starting point to overwrite the xhtmlMedia.xsl stylesheet. For example, the results might be:

```xml
<xsl:template
    match="*[contains(@class, ' topic/object ')]*[contains(@outputclass, 'video')]">
    <video class="embed-responsive-item">
        <xsl:call-template name="commonattributes"/>
        <xsl:call-template name="setidname"/>
        <xsl:call-template name="copySource"/>
    </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called pdfMedia.xsl (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl to use as a starting point to overwrite the pdfMedia.xsl stylesheet, with results looking something like this:

```xml
<!--Treat video, audio or iframe objects as links-->
<xsl:template
    match="*[contains(@class,' topic/object ')][@outputclass = 'video']">
    <xsl:variable name="target" select="@data"/>
    <xsl:variable name="baseDir">
        <xsl:call-template name="substring-before-last">
            <xsl:with-param name="text" select="@xtrf"/>
            <xsl:with-param name="delim" select="/"/>
        </xsl:call-template>
    </xsl:variable>
    <fo:inline xsl:use-attribute-sets="object">
        <xsl:call-template name="commonattributes"/>
        <xsl:if test="exists($target)">
            <fo:basic-link external-destination="url({$target})" xsl:use-attribute-sets="xref">
                <xsl:value-of select="$target"/>
            </fo:basic-link>
        </xsl:if>
    </fo:inline>
</xsl:template>
```

5. To install the created plugin in the DITA-OT, run the built-in transformation scenario called Run DITA-OT Integrator (on page 3104) by executing it from the Apply Transformation Scenario(s) dialog
box (on page 1433). If the integrator is not visible, select the **Show all scenarios** option that is available in the 📋 Settings drop-down menu. For more information, see Installing a DITA-OT Plugin (on page 3166).

**Results of running the integrator using the media plugin example:**

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet `{DITA-OT-DIR}/plugins/org.dita.xhtml/xsl/dita2html-base.xsl`, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: [http://www.w3.org/TR/xslt#import](http://www.w3.org/TR/xslt#import).

b. Likewise, for the PDF output, in the top-level stylesheet `{DITA-OT-DIR}/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl`, a new import statement appeared:

```xml
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

**Related Information:**

[DITA Open Toolkit Documentation](#)

### Installing a DITA-OT Plugin

Oxygen XML Editor comes bundled with various DITA-OT plugins (on page 3224), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins).

**Warning:**

Oxygen XML Editor has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

**Installing a DITA-OT Plugin**

To install a DITA-OT plugin, following this procedure:
1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, \DITA-OT-DIR\plugins directory).

2. Select the Configure Transformation Scenario(s) (on page 1548) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1555)).

3. Select the Run DITA-OT Integrator transformation scenario (on page 3104). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

   Important:
   The folder where the DITA-OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA-OT folder bundled with Oxygen XML Editor and your application is installed in the Program Files folder, you can start the Oxygen XML Editor main executable with administrative rights for the integrator process to be able to modify resources in the DITA-OT folder.

4. Apply the scenario (on page 1548).

5. Check the Results panel at the bottom of the application to make sure the build was successful.

After the installation, you can open a DITA map and use the Configure Transformation Scenarios dialog box to create a new DITA-OT transformation scenario. Oxygen XML Editor detects that transformation type declaration from the DITA-OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1490). Oxygen XML Editor also shows the contributed parameters from the plugin in the transformation scenario's Parameters tab (on page 3114).

   Tip:
   You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 3167).

Related Information:
Creating a DITA-OT Plugin (on page 3162)
Installing the DITA For Publishers Package
DITA Open Toolkit Documentation
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 3167)

Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Editor detects that transformation type declaration and presents descriptions in the DITA Transformation Type.
dialog box (on page 1490) and the contributed parameters in the transformation scenario's Parameters tab (on page 3114).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 3162) (you can easily create this file by using the DITA-OT Plugin new document template in the New document wizard (on page 368)).

2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

```xml
<transtype name="xhtml" extends="base-html" desc="HTML">
</transtype>
```

3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

```xml
<param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
  <val>yes</val>
  <val default="true">no</val>
</param>
```

Depending on the type declared for a parameter, Oxygen XML Editor will help you pick values for each parameter edited in the Parameters tab of the transformation scenario configuration dialog box. For example, for parameters of type "enum", Oxygen XML Editor will present a combo box for choosing the proper value for the parameter.

4. You can also extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

### Plugin Extension Example - Promote Parameters:

It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the Parameters tab of the transformation scenario configuration dialog box. To do this, you could create a pluginExtension.xml file in the root folder of the DITA-OT plugin and use the <promotedParams> element to define the promoted parameters. Here is an example:

```xml
<extensionPlugin>
  <transtype name="pdf-css-html5">
    <promotedParams>
      <param name="args.css" promotedName="CSS"/>
      <param name="args.css.param.numbering" promotedName="Numbering"/>
      <param name="args.chapter.layout" promotedName="Chapter layout"/>
    </promotedParams>
  </transtype>
</extensionPlugin>
```
The example above results in the **Parameters** tab looking like this:

![Promoted Parameters](image)

**Figure 808. Promoted Parameters**

5. **Install the plugin (on page 3166).**

**Note:**
If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor to properly re-detect the newly contributed transtypes and parameters.

**Example of a plugin.xml File:**

```xml
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
    <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
  </transtype>
</plugin>
```

For more information, watch this DITA-OT Day 2015 presentation:

**Built-in Third-Party DITA Open Toolkit Plugins**

The DITA Open Toolkit 3.7.0 distribution that is bundled with Oxygen XML Editor includes some pre-installed third-party open-source plugins (on page 3224) that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor include:
• **DITA For Publishers** - These *plugins* allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.

• **DITA to Word** - This *plugin* allows users to publish DITA content to MS Word.

• **DITA Community** - These *plugins* allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

Extra Free Publishing Plugins

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTM5, PDF, and Eclipse Help. Since the architecture of the publishing engine is plugin-based, over time, *lots of useful plugins* were developed in the [Oxygen XML GitHub](https://github.com/oxygenxml) account that enhance the publishing and some of them are listed below. The plugins that are already installed within the DITA-OT engine that comes bundled with Oxygen XML Editor are listed with a [*Bundled*](https://www.oxygenxml.com) marker.

**Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]**

You can use this very popular plugin to publish DITA to PDF output using CSS. As the publishing engine, it can use the [Oxygen XML Chemistry](https://www.oxygenxml.com) processor (freely bundled with [Oxygen XML Editor](https://www.oxygenxml.com)), the Antenna House engine, or the Prince XML engine.

**DITA Metrics Report [Bundled]**

This is a very useful open-source plugin can be used to generate an HTML report from an existing DITA project and contains a lot of useful information, including:

• Total number of maps and topics that are part of the project.

• Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.

• The used elements for each DITA domain.

• Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.

• Statistics about the conditional attributes used in the project.

• Information about content reuse.

• Text and content statistics, including both total words (word count) and unique words (vocabulary).

• List of largest and smallest topics and the number of words each one uses.

• Listing of all links to resources outside of the project.

• A metrics evolution report between different versions of your documentation.

**Export DITA Map Plugin [Bundled]**

You can use this free plugin to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.
Publish DITA Content with References to Video and Audio Resources. [Bundled]

A DITA Open Toolkit plugin can be used to convert the DITA <object> element to various HTML 5 structures (such as <video>, <audio>, or <iframe>).

Show Consecutive Codeblocks in Multiple Tabs for WebHelp Output

This open-source plugin can be used to display consecutive DITA <codeblock> elements in separate tabs.

Add Edit Links in HTML or PDF-based Output [Bundled]

This plugin can be used to add edit links in HTML or PDF-based output that allows subject matter experts to offer feedback for the published content directly in the source using a DITA web editing tool (such as Oxygen XML Web Author).

Create a Single Merged XML Document From an Entire DITA Project [Bundled]

This plugin can be used to produce a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.

Dynamically Publish Excel Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert Excel files to DITA (Excel files referenced with format="excel" in DITA maps).

Dynamically Use JSON Content in DITA Topics

A DITA Open Toolkit plugin that can be used to dynamically convert JSON content to DITA (JSON files referenced with format="json" in DITA maps).

Dynamically Publish ASCIIDoc Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert ASCIIDoc content to DITA (ASCIIDoc files referenced with format="ant-parser" in DITA maps).

Embed HTML Content in DITA Topics [Bundled]

A plugin that can be used to embed well-formed HTML content in a DITA topic inside a special element.

Embed LaTeX Equations in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded LaTeX mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded UML diagrams equations to HTML and PDF.
Float Images in HTML and PDF Outputs

A plugin that can be used to float an image referenced in a DITA topic left or right depending on the specified @outputclass attribute value.

Embed Referenced MathML and SVGZ Images in HTML Output

A DITA Open Toolkit plugin that can be used to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs

A DITA Open Toolkit plugin that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]

This plugin can be used to display Oxygen XML Editor tracked changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output

This sample DITA Open Toolkit PDF customization plugin is a good starting point if you want to:

- Customize fonts.
- Customize a cover page to provide custom logos and coloring.
- Customize page headers and footers.

PDF (XSL-FO) - Generate Numbers Before a Topic's Title

A DITA-OT PDF2 customization plugin that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output

A PDF customization folder that can be used to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Editor

Oxygen XML Editor comes bundled with a DITA Open Toolkit, located in the DITA-OT-DIR directory. Starting with Oxygen XML Editor version 17, if you want to use an external DITA-OT for all transformations and validations, you can open the Preferences dialog box (Options > Preferences) (on page 124) and go to the DITA page (on page 269), where you can specify the DITA-OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:
1. Edit your transformation scenarios and in the Parameters tab change the value for the dita.dir parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (on page 138), edit the DITA and DITA Map document types and modify the catalog entry in the Catalogs tab to point to the custom catalog file catalog-dita.xml.

Related Information:

- Editing a Transformation Scenario (on page 1545)
- Creating New Transformation Scenarios (on page 1464)
- DITA Open Toolkit Documentation

DITA Open Toolkit Project

The DITA Open Toolkit project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: https://www.dita-ot.org/dev/topics/using-project-files.html.

Oxygen XML Editor has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

Editing DITA Open Toolkit Project Files

The New Document wizard (on page 368) includes a template to help you create DITA Open Toolkit project files (with an .xml file extension). The template is located in the Framework templates > DITA-OT folder. There is also a sample project file that can be found in the application samples folder: OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml.

When working with a DITA-OT project file in the Author visual editing mode, you can see a compact representation of the file by default. You can switch to the Edit style in the Styles toolbar drop-down menu to edit the file using form controls and inline buttons. The additional View as YAML style can be selected to see a visual representation of the same document in YAML.

DITA-OT Project File Content Completion

Content completion is available according to the associated schema and it is enhanced with proposals for ID references, available transformation types, parameter names, and values.
DITA-OT Project File Validation

The default automatic validation support for DITA-OT project files has enhanced Schematron rules that report invalid references to non-existing contexts. The default validation is based on a validation scenario named **DITA-OT Project** that is included in the DITA-OT project framework.

The DITA-OT Project framework also includes a validation scenario named **DITA-OT Project Validation and Completeness Check**. It contains validation units that automatically validate the project file based on the **DITA-OT Project** scenario and also a manual validation unit based on the **DITA-OT Project Validation and Completeness Check** validation engine that validates all contexts recursively.

When creating a validation scenario (on page 788), or editing an existing scenario (on page 798) for a DITA-OT project file, you can select **DITA-OT Project Validation and Completeness Check** engine in the **Validation engine** column and clicking the **Settings** button for that engine opens the **Configure validation engine** dialog box where you can configure options for validating the DITA-OT project.

![Figure 809. Configure Validation Engine Dialog Box for DITA-OT Project Validation](image)

The options available in this dialog box include:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:
• If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
• If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 787).*

**Note:**
If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Report references to resources outside of the DITA map folder**

If selected, it will report any references to DITA resources that are located outside the *main DITA map (on page 3225)* folder.

**Report links to topics not referenced in DITA maps**

Checks that all the topics referenced by other topics are also linked in the *DITA map*.

**Report multiple references to the same topic**

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique @copy-to attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a @copy-to attribute set:

```
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.
Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note:
This option takes key scopes (on page 3060) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the “k2” key as a duplicate because it is defined in a key scope (on page 3060) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any <topicref> that contains a @processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a @conref or @conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of <colspecs> is different than the number of columns detected from the table @cols attribute.
- For a CALS table, if the number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the @cols, @rowsep, or @colsep attributes are not numeric.
- For a CALS table, if the @names, @nameend, or @colname attributes point to an incorrect column name.
Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 187) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 323) button, or the browsing actions in the Browse drop-down list.

Publishing DITA Open Toolkit Project Files

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the Configure Transformation Scenario(s) dialog box (on page 1548):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional_args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.

Main Files Support for DITA Open Toolkit Project Files

If you enable main files support at project level (on page 3183), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Main Files folder. You could also manually add the top-level files for your DITA-OT project in the Main Files folder. The benefit of this is that whenever you rename or move files in the Project view, the references to those resources will automatically be updated.

Tip:
The Resource Hierarchy/Dependencies view (on page 3185) also works for DITA-OT project files.
Editing Contexts Detected from DITA Open Toolkit Project Files

Once a DITA-OT project file is added to the Main Files folder, the Context drop-down menu on the DITA Maps Manager toolbar will contain context DITA maps defined in the project file and the Profiling/Conditional Text menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following:

- **DTD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **XSD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/ Specialization Plugins. For Relax NG coding requirements, see https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html.

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the @class attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:
1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, `DITA-OT-DIR\plugins` directory).

   **Important:**
   The application needs to have full write access permissions to the DITA-OT directory.

2. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.
3. Select the **Configure Transformation Scenario(s)** (on page 1548) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1555)).
4. Select the **Run DITA-OT Integrator** transformation scenario (on page 3104).

   **Tip:**
   If you don't see that scenario in the **Configure Transformation Scenario(s)** (on page 1548) dialog box or Transformation Scenarios view (on page 1555), click the **Settings** button and select the **Show all scenarios** option, but don't forget to change it back to **Show only the scenarios available for the editor** after you are finished with this procedure.

5. Apply the scenario (on page 1548).
6. Check the **Results** panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Editor with your normal permissions.

   **Tip:**
   Oxygen XML Editor detects new document templates (on page 375) contributed by the DITA-OT plugin as long as you do the following:

   1. Create a new folder called **template_folders** inside your DITA OT plugin's folder. For example: `DITA-OT-DIR\plugins\my_custom_plugin\template_folders`.
   2. Create one or more subfolders inside the **template_folders** directory that contain the new document templates. The new document templates found in those subfolders will be available in the **New** document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and
transformation of the **DITA maps** or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.

- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

![Important:](image)

If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association** preferences page (on page 138).

- You could create your own document templates (on page 375), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor uses by adding the directory to the list in the **Document Templates Preferences** (on page 167) page.

DITA Configuration and Specialization Tutorials

---

**Editing DITA Map Specializations**

In addition to recognizing the default **DITA map** (on page 3220) formats ( `<map>` and `<bookmap>`), the **DITA Maps Manager view** (on page 2899) can also be used to open and edit specializations of **DITA maps**.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager view** (on page 2899) are collected from the target files by matching the `@class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the **DITA Map document type** from the **Document Type Association preferences page** (on page 138) and edit the table actions to insert the element names as specified in your specialization. See Creating a Framework through the **Configuration Dialog** (on page 2133) for more details.

**Related Information:**

DITA Configuration and Specialization Tutorials

Integrating a DITA Specialization (on page 3178)
Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 138) and edit the actions to insert the element names, as specified in your specialization. See Creating a Framework through the Configuration Dialog (on page 2133) for more details.

Integrating a DITA Specialization (on page 3178)

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 3033).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note:
If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).
Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.
3. Avoid profiling/filtering content at inline level, for similar reasons.

General DITA Project Structure

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

General Translation Workflow

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The DITA Translation Package Builder Add-on (on page 2550) could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 3182).

Publishing Translated Content

All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1683).

Liability

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.
Other Resources

Here are some links to other resources that might help you with translating DITA projects:

- DITA Translation: Organizing Your DITA Files
- DITA Translation: Using XLIFF to Translate DITA Projects
- WhP Localization Services Blog Page

Main Files Support in DITA

Oxygen XML Editor includes a feature that allows you to define *Main Files (on page 3222)* at project level. This feature is typically used in Oxygen XML Editor for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 2899), the root map (on page 3225) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Main Files support in DITA to update all the references to moved or renamed resources in the scope of the Main Files, and since the root map (on page 3225) will be set as the Main File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project view (on page 402), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Main Files Support in DITA

To use the Main Files support in DITA, follow these steps:

1. Go to the Project view (on page 402) and enable Main Files support with one of the following methods:
   - Select Enable Main Files Support from the Settings menu in the top-right corner.
   - Select Enable Main Files Support from the contextual menu of the project root folder. If a disabled Main Files folder exists, you can also select that option from its contextual menu.
   - Click the Enable button in the tooltip located at the bottom. This tooltip window is displayed when the Main Files support is disabled. Clicking the Read more link takes you to the user guide. Clicking the Enable button opens the Enable Main Files dialog box. This dialog box contains general information about the Main Files Support and allows you to enable it.

**Warning:**

Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Editor to its default settings (on page 314). However, doing so will result in you losing your customized options.
2. Add the main DITA map (root map) (on page 3225) to the Main Files folder by doing one of the following:
   ◦ Right-click the project root folder and select Detect Main Files.
   ◦ Right-click the Main Files folder and select Detect Main Files from Project.
   ◦ If you enabled the Main Files support from the tooltip at the bottom of the Project view, you can also use the Detect and Enable button in the resulting dialog box to detect the main files from the current project.
   ◦ Manually add the root map (on page 3225) to the Main Files folder by doing one of the following:
     • Right-click a file from your project and select Add to Main Files from the contextual menu (or simply drag and drop it into the Main Files folder).
     • Select Add Files or Add Edited File from the contextual menu of the Main Files folder.

   Tip:
   You can set multiple maps in the Main Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 2903).

3. [Alternative] If you have a defined DITA Open Toolkit project XML file (on page 3177) you can add it to the Main Files folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Main Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project view (on page 402) and Oxygen XML Editor will offer the option of updating all the references to the moved or renamed resources in the scope of the Main Files (in this case, the main DITA map (root map) (on page 3225)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Main Files support and add your root DITA map (on page 3225) to the Main Files folder as described in the How to Enable Main Files Support in DITA (on page 3183) section above.

2. Go to the Project view (on page 402), and use one of the following methods to move or rename the resources:

   **Moving Resources**

   To move resources in the Project view (on page 402), do one of the following:
Simply drag and drop the resource to the new location in the tree structure (the Enable drag-and-drop in Project view option must be selected in the View preferences page (on page 306)).

Use the Cut, Copy, and Paste actions from the contextual menu.

Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

Result: In all cases, a Move resource dialog box will be presented.

Renaming Resources

To rename resources in the Project view (on page 402), do one of the following:

- Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.

- Right-click the resource and select Rename or Refactoring > Rename resource.

Result: In all cases, a Rename resource dialog box will be presented.

3. Make sure the Update references of the moved resource(s) option is selected in the resulting Move or Rename dialog box and keep the scope as main files to make sure all the references to the moved or renamed resource are updated.

DITA Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view displays the hierarchy (on page 3221) or dependencies (on page 3219) for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the Project view (on page 402) and either select Resource Hierarchy or Resource Dependencies.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the Show Dependencies button on the toolbar of the Resource Hierarchy/Dependencies view, select the All files filter in the file browser, find the particular resource, and double-click it.
The following actions are available on the toolbar of the **Resource Hierarchy/Dependencies** view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies from computing.

- **Show Hierarchy**
  Compute the hierarchy structure.

- **Show Dependencies**
  Compute the dependencies structure.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple **working sets (on page 3226)**. If the **Use only Main Files, if enabled** checkbox is selected, the scope of the search is restricted to the **Main Files directory (on page 3183)**.

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Resource Hierarchy/Dependencies** view contains the following actions:
Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Opens the Move resource dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as Main Files support is enabled (on page 3183), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

Rename resource

Opens the Rename resource dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as Main Files support is enabled (on page 3183), you can select this option to update the references to the resource you are renaming. A Preview option is available that allows you to see what will be updated before selecting Rename to process the operation.

Resource Hierarchy

Shows the hierarchy for the selected resource.

Resource Dependencies

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the Main Files directory.

Expand More

Expands more of the children of the selected resource from the Hierarchy/Dependencies structure.
Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip:
When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

Search and Rename Actions for IDs in DITA

Oxygen XML Editor allows you to search references to ID attributes (either direct references using the @href and @conref attributes or indirect references using @keyref or @conkeyref attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename id attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In Author mode, these operations are available for DITA documents in the contextual menu (grouped in the Manage IDs submenu). In Text mode, these actions are also available in the Quick Assist menu. To access it, place the cursor inside the value of an @id attribute and click the yellow light bulb icon.

The possible actions include:

Rename in

Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File (Available in the Text mode only)

 Renames the ID you are editing and all its occurrences in the current file.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project.

Search References in

Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

Search Declarations (Available in the Text mode only)

Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

Search Declarations in (Available in the Text mode only)

Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

Search Occurrences in file
Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

**Change scope (Available in the Quick Assist menu in Text mode only)**

Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

**Tip:**

A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

**Related Information:**

Main Files Support in DITA (on page 3183)

---

**Metadata**

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

**Topic Metadata**

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

**Taxonomy and Subject Scheme**

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using subject scheme maps (on page 3226). When you are authoring, many of the values you choose from have been defined in subject scheme maps.
Migrating MS Office Documents to DITA

Oxygen XML Editor integrates the entire DITA for Publishers plugins suite and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see Migrating Various Document Formats to and from DITA (on page 3192).

Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Oxygen XML Editor Batch Documents Converter Add-on (Multiple Documents)

The provided Word to DITA conversion of the Oxygen Batch Documents Converter add-on (on page 2533) contains an option named Create DITA maps from Word documents containing multiple sections. When this option is selected, all sections from your Word document marked by titles or headings will be separated into individual DITA topics and referenced in a DITA map.

Smart Paste (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor and create a new DITA topic.
3. Paste the selected content in Author mode. The Smart Paste functionality (on page 613) will attempt to convert the content to DITA structure.

HTML to DITA (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   ◦ In Oxygen XML Editor, select File > Import/Convert > HTML File to XHTML to import it as XHTML. Then, open the XHTML in Oxygen XML Editor and use one of the XHTML to DITA transformation scenarios (on page 1375) to convert the content to DITA structure.
   ◦ Open the HTML file in any web browser, select all of its content, and copy it. Then, open Oxygen XML Editor, create a new DITA topic, and paste the selected content in Author mode. The Smart Paste functionality (on page 613) will attempt to convert the HTML content to DITA structure.

Word to LibreOffice to DITA (Single Document)

1. Open the document in the LibreOffice application and save it as DocBook.
2. Open the DocBook document in Oxygen XML Editor.
3. Run the built-in DocBook to DITA transformation scenario (on page 1461).
4. You may need to make some manual adjustments for elements that could not be mapped.
Word to DITA using DITA For Publishers (Single Document)

1. Save the document in the MS Word DOCX format.
2. Open it in the Archive Browser view (on page 2008) in Oxygen XML Editor and then open the document.xml file contained in the archive.
3. Run the built-in DOCX DITA transformation scenario. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the DITA For Publishers plugin and there is documentation for it available here: http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html.

Word to DocBook to DITA (Multiple Documents)

1. Use a tool to convert the documents to DocBook. For example, Pandoc is a free document converter engine that can convert DOCX documents to DocBook and according to Pandoc's manual, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted DocBook documents somewhere in your project.
3. Perform a batch transformation (on page 1553) on all the newly converted DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 402).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in DocBook to DITA transformation scenario (on page 1461).
4. You may need to make some manual adjustments in the resulting documents for elements that could not be mapped.

Word to HTML/Markdown to DITA (Multiple Documents)

1. Use a tool to convert the documents to HTML or Markdown. For example, Pandoc is a free document converter engine that can convert DOCX documents to those formats.
2. Use Oxygen's Batch Converter add-on (on page 2533) to convert the documents to DITA.
3. You may need to make some manual adjustments in the resulting documents for elements that could not be mapped.

Migrating Excel and Other Types of Spreadsheets to DITA

There are two possibilities for converting Microsoft Excel (or other similar types of documents) to DITA:

- Copy the spreadsheet content and paste it in a DITA topic in Author mode. The Smart Paste functionality (on page 613) will attempt to convert the content to DITA.
- Use Oxygen's Batch Converter add-on (on page 2533) to convert one or more spreadsheet documents to DITA.
Migrating Various Document Formats to and from DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 3190).

Migrating DocBook Content to DITA

The Oxygen Batch Documents Converter add-on (on page 2533) can be used for migrating one or multiple DocBook documents to DITA.

The provided DocBook to DITA conversion contains an option named Create DITA maps from DocBook documents containing multiple sections. When this option is selected, all sections from your DocBook document will be separated into individual DITA topics and referenced in a DITA map.

Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:
• Copy the content from Google Docs and paste it in an open DITA topic in **Author** mode. The *Smart Paste* functionality (on page 613) will attempt to convert the content to DITA.
• Save the Google document as OpenDocumentFormat (**ODF**), then open it in the free **LibreOffice** application and save it as **DocBook**. Next, open the **DocBook** document in Oxygen XML Editor and run the built-in transformation scenario called **DocBook to DITA** (on page 1461).
• If you want to convert multiple Google documents at once, save the documents as HTML, then use **Oxygen's Batch Documents Converter add-on** (on page 2533) to convert the documents to DITA.

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Migrating Markdown Content to DITA**

There are several possibilities to convert Markdown content to DITA:

• The DITA Open Toolkit publishing engine bundled with Oxygen XML Editor allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see **Working with Markdown Documents in DITA** (on page 3026).
• If you want to convert multiple Markdown files at once, you can use **Oxygen's Batch Documents Converter add-on** (on page 2533) to convert the documents to DITA.

**Migrating HTML Content to DITA**

There are several possibilities to convert HTML content to DITA:

• Copy the HTML content and paste it in an open DITA topic in **Author** mode. The *Smart Paste* functionality (on page 613) will attempt to convert the content to DITA.
• Convert the HTML file to XHTML by selecting **File > Import/Convert > HTML File to XHTML**. Then, open the XHTML file and use one of the **XHTML to DITA** Transformation Scenarios (on page 1375) to convert the content to DITA.
• If you want to convert multiple HTML files at once, you can use **Oxygen's Batch Converter add-on** (on page 2533) to convert the documents to DITA.

**Migrating Unstructured FrameMaker to DITA**

There is a FrameMaker plugin that can be used for this type of conversion: https://leximation.com/tools/info/fm2dita.php.

**Migrating MadCap Content to DITA**

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.
Migrating Confluence to DITA

To migrate Confluence content to DITA, first export the content to HTML. For this, log in to your Confluence account and navigate to the specific space that you want to export. Then go to Space Settings > Export space and choose to export it as HTML.

You can then use Oxygen's Batch Documents Converter add-on (on page 2533), selecting the Confluence to DITA action, to convert the exported index.html file into a DITA map with topics.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.

Migrate from DITA to Confluence and Other Formats

There are various possible methods available for converting DITA content to Confluence and other formats (such as Microsoft Word or HTML). For details and ideas for some of the possible methods, see the DITA to Confluence blog post.

Resources

For more information about migrating to DITA, see our webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring.

How to Count Words in DITA Topics or Maps

There are various ways to count words in Oxygen XML Editor:

- Open a DITA topic in the Author visual editing mode, right-click anywhere in the editor, and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Open map in editor with resolved topics toolbar button. In the newly opened DITA map, right-click anywhere in the editor and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Configure Transformation Scenarios toolbar button and choose the DITA Map Metrics Report transformation scenario.

Tip:

Along with the word count, this DITA Map Metrics Report transformation provides additional information (such as the number of processed maps and topics, content reuse percentage, the number of elements, attributes, words, and characters used, and more).

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor includes support for some DITA 1.3 features.
The Oxygen XML Editor publication of the full DITA 1.3 specifications can be found at [https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html](https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html).

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor:

**Table 55. DITA 1.3 Features Implementation Status**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.7.0 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</td>
<td>N/A</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>

DITA 2.0 Support

Starting with version 23, Oxygen XML Editor includes support for some DITA 2.0 features. To enable this support, go to the Options > Preferences > DITA page and select the Enable DITA 2.0 Editing Support (Experimental) checkbox. Enabling it results in DITA 2.0 topic and map templates being available in the New document wizard (on page 368).

The following table is a list of DITA 2.0 features and their implementation status in Oxygen XML Editor. The list of proposed DITA 2.0 changes is published here: https://www.oasis-open.org/committees/download.php/65626/DITA-2.0-proposals.pdf.

Scripting Oxygen

Although Oxygen XML Editor is mostly intended to be a visual editing tool, the all platforms distribution is bundled with a `scripts` subfolder that contains scripts to automate and run various utilities from a command line.

To run any of these scripts, you are required to purchase a special scripting commercial license. Trial scripting licenses are also available, by request, for clients who are interested in testing the scripts for their particular workflows. Once you have a scripting license key available, you should copy the license key to a file named `scriptinglicensekey.txt` and save it in the main application directory (the parent directory of the "scripts" directory).

For more information about the Oxygen Scripting support, watch our Webinar: Automate XML processing with Oxygen XML Scripting.

DITA Validate and Check For Completeness

⚠️ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

The Validate and Check For Completeness (on page 2943) action that is available on the toolbar of the DITA Maps Manager view provides the ability to validate a DITA map or a DITA Open Toolkit project file with a large array of settings. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `validateCheckDITA.sh` script to run a validation on a DITA map or DITA Open Toolkit project file and report the results in a separate XML document.

Sample Command-Line Arguments for the Validate and Check for Completeness Script:

```
sh scripts/validateCheckDITA.sh -i inputFile [-c contextId] [-s settingsFile] [-r reportFile]
```

A public example of using such a script as a GitHub action for reporting errors in pull requests on DITA project can be found here: https://github.com/oxygenxml/blog/blob/master/.github/workflows/workflow.yml. The GitHub action calls a Gradle script target named `runValidation`: https://github.com/oxygenxml/blog/blob/master/build/build.gradle.
Transform

Attention:

- This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.
- To execute a scenario based on WebHelp using this script, in addition to the scripting commercial license, you are required to purchase an Oxygen XML WebHelp license or an Oxygen Publishing Engine license.
- To execute a scenario based on Chemistry using this script, in addition to the scripting commercial license, you are required to purchase an Oxygen PDF Chemistry license or an Oxygen Publishing Engine license.

The Transform script (transform.sh) helps you to execute a transformation scenario. You can run the scenarios for the existing document types (frameworks) (on page 3221) without setting a scenarios file, but for others, you have to specify a specialized scenarios file or a project file that contains scenarios.

You can export transformation scenarios from Oxygen XML Editor into a specialized scenarios file by using the Export selected scenarios action from the Transformation Scenarios view or using the Export Global Transformation Scenarios action from the Options menu.

Arguments for the Transform Script

```
sh scripts/transform.sh -i inputFile -sn scenarioName [-s scenariosFile] [-v]
```

- **-i inputFile**
  
The input file that the transformation scenario is applied to.

- **-sn scenarioName**
  
The name of the transformation scenario to be executed.

- **-s scenariosFile**
  
The name of a file that contains additional scenarios. It can be a specialized scenarios file or a project file that contains project transformation scenarios.

  The scenarios from this file are merged with the scenarios from the document types (frameworks) (on page 3221).

- **-v**
  
This argument can be specified to activate verbose logging for DITA-OT and ANT scenarios. It is useful for debugging.
XML Refactoring

Attention:

- This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.
- To execute an XQuery refactoring operation using this script, in addition to the scripting commercial license, you are required to purchase a Saxon EE license.

The XML Refactoring script (xmlRefactoring.sh) can be used to execute XML refactoring operations (on page 840). You can run a refactoring operation by specifying the operation id of the operation. If, in addition to the refactoring operations provided by Oxygen XML Editor in the OXYGEN_INSTALL_DIR/refactoring folder and in framework configurations, you want to run a custom refactoring operation, you have to specify the directory that contains it, using the od (operations directory) argument.

Arguments for the XML Refactoring Script

```
sh scripts/xmlRefactoring.sh  -id operationId -i inputFilesOrDirectories [-f filesFilter]
[-od operationsDirectory] [-p param1=value1...] [-v]
```

- **-id operationId**
  The ID of the refactoring operation to be executed.

- **-i inputFilesOrDirectories**
  A list of space-separated input files or directories that the refactoring operation is applied to.

- **-f filesFilter**
  Specifies a filter for the input files by using a file pattern. For example, to restrict the operation to only analyze build files, you could use build*.xml for the file pattern.

- **-od operationsDirectory**
  A directory that contains additional refactoring operations.

- **-p param1=value1...**
  A list of space-separated pairs of a parameter's name and value used by the refactoring operation.

- **-v**
  This argument can be specified to activate verbose logging.
DITA Translation Package Builder

⚠️ Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

The DITA Translation Package Builder (translationPackageBuilder.sh) script helps you to build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

This script requires the DITA Translation Package Builder add-on to be installed in the all platforms distribution of Oxygen XML Editor. To install it the add-on, follow these instructions:

1. Go on the DITA Translation Package Builder plugin Releases page and download the latest translation-package-builder-{version}-plugin.jar package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

Note:
Do not create any intermediate folders. Afterwards, the file system should look like this:

```
{oxygenInstallDir}/plugins/translation-package-builder-{version}/
plugin.xml
```

Examples for the DITA Translation Package Builder Script

Example: Generating a Milestone File

```
sh scripts/translationPackageBuilder.sh -gm -i ditamapFile [-m milestoneFile] [-verbose]
```

This action is the first one to use. It will generate a unique hash for each documentation resource. This information will be used by the second action to detect which files have been modified. A milestone file should be generated the first time you install this plugin and henceforth, after each package is sent to translators.

- **-gm**
  Requests the generation of a milestone file.

- **-i ditamapFile**
  The main DITA map file.

- **-m milestoneFile**
  The path to the milestone file. If missing, it is assumed that the milestone will be saved in the DITA map parent folder with the following name:
  `{ditamapName}_translation_milestone.xml`.

- **-verbose**
  Generates a console log about the performed steps. It is useful for debugging.
**Example: Creating a Package with the Modified Files to Send to Translation**

```
sh scripts/translationPackageBuilder.sh -gp -i ditamapFile [-m milestoneFile] -p package.zip [-verbose]
```

This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

- **-gp**
  Requests the generation of a package with the modified files.

- **-i ditamapFile**
  The main DITA map file.

- **-m milestoneFile**
  The path to the milestone file. If missing, it is assumed that the milestone will be located in the DITA map parent folder with the following name: `{ditamapName}_translation_milestone.xml`.

- **-p package.zip**
  The path to the zip archive where all the modified files are collected.

- **-verbose**
  Generates a console log about the performed steps. It is useful for debugging.

**Example: Applying a Translation Package Over a DITA Map**

```
sh scripts/translationPackageBuilder.sh -ap -i ditamapFile -p package.zip [-verbose]
```

When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open `dita-map-french.ditamap` if the package contains the french translation). Invoking this action will extract the changed files inside the map's directory.

- **-ap**
  Requests the application of a translation package over a DITA map.

- **-i ditamapFile**
  The main DITA map file that matches the received package language. For example, if the package contains topics translated into French, then this map is the French version of your DITA map.

- **-p package.zip**
  The path to the archive with all the translated files.

- **-verbose**
  Generates a console log about the performed steps. It is useful for debugging.
Batch Converter

⚠️ Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

The Batch Converter script (batchConverter.sh) helps you to convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4 / DocBook5
- Markdown to XHTML
- Markdown to DITA
- Markdown to DocBook4 / DocBook5
- Word to XHTML
- Word to DITA
- Word to DocBook4 / DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- JSON to XML
- JSON to YAML
- XML to JSON
- YAML to JSON

This script requires the Oxygen Batch Documents Converter add-on to be installed in the all platforms distribution of an Enterprise edition of Oxygen XML Editor.

To install the add-on, follow these instructions:

1. Go on the Oxygen Batch Documents Converter plugin Releases page and download the latest oxygen-batch-converter-{version}-plugin.jar package.
2. Unzip it inside {oxygenInstallDir}/plugins.

Note:
Do not create any intermediate folders. Afterwards, the file system should look like this: {oxygenInstallDir}/plugins/oxygen-batch-converter-{version}/plugin.xml

Arguments for the Batch Converter Script

```bash
sh scripts/batchConverter.sh -i inputFiles -if inputFormat -o outputDirectory
-of outputFormat [-ss (true|false)] [-csd (true|false)] [-cs converterSettingsFile]
```

-i inputFiles
A list of space-separated input files or directories in file syntax form.

- **if inputFormat**
  
  The format of the input files. The possible values are: `html`, `markdown`, `word`, `confluence`, `docbook`, `excel`, `json`, `yaml`, or `xml`.

- **o outputDirectory**
  
  The output directory in file syntax form.

- **of outputFormat**
  
  The format of the output files. The possible values are: `xhtml`, `dita`, `docbook4`, `docbook5`, `json`, `yaml`, or `xml`.

- **ss (true|false) [only for Word to DITA, HTML to DITA, Markdown to DITA, and DocBook to DITA conversions]**
  
  Splits sections marked by titles or headings to separate files and create a DITA map. The possible values are `true` or `false` (default).

- **csd (true|false) [only for Markdown to DITA conversions]**
  
  Creates short description elements from the first paragraph before the headings. Possible values are `true` or `false` (default).

- **cs converterSettingsFile**
  
  A file that contains the Batch Documents Converter add-on preferences settings. It can be an xpr file that contains project options or an xml file that contains global options. If not specified, the operation uses the application's default settings.

**Confluence to DITA**

The Confluence to DITA conversion processes the HTML content generated by the Confluence export process. For exporting, login to your Confluence account and navigate to the specific space that you want to export. Go to **Space Settings > Export space** and choose to export it as HTML. The `index.html` file resulting from this process has to be provided in the `inputFiles` argument.

**Compile Framework Script**

⚠ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor.

A custom framework (on page 3221) (document type) can be created using a special XML descriptor file (on page 2134), either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it.

The Compile Framework Script (`compileFrameworkScript.sh`) helps you to compile the script into the `*.framework` file that represents the framework configuration. Although Oxygen XML Editor is now able
to automatically compile and load scripts, you might want to compile it yourself to obtain the resulting *.framework file if your framework runs on a different version of Oxygen XML Editor.

Arguments for the Compile Framework Script

```
sh scripts/compileFrameworkScript.sh -i "script1.exf" "script2.exf" "frameworksDir"
```

-i inputFiles

A list of space-separated Framework Extension Script Files (on page 2136) (*.exf) or directories in file syntax form. If a directory is specified, the Framework Extension Script Files (on page 2136) are searched for inside it and in its child directories.

XSLT Stylesheets Documentation

Attention:

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XSLT Stylesheets from Oxygen XML Editor by using the Tools > Generate Documentation > XSLT Stylesheet Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the scripts/stylesheetDocumentation.sh script to generate XSLT stylesheets documentation from the command line.

Sample Command-Line Arguments for the Generate XSLT Stylesheet Documentation Script

```
sh scripts/stylesheetDocumentation.sh xslFile [-cfg:configFile] | [-out:outputFile]
```

Related information

XML Schema Documentation (on page 3205)
WSDL Documentation (on page 3206)

XML Schema Documentation

Attention:

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XML Schemas from Oxygen XML Editor by using the Tools > Generate Documentation > XML Schema Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the scripts/schemaDocumentation.sh script to generate XML Schema documentation from the command line.
Sample Command-Line Arguments for the Generate XML Schema Documentation Script

```
```

Related information

- XSLT Stylesheets Documentation (on page 3205)
- WSDL Documentation (on page 3206)

WSDL Documentation

**Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for WSDL documents from Oxygen XML Editor by using the Tools > Generate Documentation > WSDL Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `scripts/wsdlDocumentation.sh` script to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate WSDL Documentation Script

```
sh scripts/wsdlDocumentation.sh wsdlFile [-cfg:configFile] [-out:outputFile]
```

Related information

- XSLT Stylesheets Documentation (on page 3205)
- XML Schema Documentation (on page 3205)

XML Instance Generator

**Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

You can generate multiple XML documents from an XML Schema from Oxygen XML Editor by using the Tools > Generate Sample XML Files main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `scripts/xmlGenerator.sh` script to generate multiple XML instance files from the command line.

Sample Command-Line Arguments for the Generate Sample XML Files Script

```
sh scripts/xmlGenerator.sh path/to/config/file [-verbose]
```
### Extended Version of the Script and its Arguments

```
sh scripts/xmlGenerator.sh [[path_to_config_file] [-s XML_schema_path -r root [-n ns] [-o output_dir]
[-f instance_name] [-i num_of_instances]] [-verbose]]
```

#### path_to_config_file
- The path to the file that contains the configuration to be used.

#### -s XML_schema_path
- The path to the XML schema to be used for generating the XML file(s).

#### -n ns
- The namespace used for the XML namespace declaration.

#### -r root
- The root element for the generated file(s).

#### -o output_dir
- The output directory to be used for storing the generated file(s).

#### -f instance_name
- The pattern name to be used for the generated file(s). It is usually the name plus extension.

#### -i num_of_instances
- The number of XML files to be generated.

#### -verbose
- This argument can be specified to activate verbose logging.

**Note:**
Any value specified by the `-s`, `-n`, `-r`, `-o`, `-f`, or `-i` arguments overrides the corresponding value from the configuration file, if that file is specified in the `path_to_config_file` argument.

### Flatten XML Schema

**Attention:**
This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

You can flatten an XML schema that contains multiple includes and redefines to a single schema file from Oxygen XML Editor by using the Tools > Flatten Schema main menu action. You can use the equivalent `scripts/flattenSchema.sh` script to flatten an XML schema from the command line.
Sample Command-Line Arguments for the Flatten Schema Script

```
    [-flattenImports:<boolean_value>] | [-useCatalogs:<boolean_value>]
    [-flattenCatalogResolvedImports:<boolean_value>] [-verbose]]
```

**Compare Directories**

⚠️ **Attention:**

This script is bundled with the *all platforms distribution* of Oxygen XML Editor. To run the script, you are required to purchase a special *scripting commercial license*.

The **Compare Directories** script (`compareDirs.sh`) can be used to compare two directories and get the comparison results in various formats.

**Arguments for the Compare Directories Script**

```
```

**firstDirPath**

Mandatory argument that specifies the first directory path (it can also be provided as a URL using `'file://'` protocol).

**secondDirPath**

Mandatory argument that specifies the second directory path (it can also be provided as a URL using `'file://'` protocol).

**baseDirPath**

Optional argument that specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments.

**-if includeFilesFilter**

Use this argument to only include files that match the specified pattern in the comparison (e.g. `.xml`, `.json`). Default value = `*`.

**-ia includeArchives**

If set to `true`, files from archives are included in the comparison. Default value = `false`.

**-ef excludeFilesFilter**
Use this argument to exclude files that match the specified pattern from the comparison (e.g. 
*.jpg).

-ed excludeSubdirsFilter

Use this argument to exclude sub-directories that match the specified pattern from the 
comparison (e.g. .svn, _svn, .git).

-cm comparisonMode

Specifies the comparison mode. There are three modes available: content, binary, and 
timestamp. Default value = content.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: auto, chars, words, lines, syntax_aware, xml_fast, and xml_accurate. Default value = auto.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: low, 
medium, high, and very_high. Default value = medium.

-iws ignoreWS

If set to true, whitespaces are ignored if differences consist only of whitespaces. Default value = 
false.

-ipi ignorePI (only for the XML-aware algorithms)

If set to true, processing instructions are ignored in the comparison. Default value = false.

-icm ignoreComments (only for the XML-aware algorithms)

If set to true, comments are ignored in the comparison. Default value = false.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to true, DOCTYPE sections are ignored in the comparison. Default value = false.

-itn ignoreText (only for the XML-aware algorithms)

If set to true, text content is ignored in the comparison. Default value = false.

-ins ignoreNS (only for the XML-aware algorithms)

If set to true, namespaces are ignored in the comparison. Default value = false.

-ind ignoreNSDecl (only for the XML-aware algorithms)

If set to true, namespace declarations are ignored in the comparison. Default value = false.

-inp ignorePrefixes (only for the XML-aware algorithms)

If set to true, prefixes are ignored in the comparison. Default value = false.

-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to true, the order of attributes is ignored in the comparison. Default value = false.

-ieee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)
If set to `true`, the expansion state for empty elements is ignored in the comparison. Default value = `false`.

**-merge mergeOperation**

If set to `true`, a merge operation is invoked after the comparison. Default value = `false`.

**Notes:**

- This argument is considered only for 3-way comparisons (i.e. only if the `baseDirPath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second directories (relative to the base folder), all the differences of the type `incoming` are considered and the content of the first directory is updated accordingly.
- Conflicting changes are not addressed.
- After the comparison, a report is created that provides details about the changes that were made.

**-mergeout outputDirPathForMerge**

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merge operation. For example, it allows you to specify a specific existing or new directory where the results of the merge operation is saved, other than the first directory path for the comparison (which is what happens when using only the `-merge` argument). The path of the directory can also be provided as a URL using `file://` protocol. This argument and the `-merge` argument are not dependent on each other.

**-out outputFormat**

**Notes:**

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly. If you skip specifying the `/grouped` or the `/raw` qualifiers, `/grouped` takes precedence.
- If you choose the `html` or `htm` output format, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The `/ifcr` qualifier for the `html` or `htm` values is considered only if the `-outfile` argument is also present. IFCR is an acronym for Include File Comparison Reports and it means that, along with generating the directory comparison report,
separate file comparison reports will be generated for all modified file pairs. These reports are available through links from the main report and are saved to a specific directory based on the value provided by the `outfile` argument. It will have the same parent directory and the same name as the `outputFile` plus `-OXY-FC-REPORTS` added to the end of its name.

- The `html` value, as well as the `grouped`, `raw`, or `ifcr` qualifiers, are not considered if the `-merge` argument is present.

### `-outfile outputFile`

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL using `file://` protocol.

### `-help | --help | -h | --h`

Displays help text.

### Notes:

- For boolean arguments, it is not necessary to provide the “true” value. Their presence in the argument list is equivalent to setting their value to “true” (and their absence from the argument list is equivalent to setting their value to “false”). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- File markers used in reports are as follows: M = modified, O1 = only found in 1st directory, O2 = only found in 2nd directory.

### Examples of Compare Directories Script

**Example 1: Compare Directories and Include Archives While Excluding JPEGs**

The following command results in archives being included in the comparison, while JPEGs are excluded:

```
sh scripts/compareDirs.sh dir1 dir2 -ia true -ef *.jpg
```

**Example 2: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order**

The following command only includes XML files (even from archives) in the comparison, while ignoring the comments and attribute order:

```
sh scripts/compareDirs.sh dir1 dir2 -if *.xml -ia -iao -icm
```

**Example 3: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order**
The following command redirects the comparison results to a JSON file named "results.json", with "raw" mode formatting:

```
sh scripts/compareDirs.sh dir1 dir2 -out json/raw > results.json
```

**Example 4: Compare Directories and Generate Comparison Report**

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the directories and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareDirs.sh dir1 dir2 -out html -outfile results.html
```

**Figure 811. Example of an HTML Report for Directory Comparison**

**Resources**

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:

**Related information**

- Compare Directories Tool (on page 494)
- Compare Files Script (on page 3212)

**Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.
The **Compare Files** script (`compareFiles.sh`) can be used to compare files (2-way or 3-way) and get the comparison results in various formats.

**Arguments for the Compare Files Script**

```bash
```

**firstFilePath**

Mandatory argument that specifies the first file path (it can also be provided as a URL).

**secondFilePath**

Mandatory argument that specifies the second file path (it can also be provided as a URL).

**baseFilePath**

Optional argument that specifies the path of the base file that the other two files will be compared against in a 3-way comparison (it can also be provided as a URL).

**-ct contentType**

Specifies the content type of the files to be compared. Possible values (based on known extensions of some of the most common file types): `.xml`, `.dtd`, `.css`, `.rnc`, `.xquery`, `.json`, `.yaml`, `.java`, `.js`, `.c`, `.cpp`, `.pl`, `.py`, `.php`, `.sql`, `.bat`, `.sh`, `.properties`, `.txt`. The option is used to force the file handling to the specific type of file. Otherwise, the file extension is auto-detected.

**-alg comparisonAlg**

Specifies the algorithm to be used for the comparison. Possible values: `auto`, `chars`, `words`, `lines`, `syntax_aware`, `xml_fast`, and `xml_accurate`. Default value = `auto`.

**-als algStrength**

Specifies the strength of the algorithm to be used for the comparison. Possible values: `low`, `medium`, `high`, and `very_high`. Default value = `medium`.

**-iws ignoreWS**

If set to `true`, whitespaces are ignored if differences consist only of whitespaces. Default value = `false`.

**-ipi ignorePI (only for the XML-aware algorithms)**

If set to `true`, processing instructions are ignored in the comparison. Default value = `false`.

**-icm ignoreComments (only for the XML-aware algorithms)**

If set to `true`, comments are ignored in the comparison. Default value = `false`.

**-idt ignoreDocType (only for the XML-aware algorithms)**

If set to `true`, doctype declarations are ignored in the comparison. Default value = `false`.
If set to **true**, DOCTYPE sections are ignored in the comparison. Default value = **false**.

**-itn ignoreText (only for the XML-aware algorithms)**

If set to **true**, text content is ignored in the comparison. Default value = **false**.

**-ins ignoreNS (only for the XML-aware algorithms)**

If set to **true**, namespaces are ignored in the comparison. Default value = **false**.

**-ind ignoreNSDecl (only for the XML-aware algorithms)**

If set to **true**, namespace declarations are ignored in the comparison. Default value = **false**.

**-inp ignorePrefixes (only for the XML-aware algorithms)**

If set to **true**, prefixes are ignored in the comparison. Default value = **false**.

**-iao ignoreAttrOrder (only for the XML-aware algorithms)**

If set to **true**, the order of attributes is ignored in the comparison. Default value = **false**.

**-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)**

If set to **true**, the expansion state for empty elements is ignored in the comparison. Default value = **false**.

**-en XPathExprToExcludeNodes**

Specifies an XPath expression to exclude certain nodes from the comparison.

**-merge mergeOperation**

If set to **true**, a merge operation is invoked after the comparison. Default value = **false**.

**Notes:**

- This argument is considered only for 3-way comparisons (i.e. only if the `baseFilePath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second files (relative to the base file), all the differences of the type **incoming** are considered and the content of the first file is updated accordingly.
- If conflicting changes are detected, the merge operation is aborted and the first file remains unchanged.
- After the comparison and merge, a report is created that provides some details about the changes that were made.

**-mergeout outputDirPathForMerge**

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merged file. Instead of directly affecting the first compared file (which is what happens when using only the `-merge` argument), a new file is created with the same name.
as the first file and it is saved in the specified directory. The path of the output directory can also be provided as a URL. This argument and the `--merge` argument are not dependent on each other.

**-out outputFormat**

Specifies the format of the output. Possible values: `yaml`, `json`, `xml`, `html`, `htm`, `html/inlineCSS`, or `htm/inlineCSS`. Default value = `yaml`.

**Notes:**

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly.
- If you choose any of the `html`, `html/inlineCSS`, `htm`, or `htm/inlineCSS` output formats, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The `inlineCSS` qualifier for the `html` and `htm` values implies that the CSS-based generated HTML code is more suitable to be directly inserted in emails (as most email clients only accept inline CSS styling for HTML emails).
- The `html` and `htm` values (with or without the `inlineCSS` qualifier) are not considered if the `--merge` argument is present.

**-outfile outputFile**

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL.

**-help | --help | -h | --h**

Displays help text.

**Note:**

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.

### Examples of Compare Files Script

**Example 1: Compare Files and View Results in XML Format**

The following command compares the files (ignoring the namespaces and prefixes) and redirects the console output to the `results.xml` file (XML-formatted):

```bash
sh scripts/compareFiles file1 file2 -ins -inp -ind -out xml > results.xml
```

**Example 2: Compare Files with Line by Line Algorithm**
The following command compares the files using the **lines** algorithm and ignores whitespaces:

```
sh scripts/compareFiles.sh file1 file2 -alg lines -iws
```

### Example 3: Compare Files and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the files and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareFiles.sh file1 file2 -out html -outfile outFileName.html
```

**Figure 812. Example of File Comparison Report in HTML Format**

![Example of File Comparison Report in HTML Format](image)

**Resources**

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:

- **Webinar:** [The New Oxygen Compare and Merge Scripts](#).
- **Video:** [Generating File Comparison Reports Using Command-Line Scripts](#).

**Related information**

[Compare Directories Script (on page 3208)](#)
Format and Indent Files

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor. To run the script, you are required to purchase a special scripting commercial license.

The Format and Indent Files script (batchFormatAndIndent.bat/batchFormatAndIndent.sh) can be used to format and indent multiple files at once.

Arguments for the Format and Indent Files Script

```
batchFormatAndIndent -i inputFilesAndDirs [-f filesFilter] [-s formattingSettingsFile] [-r] [-ih] [-v]
```

- **-i inputFilesAndDirs**
  The input files and directories.

- **-f filesFilter**
  A filter for the input files, specified by using a file pattern (e.g. *.xml, *.dita).

- **-s formattingSettingsFile**
  A file that contains formatting settings. It can be an .xpr file that contains project options or an .xml file that contains global options. If not specified, the operation uses the application's default settings.

- **-r**
  Use this argument if the operation should be performed recursively for the specified input directories.

- **-ih**
  Use this argument if you want the operation to also format and indent hidden files.

- **-v**
  Activates verbose logging. It is useful for debugging purposes.
24.

Glossary

Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Alternate CSS Style

The Alternate CSS Style refers to the choices in the bottom half of Styles drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. By default, the alternate styles are applied like layers, they are merged sequentially with the main CSS style (on page 3222), and you can activate any number of them. However, if you deselect the Enable multiple selection of alternate CSSs option (on page 146) in the CSS subtab of the Document Type configuration dialog box (on page 140), the alternate styles are treated like main CSS styles (on page 3222) and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 2145).

Anchor

An Anchor is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the @href attribute with a # symbol followed by the anchor that is defined in a target ID (for example href="MyTopic.dita#anchor").

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A block element is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are block elements. It is distinct from a inline element, which has no such separation.

Bookmap

A bookmap is a specialized DITA map used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.
**Callout**

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor uses callouts to present comments and other types of review modifications.

**Canonicalize**

To canonicalize something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

**Content Completion Assistant**

The Content Completion Assistant refers to a very helpful mechanism in Oxygen XML Editor that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode (on page 616)
- Content Completion Assistant in Text Mode (on page 532)
- Content Completion Assistant in Grid Mode (on page 586)
- Content Completion in XSLT Stylesheets (on page 892)
- Content Completion in Ant Build Files (on page 937)
- Content Completion in XML Schema (on page 992)
- Content Completion in XQuery (on page 1035)
- Content Completion Assistance in WSDL Documents (on page 1053)
- Content Completion in CSS Stylesheets (on page 1077)
- Content Completion in LESS Stylesheets (on page 1081)
- Content Completion in Relax NG Schemas (on page 1089)
- Content Completion in NVDL Schemas (on page 1105)
- Content Completion in JavaScript Documents (on page 1187)
- Content Completion in Schematron Documents (on page 1209)
- Content Completion in SQF (on page 1248)

**Dependencies**

The word dependencies in XML documents refers to resources or references that are relied upon in a particular scope (e.g. the scope of the entire project or a particular DITA map) for a selected resource. This is helpful if you want to see where the resource is used or referenced in the entire hierarchy of the project or map. For example, you might want to look for the dependencies of an XML document to find all the instances where it is referenced throughout the hierarchy of a project or DITA map.
Dockable

A **Dockable** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A **document fragment** represents a portion of an XML document's tree of nodes or content.

Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a **framework** ([on page 3221](#)). In Oxygen XML Editor, **Document Type Association** also specifically refers to a **preferences page** ([on page 138](#)) where you can create new custom **frameworks** or edit existing ones. Note that **frameworks** (document types) that come built-in with Oxygen XML Editor are read-only, but you can **Extend** ([on page 138](#)) or **Duplicate** ([on page 138](#)) them to configure them as custom **frameworks**.

DITA Map

A **DITA map** is a component of the DITA **framework** ([on page 3221](#)) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually, the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or **bookmap** ([on page 3218](#)) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

**DITA Open Toolkit** is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the **Apache License, Version 2.0**.

The toolkit supports all versions of the **OASIS DITA specification**, including 1.0, 1.1, 1.2, and 1.3.

DITA-OT

**Related Information:**

http://www.dita-ot.org/
DITA-OT-DIR

*DITA_OT_DIR* refers to the default directory that is specified for your DITA Open Toolkit distribution in the Options > Preferences > DITA preferences page *(on page 269)*.

For example, if you are using DITA-OT 3.7.0 that comes bundled with Oxygen XML Editor, the default directory is: *{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x*. You can also specify a custom directory.

Foldable Element

A *foldable element* refers to elements that can be collapsed and expanded in Oxygen XML Editor. *Foldable elements* are marked with a small triangle (⌜ / ⌝) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (*Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All*).

Framework

A *framework* refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A *framework* is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor includes a *Document Type Configuration Dialog Box* *(on page 140)* that allows you to define the set of rules and customize various authoring mechanisms for new or existing *frameworks*.

For advanced details about customizing your own *framework*, see the *Creating and Configuring Custom Frameworks* *(on page 2133)* section.

Global Options

*Global Options* refers to the storage option *(on page 311)* in the Oxygen XML Editor preference pages *(Options > Preferences)*. If you select *Global Options* *(on page 312)*, the options in that particular preferences page are stored locally on your computer and are not accessible to other users (unless you export them into an XML options file *(on page 313)* that can then be shared).

Hierarchy

In the *Oxygen Resource Hierarchy view*, the word *hierarchy* refers to a set of components (outgoing references) that are displayed as a tree, recursively, starting from the selected XML file (shown as the root). It makes it easy to navigate through the hierarchy (tree) to find specific data.

IDML

*IDML* is an abbreviation for Adobe InDesign Markup files.
**Inline Element**

An *inline element* is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

**Java Archive**

*Java Archive (JAR)* is an archive file format. *JAR* files are built on the ZIP file format and have the `.jar` file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

**Key Space**

The concept of a *Key Space* in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A *Key Space* is established when a *root map* defines a set of effective key bindings. When Oxygen XML Editor processes key references, it determines the effective binding of a given key to a resource in the context of the *specified root map*.

**Keystore**

A *Keystore* is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Editor:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)

**Main CSS Style**

The *Main CSS Style* refers to the selection in the top half of the *Styles* drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. The *main CSS* applies to the whole document and you can also select one or more *alternate styles* (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the *main CSS style*.

For more information, see *Configuring and Managing Multiple CSS Styles for a Framework*.

**Main File**

A *Main File* typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the *Contextual Project Operations Using 'Main Files' Support* section.
**Named User**

*Named User* is defined as an individual full or part-time employee who is authorized by You (the individual or entity who owns the rights for Oxygen XML Editor) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, *Named User* licenses cannot be shared among multiple individuals and separate *Named User* licenses must be purchased for each individual user.

A *Named User* license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the *Named User's* employment with your company.
- (b) Permanent reassignment of a *Named User* to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an *Oxygen* license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the *Named User* license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Editor *End-User License Agreement*.

**Oxygen Publishing Template**

*Oxygen Publishing Template* defines all the aspects related with the **look and feel (layout and styles)** for the *WebHelp Responsive* output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the *WebHelp Responsive* output.

**Related Information:**

*Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1606)*

**Perspective**

In Oxygen XML Editor, a *perspective* refers to an interface layout geared towards a specific editing environment. Each *perspective* includes a unique set of interface objects, toolbars, views, and features.

You can change the *perspective* by selecting the respective icon ( ) in the top-right corner of Oxygen XML Editor or by selecting the *perspective* from the *Window > Open Perspective* menu.

The *perspectives* that are available in Oxygen XML Editor are:
Editor (on page 344) - The most commonly used perspective and it is used to edit XML documents.

DITA (on page 346) - Provides an editing environment with default side-views and other interface components that are optimal for working with DITA projects.

XSLT Debugger (on page 347) - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.

XQuery Debugger (on page 349) - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment.

Database (on page 350) - Used to browse and manage databases.

**Plugin**

In Oxygen XML Editor, a plugin is a component that adds extended functionality using a series of extension points and can be installed as an add-on. For more information, along with a full list of add-ons that are officially supported for Oxygen XML Editor, see Oxygen XML Add-on Repositories.

For more information, see the following topics:

- Installing and Updating Add-ons (on page 120)
- Automatic and Manual Methods for Installing Plugins (on page 2413)
- Packing and Deploying Plugins as Add-ons (on page 2445)
- Add-ons Preferences (on page 136)
- Extending Oxygen XML Editor with Plugins (on page 2411)
- General Configuration of an Oxygen XML Editor Plugin (on page 2411)

**Pretty-Print**

Pretty-print refers to formatting and indenting the source code in Text mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor include:

- Format and Indent Element - Available in the Source submenu of the contextual menu for the current element.
- Format and Indent - Available on the toolbar for the entire current document.
- Format and Indent Files - Available in the contextual menu of the Project view (on page 402) for one or more selected files.

**Project Options**

Project Options refers to the storage option (on page 311) in the Oxygen XML Editor preference pages (Options > Preferences). If you select Project Options (on page 312), the options in that particular preferences page are stored at project level in the project file (.xpr), which can easily be shared with other users (on page 312).
**QName**

*QName* stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

**Quick Assist**

The *Quick Assist* feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (♀) placed at the current line in the stripe on the left side of the editor in Text mode. You can also invoke the quick assist menu by using the `Alt + 1` (`Meta + Alt + 1` on macOS) keyboard shortcuts.

**Quick Fix**

The *Quick Fix* support in Oxygen XML Editor helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in Text mode and Author mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the *Quick Fix* proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in Author mode, the *Quick Fix* proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (♀) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you to select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the *Quick Fix* menu by pressing `Alt + 1` (`Command + Alt + 1` on macOS) on your keyboard.

Oxygen XML Editor also provides support for defining and customizing a library of *Quick Fixes* using the Schematron language (on page 1236).

**Root Map**

A *Root Map* (or main map) specifies a *DITA map* (on page 3220) that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a *key space* (on page 3222)).

In Oxygen XML Editor, the *DITA Maps Manager* includes an option on its toolbar where you can easily specify the root map (on page 2903), but there are also several other ways to select or change the root map (on page 2916).
Space-Preserved Element

A spaced-preserved element refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).

Subject Scheme Map

A Subject Scheme Map allows you to create custom controlled attribute values and to manage metadata. Subject scheme maps use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the subject scheme map where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon, radiologist, and so on). In a subject scheme map, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map (on page 3153).

Track Changes

The Track Changes feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (on page 664).

For more information about this feature, see Managing Tracked Changes (on page 643).

WebHelp Output Directory

WebHelp_OUTPUT_DIR refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the Output Directory text field in the Output tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A Working Set refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more working sets to restrict the scope to that specified set of files.
XML Catalog

An **XML Catalog** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 3221), and you can also create your own. Oxygen XML Editor uses these XML Catalogs to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (on page 826).
