This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.head.terms.page**

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header**

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.main.page**

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.topic.page**

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.search.page**

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**
This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area**

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toolbar**
This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.after.topic.toolbar}

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.before.topic.breadcrumb}

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.after.topic.breadcrumb}

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.before.publication.toc}

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.after.publication.toc}

This parameter can be used to display a given XHTML fragment after the publication's table of contents component in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.before.topic.content}

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.after.topic.content}

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.before.feedback}

This parameter can be used to display a given XHTML fragment before the \texttt{Oxygen Feedback} commenting component in the topic page. The value of the parameter can be either a \texttt{well-formed} XHTML fragment or a path to a file that contains a \texttt{well-formed} XHTML fragment.

\texttt{webhelp.fragment.after.feedback}
This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toc**

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toc**

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.labels.generation.mode**

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is `yes`.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is `yes`.

**webhelp.publication.toc.links**
Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.search.default.operator**

Makes it possible to change the default operator for the search engine. Possible values are **and**, **or** (default). If set to **and** while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to **or** and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of **stop words** that are filtered out before the search processing. Use comma separators to specify more than one word (for example: *if, for, is*).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is **yes**.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is **yes** (meaning the index terms icon is displayed). If set to **false**, the index terms icon is not displayed in the output and the index terms page is not generated.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a **tree** style layout, this parameter should be set to **no**.
webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.skip.main.page.generation

If set to true, the default main page is not generated in the output. The default value is false.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to yes), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state
Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

- `webhelp.pdf.link.url`
  - Specifies the target URL for the PDF link component.

- `webhelp.pdf.link.text`
  - Specifies the text for the PDF link component.

- `webhelp.pdf.link.icon.path`
  - Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- `webhelp.show.pdf.link`
  - Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

- `webhelp.pdf.link.anchor.enabled`
  - Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Author includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with `xsl:fo` customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:
• **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author. For more information, see the [Oxygen PDF Chemistry User Guide](http://www.xmladdict.org). This is the supported processor.

• **Prince Print with CSS** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).

• **Antenna House Formatter** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

### How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the [DITA Maps Manager](http://www.xmladdict.org) toolbar.

2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** ([on page 2688](http://www.xmladdict.org)) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

**Figure 274. DITA Map to PDF Templates**

![Edit DITA Scenario](image)

<table>
<thead>
<tr>
<th>Name: DITA Map PDF - based on HTML5 &amp; CSS - Copy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage: Project Options</td>
</tr>
<tr>
<td>Type: PDF (CSS Formatter - HTML5)</td>
</tr>
</tbody>
</table>

**Tags:**

- colors
- blue
- dark
- light

- Choose Custom Publishing Template
- Configure Publishing Templates Gallery

- Save template as... OK Cancel
4. In the **Parameters** tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.
   - **css.processor.type** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
   - **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 255).
   - **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
   - **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see CSS-based DITA to PDF Customization (on page 1395).

**Related Information:**

- CSS-based DITA to PDF Customization (on page 1395)
DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Author comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2816) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2472) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (on page 2817) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
   - `editlink.present.only.path.to.topic` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Related Information:
XSL FO-based DITA to PDF Customization (on page 1656)

DITA Map MS Office Word Transformation

Oxygen XML Author comes bundled with a transformation scenario that allows you to convert DITA maps (on page 2816) to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources) that is used by the transformation scenario as a template to generate the final Word document.

Tip:
You can make general modifications to the Normal.docx template file to alter the published output. The Word application used to edit the Normal.docx should be configured with English locale as the style names for each Word element must be in English.

Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:
1. Open the DITA map in the DITA Maps Manager (on page 2472).

2. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2472) toolbar.

3. Select DITA Map MS Office Word.

4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - **dotx.file** - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
   - **core.xsl** - Specifies the path to a core metadata stylesheet.
   - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
   - **document.xsl** - Specifies the path to a main document stylesheet.
   - **comments.xsl** - Specifies the path to a comments stylesheet.
   - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
   - **footnotes.xsl** - Specifies the path to a footnote stylesheet.
   - **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
   - **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click OK and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

**Related Information:**
- Editing a Transformation Scenario (on page 1154)
- Configure Transformation Scenario(s) Dialog Box (on page 1157)
- Migrating MS Office Documents to DITA (on page 2772)

**DITA Map Markdown Transformation**

Using the Configure Transformation Scenarios toolbar button, you can create a new transformation scenario of the type DITA-OT transformation and then choose one of the Markdown-specific output types:

- GitHub-flavored Markdown
- Markdown
- GitBook

More information about the Markdown output types is available in the DITA-OT documentation: https://www.dita-ot.org/dev/topics/dita2markdown.html.
The generated Markdown content can be used with a static web site generator (such as MKDocs) to build a web site: https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html.

**DITA Map CHM (Compiled HTML Help) Transformation**

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Author needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Author automatically detects if HTML Help Workshop is installed and uses it.

**Note:**

HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hhc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

**Changing the Output Encoding**

Oxygen XML Author uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Author has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the ➤ Configure Transformation Scenario(s) (`Ctrl + Shift + C (Command + Shift + C on macOS)`) action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 Standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc/rfc5646.txt.

**Customizing the CHM Output**

There are several possibilities available for customizing the CHM output:
You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:

1. Create the custom CSS.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to `yes` to instruct the transformation to copy the custom CSS to the output folder.
4. Run the transformation.

If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:

- `map2hhcmImpl.xsl` - This file is used to compile the table of contents.
- `map2hhcpImpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the *HTML Help Workshop* when creating the output.

**DITA Map Kindle Transformation**

Oxygen XML Author requires *KindleGen* to generate Kindle output from *DITA maps (on page 2816)*. To install *KindleGen* for use by Oxygen XML Author, follow these steps:

1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author and open a *DITA map* in the **DITA Maps Manager** view (on page 2472).
4. Click the **Configure Transformation Scenario(s)** button.
5. Select the **DITA Map Kindle** transformation and click the **Edit** button to edit it.
6. Go to the **Parameters** tab and set the `kindlegen.executable` parameter as the path to the *KindleGen* directory.
7. Accept the changes.

**DITA Map Metrics Report Transformation**

A **DITA Map Metrics Report** action is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a *DITA map (on page 2816)* using a transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** (on page 2472) toolbar.
2. Select the **DITA Map Metrics Report** scenario from the **DITA Map** section.
3. Run the transformation.

The generated HTML report contains information such as:
- The number of processed maps and topics.
- The number of map/bookmap/topic/task/concept/reference types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire DITA map structure.
- Number of words and characters used in the entire DITA map structure.
- DITA conditional processing attributes used in the DITA maps.
- Processing instructions.
- External links.
- All @outputclass attribute values gathered from the DITA project.

Important:
If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a metrics report evolution between multiple versions of the same DITA project.

DITA Map Zendesk Publishing

Oxygen XML Author includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the Zendesk Help Center.

Attention:
This feature is only available in the Enterprise edition of Oxygen XML Author.

To run the transformation, follow these steps:

1. Start Oxygen XML Author and open a DITA map in the DITA Maps Manager view (on page 2472).  
2. Click the Configure Transformation Scenario(s) button.  
3. Create a new DITA-OT transformation scenario and choose the Zendesk Help Center transformation type.  
4. Go to Parameters tab and set the following parameters:

   Host
   The URL reference to the Zendesk Help Center (for example, https://your-domain.zendesk.com).

   Username
   The username (e-mail address) for the account used to upload the content.

   API Token

**Article category**

The name of the category where the articles are uploaded. The category needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_til4_kk.

**Article section**

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.

**Create article draft**

This setting controls whether the articles should be published (if the value is `false`) or saved as drafts (if the value is `true`). The default value is `false`.

**Permission group name**

The name of the Zendesk permission group that controls who edits and publishes articles: https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups.

5. Save the changes and run the transformation.

---

**Important:**

There may be cases when the publishing breaks, presenting an error related to HTTPS certificates, similar to this one:

```plaintext
Error: org.zendesk.client.v2.ZendeskException: java.net.ConnectException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target
```

This usually occurs if an HTTPS proxy server is installed in your company’s network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish DITA to Zendesk and in the Advanced tab, go to the JVM Arguments field and set this value:

```
-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\Windows\win.ini
```

https://www.youtube.com/embed/QZ_9Fk_L0k8

Run DITA-OT Integrator Transformation

Oxygen XML Author comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2819). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1157).

⚠️ Attention:

The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 259).

⚠️ CAUTION:

Oxygen XML Author support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Author was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 1157) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1163)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 1156).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Author with your normal permissions.
Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. **Validate the DITA map** (on page 2516) by using the **Validate and Check for Completeness** action that is available on the **DITA Maps Manager** (on page 2472) toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. **Run the DITA transformation scenario** (on page 1100).
4. If the transformation results in errors or warnings, they are displayed in the **Results panel** (on page 530) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - **Informational** - The transformation encountered a condition of which you should be aware.
     - **Warning** - The transformation encountered a problem that should be corrected.
     - **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - Click the **See More** icon to open a web page that contains more details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
   b. Execute the transformation scenario again. The console output messages are displayed in the **DITA-OT view**.
c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page
   and set the **Show console output** option to **When build fails**.

**Related Information:**

**DITA Topic Transformation Scenarios**

Oxygen XML Author includes built-in transformation scenarios for transforming individual DITA Topics to
HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation
Scenario(s)** dialog box *(on page 1157)*.

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally
   served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to
   PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author
   comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen
   XML Author also supports some third-party processors.

   For those who are familiar with CSS, this makes it very easy to style and customize the PDF output
   of your DITA projects without having to work with **xsl:fo** customizations. Another advantage of this
   transformation scenario is that you can use the same **customization CSS *(on page 1424)* or publishing
   template *(on page 1413)* that you use for converting entire DITA maps.

   The transformation scenario automatically detects the currently selected context DITA map *(root
   map)* *(on page 2476)* so that keys and references are properly resolved (the detected context map is
   set as the value of the **args.root.map** parameter (this can be changed in the **Parameters** tab). It also
   automatically detects the currently **applied profiling condition set*** *(on page 2725)* to be used as the
   default filtering option in the transformation scenario (this can be changed in the **Filters** tab).

   The transformation scenario also supports a parameter named **args.enable.root.map.key.processing**
   that can be used to specify whether or not the values for **@keyref** and **@conkeyref** attributes within the
   transformed topics are resolved. The possible values are:

   - **no** - This means that the values for all **@keyref** and **@conkeyref** attributes are ignored in the
     transformation. This results in lower processing times.
   - **yes** - This means that the values for any **@keyref** and **@conkeyref** attributes found in the
     transformed topic are processed and resolved using the value of the **args.root.map** parameter.
• **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.

• **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

**DocBook Transformation Scenarios**

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Author also includes a DocBook 5.1 transformation scenario for Assembly documents. All of them are listed in the DocBook 4 and DocBook 5 sections in the **Configure Transformation Scenario(s) dialog box** (on page 1157).

**DocBook to WebHelp Classic Transformation (Deprecated)**

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The WebHelp Classic layout and features (on page 1361) are designed for desktop systems and include a familiar classical style. Oxygen XML Author also provides numerous possibilities for customizing the WebHelp Classic output (on page 1369).

**WebHelp Classic Transformation Scenario (Deprecated)**

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar (or the Document > Transformation menu).
2. Select the **DocBook WebHelp Classic (Deprecated)** scenario from the DocBook 4 or DocBook 5 section.
3. Click **Apply associated**.

**Result**: When the transformation is complete, the output is automatically opened in your default browser.
Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

**l10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.copyright**

Adds a small copyright text that appears at the end of the Table of Contents pane.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features such as widgets for Facebook™, X™ (formerly known as Twitter), Google Analytics, or Google+™. The file must be well-formed, each widget must be in separate `<div>` or `<span>` element, and the code for each `<script>` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    !-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
```
webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note:
You can deploy documentation for multiple products on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ * ( ) { } = ; * & + .

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note:
Multiple documentation versions can be deployed on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ * ( ) { } = ; * & + .

webhelp.search.ranking
If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the OXYGEN_INSTALL_DIR\frameworks\docbook\xsl \com.oxygenxml.webhelp.classic\predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Deploying the Oxygen Feedback Comments Component for DocBook (on page 1367)

DocBook to DITA Transformation

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   ◦ To apply the transformation scenario to a newly opened file, use the Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on macOS)) action from the toolbar or the Document > Transformation menu.
   ◦ To customize the transformation or change the scenario that is associated with the document, use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.
2. Select the DocBook to DITA transformation scenario in the DocBook 4 or DocBook 5 section.
3. Click the Apply associated button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:
Editing a Transformation Scenario (on page 1154)
Configure Transformation Scenario(s) Dialog Box (on page 1157)
DocBook to PDF Transformation

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Ctrl + Shift + T (Command + Shift + T on macOS)) action from the toolbar or the Document > Transformation menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.

2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.

3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see **DocBook to PDF Output Customization** (on page 1667).

---

DocBook to EPUB Transformation

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of OpenType fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

   ```css
   @font-face {
     font-family: "MyFont";
     font-weight: bold;
     font-style: normal;
     src: url(fonts/MyFont.otf);
   }
   ```

2. In the CSS, specify where this font is used. To set it as default for `<h1>` elements, use the `font-family` rule, as in the following example:

   ```css
   h1 {
     font-size: 20pt;
     margin-bottom: 20px;
   }
   ```
3. Open the Configure Transformation Scenario(s) dialog box (on page 1157), select the DocBook EPUB transformation scenario in the DocBook 4 or DocBook 5 section, and click Edit.

4. In the Parameters tab, set the epub.embedded.fonts parameter to fonts/MyFont.otf. If you need to provide more files, use commas to separate their file paths.

   **Note:**

   The html.stylesheet parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

**DocBook PDF (Show Change Tracking and Comments)**

Oxygen XML Author includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and tracked changes (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the Configure Transformation Scenario(s) button.
2. Select DocBook PDF (Show Change Tracking and Comments) in the DocBook 5 section.
3. If you need to configure the transformation, click the Edit (on page 1154) or Duplicate (on page 1156) button, make your changes to the scenario, and click OK.
4. Click the Apply Associated button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

**Creating New Transformation Scenarios**

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Author and how to create each type of transformation.

**XML Transformation with XSLT**

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an XML transformation with XSLT scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XML transformation with XSLT.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select XML transformation with XSLT.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

  • Project Options (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

  • Global Options (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XSLT Tab**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 242), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1076) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 1089). Otherwise, a value is mandatory in this field.
XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 250). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1079) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 240). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens a Configure parameters dialog box (on page 1077) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1076). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1078) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets (on page 1078) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.
XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all **additional stylesheets** (on page 1078), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or **editor variables** (on page 313) (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

- **New**
  
  Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An **editor variable** (on page 313) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

- **Edit**
  
  Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An **editor variable** (on page 313) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

- **Unset**
  
  Resets the selected parameter to its default value. Available only for edited parameters with set values.
Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:
Editor Variables (on page 313)

XSLT Extensions

The Extensions button opens a dialog box that allows you to specify the JARS (on page 2817) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

Tip:
You can specify the path to the resources using wildcards (for example, ${oxygenHome}/lib/*.jar).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 313) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Open

Opens the selected stylesheet in a separate view.

Up
Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

**Advanced Saxon HE/PE/EE XSLT Transformation Options**

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 240) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options (on page 2817) defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Mode ("-im")**

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1079), the value in this option takes precedence.

**Template ("-it")**

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1079), the value in this option takes precedence.

**Tip:**

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Author will automatically detect and use it as the initial template, so this option is not needed in this case.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.
Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**
Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions
Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

**Allow calls on extension functions (“-ext”)**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions (“-ea”)**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (Options > Preferences) (on page 124) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 234).

**Validation of the source file (“-val”)**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation (“strict”)** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation (“lax”)** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings (“-outval”)**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.
Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
  @Override
  public StructuredQName getFunctionQName() {
    return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
  }

  @Override
  public SequenceType[] getArgumentTypes() {
    return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
  }

  @Override
  public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
  }

  @Override
  public ExtensionFunctionCall makeCallExpression() {
  }
}
```
2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

To enable Oxygen XML Author to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 144).
- In a validation scenario (on page 770), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1076) to open a dialog box where you can add libraries.
- You can also create a plugin that contributes such a JAR file in the classpath (on page 2039).

**FO Processor Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:
• **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.

• **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an **external processor (on page 251)**.

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📈 **Insert Editor Variables (on page 313)** button, or the 📦 **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows **PDF** files are often opened in **Acrobat Reader**).

---

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.
• **Output file** - When *Open in Browser/System Application* is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When *Open in Browser/System Application* is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  
  Insert Editor Variables (on page 313) button, or the  
  Browse button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 220).

• **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the **Results** panel (on page 862) at the bottom of the application window and renders the result as an SVG image.

• **XHTML** - This option is only available if *Open in Browser/System Application* is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the *Open in Browser/System Application* option instead.

• **Image URLs are relative to** - If *Show in results view as XHTML* is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  
  Insert Editor Variables (on page 313) button, or the  
  Browse button.
Attention:
If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author.

Supported XSLT Processors

Oxygen XML Author includes the following XSLT processors:

- **Xalan 2.7.2 - Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5 - Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 12.3 Home Edition (HE), Professional Edition (PE) - Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 12.3 Enterprise Edition (EE) - Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 234).

Note:
Oxygen XML Author implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

Note:
Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in
the Oxygen XML Author installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author.

• **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Author uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

**Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the bin folder for all four archives.

**Result:** You can now use the xsltproc processor as an XSLT engine in the XSLT transformation scenario.

**Note:**
The Xsltproc processor can be configured from the XSLTPROC options page (on page 242).

**CAUTION:**
There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2821) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the [OXYGEN_INSTALL_DIR]/frameworks subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 1074).

  Oxygen XML Author uses the Microsoft XML parser through its command-line tool msxsl.exe.

  Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 1074).

  Oxygen XML Author performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author is 1.6.
You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 1.0 (Legacy)** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 2.0 (Legacy)** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the XSLT options (on page 239) section.

**Configuring Custom XSLT Processors**

Oxygen XML Author allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to XML > XSLT-XQuery > Custom Engines.
2. Click the New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 250).
4. Click OK.

**Note:**

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author linked message (on page 766), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1076) in the Edit scenario dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the XML transformation with XQuery scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an XML transformation with XQuery scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XML transformation with XQuery.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:
• **Project Options** *(on page 2819)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, SourceSafe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• **Global Options** *(on page 2817)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you *create a new transformation scenario* *(on page 1074)* or *edit an existing one* *(on page 1154)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the ✉️ **Insert Editor Variables** *(on page 313)* button, or the browsing actions in the 📦 ➤ **Browse** drop-down list. You can also use the ✒️ **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(on page 242)*, the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the ✉️ **Insert Editor Variables** *(on page 313)* button, or the browsing actions in the 📦 ➤ **Browse** drop-down list. You can also use the ✒️ **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page *(on page 250)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).
Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1093) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 240). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens the Configure parameters dialog box (on page 1092) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 1093) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter textbox to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
<doc('test.xml')//entry
  //person[@atr='val']
```

Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 313) (such as `{cfdu}` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.
Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 313) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 313) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

Editor Variables (on page 313)

**XQuery Extensions**

The Extensions button is used to specify the JAR (on page 2817) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.
Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Use a configuration file ("-config")**

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.

**Enable profiling ("-TP")**

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

---

**Note:**

The profiling support works only if the Present as a sequence transformation option *(on page 1096)* is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:
Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted styleSheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions,
collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 251).

**Output Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ❧ Insert Editor Variables (on page 313) button, or the ❯ Browse button.

Open in Browser/System Application

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note:
To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

• Output file - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.

• Other location - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ❧ Insert Editor Variables (on page 313) button, or the ❯ Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

• XML - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 220).

• SVG - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel (on page 862) at the bottom of the application window and renders the result as an SVG image.

• XHTML - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.
Important:
When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** (on page 313) button, or the **Browse** button.

**XML to PDF Transformation with CSS**

This type of transformation uses the **Oxygen PDF Chemistry** processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an **XML to PDF transformation with CSS** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML to PDF transformation with CSS**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view (on page 1163). Click the **New Scenario** drop-down menu button and select **XML to PDF transformation with CSS**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the **Oxygen PDF Chemistry** processing engine and numerous tips for customizing the output, see the **Oxygen Chemistry User Guide**.
CSS Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**CSS URL**

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel.

**Apply CSS stylesheets set in the current framework**

If selected, CSS stylesheets that are specified in the framework (in the Document Type configuration CSS subtab (on page 146)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the CSS URL field (on page 1099).

**Note:**

If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the Document Type configuration CSS subtab (on page 146)).
- CSS files referenced directly in the document.
- CSS files specified in the CSS URL field (on page 1099).

**Processor options link**

Opens the CSS-based Processors preferences page (on page 255) where you can configure some options for generating PDF output.
Output Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Output File section**

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 🛠️ Insert Editor Variables (on page 313) button, or the 📡 Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).

**Debugging section**

**Dump the intermediate annotated XML**

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

**Dump the FO file**

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

**Console options link**

Opens the CSS-based Processors preferences page (on page 255) where you can configure some options for generating PDF output.

**DITA-OT Transformation**

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a DITA-OT Transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the New button and select DITA-OT Transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the 🛠️ New Scenario drop-down menu button and select DITA-OT Transformation.
Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

![DITA Transformation Type Dialog Box](image)

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(on page 2819)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options** *(on page 2817)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Skins Tab (DITA-OT Transformations)**

When you create a new transformation scenario *(on page 1074)* or edit an existing one *(on page 1154)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **Skins** tab is available for DITA-OT transformations with the **WebHelp Classic** output type and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A skin is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

**Figure 276. Skins Tab**

The Skins tab includes the following sections:

**Built-in Skins**

This section presents the built-in skins that are included in Oxygen XML Author. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Author website, click the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.
Note:
The output can also be styled by setting the `args.css` parameter in the Parameters tab. The properties taken from the stylesheets referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.

Create custom skin

Use this link to open the WebHelp Skin Builder (on page 1369) tool.

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1214). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 277. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.
Built-in Templates Locations

Oxygen XML Author scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory:
  
  
  \`DITA-OT-DIR\`/plugins/com.oxygenxml.webhelp.responsive/templates

- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  
  - \`DITA-OT-DIR\`/plugins/com.oxygenxml.pdf.css/templates
  - \`DITA-OT-DIR\`/plugins/com.oxygenxml.webhelp.responsive/templates

Custom Templates Locations

Oxygen XML Author scans the locations specified in the **DITA > Publishing** preferences page (on page 265) to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates (on page 1257) to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the **DITA > Publishing** preferences page (on page 265) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1420). Clicking this button will open a template package configuration dialog box (on page 2691) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](image)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.
Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 265) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

**Resources**

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**
- Publishing Templates (on page 1214)
- Publishing Template Package Contents for PDF Customizations (on page 1414)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1217)

**Template Package Configuration Dialog Box**

The **Save template as** button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1420). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**
This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**
Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1043) or [DITA Map to PDF - based on HTML5 & CSS](on page 1057)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For WebHelp Responsive customizations, select this option if you want to copy the default [HTML Page Layout Files](on page 1233) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1043) or [DITA Map to PDF - based on HTML5 & CSS](on page 1057)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.
Figure 278. Template Package Configuration Dialog Box

**FO Processor Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.
You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Author.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page (on page 251).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Author installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Author preferences pages.
To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. Edit the transformation scenario.
2. Open the Parameters tab *(on page 2694)*.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

### Related information

- FO Processors Preferences *(on page 251)*
- XSL-FO (Apache FOP) Processor for Generating PDF Output *(on page 1135)*

## Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario *(on page 1074)* or edit an existing one *(on page 1154)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable *(on page 313)* selector to simplify setting a file path as the value of a parameter.

### Note:

To input parameter values at runtime, use the ask editor variable *(on page 314)* in the Value column.

Below the table, the following actions are available for managing parameters:

- **New**
  
  Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables *(on page 313)* button or the Browse button. You can also use the Open in editor button to open the specified file in the editor panel.

- **Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**

Transformation parameters that are defined in an *Oxygen Publishing Template* (on page 1413) descriptor file are displayed in italics. After creating a publishing template (on page 1420) and adding it to the templates gallery (on page 1257), when you select the template in the **Templates** tab (on page 2688), the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

- DITA Open Toolkit Documentation

**Feedback Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the *DITA Map WebHelp Responsive* transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback** administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an **Oxygen Publishing Template** (on page 1413), either as an HTML fragment extension point (on page 1224) or as a transformation parameter (on page 1222) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.
Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a DITAVAL file associated with the DITA map (on page 2816), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

Note:
If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2694)), the filters are combined (neither file takes precedence over the other).

Use profiling condition set
Sets the profiling condition set (on page 2725) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the ✤ New, ✢ Edit, or ✗ Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Note:**

The colors and styles of the profiled content (on page 2730) settings are used for rendering it in Author mode but are not applied in the output.

**Advanced Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.
You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Author will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (Custom build file, Build target, Ant Home) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the Parameters tab, the transformation is started as an ANT process instead of using the executable.

**Custom build file**
If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 2694) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as -diagnostics).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 256).

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

- **Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to -Xmx2g, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an -Xmx value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

**Libraries**

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2817) files or additional class paths) to be used by the transformer.

- **Tip:** You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).
Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

**Figure 282. Output Settings Tab**

![Output Settings Tab](image)

You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the **Insert Editor Variables** (on page 313) button, or the **Browse** button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the **Insert Editor Variables** (on page 313) button, or the **Browse** button.

**Output directory**
The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Note:**
If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**
To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options preferences page that contains options to control the display of the console output received from the publishing engine.

**Ant Transformation**

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Author runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.
Tip:
Certain Ant tasks require additional JAR libraries (for example, Ant mail tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the Output tab, click the Libraries button (on page 1117) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

To create an Ant transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu. Then click the New button and select ANT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select ANT transformation.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options (on page 2819)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options (on page 2817)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Options Tab (Ant Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

**Working directory**

The path of the current directory of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.

**Build file**

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.
Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional Ant arguments

You can specify additional Ant-specific command-line arguments (such as \texttt{-diagnostics}).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page \textit{(on page 256)}.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (\texttt{OutOfMemoryError}). For example, if it is set to \texttt{-Xmx2g}, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an \texttt{-Xmx} value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (\texttt{JAR \textit{(on page 2817)}} files or additional class paths) to be used by the transformer.

\textit{Tip:} You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

Parameters Tab (Ant Transformations)

When you create a new transformation scenario \textit{(on page 1074)} or edit an existing one \textit{(on page 1154)}, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a
specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 313) selector to simplify setting a file path as the value of a parameter.

Note:
To input parameter values at runtime, use the ask editor variable (on page 314) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 313) button or the Browse button. You can also use the Open in editor button to open the specified file in the editor panel.

**Edit**
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Output Tab (Ant Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Open**
Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.
In System Application - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).

In Editor - The file specified in the Open text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- When build fails - Displays the console output log only if the build fails.
- Always - Displays the console output log, regardless of whether or not the build fails.

XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an XSLT transformation scenario, use one of the following methods:

- Use the "Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))" action from the toolbar or the Document > Transformation menu. Then click the New button and select XSLT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select XSLT transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- Project Options (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- Global Options (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
XSLT Tab

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

---

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 242), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1122) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 1089). Otherwise, a value is mandatory in this field.

**XSL URL**

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use “xml-stylesheet” declaration**

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 250). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).
Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1079) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 240). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens a Configure parameters dialog box (on page 1077) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1122). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1078) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets (on page 1078) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1078), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

doc('test.xml')//entry
//person[@atr='val']
Note:

1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables *(on page 313)* (such as `$cfdu` [current file directory]) to specify other locations:

```
doc('${cfdu}/test.xml')/*
```

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(on page 313)* can be inserted in the text box using the ✡️ **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(on page 313)* can be inserted in the text box using the ✡️ **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

*Editor Variables *(on page 313)**

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the *JARS *(on page 2817)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.
Tip:
You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add
Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 313) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove
Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Open
Opens the selected stylesheet in a separate view.

Up
Moves the selected stylesheet up in the list.

Down
Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 240) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options (on page 2817) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")
A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1125), the value in this option takes precedence.

**Template ("-it")**

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1125), the value in this option takes precedence.

**Tip:**
If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Author will automatically detect and use it as the initial template, so this option is not needed in this case.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Line numbering ("-l")**

Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**
Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.
Strip whitespaces ("-strip")

Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

**XML Schema version**
Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (Options > Preferences) (on page 124) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 234).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.
Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0<<v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:
To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Author to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 144).
- In a validation scenario (on page 770), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1076) to open a dialog box where you can add libraries.
- You can also create a plugin that contributes such a JAR file in the classpath (on page 2039).

**FO Processor Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**
Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external processor defined in Preferences) during the transformation.

**Input**
Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**
The output format of the FO processing. The available options depend on the selected processor type.

**Processor**
Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 251).
Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:
• **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 220).

• **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel (on page 862) at the bottom of the application window and renders the result as an SVG image.

• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ✉️ Insert Editor Variables (on page 313) button, or the 📦 Browse button.

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

**Configuring an XSLT Processor for Generating Output**

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author.

**Supported XSLT Processors**

Oxygen XML Author includes the following XSLT processors:

• **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

• **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that
were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies version="1.0".

- **Saxon 12.3 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 12.3 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences *(on page 234)*.

---

**Note:**

Oxygen XML Author implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: Saxon *collection catalog* and Saxon *configuration*. Both of these templates support content completion, element annotation, and attribute annotation.

---

**Note:**

Saxon can use the *ICU-J localization library* *(saxon9-icu.jar)* to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Author installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author.

---

- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.
Oxygen XML Author uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

**Tip:**
As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the bin folder for all four archives:

   ![Edit environment variable]

   D:\apache-maven-3.1.1\bin
   D:\Python27
   %PATH%
   C:\Users\r\Desktop\abc\libxslt-1.1.26.win32\bin
   C:\Users\r\Desktop\abc\libxml2-2.7.8.win32\bin
   C:\Users\r\Desktop\abc\iconv-1.9.2.win32\bin
   C:\Users\r\Desktop\abc\zlib-1.2.5\bin

**Result:** You can now use the xsltproc processor as an XSLT engine in the XSLT transformation scenario.

**Note:**
The Xsltproc processor can be configured from the XSLTPROC options page (on page 242).

**CAUTION:**
There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2821) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the {OXYGEN_INSTALL_DIR}/frameworks subdirectory of the installation directory, and in this case it contains a space character.
MSXML 4.0 (Legacy) - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 1074).

Oxygen XML Author uses the Microsoft XML parser through its command-line tool msxsl.exe.

Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

MSXML .NET (Legacy) - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 1074).

Oxygen XML Author performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

.NET 1.0 (Legacy) - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

.NET 2.0 (Legacy) - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the XSLT options (on page 239) section.

Configuring Custom XSLT Processors

Oxygen XML Author allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:
1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to XML > XSLT-XQuery > Custom Engines.
2. Click the New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 250).
4. Click OK.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author linked message (on page 766), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

Custom Engines Preferences (on page 250)

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1076) in the Edit scenario dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Author installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (on page 251).
Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (on page 1137).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   
a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

   ```xml
   <fop version="1.0">
     <renderers>
       <renderer mime="application/pdf">
         <fonts>
           <auto-detect/>
         </fonts>
       </renderer>
     </renderers>
   </fop>
   ```

   b. Open the Preferences dialog box (Options > Preferences) (on page 124), go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.

   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   ◦ For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1074) and set the font name (for example, Arial Unicode MS) to the body.font.family and title.font.family parameters.

   ◦ For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1074) and set the font name (for example, Arial Unicode MS) to the bodyFont and sansFont parameters.

   ◦ For DITA transformations to PDF using DITA-OT you should modify the following two files:

     * **DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml** - The `<font-face>` element included in each `<physical-font>` element that has the charset="default" attribute must contain the name of the font (for example, Arial Unicode MS)

     * **DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf** - An `<auto-detect>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the mime="application/pdf" attribute:
Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important:
On Windows, fonts are located into the C:\Windows\Fonts directory. On macOS, they are placed in /Library/Fonts. To install a new font on your system, it is enough to copy it in the Fonts directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP (on page 1136).

1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

Note:
DITA PDF transformations have their own fop.xconf(DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf). If the font is not installed in the system, it needs to be referenced in the fop.xconf.

   a. For information about registering the font in the FOP Configuration, see: https://xmlgraphics.apache.org/fop/2.3/fonts.html.
   b. Open the Preferences dialog box (Options > Preferences) (on page 124), go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content.

   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   **DocBook Example:** For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1074), and set the font name (for example, ArialUni) to the body.font.family and title.font.family parameters.
**TEI Example:** For TEI documents, you can start with the built-in scenario called **TEI PDF**, edit the XSLT parameters *(on page 1074)*, and set the font name (for example, Arialuni) to the `bodyFont` and `sansFont` parameters.

**DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:

- `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font.
- `DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - A `<font>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute.

For more information, see: [https://xmlgraphics.apache.org/fop/2.1/fonts.html](https://xmlgraphics.apache.org/fop/2.1/fonts.html).

**Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)**

Starting with Oxygen XML Author version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Author, use the following procedures to enable such support.

**Adding Hyphenation Support for XML with XSLT Transformation Scenarios**

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Author, follow this procedure:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the compiled `JAR (on page 2817)` from OFFO.
3. Copy the `fop-hyph.jar` file into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.

**Adding Support for PDF Images**

To add support for PDF images in an older version of Oxygen XML Author, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the `fop-pdf-images JAR` libraries.
3. Copy the libraries into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.

**How to Enable Debugging for FO Processor Transformations**

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:
1. Locate and edit the following configuration file: 
   \[OXYGEN_INSTALL_DIR]/tools/config/logback.xml.

   **Note:**
   You need write access to this folder, so if you do not have administrator permissions, you might first need to copy the file to another location where you have write access.

2. Edit the `<root>` element (inside the `<configuration>` element), change its level to **debug**, and save the file.

3. Restart Oxygen XML Author and re-run the transformation.

   **Tip:**
   To make it easier to analyze the data in the logs, it is recommended that you use a small input file when trying to reproduce the problem.

4. Once you are finished with the debugging session, remember to edit the `logback.xml` file and change the `<root>` element back to its original value. Otherwise, performance could be affected.

### XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XProc transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select XProc transformation.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options** (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
XProc Tab

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

XProc URL

Specify the source XProc file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (on page 237).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:

New

Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (on page 313) and custom editor variables (on page 322) can be used to specify the URL.

Edit

Opens an Edit dialog box that allows you to modify the selected port and its URL. The built-in editor variables (on page 313) and custom editor variables (on page 322) can be used to specify the URL.
Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the New and Delete buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters collection. You can use the New and Delete buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The built-in editor variables (on page 313) and custom editor variables (on page 322) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Outputs tab displays a list of output ports (along with the URL) collected from the XProc script. Use the Filter text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an Edit dialog box that allows you to add a new output port and its URL. An editor variable (on page 313) can be inserted for the URL by using the Insert Editor Variables button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (on page 530).

Edit
Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An editor variable (*on page 313*) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (*on page 530*).

**Delete**

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

**Open in Editor**

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

**Open in Browser/System Application**

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (*on page 313*) button, or the browsing actions in the **Browse** drop-down list.

**Results**

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

**Figure 283. XProc Transformation Results View**

![XProc Transformation Results View](image)

**Options Tab (XProc Transformations)**

When you create a new transformation scenario (*on page 1074*) or edit an existing one (*on page 1154*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.
The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

**List of Options**

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

**Editor Variable Information**

The built-in editor variables (on page 313) and custom editor variables (on page 322) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

**Calabash XProc Processor for Generating PDF Output**

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../tools/xep/xep.xml"/>` system property. Edit the `@file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Author.

**Integrating an External XProc Engine**

Oxygen XML Author includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a **Processor** drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the **XProc preferences page** (on page 237). Otherwise, if the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Author: [https://github.com/xml-project/support-for-xmleditor](https://github.com/xml-project/support-for-xmleditor). Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: *xprocAPI.zip*. 
To create an XProc integration project, follow these steps:

1. Move the oxygen.jar file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a Java archive (JAR) from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `<engine>` element are as follows:
   a. **name** - The name of the XProc engine.
   c. **class** - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
   d. **version** - The version of the integration.
   e. **engineVersion** - The version of the integrated engine.
   f. **vendor** - The name of the vendor / implementer.
   g. **supportsValidation** - `true` if the engine supports validation (otherwise, `false`).

   The `<engine>` element has only one child, `<runtime>`. The `<runtime>` element contains several `<library>` elements with the `@name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (e.g. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (e.g. `MyXprocEngine`).

   The `plugin.xml` file would look like this (it is based on the `AdditionalXProcEngine extension (on page 2051)`):

   ```xml
   <plugin
     id="morgana.xproc.addon"
     name="Contribute Morgana XProc"
     description="Contribute Morgana XProc"
     version="1.0"
     vendor="Syncro Soft"
     class="ro.sync.exml.plugin.Plugin"
     classLoaderType="preferReferencedResources">
   <extension type="AdditionalXProcEngine" path="MyXprocEngine/"/>
   </extension>
   </plugin>
   ```

Related Information:

- Creating an XProc Transformation Scenario *(on page 1139)*
- Additional XProc Engine Plugin Extension *(on page 2051)*
XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:**
When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an XQuery transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XQuery transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1163). Click the New Scenario drop-down menu button and select XQuery transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options** (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the
specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](on page 242), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 250). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1093) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 240). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (on page 1092) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 1093) that define extension Java functions or extension XSLT elements used in the transformation.
XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 313) (such as `$cfdu` [current file directory]) to specify other locations: `doc('$cfdu/test.xml')/*`

2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 313) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 313) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**
Editor Variables (on page 313)

### XQuery Extensions

The **Extensions** button is used to specify the [JAR (on page 2817)](#) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **Move up** or **Move down** buttons.

### Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file** ("-config")
  
  Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations** ("-opt")
  
  This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

- **Use linked tree model** ("-tree:linked")
  
  This option activates the linked tree model.

- **Strip whitespaces** ("-strip")
Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

**Enable profiling ("-TP")**

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**
The profiling support works only if the **Present as a sequence** transformation option (on page 1096) is not set.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:
- **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

- **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update** ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery** ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**
Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 251).

**Output Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1074) or edit an existing one (on page 1154), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

- **Present as a sequence**
  
  Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

- **Prompt for file**
  
  At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

- **Save As**
  
  The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📋 Insert Editor Variables (on page 313) button, or the 📦 Browse button.

- **Open in Browser/System Application**
  
  If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).
Note:
To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 313) button, or the Browse button.

**Open in editor**
When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**
You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 220).
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel (on page 862) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**
When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.
• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** (on page 313) button, or the **Browse** button.

### SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display **this view** (on page 1163). Click the **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

**Name**

The unique name of the SQL transformation scenario.

**Storage**

Allows you to select one of the following storage options:

- **Project Options** (on page 2819) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2817) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

**SQL URL**

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 313) button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel.

**Connection**

Allows you to select a connection from a drop-down list. To configure a connection, use the **Advanced options** button to open the **Data Source preferences page** (on page 267).

**Parameters**
Allows you to add or configure parameters for the transformation.

**Editing a Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

**Note:**
Since transformation scenarios that are associated with built-in frameworks (on page 2817) are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario (on page 1156).

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1157) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Tip:**
   You could also select the scenario and the Edit button in the Transformation Scenarios view (on page 1163) to achieve the same result.

**Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

**Figure 284. Edit Scenarios Configuration Dialog Box**

![Edit DITA Scenario Configuration Dialog Box](image)
Transformation Types

The Configure Transformation Scenario(s) dialog box (on page 1157) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

• **DITA-OT** - This type of transformation includes configurable options in the following tabs:
  ◦ Templates Tab (on page 2688)
  ◦ FO Processor Tab (on page 2693) (Available for PDF output)
  ◦ Parameters Tab (on page 2694)
  ◦ Filters Tab (on page 2696)
  ◦ Advanced Tab (on page 2697)
  ◦ Output Tab (on page 2700)

• **ANT** - This type of transformation includes configurable options in the following tabs:
  ◦ Options Tab (on page 1117)
  ◦ Parameters Tab (on page 1118)
  ◦ Output Tab (on page 1119)

• **XSLT** - This type of transformation includes configurable options in the following tabs:
  ◦ XSLT Tab (on page 1075)
  ◦ FO Processor Tab (on page 1083)
  ◦ Output Tab (on page 1084)

• **XProc** - This type of transformation includes configurable options in the following tabs:
  ◦ XProc Tab (on page 1140)
  ◦ Inputs Tab (on page 1140)
  ◦ Parameters Tab (on page 1141)
  ◦ Outputs Tab (on page 1141)
  ◦ Options Tab (on page 1142)

• **XQuery** - This type of transformation includes configurable options in the following tabs:
  ◦ XQuery Tab (on page 1091)
  ◦ FO Processor Tab (on page 1096)
  ◦ Output Tab (on page 1096)

**Related Information:**

Duplicating a Transformation Scenario (on page 1156)
Configure Transformation Scenario(s) Dialog Box (on page 1157)
Applying Associated Transformation Scenarios (on page 1156)
Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1157) is opened.

2. Select the particular transformation scenario and click the Duplicate button at the bottom of the dialog box or from the contextual menu.

   **Tip:** You could also select the scenario and the Duplicate button in the Transformation Scenarios view (on page 1163) to achieve the same result.

   **Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1155).

**Related Information:**
Creating New Transformation Scenarios (on page 1074)
Editing a Transformation Scenario (on page 1154)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (on page 1157) or Transformation Scenarios view (on page 1163)), Oxygen XML Author included an Apply Transformation Scenario(s) action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 1157) where you can choose the scenarios you want to apply.

The Apply Transformation Scenario(s) action can be initiated from any of the following methods:

- Use the Ctrl + Shift + T (Command + Shift + T on macOS) keyboard shortcut.
- Click the Apply Transformation Scenario(s) button on the main toolbar.
- Click the Apply Transformation Scenario(s) button on the toolbar in the Transformation Scenarios view (on page 1163).
• Right-click a file in the Project view (on page 385) and select Transform > Play Apply Transformation Scenario(s).
• Use the Apply Associated button in the Configure Transformation Scenario(s) dialog box (on page 1157).

Related Information:
Creating New Transformation Scenarios (on page 1074)
Editing a Transformation Scenario (on page 1154)
Configure Transformation Scenario(s) Dialog Box (on page 1157)
Transformation Scenarios View (on page 1163)

Configure Transformation Scenario(s) Dialog Box

You can use the Configure Transformation Scenarios(s) dialog box for editing existing transformation scenarios (on page 1154) or creating new ones (on page 1074).

To open this dialog box, use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the Document > Transformation menu.

Figure 285. Configure Transformation Scenario(s) Dialog Box

The dialog box includes the following options and features:

Search Filter Field
You can begin typing text in the search field at the top of the dialog box to filter the scenarios shown in the table below this field.

Settings

Use this drop-down to access the following options:

Show all scenarios
Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor
Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

Show associated scenarios
Select this option to only display the scenarios associated with the document you are editing.

Import scenarios
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

• Keep or replace the existing scenario.
• Keep both scenarios.

Note:
When you keep both scenarios, Oxygen XML Author adds imported to the name of the imported scenario.

Export selected scenarios
Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Scenarios Table Section

The middle section of the dialog box is a table that displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level (on page 2819). The table includes following sortable columns:
• **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.

• **Scenario** - This column presents the names of the transformation scenarios.

• **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Author, see the Transformation Types section (on page 1155).

If you right-click in the header area, the following options are accessible:

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Association**

Select this option to group the scenarios depending on whether or not they are associated with the current document.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.

If you right-click any particular transformation scenario, the following actions are accessible:

**Edit**

This button opens the **Edit Scenario** configuration dialog box (on page 1154) that allows you to configure the options of the transformations scenario.

**Duplicate**

Use this button to create a duplicate transformation scenario (on page 1156).

**Remove**

Use this button to remove custom transformation scenarios.

**Change storage**
Allows you to change the storage location of a transformation scenario to **Project Options** *(on page 2819)* or **Global Options** *(on page 2817)*. You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

**Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

**Bottom Section**

The bottom section of the dialog box contains the following actions and options:

**New**

This button allows you to create a new transformation scenario *(on page 1074).*

**Edit**

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the **Transformation Types section** *(on page 1155).*

**Note:**

If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Author displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario *(on page 1156)* to edit instead.

**Duplicate**

Use this button to create a duplicate transformation scenario *(on page 1156).*
Remove

Use this button to remove transformation scenarios.

**Note:**
Removing scenarios associated with a defined document type is not allowed.

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:**
When this option is selected, the **Association** column is hidden.

Run in parallel (DITA-OT or Ant scenarios)

This option is available if you select multiple DITA-OT or Ant type scenarios. Selecting this option results in the transformations being done in parallel, instead of sequentially. It should help to reduce the amount of time it takes for the publishing to finish when transforming large projects.

**Attention:**
If multiple selected DITA-OT scenarios have the same output or temporary files folder, this option is not available since the process would need to read and write content to the same folder in this case.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon ( ✗ ) to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.
Tip:
Your selections in the **Configure Transformation Scenarios(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:
- Editing a Transformation Scenario *(on page 1154)*

- Sharing Transformation Scenarios *(on page 1163)*

### Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the Project view *(on page 391)* without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.
   a. Create a logical folder in the Project view *(on page 385)* by using the **New > Logical Folder** action from the contextual menu of the root file.
   b. Add the files you want to transform to the logical folder by using the ![Add Files](image) or ![Add Edited File](image) actions from the contextual menu of the logical folder.

   **Note:**
   You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the Project view *(on page 385)* each time you want to transform them, but this can be tedious.

2. Select the files you want to transform (or the newly created logical folder) and from the contextual menu, select **Transform > Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.

3. Use Oxygen XML Author editor variables *(on page 313)* to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate editor variable *(on page 313)* is assigned for the input file. For example, for a DocBook PDF transformation, make sure the **XML URL** input box is set to the `$currentFileURL` editor variable *(on page 319)*. For a DITA PDF transformation, make sure the `args.input` parameter is set to the `$cf` editor variable *(on page 319)*.
b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an XML transformation with XSLT, switch to the Output tab and set the path of the output file using a construct of editor variables (on page 313), such as ${{cfd}}/{{cfn}}.html.

4. Now that the logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation, you can select Transform > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.

5. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select Transform > Apply Transformation Scenario(s) from the contextual menu of the logical folder.

Related Information:
Editor Variables (on page 313)

Sharing Transformation Scenarios
The transformation scenarios and their settings can be shared with other users by saving them at project level (on page 2819) or by exporting them to a specialized scenarios file (on page 312) that can then be imported. When you create a new transformation scenario or edit an existing one, there is a Storage option to control whether the scenarios are stored in Project Options (on page 2819) or Global Options (on page 2817).

Selecting Project Options (on page 2819) stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting Global Options (on page 2817) stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing transformation scenarios by using the Change storage action (on page 1157) from the contextual menu of the list of scenarios.

Related Information:
Sharing Application Settings (on page 302)

Transformation Scenarios View
You can manage the transformation scenarios by using the Transformation Scenarios view. To open this view, select Window > Show View > Transformation Scenarios.
Oxygen XML Author supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the `Configure Transformation Scenario(s)` dialog box (on page 1157).

The `Transformation Scenarios` view presents both global and project-level (on page 2819) scenarios. By default, Oxygen XML Author presents the items in the following order:

1. Scenarios that match the current framework (on page 2817).
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  
  Select this option to run the current transformation scenario.

- **New**
This drop-down menu contains a list of the scenarios that you can create (on page 1074). Oxygen XML Author determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

**Duplicate**

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

**Edit**

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1155).

**Remove**

Removes the current scenario from the list. This action is also available by using the Delete key.

**Change storage**

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

**Import scenarios**

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Author adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export transformation and validation scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export.

**Settings**

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

- Show all scenarios
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

**Change storage**

Use this option to change the storage location of the selected scenario to Project Options (on page 2819) or Global Options (on page 2817). You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

**Import scenarios**

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Author adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Association**

Select this option to group the scenarios depending on whether or not they are associated with the current document.
Group by Type
Select this option to group the scenarios by their type.

Group by Storage
Select this option to group the scenarios by their storage location.

Ungroup all
Select this option to ungroup all the scenarios.

Reset Layout
Select this option to restore the default settings of the layout.

Your selections in the Transformation Scenarios view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Output Customization

Oxygen XML WebHelp provides the ability to generate two different types of output, WebHelp Responsive and WebHelp Classic. Each type has its own set of options and features. The WebHelp Responsive variant is available for DITA documents while the WebHelp Classic variants are available for DocBook.

**WebHelp Responsive Output for DITA**

**WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

WebHelp Responsive output can be generated by using the [DITA Map WebHelp Responsive](on page 1043) transformation scenario.

For an in-depth look at WebHelp Responsive features and the publishing process, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

**Layout and Features**

This section contains information about the layout and features of the WebHelp Responsive output.

**Layout of the Responsive Page Types**

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.
Figure 287. WebHelp Responsive Output on a Normal Screen
Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the tiles presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.
Figure 289. Main Page - Tiles Layout

1. Logo Component (on page 1172)
2. Title Component (on page 1172)
3. Search Input Component (on page 1173)
4. Menu Component (on page 1173)
5. Index Terms Link Component (on page 1173)
6. Topic Tiles Component (on page 1173)
7. Footer Component (on page 1173)

Main Page - Tree Layout

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.
Figure 290. Main Page - Tree Layout

1. Logo Component (on page 1172)
2. Title Component (on page 1172)
3. Search Input Component (on page 1173)
4. Menu Component (on page 1173)
5. Index Terms Link Component (on page 1173)
6. Table of Contents Component (on page 1173)
7. Footer Component (on page 1173)

Main Page Components

The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1345). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1345).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1275) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1354).

**Search Input**

An input text field where you can enter search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association (on page 1275) is done in the DITA map.

**Tree Table of Contents**

An area that contains first and second-level topic titles from your publication.

**Page Footer**

WebHelp Responsive output footer.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 291. Topic Page

1. Logo Component (on page 1175)
2. Title Component (on page 1174)
3. Search Input Component (on page 1175)
4. Menu Component (on page 1175)
5. Index Terms Link Component (on page 1175)
6. Expand/Collapse All Sections Component (on page 1175)
7. Navigation Links Component (on page 1175)
8. Print Link Component (on page 1175)
9. Breadcrumb Component (on page 1175)
10. Publication Table of Contents Component (on page 1176)
11. Topic Content Component (on page 1175)
12. Topic Table of Contents Component (on page 1176)

**Topic Page Components**

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.
Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1345). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1345).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1275) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1354).

Search Input

An input text field where you can enter search queries.

Navigation Links

The navigation links (Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip:

To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

Expand/Collapse Sections Button

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic.

Topic Content

Presents the content of the associated DITA topic.
Publication Table of Contents

A Table of Content for the publication displayed in the left side of the screen. You can use the button to collapse the table of contents (or the button to expand it).

Topic Table of Contents (On this page links)

A table of contents for the topic displayed on the right side with a heading named On this page and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two elements and each must have an attribute. You can use the button to collapse the table of contents (or the button to expand it).

Page Footer

WebHelp Responsive output footer.

Search Results Page

The Search Page presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.
1. Logo Component (on page 1177)
2. Title Component (on page 1177)
3. Search Input Component (on page 1178)
4. Menu Component (on page 1178)
5. Index Terms Link Component (on page 1178)
6. Search Results Component (on page 1178)
7. Footer Component (on page 1178)

Search Results Page Components

The layout components displayed in the search page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1345). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1345).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1275) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1354).

**Search Input**

An input text field where you can enter search queries.

**Search Results**

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

**Page Footer**

WebHelp Responsive output footer.

**Auto-complete Suggestions in the Search Input Field**

When you are typing in the search input field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```xml
<prolog>
  <metadata>
    <keywords><indexterm>databases</indexterm></keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Related information
WebHelp Responsive Search Engine (on page 1180)

Index Terms Page

The Index Terms Page page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 293. Index Terms Page

1. Logo Component (on page 1180)
2. Title Component (on page 1180)
3. Menu Component (on page 1180)
4. Index Terms Link Component (on page 1180)
5. Index Terms Component (on page 1180)
Index Terms Page Components

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1345). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1345).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1275) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1354).

**Index Terms Alphabet**

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

**Index Terms**

The first letter of the index along with the list of index terms.

**Page Footer**

WebHelp Responsive output footer.

**Built-in JavaScript-based Search Engine**

The client-side JavaScript-based search engine comes preconfigured in the WebHelp responsive plugin. It is enabled by default when you run the WebHelp Responsive transformation.

**Search Index**

The search index is created when you publish your documentation to WebHelp by traverses all HTML pages (for DITA topics) from output folder to gather information.
This component is an interface between the user and the search index. It helps the user to search through the search index and displays results in the search page.

**Search Field and Results Page**

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the **Toggle Highlights** button at the top-right side of the page. The Search field also includes an autocomplete feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

**Tip:**
You can use the searchQuery URL parameter to perform a search operation when WebHelp is loaded. This opens the Search Results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

**5-Star Rating Mechanism and Sorting**

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

**Tag Element Scoring Values**

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1287).
Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.

- **Boolean Search** is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).

- The space character separates keywords (an expression such as grow flowers counts as two separate keywords).

- Words composed by merging two or more words with colon (";"), minus ("-"), underline ("_"), or dot (".")) characters count as a single word.

- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

- When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

  **Note:**
  Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

  **Tip:**
  The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a `<keywords>` element weighs more than an `<H1>` HTML element).

Excluded Terms

To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.

Related Information:
WebHelp Responsive HTML5 Pages: Search Page (on page 1176)
Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:

```xml
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources (resourceid element or @id attribute):

**resourceid**

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `<topicref>` within a DITA map or in a `<prolog>` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used.

**Note:**

Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map (on page 2820). For example, suppose that you need two different functions of an application to both open the same WebHelp page.
Example: The `<resourceid>` Element Specified in a DITA Map

The `<resourceid>` element can be specified in a `<topicmeta>` element within a `<topicref>`.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

Example: The `<resourceid>` Element Specified in a DITA Topic

The `<resourceid>` element can be specified in a `<prolog>` element within a DITA topic.

```xml
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the `<resourceid>` element, see DITA Specifications: `<resourceid>`.

**id**

If a `<resourceid>` element is not declared in the DITA map or DITA topic (as described above), the `@id` attribute that is set on the topic root element is mapped into the `<appContext>` element.

**Important:**

You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

**path**

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

There are two ways of implementing context-sensitive help in your system:
• The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.

• Invoke the `cshelp.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```cshelp.html?contextId=myDITATopic```

**Note:**
The `contextId` parameter is not case-sensitive.

**Attention:**
Prior to version 24.1, the method was to invoke the `index.html` file. The system still works using this method but it has been deprecated and its functionality will be removed in a future version.

**Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

**contextId**

The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

**Note:**
You can use an anchor (on page 2814) in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

**appname**

You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.

```http://localhost/webhelp/cshelp.html?contextId=topicID&appname=myApplication```

**Tip:**
The `webhelp.csh.disable.topicID.fallback` parameter (on page 1345) can be set `true` to use a topic ID fallback when `resourceid` information is not available when computing the mapping for context-sensitive help.
Accessibility

**Oxygen XML WebHelp Responsive** output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

**Related Information:**

DITA-OT Day 2017 Presentation: Accessibility in DITA-OT

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

**Short Text Equivalents for Images**

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

**Long Descriptions of Images**

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdesc>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdesc href="http://www.example.org/birds/puffin.html" scope="external" format="html"/>
</image>
```

**Related Information:**

Darwin Information Typing Architecture (DITA) Specification `<image>` element
Web Accessibility Tutorials: Alt Decision Tree
Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="#parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>
  <area>
    <shape>circle</shape>
    <coords>324, 210, 14</coords>
    <xref href="#parts/ports.dita#ports_topic/suction_port" format="dita">Suction Port</xref>
  </area>
</imagemap>
```

Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `<scope>`, `<id>`, and `<headers>` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition

VPAT® Version 2.3 – April 2019

Product Name/Version

Oxygen XML WebHelp Responsive

Product Description

Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With Oxygen XML WebHelp Responsive, your published content is accessible, interactive, and convenient.
Date

May 2019

Contact Information

support@oxygenxml.com

Notes

Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the U.S. Government Section 508 accessibility standards and the Web Content Accessibility Guidelines (WCAG). For details, see WebHelp Responsive Accessibility (on page 1186).

Evaluation Methods Used:

The following applications were used for testing Oxygen XML WebHelp Responsive:

- Desktop browsers: Chrome, Firefox, Safari, Edge.
- Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator.

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

<table>
<thead>
<tr>
<th>Standard/Guideline</th>

<td>EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)</td>
<td>No</td>
</tr>
</tbody>
</table>

Terms

The terms used in the Conformance Level information are defined as follows:
• **Supports**: The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.

• **Partially Supports**: Some functionality of the product does not meet the criterion.

• **Does Not Support**: The majority of product functionality does not meet the criterion.

• **Not Applicable**: The criterion is not relevant to the product.

• **Not Evaluated**: The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

**WCAG 2.x Report**

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

**Note:**

When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](#).

### 2.1.1 Keyboard (Level A)

Also applies to:

Revised Section 508

- 501 (Web)(Software)
- 504.2 (Authoring Tool)
- 602.3 (Support Docs)

**Partially Supports**

Most of the content is operable through a keyboard interface, with exceptions that include:

- The submenus (the user cannot tab to the submenus).
- The top-level links in the main page accordion cannot be accessed.
- The facets component does not have full keyboard support.

### 2.1.2 No Keyboard Trap (Level A)

Also applies to:

Revised Section 508

- 501 (Web)(Software)
- 504.2 (Authoring Tool)
- 602.3 (Support Docs)

**Supports**

The product does not contain content that traps the keyboard focus.

### 2.1.4 Character Key Shortcuts (Level A 2.1 only)

Also applies to:

Revised Section 508 – Does not apply

**Supports**

The product does not include character key shortcuts.

### 2.2.1 Timing Adjustable (Level A)

Also applies to:

Revised Section 508

**Supports**

The product does not include time limits.

### 3.2.3 Consistent Navigation (Level AA)

Also applies to:

Revised Section 508

- 501 (Web)(Software) – Does not apply to non-web software
- 504.2 (Authoring Tool)
- 602.3 (Support Docs) – Does not apply to non-web docs

Supports

Repeated components appear in the same relative in each page.

### 3.2.4 Consistent Identification (Level AA)

Also applies to:

Revised Section 508

- 501 (Web)(Software) – Does not apply to non-web software
- 504.2 (Authoring Tool)
- 602.3 (Support Docs) – Does not apply to non-web docs

Partially Supports

The output uses labels, names, and text alternatives consistently for items that have the same functionality.

Text alternatives are provided for many instances of non-text content, with exceptions that include:

- Permalinks for subtopics and sections.
- Enlarge images action.

The Home link from the breadcrumb does not have an associated aria-label.

### 3.3.3 Error Suggestion (Level AA)

Also applies to:

Revised Section 508

Does Not Support

The Search input does not have the aria-required information set and does not contain a text description specifying that it is a required field.

### Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

**Tip:**

You can start creating publishing templates by using the Oxygen Styles Basket. [https://styles.oxygenxml.com](https://styles.oxygenxml.com)

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicon files, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for Oxygen Publishing Template packages:
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

**Related Information:**
- How to Create a Publishing Template (on page 1254)
- How to Edit a Packed Publishing Template (on page 1256)
- How to Add a Publishing Template to the Publishing Templates Gallery (on page 1257)
- How to Share a Publishing Template (on page 1424)

**Publishing Templates Gallery**

Oxygen XML Author comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.
Built-in Templates

There are two categories of templates, Tiles and Tree. You can see the built-in templates in the Templates tab when editing a WebHelp Responsive transformation scenario in Oxygen XML Editor/Author. Each one also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.
Built-in Templates Location

All built-in templates are stored in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (on page 1420). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's Template tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with the template. It is an XML file that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
  </webhelp>
</publishing-template>
```
Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.
**Template Author**

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```xml
<publishing-template>
...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
...
</publishing-template>
```

**Webhelp Element**

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the template tags (on page 1220), template preview image (on page 1220), resources (on page 1220) (such as CSS, JS, fonts, logos), transformation parameters (on page 1222), HTML fragment extensions (on page 1224) (used to add fragments to placeholders), XSLT extensions (on page 1223), or HTML page layout files (on page 1233).

```xml
<webhelp>
  <tags>...
  </tags>
  <preview-image file="MyPreview.png"/>
  <resources>...
  </resources>
  <html-page-layouts>...
  </html-page-layouts>
  <parameters>...
</webhelp>
```
Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<tags>
  <tag>tree</tag>
  <tag>dark</tag>
</tags>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```xml
<preview-image file="ashes/ashes-tree.png"/>
<online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

⚠️ Warning:

All paths set in the @file attribute must be relative.

This section is defined using the resources element and the types of resources that can be specified include:
• **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.

• **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the `<favicon>` element.

• **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
  ◦ `<target-url>` - will redirect the user to the specified URL if they click the logo in the output.
  ◦ `<alt>` - provides an alternate text for the logo image.

• **Additional Resources (graphics, JS, fonts, folders)** - For other resources (such as images referenced in CSS, JavaScript, fonts, entire folders, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the ANT FileSet.

```xml
<publishing-template>
  ...
  <webhelp>
  ...
  <resources>
    <css file="css/custom_styles.css"/>
    <css file="css/custom_fonts.css"/>
    
    <favicon file="images/favicon.png"/>
    
    <logo
      file="images/logo.png"
      target-url="http://www.example.com"
      alt="Alternate text for the logo image"/>
      
    <js-amd-module file="js/template-main.js"/>
    
    <fileset>
      <include name="common/**/*"/>
      <include name="JS/**/*"/>
      <exclude name="***/*.svn"/>
      <exclude name="***/*.git"/>
    </fileset>
  </resources>
</publishing-template>
```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.
The resources specified in the template descriptor are copied to the following output folder: 
[WebHelp_OUTPUT_DIR]/oxygen-webhelp/template. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

**Figure 296. Template Resources Mapping**

![Diagram of template resources mapping]

**Related Information:**
How to Add a Favicon in WebHelp Systems (on page 1283)

**Transformation Parameters**

You can also set one or more WebHelp transformation parameters in the descriptor file.

```
<publishing-template>
  ...
  <webhelp>
  ...
  <parameters>
    <parameter
      name="webhelp.show.main.page.toc"
      value="yes"/>
    <parameter
      name="webhelp.top.menu.depth"
      value="3"/>
    <parameter
      name="webhelp.fragment.welcome"
      value="html-fragment/webhelp.fragment.welcome.html"
      type="filePath"/>
  </parameters>
  </webhelp>
</publishing-template>
```

The following information can be specified in the `<parameter>` element:

**Parameter name**
The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (on page 1344) or a DITA-OT HTML-based output parameter.

Note:
It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention:
JVM arguments like -Xmx cannot be specified as a transformation parameter.

Parameter Value
The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type
The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1420) and adding it to the templates gallery (on page 1257), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points
The publishing templates can include one or more supported XSLT extension points (on page 1358). They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the <xslt> element in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.dita2webhelp"
        file="xsl/customDita2webhelp.xsl"/>
      
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
</publishing-template>
```

For a full list of the supported extension points, see: XSLT-Import and XSLT-Parameter Extension Points (on page 1358).
Note:
You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

### HTML Fragment Placeholders

The HTML pages contain component placeholders that can be used to insert custom HTML fragments either by specifying a well-formed XHTML fragment or referencing a path to a file that contains a well-formed XHTML fragment (for details on how the file or fragment needs to be constructed, see How to Insert Custom HTML Content (on page 1266)).

These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section. You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/webhelp_fragment_welcome.html"
        placeholder="webhelp.fragment.welcome"/>
      <fragment
        file="html-fragments/webhelp_fragment_footer.html"
        placeholder="webhelp.fragment.footer"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. Some of the placeholder parameters are global and can be used in all type of pages (main page, topic page, search results page, index terms page), while others are applicable for certain type of pages. The following diagram illustrates the predefined placeholders that are global (can be used in any of the types of pages).
Figure 297. Global Predefined Placeholders Diagram

1. Header (on page 1225)
2. After Header (on page 1225)
3. Before Body (on page 1225)
4. Before Logo and Title (on page 1226)
5. After Logo and Title (on page 1226)
6. Before Top Menu (on page 1226)
7. After Top Menu (on page 1226)
8. Before Search Input (on page 1226)
9. After Search Input (on page 1226)
10. Before Main Content (on page 1226)
11. After Main Content (on page 1226)
12. Footer (on page 1226)
13. After Body (on page 1226)

Global Placeholder Parameters

The following placeholder parameters can be used in any of the type of pages (main page, topic page, search results page, index terms page). The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

- **1 = webhelp.fragment.head** - Displays the specified XHTML fragment in the header section.
- **2 = webhelp.fragment.after.header** - Displays the specified XHTML fragment after the header section.
- **3 = webhelp.fragment.before.body** - Displays the specified XHTML fragment before the body.
**Main Page Placeholder Parameters**

The following placeholder parameters can be used in the *main page*. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

- **webhelp.fragment.head.main.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.main.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.main.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.main.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.main.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.main.page** - Displays the specified XHTML fragment before the main content area.
- **webhelp.fragment.after.main.content.area.main.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.before.toc_or_tiles** - Displays the specified XHTML fragment before the main table of contents or tiles component on the main page.
- **webhelp.fragment.after.toc_or_tiles** - Displays the specified XHTML fragment after the main table of contents or tiles component on the main page.

**Topic Page Placeholder Parameters**

The following placeholder parameters can be used in the *topic page*. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:
• `webhelp.fragment.head.topic.page` - Displays the specified XHTML fragment in the header section.
• `webhelp.fragment.after.header.topic.page` - Displays the specified XHTML fragment after the header section.
• `webhelp.fragment.before.body.topic.page` - Displays the specified XHTML fragment before the body.
• `webhelp.fragment.before.search.input.topic.page` - Displays the specified XHTML fragment before the search input component.
• `webhelp.fragment.after.search.input.topic.page` - Displays the specified XHTML fragment after the search input component.
• `webhelp.fragment.before.main.content.area.topic.page` - Displays the specified XHTML fragment before the main content area.
• `webhelp.fragment.after.main.content.area.topic.page` - Displays the specified XHTML fragment after the main content area.
• `webhelp.fragment.after.body.topic.page` - Displays the specified XHTML fragment after the body.
• `webhelp.fragment.before.topic.toolbar` - Displays the specified XHTML fragment before the toolbar buttons above the topic content in the topic page.
• `webhelp.fragment.after.topic.toolbar` - Displays the specified XHTML fragment after the toolbar buttons above the topic content in the topic page.
• `webhelp.fragment.before.topic.breadcrumb` - Displays the specified XHTML fragment before the breadcrumb component in the topic page.
• `webhelp.fragment.after.topic.breadcrumb` - Displays the specified XHTML fragment after the breadcrumb component in the topic page.
• `webhelp.fragment.before.publication.toc` - Displays the specified XHTML fragment before the publication's table of contents component in the topic page.
• `webhelp.fragment.after.publication.toc` - Displays the specified XHTML fragment after the publication's table of contents component in the topic page.
• `webhelp.fragment.before.topic.content` - Displays the specified XHTML fragment before the topic's main content in the topic page.
• `webhelp.fragment.after.topic.content` - Displays the specified XHTML fragment after the topic's main content in the topic page.
• `webhelp.fragment.before.feedback` - Displays the specified XHTML fragment before the Oxygen Feedback commenting component in the topic page.
• `webhelp.fragment.after.feedback` - Displays the specified XHTML fragment after the Oxygen Feedback commenting component in the topic page.
• `webhelp.fragment.before.topic.toc` - Displays the specified XHTML fragment before the topic's table of contents component in the topic page.
• `webhelp.fragment.after.topic.toc` - Displays the specified XHTML fragment after the topic's table of contents component in the topic page.

**Search Results Page Placeholder Parameters**

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:
• `webhelp.fragment.head.search.page` - Displays the specified XHTML fragment in the header section.
• `webhelp.fragment.after.header.search.page` - Displays the specified XHTML fragment after the header section.
• `webhelp.fragment.before.body.search.page` - Displays the specified XHTML fragment before the body.
• `webhelp.fragment.before.search.input.search.page` - Displays the specified XHTML fragment before the search input component.
• `webhelp.fragment.after.search.input.search.page` - Displays the specified XHTML fragment after the search input component.
• `webhelp.fragment.before.main.content.area.search.page` - Displays the specified XHTML fragment before the main content area.
• `webhelp.fragment.after.main.content.area.search.page` - Displays the specified XHTML fragment after the main content area.
• `webhelp.fragment.after.body.search.page` - Displays the specified XHTML fragment after the body.
• `webhelp.google.search.script` - Replaces the search input component with a Google search component.

Index Terms Page Placeholder Parameters

The following placeholder parameters can be used in the search results page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

• `webhelp.fragment.head.terms.page` - Displays the specified XHTML fragment in the header section.
• `webhelp.fragment.after.header.terms.page` - Displays the specified XHTML fragment after the header section.
• `webhelp.fragment.before.body.terms.page` - Displays the specified XHTML fragment before the body.
• `webhelp.fragment.before.search.input.terms.page` - Displays the specified XHTML fragment before the search input component.
• `webhelp.fragment.after.search.input.terms.page` - Displays the specified XHTML fragment after the search input component.
• `webhelp.fragment.before.main.content.area.terms.page` - Displays the specified XHTML fragment before the main content area.
• `webhelp.fragment.after.main.content.area.terms.page` - Displays the specified XHTML fragment after the main content area.
• `webhelp.fragment.after.body.terms.page` - Displays the specified XHTML fragment after the body.

Using String Values in Placeholder Parameter Values

If you use strings for values of HTML fragment placeholder parameter values, the string values are written to files in the transformation's temporary directory. The values of the associated parameters reference the paths of the temporary files. This means that the HTML fragments will have a uniform processing in the WebHelp's XSLT Module.

Example:

Suppose the placeholder parameter has the following string value:
A new file that contains the parameter's value is created:

`[temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml`

The parameter's value then becomes:

```
webhelp.fragment.welcome= [temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

**Related Information:**

How to Insert Custom HTML Content *(on page 1266)*

**WebHelp Responsive Macros**

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

**Implementations**

The following macros are supported:

**i18n**

For localizing a string.

```
${i18n(string.id)}
```

**param**

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

**env**

Returns the value of an environment variable.
${env(JAVA_HOME)}

**system-property**

Returns the value of a system property.

${system-property(os.name)}

**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}

**path**

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

${path(oxygen-webhelp-template-dir)}

**Note:**

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

**map-xpath**

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

**Tip:**
Available in all template layout HTML pages.

${map-xpath(/map/title)}
**topic-xpath**

Can be used to execute an XPath expression over the current topic.

<i>Tip:</i>
Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

**oxygen-webhelp-build-number**

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

**Extensibility**

To add new **macros**, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl` file.

```xml
<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
  <xsl:param name="name"/>
  <xsl:param name="params"/>
  <xsl:param name="contextNode"/>
  <xsl:param name="matchedString"/>

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:message>Cannot expand macro: ["$matchedString"]</xsl:message>
      <xsl:copy-of select="$contextNode"/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>
```

The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current macro.
- **params** - List of parameters of the current macro as a string sequence. The current macros parsing mechanism only allows macros with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the macro was declared.
- **matchedString** - The entire value of the matched macro as specified in the HTML template page.
Combining WebHelp Responsive and PDF Customizations in a Template Package

An Oxygen Publishing Template package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (main, search, topic, index) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

**Warning:**

It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them. Instead, use any of the other methods described in Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1217).

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.

```
<!-- HTML page layout files -->
<html-page-layout-files>
  <page-layout-file page="main" file="page-templates/wt_index.html"/>
  <page-layout-file page="search" file="page-templates/wt_search.html"/>
  <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
  <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
</html-page-layout-files>
```

If you do use the `html-page-layout-files` element, you must specify all four types of pages (main, search, topic, index). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed DITA map (on page 2816).
Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the Publication Title component can be used in all pages, but the Navigation Breadcrumb component can only be used in the Topic Page.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the http://www.oxygenxml.com/webhelp/components namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the <whc:component_content> element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```xml
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
  role="form">
  <div class="custom-content-before">Enter search terms here:</div>
  <div class="custom-wrapper">
    <whc:component_content/>
  </div>
  <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is wt_index.html and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.
Figure 298. Examples of Main Page Components for a Tiles Style of Layout

1. Publication Logo (on page 1236)
2. Publication Title (on page 1236)
3. Search Input (on page 1237)
4. Main Menu (on page 1237)
5. Index Terms Link (on page 1238)
6. Topic Tiles (on page 1237)
7. Print Link (on page 1237)
Figure 299. Examples of Main Page Components for a Tree Style of Layout

1. Publication Logo (on page 1236)
2. Publication Title (on page 1236)
3. Search Input (on page 1237)
4. Main Menu (on page 1237)
5. Index Terms Link (on page 1238)
6. Table of Contents (on page 1238)
7. Print Link (on page 1237)

The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the webhelp.logo.image transformation parameter (in the Parameters tab in the transformation scenario). You can set the webhelp.logo.image.target.url parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
    xmlns:whc="http://www.oxygenxml.com/webhelp/components"
/>
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
    xmlns:whc="http://www.oxygenxml.com/webhelp/components"
/>
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
    xmlns:whc="http://www.oxygenxml.com/webhelp/components"
/>
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1275).

**Main Page Topic Tiles (webhelp_tiles)**
This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_tiles
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```html
<whc:webhelp_tile class="col-md-4">
    <!-- Place holder for tile's image -->
    <whc:webhelp_tile_image/>

    <div class="wh_tile_text">
        <!-- Place holder for tile's title -->
        <whc:webhelp_tile_title/>

        <!-- Place holder for tile's shortdesc -->
        <whc:webhelp_tile_shortdesc/>
    </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page (on page 1280).

**Main Page Table of Contents (webhelp_main_page_toc)**

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: \textit{wh_indexterms_link}. This component will contain a link to the \textit{indexterms.html} page.

**Link to Skins Resources (**\texttt{webhelp\_skin\_resources}**)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the \texttt{<whc:webhelp\_skin\_resources/>} element must be specified in the HTML file as in the following example:

\begin{verbatim}
<whc:webhelp_skin_resources/>
\end{verbatim}

In the output, you will find a link to the skin resources.

**Topic Page**

The \textit{Topic Page} is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is \texttt{wt_topic.html} and it is located in the following directory: \texttt{DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates}.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 300. Examples of Topic Page Components

1. Publication Logo (on page 1241)
2. Publication Title (on page 1240)
3. Search Input (on page 1241)
4. Main Menu (on page 1243)
5. Index Terms Link (on page 1243)
6. Expand/Collapse All Sections (on page 1243)
7. Navigation Links (on page 1241)
8. Print Link (on page 1242)
9. Breadcrumb (on page 1241)
10. Publication Table of Contents (on page 1242)
11. Topic Content (on page 1242)
12. Topic Table of Contents (on page 1242)

The following components can be referenced in the Topic Page (wt_topic.html) file:

Publication Title (webhelp_publication_title)
This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Topic Breadcrumb (webhelp_breadcrumb)**

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `<whc:webhelp_breadcrumb>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_breadcrumb
```

In the output, you will find an element with the class: `wh_breadcrumb`. This component will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

**Navigation Links (webhelp_navigation_links)**
This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class: `wh_navigation_links`. This component will contain the links to the next and previous topics.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Topic Content (webhelp_topic_content)**

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class: `wh_topic_content`.

**Publication TOC (webhelp_publication_toc)**

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of the current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_toc
```

In the output, you will find an element with the class: `wh_publication_toc`. This component will contain links to the topics referenced in the DITA map. It also includes an expand/collapse button (either `<` to collapse or the `>` to expand).

**Topic TOC (webhelp_topic_toc)**

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and
the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an @id attribute. To generate this component, the `<whc:webhelp_topic_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: `wh_topic_toc`. This component will contain links to the sections within the current topic. It also includes an expand/collapse button (either to collapse or to expand).

**Expand/Collapse Sections (webhelp_expandCollapse_sections)**

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `<whc:webhelp_expandCollapse_sections>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_expandCollapse_sections
```

In the output, you will find an element with the class: `webhelp_expandCollapse_sections`.

**Topic Feedback (webhelp_feedback)**

This component generates a placeholder for where the comments section will be presented. To generate this component, the `<whc:webhelp_feedback>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_feedback
```

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1275).

**Index Terms Link (webhelp_indexterms_link)**
This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class `wh_indexterms_link`. This component will contain a link to the indexterms.html page.

### Child Links (webhelp_child_links)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `<whc:webhelp_child_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_child_links
```

### Related Links (webhelp_related_links)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `<whc:webhelp_related_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_related_links
```

### Link to Skins Resources (webhelp_skin_resources)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

### Search Results Page

The *Search Results Page* is the page generated that presents search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.
Figure 301. Examples of Search Results Page Components

1. Publication Logo (on page 1245)
2. Publication Title (on page 1245)
3. Search Input (on page 1246)
4. Main Menu (on page 1246)
5. Index Terms Link (on page 1247)
6. Search Results (on page 1246)
7. Print Link (on page 1246)

The following components can be referenced in the Search Results Page file:

**Publication Title** (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `<wch:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<wch:webhelp_publication_title
    xmlns:wch="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo** (webhelp_logo)
This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Search Results (webhelp_search_results)**

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
```

In the output, you will find an element with the class: `wh_search_results`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1275).

**Index Terms Link** (webhelp_indexterms_link)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources** (webhelp_skin_resources)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The Index Terms Page is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.
Figure 302. Example of Index Terms Page Components

1. Publication Logo (on page 1248)
2. Publication Title (on page 1248)
3. Search Input (on page 1249)
4. Main Menu (on page 1249)
5. Index Terms Link (webhelp_indexterms_link) (on page 1249)
6. Print Link (on page 1249)

The following components can be referenced in the Index Terms Page (wt_terms.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1275).

**Index Terms Link (webhelp_indexterms_link)**
This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: wh_indexterms_link. This component will contain a link to the indexterms.html page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Generating WebHelp Responsive Output**

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

**Running WebHelp Responsive from Oxygen XML Editor/Author**

To publish a DITA map (on page 2816) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Feedback Tab** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

Result: When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Responsive Output for DITA

DITA-based WebHelp output can be generated from an automated publishing process using a command line outside of Oxygen XML Editor/Author or an automatic publishing system, such as Jenkins or Travis. However, to do this, you must purchase an additional Oxygen XML WebHelp license.

Adding Oxygen Feedback to WebHelp Responsive Documentation

You can add Oxygen Feedback in WebHelp Responsive for DITA output to benefit from a modern commenting system, advanced ready-to-use search engine, administrative interface, and Oxygen XML Editor/Author integration.

Comments Component

A comments component is presented in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by Oxygen Feedback, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

External Search Engine

Oxygen Feedback can be configured as an external search engine for the Oxygen WebHelp Responsive output. This function be enabled from the Content Indexing and Search section that is available in the Version Settings page.

Administration Interface

Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an Oxygen Feedback site configuration in the administration interface, copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the Feedback tab in the WebHelp Responsive transformation scenario dialog box (on page 2695).

Oxygen XML Editor/Author Integration

An add-on is available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp
output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Deploying the Oxygen Feedback Comments Component

Prerequisite

To install and manage Oxygen Feedback, you will need to obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click on Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.
2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.
4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic.
5. [Optional] To configure Oxygen Feedback as an external search engine check the Enable content indexing option.
6. Click Continue.
7. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      iii. Select and duplicate the DITA Map WebHelp Responsive scenario.
      iv. Go to the Feedback tab.
      v. Click the Edit button and paste the generated installation fragment.
   b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
iii. Use the `webhelp.fragment.feedback` parameter in your command-line script to specify the path to the file you just created. For example:

```
dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml
```

8. [Optional] If you want the Oxygen Feedback comments component to fill the entire page width, contribute a custom CSS file (use the `args.css` parameter to reference it) that contains the following style rule:

```css
div.footer {
    float: none;
}
```

For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.

### Customizing WebHelp Responsive Output

Oxygen XML Author provides support for customizing the WebHelp Responsive output to suit your specific needs. The WebHelp Responsive output is based upon the Bootstrap responsive front-end framework and is available for DITA document types.

To change the overall appearance of your WebHelp Responsive output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

For an in-depth look at WebHelp Responsive features and some customization tips, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

### Working with Publishing Templates

An Oxygen Publishing Template (on page 2818) defines all aspects of the layout and styles of the WebHelp Responsive output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the WebHelp Responsive output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new Oxygen Publishing Template (on page 2818), follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

   Figure 303. Choosing the Publishing Template Descriptor Document Template

   ![Choosing the Publishing Template Descriptor Document Template]

   3. Save the .opt file into your customization directory.
   4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a DITA Map WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2818) is to select an existing template
in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the **Save template as** button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. **Optional:** Specify a template description.

6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (*DITA Map WebHelp Responsive* or *DITA Map to PDF - based on HTML5 & CSS*). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.

7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (on page 1233)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Creating a Publishing Template Using the Oxygen Styles Basket**

Another way to create an *Oxygen Publishing Template (on page 2818)* is to use the *Oxygen Styles Basket*. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your *DITA Map WebHelp Responsive* transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.
It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

**Figure 304. Oxygen Styles Basket Interface**

---

**Resources**

For more information about the **Oxygen Styles Basket**, see the following resources:

- **Video: Introducing the New Oxygen Styles Basket**
- **Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch**

**Related information**

- Publishing Template Package Contents for PDF Customizations *(on page 1414)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1217)*

**How to Edit a Packed Publishing Template**

To edit an existing **Oxygen Publishing Template *(on page 2818)* package, follow these steps:

1. Unzip the ZIP archive associated with the **Oxygen Publishing Template** in a separate folder.
2. Link the folder associated with the template in the **Project** view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the **Oxygen Publishing Template** folder to fit your needs.
4. Open the publishing template descriptor file (**.opt** extension) in the editor and modify it to suit your needs.
5. **Optional**: Once you finish your customization, you can archive the folder as a ZIP file.
How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   This will open the preferences page.
3. Click the Add button and specify the location of your template directory.
   Your template directory is now added to the Additional Publishing Templates Galleries list.
4. Click OK to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a single template descriptor file or multiple descriptor files. If you don't know, open the ZIP archive or folder and check for files with the .opt extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter. This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command-Line Example:

- **Windows**:

  dita.bat
    --format=webhelp-responsive
    --input=c:\path\to\mySample.ditamap
    --output=c:\path\to\output
    -Dwebhelp.publishing.template=custom-template

- **Linux/macOS**:

  dita
    --format=webhelp-responsive
    --input=/path/to/mySample.ditamap
Tip:
You can also start the dita process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the webhelp-responsive transformation type the WebHelp-related parameters.

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the webhelp.publishing.template (on page 1344) and webhelp.publishing.template.descriptor (on page 1344) parameters.

The webhelp.publishing.template (on page 1344) parameter specifies the path to the ZIP archive (or root folder) while the webhelp.publishing.template.descriptor (on page 1344) parameter specifies the name of the descriptor you want to use.

Command-Line Example:

• Windows:

```bash
dita.bat
    --format=webhelp-responsive
    --input=c:\path\to\mySample.ditamap
    --output=c:\path\to\output
    -Dwebhelp.publishing.template=custom-template
    -Dwebhelp.publishing.template.descriptor=flowers.opt
```

• Linux/macOS:

```bash
dita
    --format=webhelp-responsive
    --input=/path/to/mySample.ditamap
    --output=/path/to/output
    -Dwebhelp.publishing.template=custom-template
    -Dwebhelp.publishing.template.descriptor=flowers.opt
```
Tip:
You can also start the dita process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the webhelp-responsive transformation type the WebHelp-related parameters.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Troubleshooting: Errors Encountered when Loading Templates

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file (on page 1217) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded. More details.

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure (on page 1217).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (on page 1217), a warning icon (∆) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (on page 1220) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Author can be converted to the Publishing Template format that was introduced in Oxygen XML Author version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 24.1 Publishing Templates to Version 25

If you have a custom Publishing Template that was created in Oxygen XML Author version 24.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 25.0:
1. In the **Project** view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 385) and the easiest way to do this is to drag and drop the folder).

   ![Note:]
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v25**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 25.0.

**Related information**
- Convert Version 23 Publishing Templates to Version 24 (on page 1261)
- Convert Version 22 Publishing Templates to Version 23 (on page 1261)
- Convert Version 21 Publishing Templates to Version 22 (on page 1262)
- Convert Version 20 Publishing Templates to Version 21 (on page 1262)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 1263)

**Convert Version 24.0 Publishing Templates to Version 24.1**

If you have a custom Publishing Template that was created in Oxygen XML Author version 24.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 24.1:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 385) and the easiest way to do this is to drag and drop the folder).

   ![Note:]
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24.1**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.
**Result:** The converted Publishing Template can now be used in version 24.1.

### Convert Version 23 Publishing Templates to Version 24

If you have a custom Publishing Template that was created in Oxygen XML Author version 23.0 or 23.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 24:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can use a linked folder *(on page 385)* and the easiest way to do this is to drag and drop the folder).

   ![Note:]
   
   *If your template is stored as a ZIP archive, you first need to unzip it.*

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 24.

### Convert Version 22 Publishing Templates to Version 23

If you have a custom Publishing Template that was created in Oxygen XML Author version 22.0 or 22.1, it is not necessary to convert it to version 23 because there were no structural changes made for the **HTML layout files** *(on page 1233)* between the two versions.
Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Author version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 22:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 385) and the easiest way to do this is to drag and drop the folder).

   **Note:**
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v22**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 22.

Converting Version 22 Publishing Templates to Version 23 *(on page 1261)*

Converting Version 20 Publishing Templates to Version 21 *(on page 1262)*

Converting Version 19 (and Older) Publishing Templates to Version 20 *(on page 1263)*

---

Convert Version 20 Publishing Templates to Version 21

If you have a custom Publishing Template that was created in Oxygen XML Author version 20.0 or 20.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 21.0 or 21.1:
1. In the **Project** view, add the root directory for your custom Publishing Template (you can use a linked folder *(on page 385)* and the easiest way to do this is to drag and drop the folder).

   ![Note]
   
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.

3. **Convert Version 20 Publishing Templates to Version 21 (on page 1262)**

4. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v21**, then click **Next**.

5. The **Scope** should be left as **Selected project resources**.

6. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

7. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 21.0 or 21.1.

**Convert Version 19 (and Older) Publishing Templates to Version 20**

With the introduction of the Publishing Template concept in Oxygen XML Author version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format (version 20.0 or 20.1) by following this procedure:

1. Set Oxygen XML Author to point to the DITA-OT distribution that contains your old template:
   a. Go to **Options > Preferences > DITA**.
   b. Select **Custom** in the **DITA Open Toolkit** section and specify the DITA-OT directory that contains your old template.

2. Edit a **WebHelp Responsive** transformation scenario.

3. Select your old custom template in the **Templates** tab.

4. Click on the **Save Template as** button, complete the required fields, and save the template.

5. Reset the option set in step 1 to its previous value.

6. Edit the **WebHelp Responsive** transformation scenario again.

7. This time, use the **Choose custom template** button to select your converted template.

8. Save the scenario and use it to generate the WebHelp Responsive output.
Result: The converted template is now in a Publishing Template format for version 20.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an Oxygen Publishing Template (on page 2818) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.
Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

**Tip:**
When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure changes the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

   ```css
   .wh_footer {
       font-size: 15px;
       line-height: 1.7em;
       background-color: #000;
   }
   ```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:

   ```css
   .wh_footer {
       background-color: #255890;
   }
   ```

4. Save the custom CSS file at a location of your convenience.

5. Reference the CSS file in a WebHelp Responsive transformation using an **Oxygen Publishing Template (on page 1266)** or the **args.css** parameter (on page 1266).

**Fastpath:**
Regenerating the output to see the changes made in the CSS is not required. Instead, you can directly edit the files in **WebHelp Output Directory/oxygen-webhelp/template** and reload the
Referencing the CSS Using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Using the Project view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 1217) associated with your publishing template and add your custom CSS in the resources section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
    <css file="resources/MyCustom.css"/>
  </resources>
  ...
</webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert Custom HTML Content

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file (or specifying it in a well-formed XHTML fragment) that will be referenced in the transformation (either from an Oxygen Publishing Template (on page 2818) or using one of the HTML fragment placeholder parameters
This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the content of the file is not XML Well-formed (on page 755), the transformation will automatically convert non-well-formed HTML content to a well-formed XML equivalent (assuming the webhelp.enable.html.fragments.cleanup transformation parameter is set to true).

  For example, if the HTML content includes several `<script>` or `<link>` elements, the XML fragment would have multiple root elements and to make it well-formed, it would be wrapped in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents.

  Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

  **Note:**
  The converted fragments are stored in a file located in the `whr-html-fragments` subfolder of the transformation's temporary directory.

  **Tip:**
  If you do not want the transformation to automatically convert non-well-formed content into well-formed XML content, you can set the `webhelp.enable.html.fragments.cleanup` transformation parameter to `false`. This will instead cause the transformation to fail if at least one HTML fragment is not well-formed.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

  ```html
  <html>
    <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
    <link rel="stylesheet" type="text/css"
          href="${oxygen-webhelp-output-dir}/css/test.css" />
  </html>
  ```

  If you want that the path of your resource to be relative to the templates directory (on page 1214), you can use the `${oxygen-webhelp-template-dir}` macro.

  To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1325).

- **Inline JavaScript or CSS Content**:

  JavaScript:
<script type="text/javascript">
/* Include JavaScript code here. */

function myFunction() {
    return true;
}
</script>

CSS:

<style>
/* Include CSS style rules here. */

*{
    color:red
}
</style>

Note:

If you have special characters (e.g. &lt;, &gt;) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

Otherwise, the WebHelp transformation automatically wraps inline JavaScript or CSS content in an XML comment. Also, if the commented content contains constructs that are not allowed in an XML comment, those constructs are escaped.

[Important] XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

<script type="text/javascript">
<!--
/* Include JavaScript code here. */

function myFunction() {
    return true;
}
-->
</script>

Using WebHelp Macros

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.
There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

```xml
<script type="text/javascript" src="${path(oxygen-webhelp-template-dir)}/"></script>
```

- **In text content** - Using the `<whc:macro>` template component:

```xml
<script type="text/javascript">
    var outDirPath = '<whc:macro value="${path(oxygen-webhelp-output-dir)}" xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
    console.log("The output directory path is:", outDirPath);
</script>
```

**Note:**
When using the `<whc:macro>` element, you should also include the `xmlns:whc="http://www.oxygenxml.com/webhelp/components"` namespace declaration for the `whc` prefix. This is necessary for the XML fragment to be well-formed.

The following *macros* are supported:

**i18n**

For localizing a string.

```xml
${i18n(string.id)}
```

**param**

Returns the value of a transformation parameter.

```xml
${param(webhelp.show.main.page.tiles)}
```

**env**

Returns the value of an environment variable.

```xml
${env(JAVA_HOME)}
```

**system-property**

Returns the value of a system property.

```xml
${system-property(os.name)}
```

**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```xml
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001]})
```
path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```淌
${path(oxygen-webhelp-template-dir)}
```

Note:

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

```淌
${map-xpath(/map/title)}
```

Tip:

Available in all template layout HTML pages.

```淌
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

```淌
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

Tip:

Available only in the topic HTML page template (`wt_topic.html`).

```淌
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```淌
${oxygen-webhelp-build-number}
```
Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1253).
2. Insert the HTML content in a file that is XML well-formed (for example, custom-html.xml).
3. Using the Project view, copy your custom XML file in a folder inside publishing the template root folder (for example, in the custom_footer_template/html-fragments folder).
4. Open the template descriptor file (on page 1217) associated with your publishing template and add a reference to the custom HTML fragment in the html-fragments section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/custom-html.xml"
        placeholder="webhelp.fragment.head"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

**Note:**
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1224).

5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the <head> element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.fragment.head parameter and set it to the absolute path of your XML file.

**Note:**
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1224).

4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the <head> element of your output document.
How to Change Numbering Styles for Ordered Lists

Ordered lists (<ol>) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom @outputclass value and set it as an attribute of the ordered list, as in the following example:

```xml
<ol outputclass="number-alpha">
    <li>A</li>
    <li>B</li>
    <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```css
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1272) or the args.css parameter (on page 1273).

Referencing the Custom CSS from a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Using the Project view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 1217) associated with your publishing template and add your custom CSS in the resources section.

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            ...
            <css file="resources/MyCustom.css"/>
        </resources>
    </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click **OK** to save the changes to the transformation scenario.

7. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

**Referencing the CSS Using the **args.css** Parameter**

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set the **args.css** parameter to the path of your custom CSS file.
3. Set the **args.copycss** parameter to **yes** to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

**How to Add Syntax Highlights for Codeblocks in the Output**

**Syntax Highlighting** makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the **@outputclass** attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the **@outputclass** attribute on the **<codeblock>** element and set its value to one of the predefined language values. The **Content Completion Assistant** offers a list of the possible values when adding the **@outputclass** attribute in **Text** mode but there are also two simple ways to set the value in **Author** mode:

- Select the **<codeblock>** element in the editor and in the **Attributes** view, click on the **Value** cell for the **@outputclass** attribute and select one of the predefined values (for example, **language-xml**).
- Select the **<codeblock>** element in the editor and use the **Alt + Enter** keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the **Value** drop-down menu.

The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
• language-csharp
• language-css
• language-dtd
• language ini
• language-java
• language-javascript
• language-lua
• language-perl
• language-powershell
• language-php
• language-python
• language-ruby
• language-sql
• language-xquery

⚠️ Attention:
It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

⚠️ Tip:
Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:
The following codeblock with the `@outputclass` set as `language-css`:

```xml
<codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[@class ~="topic/topic"][@topicrefclass ~="bookmap/preface"] {
  page: preface-page;
}</codeblock>
```

would like this in WebHelp output:

```xml
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
```
How to Show or Hide Navigation Links in Topic Pages

The topic pages (on page 1173) in WebHelp Responsive output can contain navigation links (Previous / Next arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the @collection-type attribute. For example, if you set collection-type="sequence" on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```xml
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="../topics/Childtopic.dita"/>
  </topicref>
</map>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the webhelp.default.collection.type.sequence parameter in the transformation and set its value to yes to generate navigation links for all topics, regardless of whether or not the collection-type attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the webhelp.show.navigation.links parameter in the transformation and set its value to no.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.
How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map (on page 2816) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author.
2. Add the following metadata information in the topicref element (or any of its specializations) for each topic you do not want to be displayed in the menu:

   <topicmeta>
   <data name="wh-menu">
     <data name="hide" value="yes"/>
   </data>
   </topicmeta>

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID growing-flowers in the following example). The CSS file should have content that is similar to this:

   .wh_top_menu *[data-id='growing-flowers'] {
     display:none;
   }

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1266) or the args.css parameter (on page 1266).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an Oxygen Publishing Template (on page 1214), follow this procedure:
1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).

2. Open the template descriptor file (on page 1217) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the `parameters` section with its value set to `no`.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <parameters>
         <parameter name="webhelp.show.top.menu" value="no"/>
       </parameters>
     </webhelp>
   </publishing-template>
   ```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.show.top.menu` parameter to `no`.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1224) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Open the template descriptor file (on page 1217) associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the `parameters` section with its value set to one of the following:
A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
- A path to a file that contains well-formed XHTML content.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.

### Using a Transformation Scenario in Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of *Oxygen XML Editor/Author* requires an additional license and some additional setup:

- You must have a valid license for the *Oxygen XML WebHelp Plugin* ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The *Oxygen XML WebHelp Plugin* must be installed and integrated.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.
How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of empty placeholders that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.footer` parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an Oxygen Publishing Template, follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template.
2. Open the template descriptor file associated with your publishing template and add the `webhelp.fragment.footer` parameter in the `html-fragments` section with its value set to a path of a file that contains well-formed XHTML content.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment file="html/footer.xhtml" placeholder="webhelp.fragment.footer"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

Important:
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author (do not use it with a trial license).

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).

The Oxygen XML WebHelp Plugin must be installed and integrated.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.fragment.footer parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The tiles version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map (on page 2816). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author.
2. Add the following metadata information in the <topicref> element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:
Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

   ```css
   .wh_tile [data-id='growing-flowers'] {
     display:none;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1266) or the args.css parameter (on page 1266).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

   ```xml
   <topicmeta>
     <data name="wh-tile">
       <data name="image" href="img/tile-image.png" format="png">
         <data name="attr-width" value="64"/>
         <data name="attr-height" value="64"/>
       </data>
     </data>
   </topicmeta>
   ```
Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile to include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

   ```css
   .wh_tile[data-id='growing-flowers'] > div {
       background-image: url('resources/flower.png');
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1266) or the args.css parameter (on page 1266).

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Add a Logo Image in the Title Area

You can customize WebHelp Responsive output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Open the template descriptor file (on page 1217) associated with your publishing template and add the <logo> element in the <resources> section and set the @file attribute value to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `@target-url` attribute.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <logo
        file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"/>
    </resources>
  </webhelp>
</publishing-template>
```

4. Open the `DITA Map WebHelp Responsive` transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the `DITA Map WebHelp Responsive` transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**How to Add a Favicon in WebHelp Systems**

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

**Using a Publishing Template**

To add a favicon to your WebHelp output using an Oxygen Publishing Template (on page 1214), follow this procedure:
1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1253).

2. Open the template descriptor file (on page 1217) associated with your publishing template and add the `<favicon>` element in the `resources` section. The path to the image is relative to the template root folder.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <favicon file="images/favicon.png"/>
    </resources>
  </webhelp>
  ...
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** Browsers that provide favicon support display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.favicon parameter to the path of your image.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

**How to Add Video and Audio Objects in DITA WebHelp Output**

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

**Adding Videos to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 2553).
   - Drag (or copy) the video file from your system explorer or the Project view (on page 385) and drop (or paste) it into your document.
   - Manually add an `<object>` element, as in one of the following examples:
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>

or, instead of the @data attribute, you can specify the video using a parameter like this:

<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4"/>
</object>

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <video> element.

<video controls="controls">
  <source type="video/mp4" src="MyVideo.mp4"/>
</video>

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   ◦ Use the Insert Media Object toolbar action (on page 2553).
   ◦ Drag (or copy) the audio file from your system explorer or the Project view (on page 385) and drop (or paste) it into your document.
   ◦ Manually add an <object> element, as in one of the following examples:

   <object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>

or, instead of the @data attribute, you can specify the video using a parameter like this:

<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <audio> element.

<audio controls="controls">
  <source type="audio/mpeg" src="MyClip.mp3"/>
</audio>

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (on page 2553) or by manually adding an <object> element, as in one of the following examples:

   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>

or, instead of the @data attribute, you can specify the object using a parameter like this:

   <object outputclass="iframe">
     <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   </object>
2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to `true`:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
<param name="allowfullscreen" value="true"/>
</object>
```

**Tip:**

If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (on page 2556)), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to `true`.

3. Apply a DITA to WebHelp transformation to obtain the output.

**Result:** The transformation converts the `<object>` element to an HTML5 `<iframe>` element.

```html
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4"></iframe>
```

**Resources**

For more information, see the following video demonstration:

https://www.youtube.com/embed/IIX11gS4WaU

**Related Information:**

Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 2553)

**How to Add MathML Equations in WebHelp Output**

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the `head` element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"

src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM L"

</script>
```

**Result:** The equation should now be properly rendered in the WebHelp output for other browsers.
Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

Built-in JS Based Search Engine Customizations

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`.

   The following values can be edited in the `scoring.properties` file:

   ```
   h1 = 10
   h2 = 9
   h3 = 8
   h4 = 7
   h5 = 6
   h6 = 5
   b = 5
   strong = 5
   em = 3
   i = 3
   u = 3
   div.toc = -10
   title = 20
   div.ignore = ignored
   meta_keywords = 20
   meta_indexterms = 20
   meta_description = 25
   shortdesc = 25
   ```

2. Save your changes to the file.

3. Re-run your WebHelp transformation.
How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the *Lucene Kuromoji Japanese analyzer* can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

**Restriction:**

The *Kuromoji* analyzer does not work if your WebHelp output is accessed locally. In this scenario, a warning message will be displayed informing you that the *Kuromoji* analyzer is disabled. It is possible to hide this warning message by using a transformation parameter named `webhelp.enable.search.kuromoji.js`. By default, its value is **yes**, which means the *Kuromoji* analyzer is enabled by default. To hide the warning message, set the value of that parameter to **no** using either of the methods listed below. When it is set to **no**, the *Kuromoji* analyzer is disabled even if you deploy your WebHelp output on a web server.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Open the template descriptor file (on page 1217) associated with your publishing template and add the `<default.language>` parameter in the `<parameters>` section with its value set to `ja-jp`.

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <parameters>
   <parameter name="default.language" value="ja-jp"/>
   </parameters>
   </webhelp>
   </publishing-template>
   
   ```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

**Note:**
Alternatively, you could set the @xml:lang attribute on the root of the DITA map (on page 2816) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

**How to Implement a Custom Search Filter**

It is possible to implement a custom search filter (search input component) in your WebHelp Responsive output. The search input component is where users enter search queries to locate certain content within the WebHelp output.

To integrate a custom search filter, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Create the following items in the folder that contains your publishing descriptor file (the .opt file):
   - A folder named js.
   - A folder named fragments.
3. In the js folder, create a file named search-filter.js.
4. As a starting point, you can copy the following content to the search-filter.js file:

```javascript
/**
 * Object that implements the methods required by WebHelp to run a search filter.
 */
function CustomSearchFilter() { }

/**
 * Method required to run the search filter in webhelp. It is called when the users executes the query in the search page.
 *
 * @param {WebHelpAPI.SearchResult} searchResult The search result for the executed query.
 *
 * @return A list of WebHelpAPI.SearchResult objects
 */
this.filterResults = function (searchResult) {
    // implement filter
```
5. Implement your custom search filter.
6. In the fragments folder, create a file named search-filter-script-fragment.xml.
7. In the search-filter-script-fragment.xml file, define the scripts that are required for your custom search filter to run. For example:

   ```xml
   <div>
     <script src="${oxygen-webhelp-template-dir}/js/search-filter.js"></script>
   </div>
   ```

8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the <resources> section (see Template Resources (on page 1220) for more details):

   ```xml
   <fileset>
     <include name="js/**"/>
   </fileset>
   ```

9. Set the transformation parameters needed to enable the custom search filter. For this, open the .opt file and add the following content inside the <webhelp> element:

   ```xml
   <html-fragments>
     <fragment file="fragments/search-filter-script-fragment.xml"
               placeholder="webhelp.fragment.head.search.page"/>
   </html-fragments>
   ```

10. Run the transformation with this publishing template selected.

### How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (on page 2816) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.
Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   **Example:** Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a .bak file extension. You could create a simple text file (for example, named exclude.properties), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the parameters section of the template descriptor file (on page 1222) associated with your publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the @search attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any `<topicref>` that you want to exclude from search results, set the `@search` attribute to no. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.

Oxygen Feedback Search Engine

How to Configure Faceted Search in WebHelp Output

A faceted search is a powerful tool that allows users to refine search results by selecting filters or facets. **Facets** are predefined categories that are associated with search results. By selecting one or more facets, users can narrow down their search results to a specific category or set of categories.

Configure Oxygen Feedback as an External Search Engine

To enable faceted searches, you need to have a search engine that supports this functionality. The Oxygen Feedback search engine implements faceted searches and can be easily configured as a search engine for
WebHelp, see Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1251) for more details.

⚠ Attention:  
The default search engine that comes embedded in the WebHelp Responsive output does not support faceted searches.

Defining Facets Using a DITA Subject Scheme Map

A subject scheme map can be used to define controlled values and subject definitions. Subject definitions are classifications and sub-classifications that compose a tree. Subject definitions provide semantics that can be used in conjunction with taxonomies and ontologies.

The `<subjectdef>` element is used to define both a subject category and a list of controlled values. The parent `<subjectdef>` element defines the category, and the children `<subjectdef>` elements define the controlled values.

The following example defines the "Operating system" category, with "Linux" and "Windows" sub-categories. The controlled values (facet values) are: "RedHat Linux", "SUSE Linux", "Windows 7", and "Windows 10".

```xml
<subjectScheme>
  <subjectdef keys="os" navtitle="Operating system">
    <subjectdef keys="linux" navtitle="Linux">
      <subjectdef keys="redhat" navtitle="RedHat Linux"/>
      <subjectdef keys="suse" navtitle="SUSE Linux"/>
    </subjectdef>
    <subjectdef keys="windows" navtitle="Windows">
      <subjectdef keys="win7" navtitle="Windows 7"/>
      <subjectdef keys="win10" navtitle="Windows 10"/>
    </subjectdef>
  </subjectdef>
</subjectScheme>
```

Associating Faceted Values With a Topic Using a DITA Classification Map

The classification domain provides elements that enable map authors to indicate information about the subject matter of DITA topics. The subjects are defined in subject scheme maps, and the subjects are referenced using the `@keyref` attribute.

The following example shows you how to associate a faceted value with a topic:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Classification Map//EN" "classifyMap.dtd">
<map>
  <title>Classification map</title>
  <topicref keyref="how-to-install-on-suse.dita">
    <topicsubject keyref="linux">
```
Note:
The facet information cascades into child <topicref> elements.

Refining the Search Results by Using Facets in the Search Page

The configured facets are displayed in the search page, allowing you to narrow down the results.

When a user selects a facet, the search results are updated to only include the topics that match the selected facets. If multiple facet values are selected from the same category/facet, the search results display all topics with at least one facet. On the other hand, if multiple facet values from distinct facets are selected, the search results display all topics with all selected facet values.

Related information

Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1251)

How to Add Searchable Labels in WebHelp Output

It is possible to add searchable labels in WebHelp Responsive output that can be clicked to search for topics with that exact same label. Labels are textual words attached to a DITA topic that enables it to be easily found using the search function. These labels can help you organize your topics, making it more accessible to retrieve topics for a specific text.

Configure Oxygen Feedback as an External Search Engine

To enable searchable labels, you need to have a search engine that supports this functionality. The Oxygen Feedback search engine implements searchable labels and can be easily configured as a search engine for WebHelp. See Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1251) for more details.

Attention:
The default search engine that comes embedded in the WebHelp Responsive output does not support searchable labels. It will simply perform a standard search using the content within the label.
How to Add Searchable Labels in a DITA Topic

The generation of searchable labels in the WebHelp Responsive output is activated by default. You need to insert the desired text (to be displayed in the label in the output) in a `<keyword>` element with an `@outputclass` attribute set to `label` within the prolog of each topic that you want to have that label displayed in the output.

**Note:**
You can right-click anywhere within the topic in Author mode and select Insert > Insert Label to quickly insert the needed structure in the prolog.

For example:

```xml
<prolog>
  <metadata>
    <keywords>
      <keyword outputclass="label">Customization</keyword>
    </keywords>
  </metadata>
</prolog>
```

This would add a label that contains the text "Customization" in the output for the particular topic. If the user clicks that label, the search engine will search for all topics that have this same label defined.

Transformation Parameters for Generating Searchable Labels

You can have more control over how the labels are generated in the WebHelp Responsive output by using the `webhelp.labels.generation.mode` transformation parameter. The possible values for this parameter are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the WebHelp Responsive output.

**Note:**
The default value for the `webhelp.labels.generation.mode` transformation parameter is `keywords-label`.

Searchable Labels in WebHelp Responsive Output

The WebHelp Responsive transformation will generate a component that renders the text value of the `<keyword>` element. When the user clicks that component, they will be redirected to the search page with the search query populated for them and the search engine will display all topics that have the same text value defined in the prolog.
Custom Search Engine

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the Google Search Engine into your WebHelp Responsive output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the Google Search Engine into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine component for your site.

Important:
For the Layout, you must select Results only for the Google Search Engine to work with Oxygen XML WebHelp Responsive.

4. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '00088821088977588983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called googlecse.html.
6. Open the template descriptor file (on page 1217) associated with your publishing template and add the webhelp.google.search.script parameter in the parameters section with its value set to reference the googlecse.html file that you created earlier.
7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

8. Open the DITA Map WebHelp Responsive transformation scenario.
9. Click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes to the transformation scenario.
11. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site.

   Important:
   For the Layout, you must select Results only for the Google Search Engine to work with Oxygen XML WebHelp Responsive.

4. At the end of this process you should obtain a code snippet that looks like this:

   ```xml
   <parameters>
   <parameter
     name="webhelp.google.search.script"
     value="resources/googlecse.html"
     type="filePath"/>
   </parameters>
   </webhelp>
   ```
Save the script into a well-formed HTML file called `googlecse.html`.

Edit the `DITA Map WebHelp Responsive` transformation scenario and choose a template.

Switch to the Parameters tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

- Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).

- Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

Click **Ok** and run the transformation scenario.

### Replacing the Search Engine Only

It is possible to replace the internal search engine that is used by Oxygen XML WebHelp by using a custom JavaScript file. This customization method allows you to replace the search engine but keep the search results presentation.

To replace WebHelp's internal search engine, follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
   - A folder named `js`.
   - A folder named `fragments`.
3. In the `js` folder, create a file named `search-engine.js`.
4. As a starting point, you can copy the following content to the `search-engine.js` file:

```javascript
/**
 * Object that implements the methods required by WebHelp to run a search engine.
 */
function CustomSearchEngine() {
```

```javascript
gcse.async = true;

gcse.src = (document.location.protocol == 'https:' ? '
  //www.google.com/cse/cse.js?cx=' : 'http:') + cx;

var s = document.getElementsByTagName('script')[0];
s.parentNode.insertBefore(gcse, s);
}
})();
```
/**
 * Method required to run the search engine in webhelp. Handler when the user executes the query in the search page.
 * 
 * @param {String} query The search input string from the user.
 * @param {Function} successHandler Needs to be called if the search operation is executed successfully. The parameter needs to have the type of WebHelpAPI.SearchResult
 * @param {Function} errorHandler Needs to be called if the search operation fails to execute successfully. It needs to have the type of String.
 *
 * @this performSearchOperation = function(query, successHandler, errorHandler) {
 *    // implement search engine
 *    // const searchRestult = externalSearchEngine(query);
 *    // convert the result to WebHelpApi.SearchResult
 *    // const formattedResult = convert(searchRestult);
 *    // call successHandler with the converted result.
 *    // successHandler(formattedResult)
 * }
 */

/**
 * Method required to run the search engine in webhelp. Handler when the page is changed in the search page.
 * 
 * @param {Integer} pageToShow The page to be displayed.
 * @param {Integer} maxItemsPerPage The maximum # of items that can be displayed on a page.
 * @param {String} query The search input string from the user.
 * @param {Function} successHandler Needs to be called if the search operation is executed successfully. The parameter needs to have the type of WebHelpAPI.SearchResult
 * @param {Function} errorHandler Needs to be called if the search operation fails to execute successfully. It needs to have the type of String.
 *
 * @this onPageChangedHandler = function(pageToShow, maxItemsPerPage, query, successHandler, errorHandler) {
 *    // implement search engine
 *    // const searchRestult = externalSearchEngine(pageToShot, maxItemsPerPage, query);
 *    // convert the result to WebHelpApi.SearchResult
 *    // const formattedResult = convert(searchRestult);
 *    // call successHandler with the converted result.
 *    // successHandler(formattedResult)
 * }
 */
5. Implement your search engine.
6. In the fragments folder, create a file named search-engine-script-fragment.xml.
7. In the search-engine-script-fragment.xml file, define the scripts that are required for your search engine to run. For example:

```xml
<div>
  <script src="${oxygen-webhelp-template-dir}/js/search-engine.js"></script>
</div>
```

8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the `<resources>` section (see Template Resources (on page 1220) for more details):

```xml
<fileset>
  <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the search filter. For this, open the .opt file and add the following content inside the `<webhelp>` element:

```xml
<html-fragments>
  <fragment file="fragments/search-engine-script-fragment.xml"
            placeholder="webhelp.fragment.head.search.page"/>
</html-fragments>
```

**API Search Objects**

To replace the WebHelp Search Engine, you will need to convert your custom search result into WebHelp API Objects that WebHelp will use to render your search result on the search page. To convert your custom search result, you will have to create the following objects:

```javascript
// convert the result to WebHelpApi.SearchResult
const formattedResult = convert(searchResult);

// call successHandler with the converted result.
successHandler(formattedResult)

WebHelpAPI.setCustomSearchEngine(new CustomSearchEngine());
```

**Note:**
See the API Search Objects section (on page 1299) for details on how to convert your custom search engine results to WebHelpAPI.SearchResult.
1. `WebHelpAPI.SearchMeta` is a JavaScript object used to hold additional information for the search result. To create such an object, the following fields are required:
   - `String: searchEngineName` - The name of the search engine used to retrieve the search result.
   - `Integer: totalSearchItems` - The total number of search items the search engine returned.
   - `Integer: currentPage` - The current page to display.
   - `Integer: maxItemsPerPage` - The maximum number of items that can be displayed on a page.
   - `Integer: totalPages` - The number of total pages for the search result.
   - `String: originalSearchExpression` - The query string the user typed in the search input field.

   ```javascript
   const searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
                                                   maxItemsPerPage, totalPages, originalSearchExpression);
   ```

2. `WebHelpAPI.SearchDocument` is a JavaScript object used to hold the search result for a single topic/HTML page. To create such an object, the following fields are required:
   - `String: linkLocation` - The URL to the topic.
   - `String: title` - The topic title.
   - `String: shortDescription` - The topic short description.

   ```javascript
   const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
   ```

3. `WebHelpAPI.SearchResult` is a JavaScript object used to display the search results in the search page. To create such an object, the following fields are required:
   - `WebHelpAPI.SearchMeta: searchMeta` - Contains additional information for the search result.
   - `Array[WebHelpAPI.SearchDocument]: documents` - An array with the matching documents (HTML pages) for the search result.

   ```javascript
   const searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
                                                  maxItemsPerPage, totalPages, originalSearchExpression);
   const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
   const documents = [searchDocument]; // An array with one element.
   const searchResult = new WebHelpAPI.SearchResult(searchMeta, documents);
   ```

### Replacing the Search Engine and Results Presentation

It is possible to integrate a custom search engine and replace the search results area into your WebHelp Responsive output. This is done by using the following transformation parameters:

- **webhelp.fragment.custom.search.engine.results**

  This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

- **webhelp.fragment.custom.search.engine.script**

  This parameter can be used to replace WebHelp’s built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

To integrate a custom search engine into your WebHelp Responsive output, follow these steps:
1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).

2. Create the following items in the folder that contains your publishing descriptor file (the .opt file):
   - A file named `custom-search-results-fragment.xml`.
   - A file named `custom-search-script-fragment.xml`.
   - A folder named `js`.

3. In the `custom-search-results-fragment.xml` file, define the HTML structure that will be used as the search results area. For example:
   
   ```xml
   <div id="custom-search-results">...</div>
   ```
   
   **Note:**
   The custom search engine script will need to find an HTML element from the HTML structure that will be used as the search results area and write the search results inside it. In this example, it is the `<div>` element with the id `custom-search-results`.

4. In the `js` folder, create a file named `custom-search.js`.

5. As a starting point, you can copy the following content to the `custom-search.js` file:
   
   ```javascript
   document.addEventListener('DOMContentLoaded', (event) => {
       const params = new URLSearchParams(window.location.search);
       const searchQuery = params.get('searchQuery');
       // Implement your custom search engine
       // Display the search results
   });
   ```
   
   **Important:**
   The value entered by the user in the search page will be available in the URL's query parameters in a parameter named `searchQuery`.

   **Attention:**
   `URLSearchParams` is not supported on all browsers (it is used as an example). A list with the supported browsers can be found here. A different solution should be used if you need to support other browsers.

6. Implement your custom search engine.

   **Note:**
   The search results should be pushed into the `<div>` element created earlier with the id `custom-search-results`.

7. In the `custom-search-script-fragment.xml` file, define the scripts that are required for your custom search engine to run. For example:
8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the <resources> section (see Template Resources (on page 1220) for more details):

   <fileset>
     <include name="js/**"/>
   </fileset>

9. Set the transformation parameters needed to enable the custom search engine. For this, open the .opt file and add the following content inside the <webhelp> element:

   <html-fragments>
     <fragment file="custom-search-script-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.script"/>
     <fragment file="custom-search-results-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.results"/>
   </html-fragments>

10. Run the transformation with this publishing template selected.

   Tip:
   A sample publishing template that overrides WebHelp's default search engine is available to download here. You can use it as a starting point for your customization.

How to Display Custom Title in Search Results

It is possible to display a custom title for topics in the search results page. This can be achieved by adding the <searchtitle> element inside the particular DITA topic (or within the topic reference in the DITA map). The <searchtitle> element is used to specify the title that is displayed by search tools that locate the topic. This is useful when the topic has a title that makes sense in the context of a single information set, but may be too general in a list of search results. If the <searchtitle> is specified, then the search results page will display the contents inside the <searchtitle> as the topic title.

For details about the <searchtitle> element (including an example), see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/searchtitle.html.

How to Trigger a Search Query When WebHelp is Loaded

You can use the searchQuery URL parameter to perform a search operation when WebHelp is loaded. This opens the search results page with the specified search query processed. The URL should look something like this:

   http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
Configuring the Search Engine Optimization

A **DITA Map WebHelp** transformation scenario produces a **sitemap.xml** file that is used by search engines to aid crawling and indexing mechanisms. A **sitemap** lists all pages of a WebHelp system and allows web admins to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

**Important:**

If the `webhelp.sitemap.base.url` parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If the `webhelp.sitemap.base.url` parameter is not specified, the `loc` element will only contain the relative path of the page.

You can also set these additional parameters:

- **webhelp.sitemap.change.frequency** - Specifies how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
- **webhelp.sitemap.priority** - Specifies the priority of each page (a value ranging from 0.0 to 1.0).

The structure of the **sitemap.xml** file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  . . .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the **DITA map**).
Note:
The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD hh:mm:ss`.
- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note:
The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

### Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - `webhelp.sitemap.base.url` - The URL of the location where your WebHelp system is deployed.
     
     **Note:**
     This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.

     - `webhelp.sitemap.change.frequency` - How frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
     - `webhelp.sitemap.priority` - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.
Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize the Interface of WebHelp Responsive Output

Oxygen XML Author comes with support for the following built-in languages: English, French, German, Japanese, and Chinese. It is possible to edit existing localization strings or add a new language.

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- **DITA-OT-DIR/plugins/org.dita.base/xsl/common** folder - DITA-OT's default translations (generated text for `<note>`, `<fig>`, and `<table>` elements).
- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization** folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

Related Information:

- How to Index Japanese Content (on page 1288)
- Customizing Generated Text

Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.responsive"/>

     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:
4. Copy the strings you want to change from the translation files (on page 1305) to the strings-en-us.xml file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```xml
<strings xml:lang="en-US">
   <str name="Figure">Fig</str>
   <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1157).

### Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the dita.xsl.strings extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a com.oxygenxml.webhelp.localization plugin directory inside the DITA-OT-DIR/plugins/ location.
2. Create a plugin.xml file inside that com.oxygenxml.webhelp.localization directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
      <require plugin="com.oxygenxml.webhelp.responsive"/>
      <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   
   <langlist>
      <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
      <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

4. In the strings-pl-pl.xml file, change the `@xml:lang` attribute on the root element that conforms with the new language.
6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
</strings>
```

7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/plugins/org.dita.base/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML-based transformations (such as `<note>`, `<fig>`, and `<table>` elements). Translate the content of each `<str>` element.

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
  <str name="Figure">Polish translation for 'Figure'</str>
  <str name="Table">Polish translation for 'Table'</str>
  ...
</strings>
```

8. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1157).

**How to Activate Support for Right-to-Left (RTL) Languages**

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (on page 2816) and set the `@xml:lang` attribute on its root element (`<map>`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

**Integrating Social Media and Google Tools in the WebHelp Output**

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.
How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ Like widget to your WebHelp output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   ◦ The file must be well-formed.
   ◦ The code for each <script> element must be included in an XML comment.
   ◦ The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       (function(d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0];
         if (d.getElementById(id)) return;
         js = d.createElement(s); js.id = id;
         js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
         fjs.parentNode.insertBefore(js, fjs);
       })(document, 'script', 'facebook-jssdk');
     }<!--
   <div class="fb-like" data-layout="standard" data-action="like"
     data-show-faces="true" data-share="true"/>
   </div>
   </script>
   </div>
   
   4. Open the template descriptor file (on page 1217) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 1224) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the facebook-widget.xml file that you created earlier.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <html-fragments>
   ```
6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       -->
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
       data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment` (on page 1224). Set that parameter to reference the `facebook-widget.xml` file that you created earlier.

6. Click **Ok** and run the transformation scenario.

**How to Add Tweet Button in WebHelp Responsive Output**

It is possible to integrate X™ (formerly known as Twitter) into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

**Using a Publishing Template**

To add a X™ Tweet widget to your WebHelp Responsive output using an **Oxygen Publishing Template** (on page 1214), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
<a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
<script>
  !function (d, s, id) {
    var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http': 'https';
    if (!d.getElementById(id)) {
      js = d.createElement(s); js.id = id;
      js.src = p + '//platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
    }
  }
  (document, 'script', 'twitter-wjs');
</script>
</div>
```
4. Open the template descriptor file (on page 1217) associated with your publishing template.

5. Use one of the parameters that begin with webhelp.fragment (on page 1224) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the tweet-button.xml file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
  ...
  <html-fragments>
    <fragment
      file="HTML-fragments/tweet-button.xml"
      placeholder="webhelp.fragment.after.toc_or_tiles"/>
  </html-fragments>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.

7. Click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes to the transformation scenario.

9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a X™ Tweet widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.

2. Fill in the displayed form. The Preview and code area displays the code that you will need.

3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   ◦ The file must be well-formed.
   ◦ The code for each <script> element must be included in an XML comment.
   ◦ The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
    !function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/ test(d.location) ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
        js.src = p + '://platform.twitter.com/widgets.js';
        js.id = id;
        js.async = true;
        js.onload = function () {
          _twitter_iframe.style.display = "block";
        };
        fjs.parentNode.insertBefore(js, fjs);
      }
    }(document, 'script', 'twitter-share-button');
    // -->
  </script>
</div>
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1224). Set that parameter to reference the tweet-button.xml file that you created earlier.
6. Click Ok and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use Google Analytics to track and report site data for your WebHelp Responsive output.

Using a Publishing Template

To integrate Google Analytics into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

   
   ```html
   (function(i,s,o,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
   })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

   ga('create', 'UA-XXXXXXXX-X', 'auto');
   ga('send', 'pageview');
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Open the template descriptor file (on page 1217) associated with your publishing template.
6. Use the webhelp.fragment.after.body parameter (on page 1346) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the googleAnalytics.xml file that you
created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/googleAnalytics.xml"
        placeholder="webhelp.fragment.after.body"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate Google Analytics into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```javascript
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');

ga('send', 'pageview');

</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
6. Switch to the Parameters tab. Edit the `webhelp.fragment.after.body` parameter (on page 1346) and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures
that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

7. Click **Ok** and run the transformation scenario.

**Ant Extensions for WebHelp Responsive**

The WebHelp Responsive plugin provides extension points that allow you to implement custom Ant targets to perform additional operations before and after certain processing stages. The following extension points are available in WebHelp Responsive:

- **whr-init-pre**
  Runs a custom Ant target before the `whr-init` processing stage.

- **whr-init-post**
  Runs a custom Ant target after the `whr-init` processing stage.

- **whr-collect-indexterms-pre**
  Runs a custom Ant target before the `whr-collect-indexterms` processing stage.

- **whr-collect-indexterms-post**
  Runs a custom Ant target after the `whr-collect-indexterms` processing stage.

- **whr-toc-xml-pre**
  Runs a custom Ant target before the `whr-toc-xml` processing stage.

- **whr-toc-xml-post**
  Runs a custom Ant target after the `whr-toc-xml` processing stage.

- **whr-context-help-map-pre**
  Runs a custom Ant target before the `whr-context-help-map` processing stage.

- **whr-context-help-map-post**
  Runs a custom Ant target after the `whr-context-help-map` processing stage.

- **whr-sitemap-pre**
  Runs a custom Ant target before the `whr-sitemap` processing stage.

- **whr-sitemap-post**
  Runs a custom Ant target after the `whr-sitemap` processing stage.

- **whr-copy-resources-pre**
  Runs a custom Ant target before the `whr-copy-resources` processing stage.

- **whr-copy-resources-post**
  Runs a custom Ant target after the `whr-copy-resources` processing stage.

- **whr-create-topic-pages-pre**
  Runs a custom Ant target before the `whr-create-topic-pages` processing stage.
To use Ant extension points for WebHelp Responsive, follow these steps:

1. In the DITA-OT-DIR/plugins/ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.responsive.custom.ant.extensions).
2. Create a plugin.xml file (in the folder you created in step 1) that extends the WebHelp Responsive plugin and specifies an Ant extension point with your custom Ant project file that contains the new build targets. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.ant.extensions">
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="ant.import" file="custom_build_file.xml"/>
   </plugin>
   ```

3. Create the custom_build_file.xml file (in the folder you created in step 1) that contains your custom Ant project implementing one or more extension points:

   ```xml
   <project name="custom.ant.extensions.integrator" basedir=".">
     <target name="custom-whr-init-pre" extensionOf="whr-init-pre">
       <echo>Extension point that executes before whr-init</echo>
     </target>
     <target name="custom-whr-init-post" extensionOf="whr-init-post">
   </project>
   ```
<echo>Extension point that executes after whr-init</echo>
</target>
</project>

4. Integrate the plugin into the DITA-OT. In the DITA-OT-DIR/bin directory of the DITA Open Toolkit, run one of the following scripts, depending on your operating system:
   - Windows: DITA-OT-DIR/bin/dita.bat --install
   - Linux/macOS: sh DOTA-OT-DIR/bin/dita --install

5. Execute a DITA Map to WebHelp Responsive transformation script.

XSLT Extensions for WebHelp Responsive

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use XSLT-import extension points from an Oxygen Publishing Template (on page 2818).

  **Note:**
  Use this method if you want to affect only the transformations that use this publishing template.

- Use XSLT-import extension points from a DITA-OT extension plugin.

  **Note:**
  This method will affect all the outputs generated with the WebHelp system.

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points (on page 1358)

How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (on page 1413).

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:
The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template (on page 1234) to expand its components. The main page template declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>
  
  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)"
        
        <span class="copyright_years">
          </span>
```
To add this functionality using a *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, see *How to Create a Publishing Template (on page 1420).*

2. Link the folder associated with the publishing template to your current project in the *Project* view.

   **Step Result:** You should have the *custom_footer_template* folder linked in your project.

3. Using the *Project* view, create an *xslt* folder inside the project root folder.

   **Step Result:** You should have the *custom_footer_template/xsl* folder in your project.

4. Create your customization stylesheet (for example, *custom_mainpage.xsl*) in the *custom_footer_template/xsl* folder. Edit it to override the template that produces the footer section:

```xml
   <xsl:template match="*:div[contains(@class, 'footer-container')]"><xsl:mode value="copy_template"></xsl:mode>

   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
```

```xml
   <!-- Apply the default processing -->
   <xsl:next-match/>

   <!-- Add only the first year if last is not defined. -->
   <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
     <xsl:choose>
       <xsl:when><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/></xsl:when>
       <xsl:when><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/></xsl:when>
       <xsl:otherwise><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/></xsl:otherwise>
     </xsl:choose>  
   </xsl:when>

   <!-- Adds only the first year if last is not defined. -->
   <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">" test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)"">
     <span class="copyright_years">
       <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
     </span>
   </xsl:when>

   <!-- Adds only the first year if last is not defined. -->
   <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
     <span class="copyright_years">
       <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
     </span>
   </xsl:when>

   <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
     <span class="organization">
       <xsl:otherwise><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
       <xsl:otherwise><xsl:text>. All rights reserved.<xsl:text>
     </span>
   </xsl:if>
<br />
```

```xml
```
```
<xsl:template
	
	
	
</xsl:template>

5. Open the template descriptor file (on page 1217) associated with your publishing template and set the XSLT styleshe XSLT extension point.

<publishing-template>

...<webhelp>

...<xslt>

<extension
	
	
	
	
</extension>

6. Open the DITA Map WebHelp Responsive transformation scenario.

7. Click the Choose Custom Publishing Template link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

**Use Case 2: Add Generation Time in the Output Footer**

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

![Figure 306. Generation Time Added in the WebHelp Footer](image)

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), modify the template by adding the following XSLT code at the end:

   ```xsl
   <xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
     <div class="generation_time">
       Generation date: <xsl:value-of select="format-dateTime(
         current-dateTime(),
         '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
     </div>
   </xsl:if>
   ```

   **Note:** You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the **template descriptor file** *(on page 1217)* associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.footer.add.generation.time"
        value="yes"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the **DITA Map WebHelp Responsive** transformation scenario.
4. In the Parameters tab, you can change the value of the webhelp.footer.add.generation.time parameter.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

Note:
This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmark:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 307. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template to expand its
components. The main page template (on page 1234) declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
    <whc:include_html href="${webhelp.fragment.footer} />
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
    <!-- Apply the default processing -->
    <xsl:next-match/>

    <!-- Add a div containing the copyright information -->
    <div class="copyright_info">
        <xsl:choose>
            <!-- Adds the start-end years if they are defined -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)""><span class="copyright_years"><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/> - <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/></span></xsl:when>
            <!-- Adds only the first year if last is not defined. -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)""><span class="copyright_years"><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/></span></xsl:when>
        </xsl:choose>

        <!-- Adds only the first year if last is not defined. -->
        <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
            <span class="organization"><xsl:text><xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/></xsl:text>. All rights reserved.</span>
        </xsl:if>
    </div>
</xsl:template>
```
You can implement this functionality with a WebHelp extension plugin that uses the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1359). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage" file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_mainpage.xsl`), and edit it to override the template that produces the footer section:

   ```xml
   <xsl:template match=":div[contains(@class, 'footer-container')]" mode="copy_template">
     <!-- Apply the default processing -->
     <xsl:next-match/>
     <!-- Add a div containing the copyright information -->
     <div class="copyright_info">
       <xsl:choose>
         <!-- Adds the start-end years if they are defined -->
         <xsl:when test="exists($toc/*/topicmeta/bookrights/copyrightfirst) and exists($toc/*/topicmeta/bookrights/copyrlast)">
           <span class="copyright_years">
             ©<xsl:value-of select="$toc/*/topicmeta/bookrights/copyrightfirst"/>-
             <xsl:value-of select="$toc/*/topicmeta/bookrights/copyrlast"/>
           </span>
         </xsl:when>
         <!-- Adds only the first year if last is not defined. -->
         <xsl:when test="exists($toc/*/topicmeta/bookrights/copyrightfirst)">
           <span class="copyright_years">
             ©<xsl:value-of select="$toc/*/topicmeta/bookrights/copyrightfirst"/>
           </span>
         </xsl:when>
       </xsl:choose>
     </div>
   </xsl:template>
   ```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1157).

5. Run a DITA Map WebHelp Responsive transformation scenario to obtain the customized side TOC.

**Use-Case 2: WebHelp XSLT-Parameter Extension Point to Control if Generation Time is Displayed in the Output**

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or note this customization is active. In this case, you can use the com.oxygenxml.webhelp.xsl.createMainPage.param extension point (on page 1360).

![Figure 308. Generation Time Added in the WebHelp Footer](image)

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (on page 1321).
2. In the customization stylesheet that you just created (for example, custom_mainpage.xsl), declare webhelp.footer.add.generation.time as a global parameter and modify the template by adding the following XSLT code at the end.

```xsl
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(current-dateTime(), '[h1]:[m01] [P] on [D01]/[M01]/[Y0001].')"/>
  </div>
</xsl:if>
```

3. Edit the plugin.xml file to specify the com.oxygenxml.webhelp.xsl.createMainPage.param extension point and a custom parameter file by adding the following line:

```xml
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, params.xml). It should look like this:
5. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1157).

6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (on page 2694), specify the desired value (yes or no) for your custom parameter (webhelp.footer.add.generation.time).

7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as graphics, JavaScript, CSS, entire folders, or other resources) to the output directory either by using an Oxygen Publishing Template (on page 2818) or the webhelp.custom.resources parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Add a new <fileset> element in the resources section of the template descriptor file (on page 1220).

```
<fileset>
  <include name="custom-resources/**/*"/>
  <exclude name="**/*.git"/>
</fileset>
```
3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the *Choose Custom Publishing Template* link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Results:** All files from the custom resources directory will be copied to the `WebHelp Output Directory/oxygen-webhelp/template` folder.

### Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** All files from the new directory will be copied to the root of the WebHelp output directory.

### How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in *Oxygen XML Web Author*. A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.

### Using a Publishing Template

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an *Oxygen Publishing Template* (on page 1214), follow this procedure:

1. If you have not already created a Publishing Template, see *Working with Publishing Templates* (on page 1253).
2. Open the *template descriptor file* (on page 1217) associated with your publishing template and add the following parameters with their values set to the URLs:
   - `editlink.ditamap.edit.url` - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
   - `editlink.additional.query.parameters` - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. `&tags-mode=no-tags`).
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

  ```
  ```

- **macOS/ Linux:**

  ```
  ```

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To embed an Edit link in the DITA Map WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - **editlink.ditamap.edit.url** - The URL of the Oxygen XML Web Author that have opened the DITA map for editing.
   - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Must start with & (e.g.: &tags-mode=no-tags).
3. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.
How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block elements (on page 2814) (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template

To flag content in DITA Map to WebHelp output using an Oxygen Publishing Template (on page 1214), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the @audience attribute set to programmer, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
     img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note:
For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the template descriptor file (on page 1217) associated with your publishing template and add the args.filter parameter in the parameters section with its value set to the path of the DITAVAL file you created.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="args.filter" value="resources/myFile.ditaval"/>
    </parameters>
  </webhelp>
</publishing-template>
```
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the @audience attribute set to programmer, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text" />
</val>
```

Note:
For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a DITA Map to WebHelp transformation scenario.
4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).
5. Run the transformation scenario.

Related Information:
Filtering Profiling Values with a DITAVAL File (on page 2739)

How to View MathML Equations in HTML Output

By default, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.
For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM"
><script>

Extensible Method for DITA

For DITA documents, you can also use the following procedure:

1. Create an XML file that contains a script similar to the one shown in the example above.
2. Edit the DITA Map transformation scenario and open the Parameters tab.
3. Set the following parameter to point to the XML file created in step 1:
   - WebHelp Responsive Systems - Set the `webhelp.fragment.head` parameter to point to your XML file.
   - WebHelp Classic Systems - Set the `webhelp.head.script` parameter to point to your XML file.
   - Any other type of HTML-based publishing - Set the `args.hdf` parameter to point to your XML file.
4. Run the transformation scenario.

Result: The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

How to Disable Caching in WebHelp Responsive Output

In cases where a set of WebHelp Responsive pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a web browser on the client side, (rather than re-using an outdated cached version in the browser).

To disable caching in WebHelp Responsive output, follow this procedure:

1. Create a new well-formed XML file and add the following code snippet:

```html
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note:
The code should look like this:

```html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
</head>
</html>
```
2. Edit the *DITA Map* *WebHelp Responsive* transformation scenario and open the **Parameters** tab.

3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

4. Click **OK** to save the changes to the transformation scenario.

5. Run the transformation scenario.

**Result:** Your additional content is included at the end of the `<head>` element of your output document.

### How to Add a Link to PDF Documentation

It is possible to add a component in your WebHelp output that links to an external PDF resource. For example, it could link to the PDF equivalent of the documentation. This is achieved by configuring some transformation parameters and the link component is added in the header/breadcrumb stripe, next to the navigation links.

The transformation parameters used for generating a PDF link component in the WebHelp Responsive output are:

- **webhelp.pdf.link.url**
  - Specifies the target URL for the PDF link component.

- **webhelp.pdf.link.text**
  - Specifies the text for the PDF link component.

- **webhelp.pdf.link.icon.path**
  - Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- **webhelp.show.pdf.link**
  - Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

- **webhelp.pdf.link.anchor.enabled**
  - Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

### How to Add a Custom Component for WebHelp Output

This topic explains how to use several customization methods to define and implement a custom component for WebHelp output pages.

#### Predefined components

The WebHelp output is based on a set of **HTML Page Layout Files** that define the default layout of the generated pages. Each layout file is made of a set of various components. Each component is described using an associated XML element that is processed at the generation time resulting in its associated component being included in the output pages.
Here are a few examples of predefined components: Logo, Title, Menu, Search Input, Topics Tiles, Topic Breadcrumb, Topic Content, Publication Table of Contents. A complete list with all the available components is available here: Layout of the Responsive Page Types (on page 1168).

For example, the page component that is used to define the Search Input field in the WebHelp HTML pages is defined as follows:

```xml
<!-- Search form -->
<whc:webhelp_search_input class="navbar-form wh_topic_page_search search" role="form"/>
```

At publishing time, the above component will be expanded into:

```xml
<div class="wh_search_input navbar-form wh_topic_page_search search">
  <form id="searchForm" method="get" role="search" action="../search.html">
    <div>
      <input type="search" placeholder="Search " class="wh_search_textfield ui-autocomplete-input" id="textToSearch" name="searchQuery" aria-label="Search query" required="required" autocomplete="off" />
      <button type="submit" class="wh_search_button" aria-label="Search">
        <span class="search_input_text">Search</span>
      </button>
    </div>
  </form>
</div>
```

Customization Methods

The most common customization methods for the WebHelp Responsive output include:

- Apply custom CSS styles (on page 1264) to change the default layout and styles.
- Insert additional HTML content (on page 1266) using one of the available HTML Fragment Placeholder parameters (on page 1224).
- Extend the default processing using XSLT Extension Points (on page 1223).
- Configure available Transformation Parameters (on page 1344).

Use Case: Custom Link Component

For the subsequent procedure, suppose you have a DITA project for a User Manual and you also have various video demonstrations available on your website that supplement the documentation. You may want to link a video demonstration for a particular feature in its associated DITA topic in the WebHelp output.

You could simply add a link somewhere in your DITA topic, but this approach would not be very suitable for a printable (PDF) version of your User Manual. Thus, you need to include the link to the associated video demonstration only in the WebHelp output of your User Manual (and not the PDF version).

One way to link a video with its associated topic is to include its URL in the metadata section. For example:
Next, you need to instruct WebHelp to pick up the URL from the metadata and generate a link in a specific location of the HTML output page. You can achieve this by creating your own WebHelp custom component.

**Creating a Custom Component**

You can combine several of the available customization methods to define and implement your own WebHelp custom component.

---

**Figure 309. Custom Component**

<table>
<thead>
<tr>
<th>HTML Fragment</th>
<th>XSLT Extension</th>
<th>CSS</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;custom-component/&gt;</code></td>
<td><code>&lt;xsl:template match=&quot;custom-component&quot;&gt;</code></td>
<td><code>.custom-component { display: block; }</code></td>
</tr>
</tbody>
</table>

To create a custom component that displays a link to the current topic's associated video tutorial, follow these steps:

1. Define your component. For example, it may have the following form:

   ```xml
   <comp:video-link xmlns:comp="http://example.com/custom-components"/>
   ```

   The component is an XML element that belongs to a custom defined namespace.

2. Insert the component in your topic pages. To do this, you will have to save the associated XML element in an HTML Fragment file (for example, named `video-link-fragment.xml`).

3. Reference the HTML Fragment file in your current Publishing Template's descriptor file (on page 1217) and associate it with an HTML Fragment placeholder that is available for the topic pages (`webhelp.fragment.before.topic.toolbar` in this case):

   ```xml
   <html-fragments>
   <fragment file="component/html-fragment/video-link-fragment.xml" placeholder="webhelp.fragment.before.topic.toolbar"/>
   </html-fragments>
   ```

   **Note:**
   The HTML Fragment file is referenced using a path relative to the Publishing Template root directory.

4. Create a custom XSLT file that processes the custom component and picks up the video URL available in the current topic's metadata and generates a link to the page that contains the video:
The HTML content generated for your component will look like this:

```html
<div class="video-link-container">
  <a href="https://www.youtube.com/watch?v=zNmXfKWXwO8" class="video-link" target="_blank" aria-label="Video">
    <span>Video</span>
  </a>
</div>
```

5. Reference the above XSL file in your Publishing Template's descriptor file using the XSLT extension point associated with the XSL module that generates an HTML file for each DITA topic:

```xml
<xslt>
  <extension file="component/xsl/video-link-impl.xsl"
             id="com.oxygenxml.webhelp.xsl.dita2webhelp"/>
</xslt>
```

6. Create a custom CSS file that contains the rules for styling the output for your component:

```css
@import url('https://fonts.googleapis.com/icon?family=Material+Icons');
```
7. Reference the above CSS file in your Publishing Template's descriptor file:

```xml
<resources>
  <!-- .... -->
  <css file="component/css/video-link.css"/>
</resources>
```

**Result:** An icon that is a link to the video appears in the header stripe in the output page.
Sample Publishing Template

A sample Publishing Template that contains all the above customizations is available here: https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component.

How to Generate Google Structured Data

It is possible to generate Google Structured Data (\texttt{<script>} elements that contain a JSON-LD object) in the DITA WebHelp Responsive output. Google uses this JSON-LD object to better understand the contents of the page and display special search results in a Google Search.

\textbf{Tip:}

For more details, see Google Search Central: Understand how structured data works.

To generate Google Structured Data in WebHelp output, use the following transformation parameter:

\texttt{google.structured.data}

Specifies whether or not Google Structured Data will be generated in the output. If set to \texttt{yes}, the transformation automatically generates Google Structured Data for \texttt{Questions and Answers} topics, DITA Task topics, and from \texttt{<data>} elements found inside a topic that has the \texttt{@name="oxy:question"} construct. If set to \texttt{no} (default value), the transformation will not generate Google Structured Data.

Generating Google Structured Data for DITA Tasks Topics

When Google Structured Data is enabled, the DITA Task \texttt{<title>}, \texttt{<shortdesc>}, and \texttt{<step>} elements are mapped to the \texttt{HowTo} JSON-LD object. For example, the following DITA Task topic:

\begin{verbatim}
<task id="task_id">
  <title>My task</title>
  <shortdesc>Task description</shortdesc>
  <steps>
    <step>
      <cmd>Step 1 content.</cmd>
    </step>
  </steps>
</task>
\end{verbatim}
<step>
  <cmd>Step 2 content.</cmd>
</step>
</steps>
</task>

will generate the following structure in the output:

```xml
<script type="application/ld+json" id="jsonld-howto">
  {
    "@context": "https://schema.org",
    "@type": "HowTo",
    "name": "My task",
    "description": "Task description",
    "supply": [],
    "tool": [],
    "step": [
      {
        "@type": "HowToStep",
        "text": "<span class="topic/ph task/cmd ph cmd">Step 1 content.</span>"
      }
    ],
    ...  
  }
</script>
```

**Generating for Questions and Answers Topics**

When Google Structured Data is enabled, the QA topic `<qatopic>` elements are mapped to the FAQPage JSON-LD object. For example, the following QA topic:

```xml
<qatopic id="qa_id">
  <title>Faq Page 1</title>
  <qabody>
    <qagroup>
      <question>What is a car engine?</question>
      <answer>The car engine is a device that uses fuel to create mechanical power that can turn the car's wheels.</answer>
    </qagroup>
  </qabody>
</qatopic>
```
will generate the following structure in the output:

```xml
<concept id="lawnmowerconcept">
  <title>Lawnmower</title>
  <shortdesc>The lawnmower is a machine used to cut grass in the yard.</shortdesc>
  <prolog>
    <metadata>
      <data name="oxy:question">What tools are necessary to cut the grass?</data>
    </metadata>
    </prolog>
  <conbody>
    <p>Lawnmowers can be electric, gas-powered, or manual.</p>
  </conbody>
</concept>
```

**Generating from `<data>` elements found inside a topic**

When Google Structured Data is enabled, the WebHelp Responsive transformation will map the `<data>` elements found inside a topic to a FAQPage JSON-LD object. There are 2 different use cases depending on where the `<data>` element is found in the document:

- In the `<prolog>` element. For example, this content:

  ```xml
  <concept id="lawnmowerconcept">
    <title>Lawnmower</title>
    <shortdesc>The lawnmower is a machine used to cut grass in the yard.</shortdesc>
    <prolog>
      <metadata>
        <data name="oxy:question">What tools are necessary to cut the grass?</data>
      </metadata>
    </prolog>
    <conbody>
      <p>Lawnmowers can be electric, gas-powered, or manual.</p>
    </conbody>
  </concept>
  ```

  will generate the following structure in the output:

  ```xml
  <script type="application/ld+json" id="jsonld-faq">
    {
      "@context": "https://schema.org",
      "@type": "FAQPage",
      "mainEntity": [
        {
          "@type": "Question",
          "name": "What is a car engine?",
          "acceptedAnswer": {
            "@type": "Answer",
            "text": "The car engine is a device that uses fuel to create mechanical power that can turn the car's wheels."
          }
        }
      ]
    }
  </script>
  ```
"@type": "FAQPage",
"mainEntity": [
    {
        "@type": "Question",
        "name": "What tools are necessary to cut the grass?,
        "acceptedAnswer": {
            "@type": "Answer",
            "text": "The lawnmower is a machine used to cut grass in the yard.<p class="- topic/p">Lawnmowers can be electric, gas-powered, or manual.</p>"
        }
    }
]

Important:
The answer represents the HTML result of the entire content inside the topic.

- Inside the topic body elements. For example, content:

```html
<topic id="concept-id">
    <title>Morning</title>
    <shortdesc>In the morning we have breakfast.</shortdesc>
    <body>
        <ul>
            <data name="oxy:question">What do people drink in the morning?</data>
            <li>Tea</li>
            <li>Milk</li>
        </ul>
    </body>
</topic>
```

will generate the following structure in the output:

```json
{
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
        {
            "@type": "Question",
            "name": "What do people drink in the morning?",
```
Important: The answer represents the HTML result of the entire block where the `<data>` element is located inside.

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

<table>
<thead>
<tr>
<th>Related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Topic</td>
</tr>
<tr>
<td>Target Concept</td>
</tr>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>

It is possible to group the links by target type (topic type) by setting the `webhelp.rellinks.group.mode=group-by-type` parameter. The output will look like this:

<table>
<thead>
<tr>
<th>Related concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Concept</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Task</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Topic</td>
</tr>
</tbody>
</table>

How to Use a Local Font in WebHelp Responsive Output

It is possible to use a local fonts in WebHelp Responsive output by copying the local font file to the output directory through a Publishing Template and referencing the font files using `@font-face` rules within a custom CSS.
To use a local font in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1420).
2. Add the local font files to the \fonts\ folder within your Publishing Template directory structure. For example:
   
   ```
   fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf
   fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf
   ```
3. Configure WebHelp Responsive to copy the font file to the output directory. Define a `<fileset>` that matches the location of the font files in the `<resources>` section of your Publishing Template's descriptor file.

   ```
   <resources>
     <!-- Copy ttf font files to the output directory. -->
     <fileset>
       <include name="fonts/**/*.ttf"/>
     </fileset>
   </resources>
   ```

   All the files matched by this fileset will be copied to the output directory. The additional resources will be copied in the following subfolder of the output directory:
4. Create a custom CSS file in your Publishing Template directory.

```
css/custom-font.css
```

5. Reference the CSS file in the `<resources>` section of the Publishing Template's descriptor file. This means that the CSS file will be referenced in each HTML page within the WebHelp Responsive output.

```
<resources>
  <css file="css/custom-font.css"/>
  <!-- ... -->
</resources>
```

6. Add `@font-face` definitions that reference the font files in your custom CSS file. The font files can be referenced using relative URLs since the CSS and the font files included in the Publishing Template package will be copied together in the output folder.

```
@font-face {
  font-family: 'Roboto Mono';
  font-style: normal;
  src: url('../fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf') format('truetype');
}
@font-face {
  font-family: 'Roboto Mono';
  font-style: italic;
  src: url('../fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf') format('truetype');
}
```

7. Add a CSS rule that applies the custom font on all elements.

```
body {
  font-family: 'Roboto Mono', sans-serif;
}
```

8. Run the transformation with the publishing template selected.
How to Use JQuery in WebHelp Responsive Output

The JQuery library that comes bundled with WebHelp is accessible in the browser's global context so that developers have access to use it.

To use the JQuery library in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template.
2. Create the following items in the folder that contains your publishing template's descriptor file (the .opt file):
   ◦ A folder named js
   ◦ A folder named fragments
3. In the js folder, create a file named custom.js.
4. As a starting point, you can copy the following content to the custom.js file:

   ```javascript
   $(document).ready(function () {
      // Your JQuery code.
   });
   ```

5. In the fragments folder, create a file named jquery-scripts.html with the following content:
Important:
Make sure that the `@defer` attribute is present on the `<script>` element.

6. Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see Template Resources for more details):

```
<fileset>
  ...
  <include name="js/**"/>
  ...
</fileset>
```

7. Include the `jquery-scripts.html` file in your WebHelp Responsive output by opening the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="jquery-scripts.html" placeholder="webhelp.fragment.head"/>
</html-fragments>
```

8. Run the transformation with your publishing template selected.

**WebHelp Responsive Transformation Parameters**

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

**Publishing Template Parameters**

- `webhelp.publishing.template`
  
  Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

  **Note:**
  The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

  **Note:**
  Relative paths are resolved based on the current working directory.
Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

**Custom Resource Parameters**

- **webhelp.custom.resources**
  
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- **webhelp.favicon**
  
  The file path that points to an image to be used as a *favicon* in the WebHelp output.

- **webhelp.logo.image.target.url**
  
  Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

- **webhelp.logo.image**
  
  Specifies a path to an image displayed as a logo in the left side of the output header.

- **webhelp.logo.image.alt**
  
  Specifies a value that will be set in the `@alt` attribute of the logo image. If the parameter is not specified, the `@alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

**Oxygen Feedback Parameter**

- **webhelp.fragment.feedback**
  
  You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**Context Sensitive Help Parameter**

- **webhelp.csh.disable.topicID.fallback**
  
  Specifies whether or not topic ID fallbacks are enabled when computing the mapping of context sensitive help and `resourceID` information is not available. Possible values are `false` (default) and `true`.

**HTML Fragment Extension Parameters**

- **webhelp.enable.html.fragments.cleanup**
  
  Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to `true` (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to `false`, the transformation will fail if at least one HTML fragment is not well-formed.
webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are no (default) and true.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.header.search.page
This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.topic.page**

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area**

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use webhelp.fragment.after.search.input.main.page instead.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toolbar
This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.main.page**

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.search.page**

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.terms.page**

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.topic.page**

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.feedback**

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo_and_title**

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**
This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use webhelp.fragment.before.search.input.main.page instead.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.fragment.footer
This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:**
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Author (do not use it with a trial license).

**webhelp.fragment.head**
This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.main.page**
This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.search.page**
This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.terms.page**
This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.topic.page**
This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**
This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Output Component Parameters**

**webhelp.default.collection.type.sequence**
Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.
webhelp.enable.sticky.header

Controls whether or not the header section will remain sticky in the output. Possible values are yes (default) or no.

webhelp.enable.sticky.publication.toc

Controls whether or not the publication table of contents will remain sticky in the output. Possible values are yes (default) or no.

webhelp.enable.sticky.topic.toc

Controls whether or not the topic table of contents will remain sticky in the output. Possible values are yes (default) or no.

webhelp.figure.title.placement

Controls the placement of the title for figures (relative to the image). Possible values include top (default) and bottom.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to label.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to label, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.
**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.rellinks.group.mode**

Specifies the related links grouping mode. All links can be grouped into a single "Related Information" heading or links can be grouped by their target type (topic, task, or concept). Allowed values: **single-group** (default) or **group-by-type**.

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is **yes**.

**webhelp.show.changes.and.comments**

When set to **yes**, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is **no**.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.full.size.image**

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is **yes**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is **yes** (meaning the index terms icon is displayed). If set to **false**, the index terms icon is not displayed in the output and the index terms page is not generated.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to **no**.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is **yes**.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is **yes**.
webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.skip.main.page.generation

If set to true, the default main page is not generated in the output. The default value is false.

webhelp.table.title.placement

Controls the placement of the title for tables. Possible values include top (default) and bottom.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to yes), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Search-Related Parameters

webhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.google.search.results
A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `@linkTarget` attribute to `frm` for frameless (iframe) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.search.default.operator**

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.index.elements.to.exclude**

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).
webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.sitemap.base.url

Base URL for all the <loc> elements in the generated sitemap.xml file. If this parameter is specified, the loc element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the loc element will only contain the relative path of the page (the relative file path from the @href attribute of a <topicref> element from the DITA map, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the <changefreq> element in the generated sitemap.xml file. The <changefreq> element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the <changefreq> element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the <priority> element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The <priority> element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the <priority> element is not added in sitemap.xml.

Publishing Speedup Parameters

parallel

A common parameter with other transformation types. When set to true (default value is false), the publishing pre-processing stages are run in parallel slightly improving the publishing time.

store-type

A common parameter with other transformation types. When set to memory, the processing stages use internal memory to store temporarily processed documents, thus decreasing the publishing time but slightly increasing the amount of internal memory used for the process. When publishing on Windows, setting this parameter can decrease the publishing times by about one-third.

Note:

The fix.external.refs.com.oxygenxml parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.
Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

- **webhelp.pdf.link.url**
  Specifies the target URL for the PDF link component.

- **webhelp.pdf.link.text**
  Specifies the text for the PDF link component.

- **webhelp.pdf.link.icon.path**
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- **webhelp.pdf.link.anchor.enabled**
  Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

- **webhelp.show.pdf.link**
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

Generating WebHelp Responsive Output *(on page 1250)*
Setting DITA-OT Parameters

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify an XSLT extension point. The extension point will only affect the transformations that use the particular template.

**Important:**
While the publishing templates only support referencing one extension point at a time, you can use `xslt:include` or `xslt:import` to aggregate multiple modules.

For a specific example of how to use an extension in a publishing template, see: *How to Use XSLT Extension Points from a Publishing Template* *(on page 1316)*.

**Example:**
Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<plug-in id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp">
    file="xsl/fixup.xsl"/>
</plug-in>
```

XSLT-Import Extension Points

The following extension points are supported:

**com.oxygenxml.webhelp.xsl.dita2webhelp**

Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

**com.oxygenxml.webhelp.xsl.createMainPage**

Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

**com.oxygenxml.webhelp.xsl.createNavLinks**

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the `navLinks` folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks`

**com.oxygenxml.webhelp.xsl.createSearchPage**

Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is...
DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl

**com.oxygenxml.webhelp.xsl.createIndexTermsPage**

Extension point to override the XSLT stylesheet (createIndexTermsPage.xsl) that produces the WebHelp Responsive index terms HTML page (indexterms.html). The location of this file is DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndexTermsPage.xsl

**com.oxygenxml.webhelp.xsl.createTocXML**

Extension point to override the XSLT stylesheet (tocDita.xsl) that produces the toc.xml file. This file contains information extracted from the DITA map (on page 2816) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\tocDita.xsl.

**com.oxygenxml.webhelp.xsl.contextHelpMap**

Extension point to override the XSLT stylesheet (contextHelpMapDita.xsl) that generates the context sensitive help mapping. The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\contextHelp\contextHelpMapDita.xsl.

**XSLT-Parameter Extension Points**

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

**com.oxygenxml.webhelp.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.dita2webhelp extension point (on page 1359).

**com.oxygenxml.webhelp.xsl.createMainPage.param**

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createMainPage extension point (on page 1359).

**com.oxygenxml.webhelp.xsl.createNavLinks.param**

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createNavLinks extension point (on page 1359).

**com.oxygenxml.webhelp.xsl.createSearchPage.param**

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createSearchPage extension point (on page 1359).

**com.oxygenxml.webhelp.xsl.createIndexTermsPage.param**

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createIndexTermsPage extension point (on page 1360).
**com.oxygenxml.webhelp.xsl.createTocXML.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createTocXML` extension point (on page 1360).

**com.oxygenxml.webhelp.xsl.contextHelpMap.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.contextHelpMap` extension point (on page 1360).

---

**WebHelp Classic Output for DocBook (Deprecated)**

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook. You can also integrate a feedback system that provides the ability for your users to add comments in the output. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using the [DocBook WebHelp Classic (Deprecated) (on page 1069)](on page 1069) transformation scenario.

**WebHelp Classic Output Layout and Features**

**Layout of the WebHelp Classic System Interface**

The layout of the **WebHelp Classic** system consists of the following components:

- **Left Pane or Frame**

  This section on the left side of the help system includes the following tabs:

  - **Content**

    A typical table of contents style presentation of your content. You can use the **Expand all**/ **Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

    **Note:**

    You can enhance the appearance of items in the *Table of Contents*. See the *Customizing WebHelp Classic Output chapter (on page 1369)* for more details.

  - **Index**

    Presents the index terms for your content. If your content does not contain any `<indexterm>` elements, this tab is not generated.
Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section *(on page 1363)*.

Upper Pane or Frame

The upper section of the help system includes the following features:

**Search Field**

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section *(on page 1363)*.

**Frames Option**

Click on this option to display the output rendered in HTML frames.

**Print Option**

Opens a dialog box with various printing options and a print preview.

**Navigation Links**

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the **Parent topic**, **Previous topic**, or **Next topic**. Links to the parent topics of the currently open topic are also presented at the top of the page.

**Tip:**

To hide the **Parent**, **Next**, and **Previous** links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to **yes**.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.
WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords.
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot ("."), characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
• When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

Note:
Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting
The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

• Search entries that satisfy the phrase search criterion are presented first.
• The number of keywords found in a single page (the higher the number, the better).
• The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:
 œ The search term is included in a meta keyword.
 œ The search term is in the title of the page.
 œ The search term is in bold text in a paragraph.
 œ The search term is in normal text in a paragraph.

Excluded Terms
To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.

WebHelp Classic Search Results Tab
When you enter search terms in the Search field at the top of the help system, the results are displayed in the Search Results tab in the left section. When you click on a result in the Search Results tab, that result is displayed in the main pane with the search terms highlighted. If you press Enter with the Search field empty, the highlights are removed.

Growing Flowers

9 documents found for "galanthus species".

Snowdrop
From Wikipedia, the free encyclopedia. Snowdrop is the common name for members of the genus Galanthus, a small genus of about 20 species in the family Amaryllidaceae; snowdrops are among the first...  

Saw
From Wikipedia, the free encyclopedia. Saw is the largest genus of plants in the mint family, Lamiaceae, with approximately 900 species of shrubs, herbaceous perennials, and annuals. It is one of...  

Lilac
From Wikipedia, the free encyclopedia. Lilac ( Syringa ) is a genus of about 20-25 species of flowering plants in the olive family ( Oleaceae ), native to Europe and Asia. They are deciduous shrubs or...  

Galanthus nivalis is the best-known and most widespread representative of the genus Galanthus. It is native to a large area of Europe, stretching from the Pyrenees in the west, through France and Germany to Poland in the north, Italy, Northern Greece and European Turkey. It has been introduced and is widely naturalised elsewhere. Although it is often thought of as a British native wild flower, or to have been brought to the British Isles by the Romans, it was probably introduced around the early sixteenth century.  

All species of Galanthus are perennial herbaceous plants which grow from bulbs. The flower has no petals; it consists of six tepals, the outer three being larger and more convex than the inner series. An important feature which helps to distinguish between species (and to help to determine the percentage of hybrids to their "varieties" (an arrangement of the emerging leaves relative to each other). This can be "apparate", "supernovuloe" or "explicative". In apparate variation the five leaf blades are pressed flat to each other within the bud and as they emerge; explicative leaves are also pressed flat against each other, but the edges of the leaves are folded back or sometimes rolled; in supernovuloe plants one leaf is tightly clasped around the other within the bud and generally remains at the point where the leaves emerge from the soil.  

Related Information
Iris

Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1383).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:
Important:
Due to some security restrictions in certain browsers (Google Chrome), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html).

Warning:
Due to some restrictions in web browsers regarding JavaScript code, the frameless version (index.html start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html). When loading WebHelp Classic pages from the local file system, the frameset version (index_frames.html start page) of the WebHelp Classic system should be used instead (file:///...).

Syntax Highlights in 'programlisting' Elements
The DocBook <programlisting> element supports settings values in its @language attribute. For some of these predefined values, syntax highlights are automatically generated in the WebHelp output:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command-line tool outside Oxygen XML Editor/Author.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
2. Select the DocBook WebHelp Classic (Deprecated) scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.

When the transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Classic Output for DocBook

DocBook-based WebHelp output can be generated from an automated publishing process using a command-line tool outside of Oxygen XML Editor/Author. However, to do this, you must purchase an additional Oxygen XML WebHelp license.

Deploying the Oxygen Feedback Comments Component for DocBook

You can add a comments component in your WebHelp Classic output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by Oxygen Feedback, a modern comment management system that can be integrated with your WebHelp Classic output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.
Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software.

An add-on is also available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Adding the Feedback System to WebHelp Classic Documentation

Prerequisite

To install and manage Oxygen Feedback, you must obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.
2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.
4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic. Click Continue.
5. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
      iii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      iv. Select and duplicate the DocBook WebHelp Classic (Deprecated) scenario (on page 1069).
      v. Go to the Parameters tab.
      vi. Set the webhelp.footer.file parameter to reference the path of the fragment file created earlier.
b. If you will generate the documentation using a command-line script, select the **Oxygen XML** WebHelp option and continue with these steps:
   
i. Copy the generated HTML fragment and click **Finish**.
   
ii. Create an XML file (for example, `feedback-install.xml`) with the generated installation fragment.
   
iii. Use the `webhelp.footer.file` parameter in your command-line script to specify the path to the file you created. For example:

   ```
   docbook.bat -Dwebhelp.footer.file=c:\path\to\feedback-install.xml
   ```

6. [Optional] If you want the **Oxygen Feedback** comments component to fill the entire page width, contribute a custom CSS file (use the `html.stylesheet` parameter to reference it) that contains the following style rule:

   ```
   div.footer {
     float: none;
   }
   ```

For more details about **Oxygen Feedback**, how to configure settings, moderate comments, view statistics, and much more, see the **Oxygen Feedback** user guide.

**Customizing WebHelp Classic Output**

**Oxygen XML WebHelp** provides support for customizing the WebHelp Classic output to suit your specific needs. The **WebHelp Classic** type of output is designed for desktop systems and features a familiar tri-pane layout. You can use this system to publish DocBook documents. You can also integrate a feedback system to allow your users to add comments to your output.

To change the overall appearance of the **WebHelp Classic** output, you can use the visual **WebHelp Skin Builder tool** *(on page 1369)*, which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

**Changing the Layout and Styles**

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

**WebHelp Skin Builder**

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the **Oxygen XML** website and allows you to experiment with various styles and colors over a documentation sample.
To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to **Oxygen XML** website.
- A late version web browser.

To start the **Skin Builder**, use a web browser to go to [https://www.oxygenxml.com/webhelp-skin-builder](https://www.oxygenxml.com/webhelp-skin-builder).

**Skin Builder Layout**

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - **Header**
  - **TOC Area**
  - **Vertical Splitter**
  - **Content**

  For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

**Creating a Customization Skin**

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **Add** button and choosing from the available properties.

   ![Note:]
   If you want to revert a particular property to its initial value, click the **Reset** button.

3. When you are happy with the skin customizations you have made, click the **Export** button. All settings will be saved in a CSS file.
Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the Parameters tab, set the webhelp.skin.css parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

Resources

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX--PQx0

How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

Tip:
When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

**Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author**

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To use a custom CSS to style WebHelp output and use a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

**How to Add Custom HTML Content in WebHelp Classic Output**

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

**Using Oxygen XML Editor/Author**

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the content of the file is not XML Well-formed (on page 755), (or fragments are not well-formed), the transformation will fail.

   A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the
output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

  ```html
  <html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"></script>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
  </html>
  ```

  To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1381).

- **Inline JavaScript or CSS Content**:

  **JavaScript**:

  ```html
  <script type="text/javascript">
  /* Include JavaScript code here. */
  
  function myFunction() {
      return true;
  }
  </script>
  ```

  **CSS**:

  ```html
  <style>
  /* Include CSS style rules here. */
  
  *[\r\n]{
      color:red
  }
  </style>
  ```

  **Note:**

  If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

  **[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.
2. Edit the WebHelp Classic transformation scenario.
3. Go to the Parameters tab.
4. Edit the value of the webhelp.head.script parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.

Note:
If you want to include the content in the body element, use the webhelp.body.script parameter instead.

5. Click OK to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the content of the file is not XML Well-formed (on page 755), (or fragments are not well-formed), the transformation will fail.

   A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an

```html
<script type="text/javascript">
<!--
/* Include JavaScript code here. */

function myFunction() {
  return true;
}
-->
</script>
```
The `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/ head>`, or `<html/ body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
<script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"></script>
<link rel="stylesheet" type="text/css"
    href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1381).

- **Inline JavaScript or CSS Content**:

  **JavaScript**:

  ```
  <script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
  </script>
  ```

  **CSS**:

  ```
  <style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
  </style>
  ```

**Note:**

If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

**[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.
<script type="text/javascript">
<!--[CDATA[
/* Include JavaScript code here. */

function myFunction() {
    return true;
}
-->
</script>

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:**

If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

**Related Information:**

How to Copy Additional Resources to Output Directory *(on page 1381)*

---

**How to Change Number Styles for Ordered Lists**

Ordered lists (`<ol>`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
    <li>a</li>
    <li>b</li>
    <li>c</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
o1.number-alpha{
    list-style-type:lower-alpha;
}
```
3. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the transformation scenario.

### How to Change the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```css
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}

.hasSubMenuOpened{
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

### Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```css
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (`\OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`).

3. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To assign other icons and use a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

   ```css
   .hasSubMenuClosed{
     background: url('TOC-my-closed-button.png') no-repeat;
   }
   ```

   ```css
   .hasSubMenuOpened{
     background: url('TOC-my-opened-button.png') no-repeat;
   }
   ```

2. It is recommended that you store the image files in the same directory as the default icons ([DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\).

3. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

4. Execute the transformation script.

How to Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory: [DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css.

2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.

3. Run the transformation.
Note:
You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by using the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DocBook WebHelp output using the WebHelp Classic transformation.

Using Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the Parameters tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

Result: Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:
1. Specify the file path that points to the image that will be use as the favicon using the webhelp.favicon parameter.
2. Execute the transformation script.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

### How to Add a Logo Image in the Title Area

You can customize WebHelp Classic output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within Oxygen XML Editor/Author or using a command-line script outside of Oxygen XML Editor/Author.

**Using Oxygen XML Editor/Author**

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a WebHelp Classic transformation scenario, then open the Parameters tab.
2. Specify the path to your logo in the webhelp.logo.image parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the webhelp.logo.image.target.url parameter.
4. Run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

警告: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a logo in the title area of your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:
1. Specify the path to your logo using the `webhelp.logo.image` parameter.

2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.

3. Execute the transformation script.

**How to Add Videos in DocBook WebHelp Classic Output**

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using a `<mediaobject>` element, as in the following example:

   ```xml
   <mediaobject>
     <videoobject>
       <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
     </videoobject>
   </mediaobject>
   ```

2. Apply a WebHelp transformation scenario to obtain the output.

**How to Copy Additional Resources to Output Directory**

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

**Using Oxygen XML Editor/Author**

To copy additional resources to the output directory using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the Parameters tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.
Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To copy additional resources to the output directory using a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

Result: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the `head` element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"

src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM
L"

</script>
```

Result: The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.
How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DocBook WebHelp systems ([DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties). The properties file includes instructions and examples to help you with your customization.

The values that can be edited in the scoring.properties file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i = 3
u = 3
div.toc = -10
title = 20
div.ignore = ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc = 25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Index Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Set the language for your content to Japanese. Edit a DocBook to WebHelp transformation scenario and in the Parameters tab, set the value of the l10n.gentext.default.language parameter to ja.

2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To activate the Japanese indexing in your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Use the l10n.gentext.default.language parameter in your transformation script and set its value to ja.

2. Execute the transformation script.

Related information
How to Localize the Interface of DocBook to WebHelp Classic Output (on page 1384)

Localization in WebHelp Classic Output
This section contains topics that explain the localization support for DocBook WebHelp Classic transformations.

How to Localize the Interface of DocBook to WebHelp Classic Output
Static labels that are used in the WebHelp output are kept in translation files in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder. Translation files have the strings-lang1-lang2.xml name format, where lang1 and lang2 are ISO language codes. For example, the US English text is kept in the strings-en-us.xml file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the strings-[lang1]-[lang2].xml file in [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: strings-fr-ca.xml). If it does not exist, create one starting from the strings-en-us.xml file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.

3. Make sure that the new XML file that you created in the previous two steps is listed in the file `resources/localization/strings.xml`. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml">`.

4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).

5. Run the transformation scenario to produce the WebHelp output.

**Related Information:**

How to Index Japanese Content in WebHelp Classic (on page 1383)

**How to Activate Support for Right-to-Left (RTL) Languages**

To activate support for RTL (right-to-left) languages in WebHelp output, set the `@xml:lang` attribute with the corresponding attribute value:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

**Integrating Social Media and Google Tools in the WebHelp Classic Output**

Oxygen XML Author includes support for integrating some of the most popular social media sites in WebHelp output.

**How to Add a Facebook Like Button in WebHelp Classic Output**

It is possible to integrate Facebook™ into your WebHelp Classic output and the widget will appear in the footer sections of your WebHelp page.

**Using Oxygen XML Editor/Author**

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
        (function(d, s, id) {
            var js, fjs = d.getElementsByTagName(s)[0];
            if (d.getElementById(id)) return;
            js = d.createElement(s); js.id = id;
            js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
            fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).

5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.

7. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important:**

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Facebook™ Like widget to your WebHelp output using a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:
1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   ◦ The file must be well-formed.
   ◦ The code for each <script> element must be included in an XML comment.
   ◦ The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       -->
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
         data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the facebook-widget.xml file that you created earlier.

5. Execute the transformation script.

**How to Add Tweet Button in WebHelp Classic Output**

It is possible to integrate X™ (formerly known as Twitter) into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

**Using Oxygen XML Editor/Author**

To add a X™ Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each `<script>` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
!function (d, s, id) {
  var js, fjs = d.getElementsByTagName(s)[0], p = /^http/.test(d.location) ? 'http' : 'https';
  if (! d.getElementById(id)) {
    js = d.createElement(s);
    js.id = id;
    js.src = p + '//platform.twitter.com/widgets.js';
    fjs.parentNode.insertBefore(js, fjs);
  }
  (document, 'script', 'twitter-wjs');

</script>
</div>
```

4. In **Oxygen XML Editor/Author**, click the <a>Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu.

5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.

7. Click **Ok** and run the transformation scenario.

---

**Using a Script Outside of Oxygen XML Editor/Author**

---

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:
To add a X™ Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.

   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
   <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
   </div>
   ```

4. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the tweet-button.xml file that you created earlier.

5. Execute the transformation script.
How to Integrate Google Analytics in WebHelp Classic Output

You can use Google Analytics to track and report site data for your WebHelp Classic output.

Using Oxygen XML Editor/Author

To integrate Google Analytics into your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
7. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the googleAnalytics.xml file that you created earlier.
8. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.
To integrate Google Analytics into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
  (function(i,s,o,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.xml` file that you created earlier.
6. Execute the transformation script.

### How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the Google Search Engine into your WebHelp Classic output and you can specify where you want the results to appear in your WebHelp page.

#### Using Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
  (function() {
    var cx = '00088821088977588983:8mn4k_mf-yg';
    var gcse = document.createElement('script');
    gcse.type = 'text/javascript';
    gcse.async = true;
```
Oxygen XML Author 26.0 | 11 - Publishing | 1392

```javascript

var s = document.getElementsByTagName('script')[0];
s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.

5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

   a. Create an HTML file with the following content:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

   (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

9. Click **Ok** and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

⚠ **Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To integrate the Google Search Engine into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** (on page 1367), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
    var cx = '000888210889775888983:8mn4k_mf-yg';
    var gcse = document.createElement('script');
    gcse.type = 'text/javascript';
    gcse.async = true;
    var s = document.getElementsByTagName('script')[0];
    s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

7. Execute the transformation script.

### Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

### How to Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:
1. Edit the following file: \OXYGEN_INSTALL_DIR\\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl.

2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />

   Note:
The code should look like this:

   ```html
   <html>
   <head>
   <xsl:if test="$withFrames">
   <base target="contentwin"/>
   </xsl:if>
   <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
   <!-- Disable caching of WebHelp pages in web browser. -->
   <meta http-equiv="Pragma" content="no-cache"/>
   <meta http-equiv="Expires" content="-1"/>
   ...
   ```

3. Save your changes to the file.

4. Re-run your WebHelp transformation scenario.

How to Publish WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.

2. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.ext` parameter to .aspx.

3. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author (on page 1367), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Use the html.ext parameter in your transformation script and set its value to .aspx.
3. Execute the transformation script.

DITA to PDF Output Customization

Oxygen XML Author provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Author supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Author comes bundled with a DITA-OT CSS-based PDF Publishing Plugin for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the pdf-css-html5 transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the pdf-css-html5-single-topic transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.

DITA Map PDF - based on HTML5 & CSS Transformation *(on page 1057)*
DITA PDF - based on HTML5 & CSS Transformation *(on page 2685)*

Overview

This section contains topics that provide a basic overview of the DITA-OT CSS-based PDF Publishing Plugin, technical details, and some additional resources to help you with your customizations.

Tip:
For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata.
- Transforming DITA documents to PDF using CSS, Part 3 – Advanced Fonts Usage.
- Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules.
- Transforming XML and HTML documents to PDF using CSS, Part 1 – Basic CSS Layout.
- Transforming XML and HTML documents to PDF using CSS, Part 2 – Lists, Tables and Images.
- Transforming XML and HTML documents to PDF using CSS, Part 3 – Global Page Layout.
- Transforming XML and HTML documents to PDF using CSS, Part 4 – Advanced Functionalities.

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: [https://www.w3.org/TR/CSS2/page.html](https://www.w3.org/TR/CSS2/page.html). Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: [https://www.oxygenxml.com/doc/ug-chemistry/](https://www.oxygenxml.com/doc/ug-chemistry/).
- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is *The DITA Style Guide - Best Practices for Authors* by Tony Self. It is available at: [www.ditastyle.com](http://www.ditastyle.com) and: [https://www.oxygenxml.com/dita/styleguide/c_DITA_Authoring_Concepts.html](https://www.oxygenxml.com/dita/styleguide/c_DITA_Authoring_Concepts.html). You can find all
the details for every DITA element on OASIS website: http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html.

• **HTML5** - You will need a good knowledge of HTML5. You can find resources here: https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5

• **Webinars** - Some helpful webinars are available on our website: https://www.oxygenxml.com/publishing_engine/videos.html?category=Webinars. They explain how to generate PDF from DITA documents using CSS, step-by-step.

**Related Information:**
DITA-OT DAY 2017: Using CSS to Style PDF Output

**Supported Processors**

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

• **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction (on page 1482) only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

**Technical Details**

It has the following transformation types:

• **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).

• **pdf-css-html5-single-topic** (*DITA PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.

2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.
3. It post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. During this phase, the `com.oxygenxml.pdf.css.xsl.merged2merged` (on page 1612) extension points are also called. The result is another merged map.

Note:
In the single topic transformation type (*DITA PDF - based on HTML5 & CSS*), these steps are simplified.
4. It converts the post-processed merged map or topic into a single HTML5 file. The generated HTML elements have the `@class` attribute from their original DITA elements. This means that you can either use selectors that were designed for DITA structure, or ones for the HTML structure. For more details, see *Reusing the Styling for WebHelp and PDF Output* (on page 1568). During this phase, the `com.oxygenxml.pdf.css.xsl.merged2html5` (on page 1612) extensions points are also called.

5. It uses a collection of CSS stylesheets against the merged HTML5 file and uses a PDF processor to generate the final PDF. References to the CSS files are collected from the publishing template (on page 1414).
Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged HTML document).
- From the Chemistry PDF CSS processor (the transformation of the merged HTML document to PDF).

When the Transformation is Started from Oxygen

To alter the memory allocation setting from the transformation scenario, follow these steps:

1. Open the Configure Transformation Scenario(s) dialog box.
2. Select your transformation scenario, then click Edit.
3. Go to the Advanced tab.
4. Uncheck the Prefer using the "dita" command option.
5. Locate the JVM Arguments and increase the default value. For instance, to set 2 gigabytes as the maximum amount of memory, you can use: `-Xmx2g`. If you do not specify the `-Xmx` value in this field, by default, the application will use a maximum of 512 megabytes when used with a 32-bit Java Virtual Machine and one gigabyte with a 64-bit Java Virtual Machine.

Note:

This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

When the Transformation is Started from the Command Line

- If the DITA-OT process fails with Out Of Memory Error: you can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

  Example: To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

  - **Windows**
    ```
    set ANT_OPTS=%ANT_OPTS% -Xmx1024M
    ```
  - **Linux/macOS**
    ```
    export ANT_OPTS="$ANT_OPTS -Xmx1024M"
    ```

  Tip:

  To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.
- If the Chemistry PDF CSS processor fails with an Out Of Memory Error: try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```-DbaseJVMArgLine=-Xmx2048m```

**Transformation Parameters**

This list includes the most common customization parameters that are available in the DITA Map PDF - based on HTML5 & CSS transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are supported.

**Note:**
These parameters must be prefixed by "-D" when used from a command line.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.allow.external.coderefs</code></td>
<td>Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code>&lt;coderef&gt;</code> element. Allowed values are <code>yes</code> or <code>no</code> (default).</td>
</tr>
<tr>
<td><code>args.chapter.layout</code></td>
<td>Specifies whether chapter-level TOCs are generated for bookmaps. When set to <code>MINITOC</code>, a small section with links is added at the beginning of each chapter. The default is <code>BASIC</code>. For details, see: Table of Contents on a Page (Mini TOC) (on page 1517).</td>
</tr>
<tr>
<td><code>args.css</code></td>
<td>You can use this to specify a list of CSS URLs to be used in addition to those specified in the <code>dita.css.list</code> parameter or publishing template. The files must have URL syntax and be separated using semicolons.</td>
</tr>
<tr>
<td><code>args.css.param.*</code></td>
<td>You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1608).</td>
</tr>
<tr>
<td><code>args.css.param.clone-referenced-footnotes</code></td>
<td>You can use this parameter to control the footnotes behavior:</td>
</tr>
</tbody>
</table>
- When set to yes, footnotes that are referenced multiple times throughout a publication are cloned and placed at the bottom of the page for each occurrence.
- When set to no (default value), only the first footnote reference is placed at the bottom of the page and subsequent references point back to the original footnote.

<table>
<thead>
<tr>
<th>args.css.param.numbering</th>
<th>You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>Only the topics from the first level are numbered (chapters). This is the default.</td>
</tr>
<tr>
<td>deep</td>
<td>All the topics from the map are numbered (nested topics up to level 3).</td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the DITA Map PDF - based on HTML5 &amp; CSS transformation scenario.</td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>Similar to deep-chapter-scope, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the DITA Map PDF - based on HTML5 &amp; CSS transformation scenario.</td>
</tr>
</tbody>
</table>

For more details, see Numbering Types (on page 1503).

<table>
<thead>
<tr>
<th>args.css.param.numbering-sections</th>
<th>Controls whether or not the sections are included in the table of contents. When set to yes (sections are included), they are numbered according the numbering scheme set by the args.css.param.numbering parameter.</th>
</tr>
</thead>
</table>

| args.css.param.show-onpage-lbl | Controls whether or not the links will have an on page NN label after them. This parameter has different defaults, depending on the transformation type. For map transformations (pdf-css-html5 trans type), the default is yes. For topic transformations (pdf-css-html5-single-topic trans type), the default is no. |
| args.css.param.show-profiling-attributes | Controls whether or not the profiling attributes are displayed in the output. Allowed values:  
• **yes**  
• **no** (default) |
| args.css.param.title.layout | Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally, the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow) and a table layout where the number is placed in one cell and the text in the other (to avoid wrapping text under the chapter number).   
• **normal**  
• **table** (avoid wrapping text under counter) |
| args.draft | Specifies whether or not the content of `<draft-comment>` and `<required-cleanup>` elements is included in the output. Allowed values:  
• **no** (default) - No draft information is shown in the output.  
• **yes** - The draft information is shown in the output. |
| args.figurelink.style | Specifies how cross references to figures are styled in output. Allowed values:  
• **NUMBER** - Only the number of the figures are shown in links.  
• **TITLE** - Only the title of the figures are shown in links.  
• **NUMTITLE** (default) - Both the title and number of the figures are shown in links. |
<p>| args.gen.task.lbl | Specifies whether or not to generate headings for sections within task topics. Allowed values: <strong>YES</strong> or <strong>NO</strong> (default). When set to <strong>YES</strong>, headings such as &quot;About this task&quot;, &quot;Before you begin&quot;, &quot;Procedure&quot;, or &quot;What to do next&quot;, are shown in the task contents. |
| args.hyph.dir | Specifies the directory that contains custom hyphenation dictionaries. For more details see: Hyphenation (on page 1547). |
| args.input | Specifies the main DITA map file for your documentation project. |</p>
<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.keep.output.debug.files</td>
<td>Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: YES (default) or NO.</td>
</tr>
<tr>
<td>args.output.base</td>
<td>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</td>
</tr>
<tr>
<td>args.rellinks.group.mode</td>
<td>Specifies the related links grouping mode. All links can be grouped into a single &quot;Related Information&quot; group or links grouped by their target type (topic, task, or concept). Allowed values: single-group (default) or group-by-type. Fore more details see: How to Group Related Links by Type (on page 1578).</td>
</tr>
<tr>
<td>args.tablelink.style</td>
<td>Specifies how cross references to tables are styled in output. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>• NUMBER - Only the number of the tables are shown in links.</td>
</tr>
<tr>
<td></td>
<td>• TITLE - Only the title of the tables are shown in links.</td>
</tr>
<tr>
<td></td>
<td>• NUMTITLE (default) - Both the title and number of the tables are shown in links.</td>
</tr>
<tr>
<td>clean.temp</td>
<td>Specifies whether or not the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: yes (default) or no.</td>
</tr>
<tr>
<td>chemistry.security.policy</td>
<td>Specifies a Java policy file that applies to the Chemistry process. A template can be found here: plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/chemistry.policy.</td>
</tr>
<tr>
<td>chemistry.security.workspace</td>
<td>Specifies a directory where the temporary files and font cache created by the Chemistry process need to be stored. This becomes required when the chemistry.security.policy is specified.</td>
</tr>
<tr>
<td>chemistry.security.resources.dir</td>
<td>Path to an additional folder that Chemistry will use to read its resources (CSS, images). The process already has read access to the input map folder, the publishing templates folder, and the OPE install folder. This optional parameter should only be used when the chemistry.security.policy parameter is set.</td>
</tr>
<tr>
<td>chemistry.security.resources.host</td>
<td>The host, specified as name:port, that Chemistry will use to get resources (e.g. CSS files, images, fonts). This optional parameter should only be used when the chemistry.security.policy parameter is set.</td>
</tr>
<tr>
<td>css.processor.path.antenena-house</td>
<td>Path to the Antenna House executable file that needs to be run to generate the PDF (for example, C:\path\to\AHFCmd.exe on Windows).</td>
</tr>
<tr>
<td>css.processor.path.chemistry</td>
<td>Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, C:\path\to\chemistry.bat on Win-</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>css.processor.path.prince</td>
<td>Path to the Prince executable file that needs to be run to generate the PDF (for example, C:\path\to\prince.exe on Windows).</td>
</tr>
<tr>
<td>css.processor.type</td>
<td>Specifies the processor to use for the transformation. Allowed values: chemistry (default), antenna-house, or prince.</td>
</tr>
<tr>
<td>default.language</td>
<td>Specifies the default language for source documents. Examples: fr, de, zh, etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1647).</td>
</tr>
<tr>
<td>drop.block.margins.at.page-boundary</td>
<td>Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values: YES (default) or NO.</td>
</tr>
<tr>
<td>editlink.ditamap.edit.url</td>
<td>Use this parameter to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author or Content Fusion where they can make changes that can be saved to a file server. The value should be set as the edit URL of the main DITA map used for publishing your output. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.</td>
</tr>
<tr>
<td>editlink.additional.query.parameters</td>
<td>You can use this optional parameter to add additional parameters to be appended to each generated edit link. Each parameter must start with &amp; (for example: &amp;tags-mode=no-tags).</td>
</tr>
<tr>
<td>editlink.remote.ditamap.url (deprecated)</td>
<td>Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: <a href="https://getFileContent/oxygenxml/userguide/master/UserGuide.ditamap">https://getFileContent/oxygenxml/userguide/master/UserGuide.ditamap</a>.</td>
</tr>
<tr>
<td>editlink.web.author.url (deprecated)</td>
<td>This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: <a href="https://www.oxygenxml.com/oxygen-xml-web-author/">https://www.oxygenxml.com/oxygen-xml-web-author/</a>.</td>
</tr>
</tbody>
</table>
| enable.latin.glyph.substitutions   | When set to yes (default), glyph substitution is enabled (if the particular font supports it). This applies to Latin-based scripts only (the substitutions are always enabled in other types of scripts). If you encounter problems rendering or copying accented glyphs (e.g. umlauts or other dia-
critics), it might be helpful to set this parameter to no to disable the font
glyph substitutions. Another example of a case when you might need to
disable the substitutions is a situation where an accented character can­
not be mapped to a compound glyph, resulting in the glyph not being ren­
dered in the PDF output.

**Warnings:**

- Disabling substitutions also disables Latin ligatures.
- Disabling substitutions is not recommended unless ab­
solutely necessary. It is better practice to use another
font if you can find one that does not have the rendering
issues.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expand.xpath.in.svg.templates</td>
<td>Expands XPath expressions (whose format is ${expression}) contained in SVG templates. Allowed values: yes (default) or no.</td>
</tr>
<tr>
<td>figure.title.placement</td>
<td>Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom.</td>
</tr>
<tr>
<td>filter.unused.glossentries</td>
<td>When set to no (default), all glossary entries are displayed in the glossary. If set to yes, only referenced entries are displayed.</td>
</tr>
</tbody>
</table>
| fix.external.refs.com.oxygenxml| The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This pa­
parameter is used to specify whether or not the application should try to fix
such references in a temporary files folder before the DITA Open Toolkit
is invoked on the fixed references. The fix has no impact on your edited
DITA content. Allowed values: true or false (default).                                                                                   |
| hide.frontpage.toc.index.glossary | When set to yes, the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is no.                                                                                       |
| image.resolution              | You can use this parameter to set the default resolution used by images. It works mainly on vector images since raster images have their resolution defined in their metadata. The default is 96 (dpi). For more informa­
tion, see how to change images resolution (on page 1580).                                                                                |
| pdf.accessibility             | When set to yes, the PDF output is generated in compliance with the PDF/Universal Accessibility standard (also known as ISO 14289). The default is no.                                                        |
| pdf.archiving.mode            | Specifies the archiving mode. The PDF output will be generated in compliance with the PDF/A standard.                                                                                                       |
Allowed values (not set by default):

- PDF/A-1a
- PDF/A-1b
- PDF/A-2a
- PDF/A-2b

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Allowed values</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.version</td>
<td>Use this parameter to specify the version of the produced PDF. It has no impact on the set of PDF features used by the engine, but may be used to signal a compatibility level to the PDF readers. The default is 1.5.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.printhq</td>
<td>Restricts high quality printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.assembledoc</td>
<td>Restricts assembling document (e.g. adding pages). Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.accesscontent</td>
<td>Restricts extracting text and graphics. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.fillinforms</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.annotations</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.print</td>
<td>Restricts printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.copy</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.restrict.edit</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.user.password</td>
<td>User password. The document can be opened using this password. When the owner password parameter is not specified, the user password gives full rights to the people using it. When the owner password parameter is specified, the people can open the document using the user password but restrictions will apply. Missing by default.</td>
<td></td>
</tr>
<tr>
<td>pdf.security.owner.password</td>
<td>Owner password. There are no restrictions for people using this password.</td>
<td></td>

<tr>
<td>-----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>pdf.security.encrypt.metadata</td>
<td>Encrypts the metadata. By default active when other security parameters are set. Accepted values: <strong>yes</strong> or <strong>no</strong>.</td>
<td></td>
</tr>
<tr>
<td>show.changes.and.comments</td>
<td>When set to <strong>yes</strong>, the user comments, colored highlights and tracked changes are shown in the output.</td>
<td></td>
</tr>
<tr>
<td>show.changes.and.comments.as.changebars</td>
<td>When set to <strong>yes</strong> (default) and the <code>show.changes.and.comments</code> parameter is also set to <strong>yes</strong>, the user comments and tracked changes are shown as change bars in the PDF output. This parameter can be used in conjunction with the <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameter to choose whether the change bars are displayed in footnotes or sticky notes. You can override this from your customization CSS (on page 1424).</td>
<td></td>
</tr>
<tr>
<td>show.changes.and.comments.as.pdf.sticky.notes</td>
<td>When set to <strong>yes</strong> (default) and the <code>show.changes.and.comments</code> parameter is also set to <strong>yes</strong>, the user comments and tracked changes are shown in the PDF output as sticky note annotations. When set to <strong>no</strong>, the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS (on page 1424).</td>
<td></td>
</tr>
<tr>
<td>show.changed.text.in.pdf.sticky.notes.content</td>
<td>When set to <strong>yes</strong> (default) and both the <code>show.changes.and.comments</code> and <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameters are also set to <strong>yes</strong>, the inserted and deleted text is shown in the sticky note annotations. When set to <strong>no</strong>, only the <code>inserted</code> and <code>deleted</code> labels are shown in the annotations (this is useful for search scope).</td>
<td></td>
</tr>
<tr>
<td>show.image.map.area.numbers</td>
<td>When set to <strong>yes</strong>, a counter for each area from the image map is displayed over the image, near the defined shape. The default is <strong>no</strong>.</td>
<td></td>
</tr>
<tr>
<td>show.image.map.area.shapes</td>
<td>When set to <strong>yes</strong>, each of the image map area shapes is displayed with a translucent fill over the image. You can use this to debug your image maps. The default is <strong>no</strong>.</td>
<td></td>
</tr>
<tr>
<td>show.media.as.link</td>
<td>When set to <strong>yes</strong>, media objects will not appear and an external link is generated for each one instead.</td>
<td></td>
</tr>
<tr>
<td>sort.and.group.glossentries</td>
<td>When set to <strong>no</strong> (default), elements in the glossary are sorted based upon the document order. If set to <strong>yes</strong>, elements in the glossary are sorted alphabetically and grouped by their first letter.</td>
<td></td>
</tr>
<tr>
<td>store-type</td>
<td>Setting this parameter to <strong>memory</strong> will increase the processing speed and thus, could help decrease the publishing time.</td>
<td></td>
</tr>
<tr>
<td>table.title.placement</td>
<td>Controls the placement of the title for tables. Possible values include <strong>top</strong> (default) and <strong>bottom</strong>.</td>
<td></td>
</tr>
</tbody>
</table>
### table.title.repeat
Specifies whether or not a table caption should repeat on other pages when the table spans onto multiple pages. The caption is not repeated for tables nested in lists or other tables. Allowed values are **yes** (default) or **no**.

### use.css.for.embedded.svg
When set to **yes** (default), the CSS files specified in the publishing template or by the `args.css` parameter are also applied on embedded SVG elements. Allowed values are **yes** and **no**.

### use.navtitles.in.all.links
Specifies whether a `<navtitle>` defined in a topic or a topic reference should be used as the display name for all links or only in the table of contents. Allowed values are **yes** and **no** (default).

### parallel
Specifies whether or not certain pre-processing tasks should be run in parallel. Setting this parameter to **true** may add a small increase to the publishing speed. Allowed values are: **true** and **false** (default).

The following parameters can be used to specify a publishing template:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pdf.publishing.template</code></td>
<td>Specifies the path to the folder containing the custom PDF template.</td>
</tr>
<tr>
<td><code>pdf.publishing.template.descriptor</code></td>
<td>Specifies the name of the descriptor file to be loaded from the PDF template folder or package. If not specified, the first encountered descriptor file is loaded.</td>
</tr>
</tbody>
</table>

The following parameter is available on all DITA transformations when using the **Oxygen Publishing Engine**:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.disable.security.checks</code></td>
<td>Specifies whether or not to load external entities that are not solved through catalogs. For security reasons, the default is <strong>no</strong>.</td>
</tr>
<tr>
<td></td>
<td>Allowed values: <strong>yes</strong> and <strong>no</strong> (default).</td>
</tr>
</tbody>
</table>

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario *(pdf-css-html5-single-topic trans type)*:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.root.map</code></td>
<td>Specifies the path of the root map file used to expand the key references in the published topic.</td>
</tr>
<tr>
<td><code>args.enable.root.map.key.processing</code></td>
<td>Indicates whether or not the keys should be processed using the root map parameter.</td>
</tr>
<tr>
<td></td>
<td>Allowed values:</td>
</tr>
</tbody>
</table>
**Console Logging**

To activate the logging of the last processing stage, involving the usage of the Chemistry processor to generate the PDF from the merged HTML, use the `--verbose` (or `-v`) DITA-OT parameter from the command line.

*Note:* When the transformation is started from an Oxygen application, this parameter is automatically set.

**License Key**

When running the Oxygen PDF Chemistry engine or the Oxygen Publishing Engine from inside a started Oxygen XML Editor/Author installation, an extra license key is not required. The sections below pertain to running the publishing from the command line.

**Chemistry License**

If you have an Oxygen PDF Chemistry license key, you will be able to generate PDF output that is not stamped with the Chemistry logo image from the command line.

To install your Chemistry license key:

- If you are using the version of Chemistry that comes bundled in Oxygen XML Editor/Author, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
- If you are using another Chemistry installation, make sure you place the `licensekey.txt` file in that folder.

**Oxygen Publishing Engine License**

If you have purchased a license for the Oxygen Publishing Engine, you will be able to produce both PDF and WebHelp output without any restrictions from the command line.

To install your Oxygen Publishing Engine license key, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR` folder.

**Generating PDF Output**

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.
Generating PDF from a Command Line

To publish the PDF output from a command line outside of Oxygen XML Editor/Author, you can use the `dita` startup script that comes bundled with the DITA Open Toolkit distribution.

The command line supports all the parameters specific to the PDF transformation (on page 1401). Here is an example of how to write the commands:

- **Windows**:
  
  ```cmd
  dita.bat -f pdf-css-html5 -i C:\path\to\map.ditamap -o C:\path\to\output\folder -v
  ```

- **Linux/macOS**:
  
  ```cmd
  dita -f pdf-css-html5 -i /path/to/map.ditamap -o /path/to/output/folder -v
  ```

**Note:**
You can use the long form of the command-line options (e.g. `--format` or `--input`). For more information about the build parameters, see DITA-OT: Building Output Using the dita Command.

Generating PDF from an Integration Server

PDF output can be automatically generated from a Continuous Integration/Continuous Delivery system, such as Jenkins.

To integrate PDF output with the Jenkins CI tool, follow these steps:

1. Create a Maven project to incorporate Oxygen Publishing Engine.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```xml
<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
  http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.oxygenxml</groupId>
  <artifactId>oxygen-oxygen-pdf-css-generator</artifactId>
  <version>1.0</version>
  
  <properties>
    <!-- The path to Oxygen Publishing Engine -->
    <dita-ot-dir>/path/to/oxygen-publishing-engine</dita-ot-dir>
    <!-- The path to the DITA map that you want to process. -->
    <input-file>/path/to/map.ditamap</input-file>
    <!-- The path of the output directory. -->
  </properties>
</project>
```
<output-dir>/path/to/output/folder</output-dir>

<!-- The path to the PDF publishing template folder (containing the .opt file). -->
<publishing-template>/path/to/template/folder</publishing-template>
</properties>

<build>
  <plugins>
    <plugin>
      <groupId>org.codehaus.mojo</groupId>
      <artifactId>exec-maven-plugin</artifactId>
      <version>1.6.0</version>
      <executions>
        <execution>
          <id>generate-pdf-css</id>
          <phase>generate-sources</phase>
          <goals>
            <goal>exec</goal>
          </goals>
          <configuration>
            <executable>${dita-ot-dir}/bin/dita</executable>
            <arguments>
              <argument>--format=pdf-css-html5</argument>
              <argument>--input=${input-file}</argument>
              <argument>--output=${output-dir}</argument>
              <argument>-Dpdf.publishing.template=${publishing-template}</argument>
              <argument>-v</argument>
            </arguments>
          </configuration>
        </execution>
      </executions>
    </plugin>
  </plugins>
</build>

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Webinar: Introducing the Oxygen Publishing Engine for DITA
Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:
You can start creating publishing templates by using the Oxygen Styles Basket. https://styles.oxygenxml.com

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicon, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for Oxygen Publishing Template packages:

Figure 315. Oxygen Publishing Template Package (WebHelp Responsive)
Figure 316. Oxygen Publishing Template Package (PDF)

- publishing template
- CSS
  - oxygen-skin.css
- XSLT-Extensions
  - topic_page_extension.xsl
- template_descriptor.opt

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

**Related Information:**

- How to Add a Publishing Template to the Publishing Templates Gallery (on page 1257)
- How to Share a Publishing Template (on page 1424)

**Publishing Template Package Contents for PDF Customizations**

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

**Template Descriptor File**

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the templates’ root folder.

A PDF template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```
Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...
</publishing-template>
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>`.

```
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
  </author>
</publishing-template>
```
PDF Element

The `<pdf>` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `<pdf>` section specify the template tags (on page 1416), template preview image (on page 1416), resources (on page 1417) (such as CSS files), transformation parameters (on page 1417), or XSLT extensions (on page 1418).

```xml
<pdf>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>
  <resources>
    ...
  </resources>
  <parameters>
    ...
  </parameters>
</pdf>
```

Template Tags

The `<tags>` section provides meta information about the template (such as color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<publishing-template>
  ...
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.
You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
  ...
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>
  </pdf>
</publishing-template>
```

**Template Resources**

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

```
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>
```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

**Transformation Parameters**

You can also set one or more transformation parameters in the descriptor file.

```
<publishing-template>
  ...
  <pdf>
    ...
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```

The following information can be specified in the `<parameters>` element:
Parameter name

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.

Note:
It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention:
JVM arguments like -Xmx cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1420) and adding it to the templates gallery (on page 1423), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates support one or more XSLT extension points. They can be specified using the <xslt> element in the descriptor file using the following structure:

```xml
<publishing-template>

...</pdf>

<xslt>

<extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>

<extension
    id="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="xslt/merged2mergedExtension.xsl"/>

</xslt>

</publishing-template>
```

For more information about the available extension points, see: XSLT Extensions for PDF Transformations (on page 1612).
Combining PDF and WebHelp Responsive Customizations in a Template Package

An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>"
    </parameters>
  </pdf>
</publishing-template>```
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new Oxygen Publishing Template (on page 2818), follow these steps:

1. Create a folder that will contain all the template files.

2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

   ![Figure 317. Choosing the Publishing Template Descriptor Document Template](image)

3. Save the .opt file into your customization directory.

4. Open the .opt file in the editor and customize it to suit your needs.
Creating a Publishing Template Starting from an Existing Template

If you are using a DITA Map WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2818) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the Save template as button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. Optional: Specify a template description.

6. Optional: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.

7. Optional: For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 1233) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXw08

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an Oxygen Publishing Template (on page 2818) is to use the Oxygen Styles Basket. This tool is a handy free-to-use web-based visual tool that helps you create your own Publishing Template Package to customize your DITA Map WebHelp Responsive transformation scenarios.
It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the Preview pane. You can also click the See Results button to generate a preview of either WebHelp or PDF output.

It is possible to Download the current template or Upload a previously generated template for further customization.

Resources

For more information about the Oxygen Styles Basket, see the following resources:

- **Video: Introducing the New Oxygen Styles Basket**
- **Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch**

**Related information**

- Publishing Template Package Contents for PDF Customizations *(on page 1414)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1217)*

**How to Edit a Packed Publishing Template**

To edit an existing Oxygen Publishing Template *(on page 2818)* package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Project view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.

4. Open the publishing template descriptor file (*.opt extension) in the editor and modify it to suit your needs.

5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

### How to Use a Publishing Template in a PDF Transformation

#### From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (or from the **DITA PDF - based on HTML5 & CSS** transformation scenario).

The **Templates** tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a **DITA Map PDF - based on HTML5 & CSS** transformation (or a **DITA PDF - based on HTML5 & CSS** transformation scenario).

2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

   **Step Result:** This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

   **Step Result:** Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

**Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

#### From a Command Line

You can use the **pdf.publishing.template** parameter to point to the *.opt (publishing template) file:  

```bash
dita.bat
   --input=map\test.ditamap
   "-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
```
Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```bash
dita.bat
   --input=map\test.ditamap
   "-Dpdf.publishing.template=full_path_to_template_dir"
   "-Dpdf.publishing.template.descriptor=my_template.opt"
   --format=pdf-css-html5
   ...
```

Tip:
You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Related Information:
Transformation Parameters (on page 1401)

### How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

### Customizing PDF Output Using CSS

The publishing process is driven by a customization CSS.

Warning:
You should not edit the CSS stylesheet from DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print. Instead, create your own customization.

To change the styling of the output for the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformation scenarios you can either create your own custom CSS rules or create a publishing template using the Oxygen Styles Basket.
Create Custom CSS Rules from Scratch

1. Create a CSS file that will contain all of your customizations. It is recommended to create this file in your project directory so you can edit it easily.

   **Tip:**
   If you use the default Chemistry processor in `Oxygen XML Editor/Author`, you can use LESS instead of CSS. In this case, the customization files should have the `.less` extension.

2. Add your custom CSS rules. As a good starting point, you can check the various topics in this section for assistance with specific types of customizations.

3. Link the CSS file. For this, you have two options:
   - Create a publishing template, create the customization CSS file inside the template folder, and link it to the publishing template descriptor. For assistance, see `Publishing Templates (on page 1214)`.
   - Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.

4. Run the transformation scenario.

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an `Oxygen Publishing Template (on page 2818)` is to use the `Oxygen Styles Basket`. This tool is a handy free-to-use web-based visual tool that helps you create your own `Publishing Template Package` to customize your DITA Map PDF - based on HTML5 & CSS transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the `Preview` pane. You can also click the `See Results` button to generate a preview of either PDF or WebHelp output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.
Tip:
For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

**CAUTION:**
Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.
Inspecting the Merged Map File

During the transformation stages, two merged map files are created. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the **HTML merged map file**. This file can be found in the `out/pdf-css` directory and it has the `.merged.html` file extension (you will also find a `.merged.xml` file that aggregates the entire DITA map structure). You can open the HTML files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (**Format and Indent**) to make the structure easier to read.

2. If the structure is as expected, you can start checking that the CSS selectors are written correctly against the document structure.

3. If the CSS selectors are correctly written, you can start inspecting how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using a Browser

The following procedure explains how to inspect the applied CSS styles using Chrome, but any modern browser can be used and the procedure for each of them is similar:

1. Open the file ending in `.merged.html`.

2. Open the Chrome Developer Tools by using `More Tools > Developer Tools` (or press `CTRL+SHIFT+i`).

3. Activate the Rendering pane by using `More Tools > Rendering` then select `print` from the Emulate CSS media section. This will activate the CSS selectors enclosed in `@media print {...}`.
Note:
This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

4. Right-click on the element you want to inspect and select the **Inspect** action, you will see the element (in the **Elements** pane) and the list of styles that are applied on it (in the **Styles** pane):

Tip:
Clicking any of the stylesheet links from the **Styles** pane opens the original CSS files in the **Sources** pane. Editing the rules in that pane results in a live preview of how the change will affect the output (these modifications will be lost on reload).

**Inspecting the Applied Styles Using Oxygen XML Editor/Author**

To inspect the applied CSS styles using Oxygen:
1. In Oxygen XML Editor/Author, open the file ending in .merged.html.

2. From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in @media print {...}.

   **Note:**

   This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

3. Right-click on the element you want to inspect and select the Inspect Styles action. The dedicated CSS Inspector view will be opened and it will show the applied CSS rules.

   **Tip:**

   With this file open in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

### Other Debugging Techniques

Here are some other debugging techniques you may find useful:

- Add background and border properties to the specific CSS rule. If they do not appear in the output, then there is a problem with the rule selector.
- Add the !important keyword to a property that is not applied, or make the selector more specific (by adding more parent selectors).
- Add the following fragment in your customization CSS to show how the elements are mapped to PDF:

```css
*:before(1000) {
    content: oxy_name() !important;
    color: orange;
}

*:before(900) {
    content: "[ class= "" attr(class) "]" !important;
    color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that are hidden.
How to Speed up CSS Development and Debugging

You may have already run the DITA Map PDF - based on HTML5 & CSS transformation scenario before using this procedure.

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can directly transform the merged map (on page 1427) (.merged.html) into PDF using Oxygen PDF Chemistry.

1. Open the .merged.html located in the output directory in the editor.
2. Configure a new XML to PDF transformation with CSS scenario. There is no need to set the CSS URL in the resulting dialog box. The stylesheets are already declared in the file theadx. This scenario uses the Chemistry CSS processor.
3. Optional: Enable the console output of the CSS processor from: Options > Preferences > XML > PDF Output > CSS-based Processors.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

Fastpath:

If your changes only involve element styling (with no specific paged media CSS rules and properties), you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (on page 1426).

How to Use XPath Expressions in CSS

How to Write XPath Expressions

To use XPath expressions in CSS, you need to use the oxy_xpath() function. These XPath expressions are used to extract the content from the HTML merged DITA map document.

The following example shows how to display the product name meta-information before the front page title:

```css
*{class="front-page/front-page-title"]:before {
    text-align: left;
    content: oxy_xpath("/(//*[contains(@class, 'topic/prodname')]/text())[1]");
    display:block;
}
```

Important:

Do not use the DITA element names directly. You must use the DITA @class attribute instead, as these attributes are propagated to the HTML elements while the element names can be lost. By using the class selectors, you also cover DITA specializations.
Tip:
Use the "[1]" XPath predicate to select the first value from the document. Do not forget the parenthesis between the node to be selected.

For example: oxy xpath("//*[contains(@class, 'topic/prodname')]/text() [1]").

Note that the meta-information might be copied multiple times in the output, inherited by the <topicref> elements, so you might get more values than expected.

Other Notes:

• You can call the oxy xpath() function in string-set property.
• You can use content extracted using the oxy xpath() function in both pseudo-elements and @page at-rules.
• Do not use strings as values for pseudo-elements content because they are not supported in them.

How to Debug XPath Expressions

Suppose that you need to display the publication author in the bottom-left part of the cover page.

The ditamap content is the following:

```
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
... 
</map>
```

To debug an XPath expression:

1. Read the XPath Expressions Guidelines (on page 1430).
2. Launch the transformation of the DITA map using your customization CSS.
3. Open the [MAP_NAME].merged.html file (from the output folder) in Oxygen XML Editor/Author. You will find this inside the HTML:

```
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
  ...
</map>
```

```
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">John Doe</div>
  </div>
  <div class="- front-page/front-page-title front-page-title">
    <div class="- topic/title title">The Art of Bike Repair</div>
  </div>
```

4. Activate the **XPath Builder** view (**Window > Show View > XPath/XQuery Builder**).

5. Paste your XPath expression (for example: `//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()`) and click the **Execute XPath** button. Check if it returns the expected results.

6. Copy the expression in your customization CSS and define the rules that will use it. For example:

```
:root {
  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()');
}

@page front-page {
  @bottom-left {
    content: "Created by " string(author);
  }
}
```

**Note:**
The "\" character used in the expression allows the multi-line display without breaking the query.

7. Run the transformation again to obtain the desired output.

**Note:**
The XPath builder has a function that allows it to display the document path of the current element from the editor (**Settings drop-down menu > Update on cursor move**). Alternatively, you can right-click the element in the merged document and select the **Copy XPath** action, then paste it in the XPath builder.

- XPath Builder Documentation
- XPath Examples ([w3schools.com](http://w3schools.com))

**Default Page Definitions**

All page definitions are found in: `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

**Note:**
This is listed solely for illustration purposes, as the plugin might use something different.
There are page definitions for the default page, chapter page, table of contents page, front matter page, back matter page, index page, large tables page, and blank page.

### Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}

@page :right {
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}
```

**Tip:** To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml
@page :left, table-of-contents:left, chapter:left {
  @top-left {
    content: "...";
  }
}

@page :right, table-of-contents:right, chapter:right
  @top-right {
    content: "...";
  }
```

### Chapter Page

This is inherited from the default page. The chapter page is associated with the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter. If you need to add other information to the chapter headers, make sure you override these rules in your CSS:
Table of Contents Page

The table of content page. It clears the headers and uses a lower roman page number in the header.

```xml
@page table-of-contents {
    @top-left { content: none; }
    @top-center { content: none; }
    @top-right { content: none; }
    @bottom-left { content: none; }
    @bottom-center { content: none; }
    @bottom-right { content: none; }
}

@page table-of-contents: left {
    @top-left {
        content: string(toc-header) " | " counter(page, lower-roman);
    }
}

@page table-of-contents: right {
    @top-right {
        content: string(toc-header) " | " counter(page, lower-roman);
    }
}

/* Do not put a header on the first page of the TOC */
@page table-of-contents:first: left {
    @top-left {
        content: none;
    }
}
```
Front Matter and Back Matter Page

The bookmap front matter and back matter page. It clears the headers.

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower alpha page number in the footer:
When transformed, the page layout is spread on two columns.

Large Tables Page

The big tables are placed on a rotated page, with orientation landscape:
Blank Page

The following example clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using double side pagination (on page 1524):

```css
@page :blank{
  @top-left {
    content: none;
  }
  @top-right {
    content: none;
  }
}
```

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `PLUGIN_DIR/css/print/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```css
@page {
  padding-top: 0.2em;
  padding-bottom: 0.2em;
}
```
How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS (on page 1424), use:

```css
@page {
  size: A4;
  margin: 2cm;
}
```

If you need different margins depending on the page side:

```css
@page {
  size: A4;
  margin: 2cm;
}
@page :left{
  margin-right:4cm;
}
@page :right{
  margin-left:4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page orientation. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS (on page 1424), use:

```css
@page {
  size: us-letter landscape;
}
```
How to Change the Page Settings for a Specific Element

Suppose your publication mainly uses a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleed outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, `wide`), you can set the attribute on the root element of the topic or on the `<topicref>` element from the map.

   ![Note:]
   The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the merged map (on page 1427).

2. In your customization CSS (on page 1424), match the output class and associate it with a named page. In the following example, the page has a landscape orientation and small margins. This technique works for any element (e.g. a table or list) not just for a topic.

   ```css
   @page wide-page {
     size: letter landscape;
     margin: 0.5in;
   }

   *[outputclass = 'wide'] {
     page: wide-page !important;
   }
   ```

   ![Note:]
   The `!important` rule is necessary to override the default page settings.

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (on page 1499):

- **parttitle**
  Set to the title of the current part (only for DITA bookmaps that use parts).

- **chaptertitle**
  Set to the title of the current chapter (Shallow and Deep numbering).

- **sectiontitle**
  Set to the title of each section (Deep numbering only).

To see where the default page rules are defined, see: Default Page Definitions (on page 1432).
Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach, in this case, is to take a look at the rules from the numbering CSS (on page 1499), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).

Related Information:
Numbering (on page 1499)

Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (on page 1432).

How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so-called page margin boxes, a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```html
@page {
  margin-top:3cm !important;
  margin-bottom:3cm !important;
  margin-left:2cm !important;
  margin-right:2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the Default Page Definitions (on page 1432) for details.

Note that the page margin boxes fill the entire page margin. This means the margin-top, for example, dictates the height of the @top-left-corner, @top-left, @top-center, @top-right, @top-right-corner margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use padding properties:

```html
@page {
  @top-left {
    content:"..."
    padding: 1cm;
  }
  ..
}
```
How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (on page 1424), add a CSS rule similar to this:

```css
@page {
    font-size: 12pt;
    font-family: "Arial";
}
```

⚠️ Important:
These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```css
@page table-of-contents {
    font-size: 12pt;
    font-family: "Arial";
}
```

Related Information:
How to Change the Header of the Table of Contents (on page 1515)

How to Display Chapter's Headers on First Page

By default, the header is not displayed on the first page of each chapter:

```css
/* No headers on the chapter first page. */
@page chapter:first:LEFT{
    @top-left {
        content: none;
    }
}
@page chapter:first:RIGHT{
    @top-right {
        content: none;
    }
}
```

If you want to display them on the first page, you just need to override the above default rules with the following default content:

```css
@page chapter:first:LEFT{
    @top-left {
```
Tip:

It is also possible to import the [PLUGIN_DIR]/css/print/p-optional-pages-and-headers.css stylesheet into your custom CSS.

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the top-left or top-right page margin boxes:

```xml
@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptetitle) string(sectiontitle) " | "
    counter(page);
  }
}

@page :right {
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
  }
}
```

If you want to change this, you should use the `content` CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```xml
@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
  }
  @top-left-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
  }
}
```
Note:

The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: How to Decorate the Header by Using a Background Image on the Entire Page (on page 1447).

How to Change the Header Separators

There are some strings defined for parts, chapters, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

- "My Publication" is the value of the `maptitle` string.
- "Introduction" is the value of the `chaptertitle` string.
- "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (on page 1424), add the following CSS rule:

```
*{class =~ "topic/topic"}[is-part] > *{class =~ "topic/title"} {  
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
```
parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
chaptertitle "",
chaptertitle-no-prefix ""; /* Avoid propagating a past chapter title on a new part */
}
*[class = "topic/topic"]{is-chapter]:not([is-part]) > *[class = "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content(),
    chaptertitle-no-prefix " " counter(chapter) " - " content();
}

If you enabled the deep numbering for chapters and subsections (on page 1503), then use:

*[class = "map/map"]{numbering ^= 'deep'} *[class = "topic/topic"]{is-part} > *[class = "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle "",
    chaptertitle-no-prefix ""; /* Avoid propagating a past chapter title on a new part */
}
*[class = "map/map"]{numbering ^= 'deep'} *[class = "topic/topic"]{is-chapter]:not([is-part]) >
*[class = "topic/title"] {
    string-set: chaptertitle " - " counters(chapter-and-sections, ".") " - " content(),
    chaptertitle-no-prefix " " counters(chapter-and-sections, ",") " - " content(),
    sectiontitle ""; /* Avoid propagating a past section title on a new chapter */
}
*[class = "map/map"]{numbering ^= 'deep'} *[class = "topic/topic"]{is-chapter]:not([is-part]) >
*[class = "topic/topic"] > *[class = "topic/title"] {
    string-set: sectiontitle " - " counters(chapter-and-sections, ",") " - " content();
}

How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as map title, part title, chapter title, and section title, ending in the page number.

```css
content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
```

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (on page 1424), add the following CSS rule:

```css
@page :left {
    @top-left {  
        content: string(chaptertitle) " | " counter(page);
    }
}
```
Important:
Some of the CSS default page rules are more important. If you see that the content does not change:

• Try to also specify the name of the page, to increase the specificity of the rules:

```css
@page :left, table-of-contents:left, chapter:left{
  ...
}
```

```css
@page :right, table-of-contents:right, chapter:right{
  ...
}
```

• Add an `!important` classifier just before the semi-colon.

```css
@top-right {
  content: string(chaptentitle) " | " counter(page) !important;
}
```

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

• Use an SVG image as the background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (on page 1446).

• Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```css
@page {
  @top-right {
    content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
    ,
    oxy_label(text, "Product", styles, "color:blue; text-decoration:underline;"));
  }
}
```

You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```css
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```
Note:
These functions work only with the Chemistry CSS processor.

Note:
You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```css
@page {
  @top-right {
    color: red;
    content: oxy_label(text, "My Company", styles, "color:black") string(chaptertitle); /* This inherits the styling from @top-right*/
  }
}
```

- Use two adjacent page margin boxes, and style them differently:

```css
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align:right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align:left;
  }
}
```

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```css
@page :left {
  @bottom-left-corner{
    content: " ";
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
```
Important:

Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (on page 1447)):

```xml
@page :left {
    @top-left{
        content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat:no-repeat;
        background-position:50% 50%;
    }
}
```

Note:

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images and Figures (on page 1579)
How to Add a Background Image for the Cover (on page 1466)
How to Add a Link in Headers and Footers (on page 1453)

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:
For a list of all the possible page names, see: Default Page Definitions (on page 1432).

How to Add a Background Image for the Cover (on page 1466)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<topicref>` topic reference:

```xml
...  
<topicref href="topics/installing.dita">  
<topicmeta>  
   <data name="header-data" value="ID778-3211"/>  
</topicmeta>  
...  
```

In the above example, there is set of key value pairs with the name header-data. This information is automatically copied into the content in the merged map file (on page 1427), like this:

```xml
<topic ... >  
   <title class="- topic/title ">Installing</title>  
   <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>  
   <prolog class="- topic/prolog ">  
    ...  
   <data class="- topic/data " name="header-data" value="ID778-3211"/>  
    ...  
```

This information can be extracted from the CSS:

```css
/* Define the string set variable that contains the text extracted from the data element */  
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-data"] {  
    string-set: hdrstr attr(value);  
}  

/* Using the value='none' stops applying the image. */  
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-data"] [value="none"] {  
```
Notes:
The string set is applied to all pages that follow the data element, until another data element changes it:

```
...<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
```

```
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
  <topicmeta>
    <data name="header-data" value="ID990-3200"/>
  </topicmeta>
</topicref>
```

```
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
```

To clear the text, use the `none` value:

```
...<topicref href="..."> <!-- The string set is void now -->
```

...
In the above example, there is a set of key-value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1427), like this:

```xml
<chapter href="topics/installing.dita">
    <topicmeta>
        <data name="header-image" value="img/installing.png"/>
    </topicmeta>

    <topic is-chapter="true">
        <title class="-topic/title">Installing</title>
        <shortdesc class="-topic/shortdesc">You install components to make them available for your solution.</shortdesc>
        <prolog class="-topic/prolog">
            ...
            <data class="-topic/data" name="header-image" value="img/installing.png"/>
        </prolog>
    </topic>
    ...
</chapter>
```

This information can be picked up from CSS:

```css
/* Define the string set variable that contains an URL */
*[class ~="topic/topic"] *[class ~="topic/data"][name="header-image"] {
    string-set: imgst oxy_url(oxy_xpath('/*/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class ~="topic/topic"] *[class ~="topic/data"][name="header-image"][value="none"] {
    string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
    @top-left-corner {
        content: string(imgst);
        font-size:0; /* remove the font ascent and descent */
    }
}
```

**Details:** The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.
Notes:

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:

```
<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="topics/change.dita">
  <topicmeta>
    <data name="header-image" value="img/change.png"/>
  </topicmeta>
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same change.png image -->
</chapter>
```

To clear the image, use the `none` value:

```
<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="none"/>
  </topicmeta>
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
<chapter href="...">
  <!-- Uses the same installing.png image -->
</chapter>
```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

© 2017 - My Company Ltd
All rights reserved
For this, you need to specify a rule that matches all the right pages and adds that content in the bottom-center. In your customization CSS (on page 1424), add the following CSS rule:

```css
@page :right {
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
        color: silver;
    }
}
```

**Note:**

Other page rules (such as the table-of-contents) override the contents of the @bottom-center because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents:right {
    ...
}
```

**Note:**

To use new lines (\n characters) in your headers or footers, use the \A notation, as in the example above.

### How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

   ```
   ...
   End topic
   Footer container topic
       Footer content topic 1
       Footer content topic 2
   ```

2. Add an @outputclass=footer on the <topic> root element of the footer container topic, or on its <topicref> in the map.

3. Use the CSS position: fixed property to position this topic to the bottom of the page:
Method 2: Using the float:footnote CSS Property

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

```css
*[^outputclass ~="footer"] { 
    float:footnote;
}
*[^outputclass ~="footer"]:footnote-call{
    color:transparent;
    font-size:0;
}
*[^outputclass ~="footer"]:footnote-marker{
    color:transparent;
    font-size:0;
}
```

Note:
Use transparent colors and/or zero size font to avoid the display of the footnote counters.

How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the `<a>` element inside an SVG document. For example, suppose you have the following SVG document named `custom.svg`: 
This creates an SVG link with PDF Chemistry displayed as its text (the content of the `<text>` element).

**Note:**
If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```xml
@page {
  @top-left {
    content: url("custom.svg");
  }
}
```

**Method 2: Using the CSS `-oxy-link` Property**

It is also possible to add a link inside the document header (or footer) by using the `-oxy-link` property on the `@page` margin box declaration. The entire page margin box will behave as a link and will be clickable.

```xml
@page {
  @top-left {
    content: "Link";
    -oxy-link: "https://www.oxygenxml.com/";
    color:blue;
  }
}
```

**How to Change the Header Styling Depending on Page Side**

To modify the styling of the default page headers, add the following CSS rule in your customization CSS (on page 1424):

```xml
@page :left {
  @top-left {
    color:navy;
    font-style:italic;
  }
  @top-right {
```
If you intend to modify just the headers of the table of contents, use the \texttt{table-of-contents} page rule selector:

```xml
@page table-of-contents: \texttt{left} {
  @top-left {
    \texttt{color:navy;}
    \texttt{font-style:italic;}
  }
  @top-right {
    \texttt{color:red;}
  }
}
```

### How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the \texttt{oxy_xpath} directly in the \texttt{content} property:

```xml
@page front-page {
  @top-center {
    \texttt{content: "Created: " oxy_xpath('//*[contains(@class, " topic/created "])][1]');}
  }
}
```

### Example 1: Compute the Number of Words

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```xml
@page front-page {
  @bottom-center {
    \texttt{content: "Number of words: "}
    \texttt{oxy_xpath("string-length(normalize-space(/)) - \string-length(translate(normalize-space(/),\'\ ',\'\')) +1");}
  }
}
```

\textbf{Note:} The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with / or //. This is different from the case when the \texttt{oxy_xpath} is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.
Tip:
XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
  <metadata>
    ...
    <data name="cover">
      <image href="product-cover.png" outputclass="cover-image"/>
    </data>
    ...
  </metadata>
</bookmeta>
```

```css
@page {
  @top-center {
    content: url("oxy_xpath('//*[contains(@outputclass, "cover-image")]/@href')");
  }
}
```

If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```css
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri('//*[contains(@outputclass, 'cover-image')]/@href'),
document-uri(/))");
  }
}
```

Example 3: Insert the Current Date in the Footer

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```css
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```
Example 4: Picking up Metadata from the Original Map

Another example is to use the oxy_xpath function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the @xtrf attribute that is set on the root element of the merged map. This attribute contains the URL of the input map.

```
:root{
    string-set: maptitle oxy_xpath('document(@xtrf)/*[contains(@class, " map/map ")/*[contains(@class, " topic/title ")]/text()');</
}
```

http://zvon.org/xxl/XPathTutorial/General/examples.html
Oxygen User Guide: oxy_xpath() Function

How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

Method 1: Add a Border in the Page Margin Boxes

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (top-left-corner, top-left, top-center, top-right, top-right-corner).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a vertical-align: bottom; declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```
@page chapter, chapter:first: left:right, front-page{

    padding-top: 1em;

    @top-left {
        content: "Custom header";
        color: gray;
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

    @top-center{
        content: " ";
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

```
Note:
The padding-top: 1em; is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (on page 1446).

How to Change the Headings Using a Parameter

Suppose you need to change the headings of your publication by specifying a static text in a parameter.

First, establish a name for your parameter (it must start with the args.css.param. prefix). For example, you could name it args.css.param.heading.text. It will have the text value that you will pass when starting the transformation. This parameter does not have to be registered anywhere as it will be automatically recognized and passed as an XML attribute on the root of the merged file, as specified in Styling Through Custom Parameters (on page 1608).

Next, alter your customization CSS to make use of the parameter value. In the example below, the text is placed in the central part of the header:
Note:

You can use any XPath 2.0 here. It will be executed in the context of the merged map document, so you can collect data from it. You can use if/then/else expressions if your parameter is a switch.

The text does not affect the first pages from the page sequences because the built-in CSS page rules (on page 1432) clear the content from the headers. If you need the text content on all pages, you might consider adding an !important keyword after the content property value, or increase the specificity of the page selectors, like this:

```css
@page front-page,
    table-of-contents,
    table-of-contents:first:left,
    table-of-contents:first:right,
    chapter:first:left,
    chapter:first:right{
    @top-center{
        ...
    }
}
```

Another use case is to alter the string-sets that are used in the headers (not the headers directly), as it is explained here: How to Use XPath Computed Data or Images in the Header or Footer (on page 1455). You can use this technique to alter the chapter titles as in the following example:

```css
*[class =~ "map/map"]{numbering~='deep']
  *[class =~ "topic/topic"]{is-chapter}:not([is-part]) >
    *[class =~ "topic/title"] {
      string-set:
        chartertitle * | " counter{chapter-and-sections, "." } * - 
        oxy_xpath("/*.@heading.text") content(),
        sectiontitle "";
}
```

Note:

This is a rule copied from p-numbering-deep.css and it may change if future versions.

How to Change the Headings depending on the Language

It is possible to customize the text displayed in the headings depending on the language of the publication.
In this case, you can simply use the @lang attribute in your customization CSS. In the following example, the page counter displayed in the bottom part of the page is preceded by the word "Page", according to the selected language:

```
@page chapter {
  @bottom-center {
    content: oxy_xpath("if (@lang='es') then 'Página' \ 
                  else if (@lang='it') then 'Pagina' \ 
                  else 'Page'") = " counter(page);
  }
}
```

**Note:**
Backslashes (\) are used to split the XPath into multiple lines to make it easier to read.

### How to Display the Chapter and the Page Number in the Footer

It is possible to display the chapter number along with the page number in the footer of each page. For example, a CC-PP (using a 2-digits numbering) display can be done using the following CSS rules:

```
*[class ~="map/map"]*[class ~="topic/topic"][is-part] {
  string-set: chapternumber "";
}
*[class ~="map/map"]*[class ~="topic/topic"][is-chapter]:not([is-part]) {
  string-set: chapternumber counter(chapter, decimal-leading-zero);
}
*[class ~="map/map"]*[class ~="bookmap/frontmatter"]
*[class ~="map/map"]*[class ~="bookmap/backmatter"]
*[class ~="map/map"]*[class ~="topic/topic"][is-part] ~ *[class ~="topic/topic"]:not([is-part]) {
  string-set: chapternumber "";
}
...
@page chapter {
  @bottom-center {
    content: string(chapternumber) "-" counter(page, decimal-leading-zero);
  }
}
```

### Page Breaks

The page breaks can be controlled in multiple ways:
1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.

**Related Information:**
- Double Side Pagination *(on page 1524)*
- Oxygen PDF Chemistry: Controlling Page Breaks

### Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

### How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS *(on page 1424)*:

```css
*[class ~="topic/table"] {  
  page-break-inside:avoid;
}
*[class ~="topic/ol"] {  
  page-break-inside:avoid;
}
*[class ~="topic/ul"] {  
  page-break-inside:avoid;
}
```

**Note:**
Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```css
*[class ~="task/steps"] {  
  page-break-inside:auto;
}
```

**Note:**
Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`. 
How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break **before all** the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your customization CSS *(on page 1424)*:

*\[class ~="map/map"] > *\[class ~="topic/topic"] {\ *
  page-break-before: always;
} *

If you need to break at third or fourth level topics, add more `.. > *\[class ~="topic/topic"]` selectors to the expression.

If you want to force a page break **for a specific topic**, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

- **page-break-before**
  Use this for a page break before the marked element.

- **page-break-after**
  Use this for a page break after the marked element.

- **page-break-avoid**
  Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```xml
<topic outputclass="page-break-before" ... >
```

**Note:**
You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```xml
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS *(on page 1424)*.

Style the separating blank page:

```xml
@page topic-separating-page{
  @top-left {
    content: "",
  }
```
Associate this page to the :after pseudo-element of the topic:

```css
*{class="topic/topic"}[outputclass="add-separator-page"]:after {
    content: " ";
    display: block;
    page: topic-separating-page;
}
```

In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```xml
<topic outputclass="add-separator-page"> ... </topic>
```

The :after pseudo-element will be created next to the topic content and will be placed on the topic-separating-page.

Use the page margin box selectors to override the default content from the headers/footers.

> **Note:**

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

### How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a subsequent page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS *(on page 1424)*:

```css
:root {
    widows:4;
    orphans:4;
}
```
Note:
As a difference from the W3C standard, the *widows* and *orphans* CSS properties are applied to lists as well (the default is 2). This means that a list that spans consecutive pages will have either zero or at least 2 lines on each of the pages.

How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```
*{[class ~= "topic/topic"] [is-chapter] {  
  -oxy-page-group:auto;
}
```

Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The merged map file *(on page 1427)* contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" ...>
      </bookmeta>
    <oxy:front-page-title>
      <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
        class="- topic/title bookmap/booktitle ">
        <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
        <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
        <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</booktitlealt>
      </booktitle>
    </oxy:front-page-title>
  </oxy:front-page>
</bookmap>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map bookmap/bookmap bookmap" ... />

<div class=" front-page/front-page front-page">
  ...
</div>

<div class=" front-page/front-page-title front-page-title">
  <div class="- topic/title bookmap/booktitle booktitle">
    Retro Tools</div>
  <div class="- topic/ph bookmap/booklibrary booklibrary">
    Tasks</div>
  <div class="- topic/ph bookmap/booktitlealt booktitlealt">
    Product tasks</div>
</div>
...```

Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```css
@media print {

  *[class="front-page/front-page"] {
    page: front-page;
  }

  /* Prevents the front-page title margin collapsing */

  *[class="front-page/front-page"]:before(1000) {
    display:block;
    content:\A;
    font-size:0;
  }

  *[class="front-page/front-page-title"] {
    display:block;
    text-align:center;
    margin-top:3in;
    font-size:2em;
    font-family:arial, helvetica, sans-serif;
    font-weight:bold;

```
How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the front-page. This makes it easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of :after pseudo-elements bound to the front page title.

To set the size to an SVG image, you should specify the @width and @height attributes on the <svg> root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```xml
<polygon points="17.78 826.21 577.51 ...."
```

Next, make sure you also specify the @viewBox attribute on the <svg> root element that defines the abstract rectangle that contains the drawing:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850"
```

The following SVG document has the @width, @height, and @viewBox attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "+//W3C//DTD SVG 1.1//EN" 
 "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd"
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110"
```
This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

**Note:**
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS *(on page 1424)*, add the following:

```css
@page front-page {
    background-image: url("us-letter.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@page front-page {
    background-image: url("company-logo.svg");
    background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis. */
    background-repeat: no-repeat;
}
```
How to Display the Background Cover Image Before the Title

It is possible to split the font-page display into two pages so that the background image appears on one page and the title on another. The solution is to define a new page for the main title:

```xml
@page front-page {
    @top-left { content: none; }
    @top-right { content: none; }
    @bottom-center { content: none; }

    background-image: url("us-letter.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

@page main-title-page {
    @top-left { content: none; }
    @top-right { content: none; }
    @bottom-center { content: none; }
}

*[class ~="front-page/front-page-title"]:before {
    display: block;
    content: "$\2002";
    margin-bottom: 3in;
}

*[class ~="front-page/front-page-title"] {
    page: main-title-page;
}
```

How to Use Different Background Cover Images Based on Bookmap or Map Information

It is common to use the same CSS file for customizing multiple publications, and you may need to set a different cover for each of them. The solution is to use an XPath expression to extract some information from the document, and based on that, select the SVG images.

```xml
@page front-page {
    background-image: url(oxy_xpath("\n```
if(/*[contains(@class, ' topic/prodname ')][1] = 'gardening') then 'bg-gardening.svg'
else
    if(/*[contains(@class, ' topic/prodname ')][1] = 'soil') then 'bg-soil.svg'
    else 'bg-default.svg'\n});
background-position:center;
}

The backslash (\) is used to continue the expression string on the subsequent lines (there should be no spaces after it). For more use cases solved using XPath, see: Metadata (on page 1482).

Oxygen PDF Chemistry: Graphics

How to Change Styling of the Cover Page Title

Match the front page title element in your customization CSS (on page 1424) based on its class attribute:

*{class ~= "front-page/front-page-title"}
  margin-top: 1in;
  font-size: 3em;
}

Important:
Make sure the sum of the top and bottom margins and paddings for this element do not exceed the physical dimension of the page. If this happens, an extra blank page may appear before the cover page. Usually, it is enough to specify only the top margin.

How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS (on page 1424), add the following:

*{class ~= "front-page/front-page-title"}:after(1) {
  display:block;
  content: "DRAFT VERSION";
  font-size: large;
  color: red;
  text-align:center;
}

*{class ~= "front-page/front-page-title"}:after(2) {
To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: How to Show Metadata in the Cover Page (on page 1487).

**Related Information:**
How to Show Metadata in the Cover Page (on page 1487)

### How to Place Cover on the Right or Left Side

In your customization CSS (on page 1424), add the following CSS rules:

```css
*[class =~ "front-page/front-page"] {
  page-break-before: left;
}
```

**Note:**
This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

**Related Information:**
Double Side Pagination (on page 1524)
How to Add a Second Cover Page and Back Cover Page

It is possible to add a second cover page after the front-page by defining another page-selector:

```xml
@page second-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  @bottom-center {content: none;}

  background-image: url("second-cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class =~ 'front-page/front-page']::after{
  page: second-cover;
  page-break-after: always;
  display: block;
  content: "\2002";
}
```

If you want to add a back cover page, you should use an `:after` pseudo element on the map itself:

```xml
*[class =~ "map/map"]::after
```

and bind it to another `@page` declaration:

```xml
@page back-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  @bottom-center {content: none;}

  background-image: url("back-cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class =~ "map/map"]::after {
  page: back-cover;
  content: "\2002";
}
```
Note:
For any `background-image`, it is recommended to use SVG instead of PNG (or JPG) because it scales it to the page size.

Tip:
To add multiple cover pages, use multiple-leveled pseudo selectors, such as `:after(1)`, `:after(2)`. Remember that the larger the value, the more distant the pseudo element is to the target element.

How to Dynamically Add a Second Cover Page

It is possible to dynamically set the path to the SVG image that will be displayed on the secondary cover page.

First, you need to declare a `<data>` element in the `bookmap`'s metadata that contains the URL to your cover image:

```xml
<bookmap>
  <booktitle>...
  </booktitle>
  <bookmeta>
    <metadata>
      <data name="second-cover-url" value="covers/second-cover.svg"/>
    </metadata>
  </bookmeta>
  ...
</bookmap>
```

Note:
This can also be done on a normal DITA map by using the `<topicmeta>` after the map's `<title>`.

Next, you need to modify the page declaration inside your CSS stylesheet and replace the `background-image` property value with the result of the `oxy_xpath()` function:

```css
@page second-cover {
  ...
  background-image: url(oxy_xpath("//*[contains(@class, 'bookmap/bookmeta')]//*[contains(@class, 'topic/data')][@name='second-cover-url']/@value"));
  ...
}
```
Tip:
You can reuse the same stylesheet on multiple maps. You just need to change the data value for each of them.

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS (on page 1424), add the following CSS rules:

```
@page my-blank-page {
  /* Hide the page numbers */
  @top-left { content: none; }
  @top-right { content: none; }
}

*[class ~='front-page/front-page']::after(1){
  page:my-blank-page;
  display:block;
  content: '\2002';
  color:transparent;
  page-break-after:always;
}

*[class ~='front-page/front-page']::after(2){
  page:my-blank-page;
  display:block;
  content: '\2002';
  page-break-after:always;
}

*[class ~='front-page/front-page']::after(3){
  page:my-blank-page;
  display:block;
  content: '\2002';
  page-break-after:always;
}
```

Note:
The \2002 character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:
How to Force an Odd or Even Number of Pages in a Chapter (on page 1526)
How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS (on page 1424), declare a new page layout:

```css
@page copyright-notice-page {
  @top-left {
    content:none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content:none;
  }
}
```

The element with the class `front-page/front-page` element contains the title of the publication and generates the cover page. A synthetic `:after` element is created that follows this element and it is placed on a different page.

```css
*[class~="front-page/front-page"]:after{
  display:block;

  page: copyright-notice-page; /* Moves the synthetic element on a new page. */

  margin-top:90%; /* use margins to position the text in the page */
  margin-left: 5em;
  margin-right: 5em;

  content: "Copyright 2018-2019 MyCorp Inc. \A All rights reserved";

  text-align:center; /* More styling */
  color:blue;
}
```

If you need to add more content as blocks, use the `:after(2), :after(3)` pseudo-elements:

```css
*[class~="front-page/front-page"]:after(2){
  display:block;
  page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
  content: "Some more styled text";
  color:red;
}
```
If you want to extract information from the document, use the `oxy_xpath()` function. For example, if the copyright info is stored in the map like this:

```xml
<map ...>
  <topicmeta>
    <copyright>
      <copyryear year="2018"/>
      <copyrholder>MyCorp Inc.</copyrholder>
    </copyright>
  </topicmeta>
</map>
```

then use this:

```css
/*[class ~="front-page/front-page"]:after(3) {
  display: block;
  page: copyright-notice-page;
  content:
  "Year: "
  oxy_xpath('/*[contains(@class, " front-page/front-page ")]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyryear ")]/@year')
  "\A Holder: "
  oxy_xpath('/*[contains(@class, " front-page/front-page ")]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyrholder ")]//text()');
  color: green;
}
```

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS *(on page 1424)*:

```css
/*[class = 'map/map'] > *[class = 'toc/toc'] { display:none !important; }
/*[class = 'map/map'] > *[class = 'front-page/front-page'][
  display:none !important;
} /*[class='topic/topic'][is-chapter] {
How to Add a Cover in Single-Topic Publishing

It is possible to add a cover page before the topic when publishing a single-topic PDF (without a DITA map) using the DITA PDF - based on HTML5 & CSS transformation scenario.

For example, to add a background image before the published topic, you need to create a new `@page` rule and add it in a block before the actual content of the document:

```xml
@page topic-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  background-image: url("img/cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

:root::before {
  page: topic-cover;
  display: block;
  content: "\2002";
  page-break-after: always;
}
```

How to Use SVG Templates for Creating Dynamic Cover Pages

It is possible to use XPath expressions inside SVG templates to insert dynamic text when creating PDF output using the DITA Map PDF - based on HTML5 & CSS scenario.

Using SVG Template as a Cover Page

A common use-case is when you want to create a custom cover page and this cover should display metadata information (i.e. the author, dates, and copyright information):

1. In the source `<bookmap>`, the various metadata elements are inserted inside the `<bookmeta>` element:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
</bookmap>
```
<bookmeta>
  <author>Howe Tuduit</author>
  <critdates>
    <created date="2015-01-01"/>
    <revised modified="2016-04-03"/>
    <revised modified="2016-03-05"/>
  </critdates>
  ...
  <bookrights>
    <copyrfirst>
      <year>2004</year>
    </copyrfirst>
    <copyrlast>
      <year>2007</year>
    </copyrlast>
    <bookowner>
      <organization>Retro Tools, Inc.</organization>
    </bookowner>
  </bookrights>
</bookmeta>

2. The corresponding *merged.html* file will have the following content:

```html
...<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
    <div class="- topic/author author">Howe Tuduit</div>
    <div class="- topic/critdates critdates">
      <div date="2015-01-01" class="- topic/created created"></div>
      <div modified="2016-04-03" class="- topic/revised revised"></div>
      <div modified="2016-03-05" class="- topic/revised revised"></div>
    </div>
    ...
    <div class="- topic/data bookmap/bookrights data bookrights">
      <div class="- topic/data bookmap/copyrfirst data copyrfirst">
        <div class="- topic/ph bookmap/year ph year">2004</div>
      </div>
      <div class="- topic/data bookmap/copyrlast data copyrlast">
        <div class="- topic/ph bookmap/year ph year">2007</div>
      </div>
      <div class="- topic/data bookmap/bookowner data bookowner">
        <div class="- topic/data bookmap/organization data organization">Retro Tools, Inc.</div>
      </div>
    </div>
</div>...```
3. The cover image (for example, named `cover.template.svg`) should display `<bookmeta>` node information (author, creation date, and copyright information) and the `<mainbooktitle>` will be displayed rotated.

```xml
<svg version="1.1" id="Layer_1" xmlns="http://www.w3.org/2000/svg" xmlns:xlink="http://www.w3.org/1999/xlink" x="0px" y="0px" viewBox="0 0 610 790" style="enable-background:new 0 0 610 790;" xml:space="preserve">
  <style type="text/css">
    .st0{fill:url(#SVGID_1_);} 
    .st1{opacity:0.31;fill:#FFFFFF;enable-background:new  ;}
    .st2{fill:#FFFFFF;}
    .st3{fill:#F04C3E;}
    .st4{fill:none;stroke:#FFFFFF;stroke-width:0.3685;stroke-miterlimit:2.6131;}
    .st5{font-family:'Arial';}
    .st6{font-size:24.3422px;}
    .st7{font-size:10px;}
    .st8{font-size:63.3422px;font-weight:bold;}
    .st9{fill:#F04C3E;stroke:#000000;stroke-miterlimit:10;}
  </style>
  <linearGradient id="SVGID_1_" x1="305.6" y1="799.9393" x2="305.6" y2="8.9393" gradientUnits="userSpaceOnUse">
    <stop offset="1.848748e-02" style="stop-color:#2F639F"/>
    <stop offset="1" style="stop-color:#1C3E72"/>
  </linearGradient>
  <rect x="0.1" y="0.1" class="st0" width="611" height="791"/>
  <path class="st1" d="M143.4,700.5l381.3-381.3c35.2-35.2,35.2-92.3,0-127.5L332.1-0.9H0.1v685.6l15.8,15.8C51.1,735.7,108.2,735.7,143.4,700.5z"/>
  <path class="st2" d="M1.5,617.6c29.2,22.6,71.4,20.5,98.2-6.31315.2-315.2c29.1-76.3,0-105.4L1.5,617.6z"/>
</svg>
```
<text transform="matrix(1 0 0 1 419.998 615.9277)
class="st2 st5 st6">

$\{//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/author')]\}$
</text>

<text transform="matrix(1 0 0 1 419.998 660.9277)
class="st2 st5 st6">

$\{//*[contains(@class, 'bookmap/bookmeta')]//*[contains(@class, 'topic/created')]/@date\}$
</text>

<text transform="matrix(1 0 0 1 471.998 749.9277)
class="st2 st5 st7">

©
$\{concat(//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'bookmap/bookrights')]/*[contains(@class, 'bookmap/organization')], ' ',
//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'bookmap/bookrights')]/*[contains(@class, 'bookmap/copyrlast')]/*[contains(@class, 'bookmap/year'))\}$
</text>

<text transform="matrix(0.7071 -0.7071 0.7071 0.7071 88.1369 568.6693)
class="st9 st5 st8">

$\{//*[contains(@class, 'front-page/front-page-title')]/*[contains(@class, 'bookmap/mainbooktitle')]\}$
</text>
</svg>

Notes:

- XPath expressions are not expanded if the SVG template is open in Author mode.
- XPath expressions can be tested (without ${}) using the XPath/XQuery Builder view.
- XPath Conditional Expressions, For Expressions, and Let Expressions are supported.

Important:

- If you received the SVG image from someone else (e.g. a graphics designer), make sure that the text from the image was not converted to glyph shapes and that it is rendered using the <text> element.
- The SVG <text> element does not wrap the text if it overflows the image. If you have longer text that needs to be rendered, you might consider using multiple <text> elements and more evolved XPath expressions (for example, using the substring() function) to place the text on multiple lines.

Tip:
You can ask a designer to fill the image with some placeholders that you can later find and replace with your XPath expressions. In the above SVG, the designer could place the text
Here comes the author, that you replace with

```xml
<text transform="matrix(1 0 0 1 419.998 615.9277)" class="st2 st5 st6">
  Here comes the author
</text>
```

4. The CSS stylesheet should declare the template file as a **background-image for the cover (on page 1466)**. Also the following example hides the `<mainbooktitle>` and its bookmark (it is displayed in the template):

```css
@page front-page {
  background-image: url("cover.template.svg");
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~="bookmap/booktitle"] {
  display: none;
}

*[class ~="front-page/front-page-title"]
> *[class ~="bookmap/booktitle"]
> *[class ~="bookmap/mainbooktitle"] {
  bookmark-level: 0;
}
```
5. After the transformation, the final document cover will look like this:

How to Use XPath Expressions in CSS (on page 1430)
SVG Templates
Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (on page 1427), the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmark (after the title), but allows for the usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmark. It only contains some of the possible metadata elements. The `<bookmeta>` metadata section is inherited from `<topicmeta>`:

```xml
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
    class="- map/map bookmark/bookmap "
    ditaarch:DITAArchVersion="1.3">

        <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
                class="- map/topicmeta bookmark/bookmeta ">
            <author class="- topic/author ">Howe Tuduit</author>
            <bookid class="- topic/data bookmark/bookid ">
                <isbn class="- topic/data bookmark/isbn ">071271271X</isbn>
                <booknumber class="- topic/data bookmark/booknumber ">SG99-9999-00</booknumber>
                <maintainer class="- topic/data bookmark/maintainer ">
                    <organization class="- topic/data bookmark/organization ">ACME Tools</organization>
                    <person class="- topic/data bookmark/person "/>
                </maintainer>
            </bookid>
            <bookrights class="- topic/data bookmark/bookrights ">
                ...
                <bookowner class="- topic/data bookmark/bookowner ">
                    <organization class="- topic/data bookmark/organization ">ACME Tools, Inc.</organization>
                </bookowner>
            </bookrights>
        </bookmeta>
    </oxy:front-page>
</bookmap>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<oxy:front-page-title>
...

Maps
The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Metadata - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-meta.css file contains the rules that extract metadata.

How to Create a Searchable PDF

To make a PDF searchable, you need to add some `<keyword>` or `<indexterm>` elements inside bookmaps, maps, or topics. Most of the search engines will parse the resulting document and extract those keywords and create a search base.

**Note:**
Both `<keyword>` and `<indexterm>` elements can be combined inside the `<keywords>` element. They will be equally processed by the search engine.

In the generated PDF, keywords are displayed in the Document Properties.

Bookmaps

If you want your keywords to appear inside a bookmap, you need to define them inside the `<bookmeta>` element:

```xml
<bookmap>
  ...
  <bookmeta>
    <keywords>
      <keyword>web server</keyword>
      <keyword>hard disk</keyword>
    </keywords>
  </bookmeta>
</bookmap>
```

Maps

If you want your keywords to appear inside a map, you need to define them inside the `<topicmeta>` element:

```xml
<map>
  ...
  <topicmeta>
    <keywords>
      <keyword>flowers</keyword>
      <indexterm>care and preparation</indexterm>
      <keyword>seasons</keyword>
    </keywords>
  </topicmeta>
</map>
```

Topics

If you want your keywords to appear inside one or more topics, you need to define them inside the `<prolog>` element:
Warning:
Keywords must be at map level or at topic level, you cannot combine them.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a <topicmeta> element in a <map> as in the following example:

```
<map>
...
<topicmeta>
...
<audience type="programmer" job="programming" experiencelevel="expert"/>
```

To collect the @type attribute, add the following in your customization CSS (on page 1424):

```
*[@class ~= "map/map"] > *[@class ~= "map/topicmeta"] > *[@class ~= "topic/audience"] { 
  -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

Notice:
It is best to use the class selector (such as *[@class ~= "map/topicmeta"]) instead of topicmeta to cover cases where the elements are specialized (for instance, in a bookmap the bookmeta is a topicmeta, so your selector will also function for bookmaps, not only simple maps.

Note:
The selector begins with map > to choose the <topicmeta> that is a direct child of the map, not other <topicmeta> elements from other <topicref> elements.

Tip:
You can define multiple key value pairs by separating them with commas:
The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:

![Document Properties dialog box](image)

**How to Show Metadata in the Cover Page**

The following CSS extensions are used in the subsequent examples:

- **oxy_xpath** - Executes an XPath expression and returns string content. Use this whenever you need to extract data from an element other than the one matched by the CSS rule selector.

- **:after(N)** - Creates more than one after pseudo-element. The argument value represents how far the generated content is from the real content. For example, in the second code snippet in the next section (on page 1488), the content of the :after is closer to the title (upper) than the content of the :after(2).
Note:
The attr() CSS function can also be used but it is limited to extracting attribute values from the matched element.

Processing Metadata for Bookmaps

Suppose you need to present the **Author** and the **ISBN** (when it exists) just under the publication title and suppose your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tuduit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
  </bookmeta>
  <bookid>
    <isbn>071271271X</isbn>
    <booknumber>SG99-9999-00</booknumber>
  </bookid>
  ...
</bookmap>
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so if you need to add the information after it, in your customization CSS *(on page 1424)*, add the following CSS rules:

```css
*[class ~="bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")/*[contains(@class, " topic/author ")]/text()"');
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class ~="bookmap/booktitle"]:after(2) {
  display: block;
  content: oxy_xpath("if('//*[contains(@class, " bookmap/isbn ")] then concat("ISBN ", //*[contains(@class, " bookmap/isbn ")]/text()) else "")");
  text-align: center;
}````
### Processing Metadata for DITA Maps

Suppose you need to present the **Revision Date** just under the publication title and suppose your DITA map contains:

```xml
<map>
    <title>Growing Flowers</title>
    <topicmeta>
        <critdates>
            <revised modified="2021-04-26"/>
        </critdates>
    </topicmeta>
</map>
```

The entire `<title>` element content is displayed on the first page of the PDF. If you need to add the information after it, add the following CSS rules in your **customization CSS** *(on page 1424)*:

```css
*[class ~= "front-page/front-page-title"] > *[class =~ "topic/title"]:after {
    display: block;
    content: "last revision " oxy_xpath("//*[contains(@class, " map/topicmeta ")][][1] \
    //*[contains(@class, " topic/revised ")]/@modified");
    margin-top: 4em;
    text-align: center;
    color: gray;
}
```

**Note:**
The [1] predicate is used to avoid duplicated results as the `topicmeta` is included in all children topics.

### Generating Synthetic Pages for Metadata

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content in it. Add the following rules in your **customization CSS** *(on page 1424)*:

```css
@page page-for-meta {
    background-color: yellow; /* Just to see it better*/
    @top-left-corner {
        content:""; /* Remove the default header */
    }
    @top-right-corner {
        content:""; /* Remove the default header */
    }
}
```
How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using string-sets.

If you need to add some of the map metadata to the header of the front page (for example, the creation date), add the following CSS rules in your customization CSS (on page 1424):

```css
*[^class ~="bookmap/booktitle"]:after {
  page: page-for-meta;
}

*[^class ~="bookmap/booktitle"]:after(2) {
  page: page-for-meta;
}

@page front-page {
  @top-center {
    content: "Created: " string(mapcreated);
  }
}
```

**Note:**
The front-page is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Show Metadata Information (Revision History) in the Topic Prologue

This topic explains how to present metadata information that is normally hidden in the published output. For the example that follows, this will be the revision history list:

```xml
<task id="task_3ml_qm3_rf">
  <title>Removing the battery</title>
  <shortdesc/>
  <prolog>
    <change-historylist>
```

```xml
```
By default, the `<prolog>` element is hidden (display:none) and has several properties that make it collapse, even if the display property is changed.

- It has a transparent color.
- The font has size zero.
- The width and height values are zero.

Start by resetting the prolog properties, but only for prologs that contains a history list. The others will be kept hidden.

```html
*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist"]){
    display:block;
    color:inherit;
    font-size:1rem;
    width:auto;
    height:auto;
}
```

Next, the following will keep the children of the prolog hidden (other than the change history):

```html
*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist"]) >
*:not([class~="relmgmt-d/change-historylist"]){
    display:none;
}
```

The `<change-item>`, `<change-revisionid>`, and `<change-completed>` (like the descendents of the `<change-historylist>`) are specializations of the `topic/data` element and are also hidden in the output, so you need to make them visible. In the following selector, you can add more classes, depending on what elements you want to be visible.

```html
*[class~="relmgmt-d/change-item"],
*[class~="relmgmt-d/change-revisionid"],
*[class~="relmgmt-d/change-completed"]:not([class~="relmgmt-d/change-historylist"]) {
    display:block;
}
```
Now some styling for the entire list:

```css
*[[class~="relmgmt-d/change-historylist"]] {  
  font-size: 1rem;  
  border: 3pt solid silver;  
  padding: 0.5em;  
}
*[[class~="relmgmt-d/change-historylist"]]:before {  
  content: "Revision History:";  
  font-weight: bold;  
}
```

And the child elements:

```css
/* Example of styling some of the descendends of the history list. */
*[[class="relmgmt-d/change-item"]] {  
  margin: 1em;  
}
*[[class="relmgmt-d/change-revisionid"]]:before {  
  content: "Revision ID: " !important;  
  font-weight: bold;  
}
*[[class="relmgmt-d/change-completed"]]:before {  
  content: "Completed: " !important;  
  font-weight: bold;  
}
```

In the output, the history list is now visible:

```
Removing the battery

Revision ID: abd3  
Completed: Build no 1.

Revision ID: bc72  
Completed: Build no 2.
```

**How to Remove or Change the PDF Keywords**

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your customization CSS (on page 1424):
To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:

```xml
:root {
  -oxy-pdf-meta-keywords:"alpha, beta, gamma";
}
```

If you need to extract them by other criteria from the merged map, you can use the `oxy_xpath()` function instead of the hard-coded list.

### How to Remove the PDF Publication Title Property

The title defined in the PDF reader is automatically collected from the map's main title.

If you want to display the map name instead of the title, you can use one of the following rules in your customization CSS (on page 1424):

```xml
/*
 * Titles (maps).
 */
/*[class =~ "front-page/front-page-title"] *[class =~ "topic/title"]:not([class
  =~ 'bookmap/booktitle']) {  
  -oxy-pdf-meta-title: unset;
}

/*
 * Titles (bookmaps).
 */
/*[class =~ "front-page/front-page"] *[class =~ "bookmap/booktitle"] > *[class
  =~ "bookmap/mainbooktitle"] {  
  -oxy-pdf-meta-title: unset;
}
```

### How to Change the PDF Publication Title Property

The `<title>` element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```xml
<booktitle>
  <booklibrary>Retro Tools</booklibrary>
  <mainbooktitle>Main Book Title</mainbooktitle>
  <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```
For the publication title, the built-in CSS uses only the content of the `<mainbooktitle>`. If you want to collect all of the text from the `<booktitle>`, you can add the following rule to your customization CSS (on page 1424):

```css
:root {
  -oxy-pdf-meta-title: oxy_xpath('//*[contains(@class, "bookmap/booktitlealt")]')[1]/text();
  -oxy-pdf-meta-description: "";
}
```

An XPath expression is used to collect all the `<booktitlealt>` elements from the merged map, select the first one, then use its text.

The built-in CSS uses the `<booktitlealt>` as the PDF description. In the example above, this property is cleared since it was moved as a title.

### How to Use Data Elements from the Map to Create Custom PDF Metadata

To use a key value in the CSS, the key must be referenced from the content (either a topic or map).

If you do not have it referenced, you may force a reference by using the `<topicmeta>` or `<bookmeta>` section of your map and a `<data>` element. This has no effect on the published content, but allows the CSS rules to use its content.

```xml
<bookmeta>
  ....
  <data keyref="my_key"/>
  ....
</bookmeta>
```

This is expanded in the merged HTML file to:

```html
<div class="map/topicmeta bookmap/bookmeta topicmeta bookmeta">
  ...
  <div keyref="my_key" class="topic/data data">
    <div class="topic/keyword keyword">
      KEY VALUE
    </div>
  </div>
  ...
</div>
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this `<data>` element:

```css
*[class =~ "topic/data"][keyref="my_key"] { 
  string-set: key-string content(text);
}
@page { 
  @bottom-left { 
    content: "My key is: " string(key-string) !important;
  }
```
Or you can use the value from a :before pseudo-element, like the one for the title:

```
*[class ~= "topic/title"]:before {
    content: oxy_xpath("//*[@class, 'topic/data']/*[@keyref = 'my_key']//text()");
}
```

Another use-case is to use the key as a source for a custom PDF document property:

```
*[class ~= "topic/data"]*[keyref='my_key'] {
    -oxy-pdf-meta-custom: attr(keyref) content(text);
}
```

### How to Control the PDF Viewer

The PDF document may contain settings for the PDF Viewer. This helps to make the viewing experience common for all of the readers. For example, you can specify the zoom level that the document is presented, or whether the outline view should be displayed.

There are several CSS properties you can use. These properties should be set on the root element. If they are set on multiple elements, the first one will be taken into account.

**Examples**

- To hide the PDF Viewer toolbar and menu bar:
  ```
  :root {
    -oxy-pdf-viewer-hide-menubar: true;
    -oxy-pdf-viewer-hide-toolbar: true;
  }
  ```

- To make the document be displayed with a different zoom level:
  ```
  :root {
    -oxy-pdf-viewer-zoom: 50%;
  }
  ```

- To make the PDF Viewer just as large as the displayed document (e.g. if there is a zoom level that makes the document smaller, then the window of the viewer will be just as big as the page):
  ```
  :root {
    -oxy-pdf-viewer-fit-window: true;
  }
  ```

- If you need the pages to be displayed as a single continuous column (to be able to scroll in a single view port), use:
The supported include: single-page, two-columns-left, and more.

• To make the document outline view visible, use:

```xml
:root {
    -oxy-pdf-viewer-page-mode: use-outlines;
}
```

The supported values include: use-thumbs, use-none. For more details, see the list of Chemistry extension CSS properties.

**Front Matter and Back Matter**

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

**Front Matter and Back Matter - XML Fragment**

In the merged map file *(on page 1427)*, the *frontmatter* topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true`:

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <oxy:front-page class="- front-page/front-page ">
        ...
    </oxy:front-page>
</bookmap>

<opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder" class="- toc/toc ">
    ...
    <frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" class="- map/topicref bookmap/frontmatter ">
        ...
    </frontmatter>
</opentopic:map>

<concept class="- topic/topic concept/concept ">
    @is-frontmatter="true"
    @topicrefclass="- map/topicref bookmap/bookabstract ">
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...
    <div class=" front-page/front-page front-page">
        ...
    </div>
    <div class=" toc/toc toc">
        ...
        <div class=" map/topicref bookmark/frontmatter topicref frontmatter">
            <div href="#unique_2" type="topic" class=" map/topicref topicref">
                ...
            </div>
        </div>
    </div>
    <article class=" topic/topic concept/concept topic concept nested0"
        is-frontmatter="true"
        topicrefclass=" map/topicref bookmark/bookabstract " ...
```

**Note:**
The process also applies for the backmatter topic references inside a `<backmatter>` element with the `bookmark/backmatter` class and referenced content with the `@is-backmatter="true"` attribute both in the merged map and merged HTML files.

**Front Matter and Back Matter - Built-in CSS**

The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css`. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

**Related Information:**
Page Headers and Footers *(on page 1439)*

**How to Remove Page Breaks Between Front Matter Child Topics**

If you do not like the fact that all the topics that enter a bookmark frontmatter start on a new page, you can disable this by using the following rules in your customization CSS *(on page 1424)*:

```css
*[class =~ "map/map"] > *[class =~ "topic/topic"][is-frontmatter] {  
    page-break-before: auto;
}
```
How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmap elements are formatted using the `matter-page` as defined in Default Page Definitions (on page 1432). In the merged file, the `<backmatter>` and `<frontmatter>` elements are omitted, and their child topic content is matched using a CSS rule like the one below:

```css
*[class ~="map/map"] > *[class ~="topic/topic"] [is-backmatter],
*[class ~="map/map"] > *[class ~="topic/topic"] [is-frontmatter] {
    page: matter-page;
    ...
}
```

Style the Topics Depending on Their Role

There might be cases when you need to distinguish between certain types of topics that have different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```xml
<topic
    class="- topic/topic"
    id="unique_1"
    topicrefclass="- map/topicref bookmap/preface " .. >
    ...
</topic>
```

This can be used to match and apply various styling choices, or even a particular page layout:

```xml
@page preface-page {
    background-color:silver;
    @top-center{
        content: "Custom Preface Header";
    }
}
```
Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- [PLUGIN_DIR]/css/print/p-numbering-shallow.css
- [PLUGIN_DIR]/css/print/p-numbering-deep.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see Numbering Types (on page 1503).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of <topicref> elements.
<div class="- map/map map" ...
  ...
</div>

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: [INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```xml
  <oxy:front-page-title>
    <title class="- topic/title ">Publication Title</title>
  </oxy:front-page-title>
</oxy:front-page>
```

The main content is organized as follows:

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/">
  ...
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>

  <topic is-chapter="true" oid="dcpp_overview">
    <title class="- topic/title ">Overview</title>
    <body class="- topic/body ">
      ...
    </body>
  </topic>

  <topic class="- topic/topic " id="unique_2" oid="dcpp_resources">
    <title class="- topic/title ">Resources</title>
    ...
  </topic>
```

For the DITA Map PDF - based on HTML5 & CSS transformations:

```
<topic class="- topic/topic" id="unique_2" oid="dcpp_parameters">
    <title class="- topic/title">Parameters</title>
    ...
</topic>
```

```
For the DITA Map PDF - based on HTML5 & CSS transformations:

```
<map class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
    <title class="- topic/title">Parameters</title>
    ...
</map>
```

```
<map class="- topic/topic topic" id="unique_2" oid="dcpp_resources">
    <title class="- topic/title">Resources</title>
    ...
</map>
```

```
<map class="- topic/topic topic" id="unique_2" oid="dcpp_overview">
    <title class="- topic/title">Overview</title>
    ...
</map>
```

**Note:**

The topic content comes after the `<opentopic:map>` element.

**Note:**

The child topics are the elements that have the class `- topic/topic` included in the parents.

**Note:**

The ones identified as chapters have the `@is-chapter` attribute set.

**The Titles of Chapters**

The titles from the content are children of the topics:
For the DITA Map PDF - based on HTML5 & CSS transformations:

```
<topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">

<title class="- topic/title ">Parameters</title>

...

</topic>
```

Note:
The title elements have the class: - topic/title. The actual element name can be different.

**Numbering Types**

The type of numbering that appears in your publication is controlled by the `args.css.param.numbering` parameter.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (shallow numbering). The following values are accepted:

**Table 14. Types of Numbering**

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections/Nested Topics</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>numbered</td>
<td>no</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep</td>
<td>numbered</td>
<td>numbered</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>restarted at the beginning of each chapter</td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>from the start of the publication</td>
</tr>
</tbody>
</table>
Table 14. Types of Numbering (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections/ Nested Topics</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>of tables and list of figures sections</td>
<td></td>
</tr>
</tbody>
</table>

Note:
When using any of the deep numbering types, no distinction is made between sections and nested topics. For example, if a topic contains two sections, followed by another nested topic, the sections will be numbered with 1 and 2, and the nested topic with 3.

Notice:
The `deep-chapter-scope` and `deep-chapter-scope-no-page-reset` values are only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Examples

Shallow
Each chapter (or first-level topic) is numbered, but sections/nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

Chapter 1. First Chapter

Page 1
Topic
  Section
  Table 1
  Table 2
Topic
  Section
Page 2
  Table 3

Chapter 2. Second Chapter

Page 3
Topic
  Table 4
  Table 5
Topic
Page 4

It will result in the following content inside the PDF:
All chapters (or first-level topics) and sections/nested topics are numbered (these are also prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1
   Topic 1.2
   Table 2
   Page 2
   Table 3
2. Second Chapter
   Page 3
   Topic 2.1
   Table 4
   Table 5
   Topic 2.2

List of Tables
   Table 1: Flowers
3.1. Spring Flowers................................................................4
   3.1.1. Iris......................................................................4
   3.1.2. Snowdrop...........................................................6
...

List of Figures
   Figure 1: Iris

List of Tables
   Table 1: Flowers

Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, pages, figures, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

1. First Chapter
   Page 1.1
   Topic 1.1
   Table 1-1
   Link to page 2.2
   Topic 1.2
   Page 1.2
   Table 1-2
2. Second Chapter

   Topic 2.1
   Table 2-1
   Table 2-2
   Table 2-3
   Topic 2.2
   Table 2-4
   Page 2.2
   Link to page 1.1

It will result in the following content inside the PDF:

1. Introduction.................................................................1
2. Care and Preparation......................................................1
   2.1. Pruning.................................................................1
   2.2. Garden Preparation..................................................2
3. Flowers by Season.......................................................1
   3.1. Spring Flowers.......................................................1
Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, figures, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1-1
   Link to page 4
   Topic 1.2
   Page 2
   Table 1-2

Tip: When using deep numbering, if you want to exclude sections from being numbered, see How to Include Topic Sections in TOC (on page 1510).

How to Reset Page Numbering at First Chapter/Part

By default, pages are numbered from the start of the publication, but in some cases, you may need to restart the page numbering at the first chapter of your publication.

Warning: The following sections do not apply for args.css.param.numbering="deep-chapter-scope" because it already define a specific numbering scheme that resets the page number at each chapter.

Reset Page Numbering in Shallow Context

To reset the page counter at the first part/chapter when the args.css.param.numbering="shallow" parameter value is set, use the following rules in your customization CSS (on page 1424):

```
*[class ~="map/map"] > :not([class ~="topic/topic"])[is-chapter] + *[class ~="topic/topic"][is-chapter] { counter-reset: page 1; }
*[class ~="map/map"] > :not([class ~="topic/topic"])[is-part] + *[class ~="topic/topic"][is-part] { counter-reset: page 1 chapter; }
```

Reset Page Numbering in Deep Context

To reset the page counter at the first part/chapter when the args.css.param.numbering="deep" parameter value is set, use the following rules in your customization CSS (on page 1424):

```
*[class ~="map/map"][numbering ^= 'deep'] > :not([class ~="topic/topic"])[is-chapter] + *[class ~="topic/topic"][is-chapter] { counter-reset: page 1 section1; }
```
Reset Page Numbering in Deep Chapter Scope No Page Reset Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep-chapter-scope-no-page-reset"` parameter value is set, use the following rules in your customization CSS (on page 1424):

```css
/*
 * [class ~="map/map"] [numbering = 'deep'] > :not([class ~="topic/topic"] [is-part]) + *[class
 ~= "topic/topic"] [is-part] {
    counter-reset: page 1 chapter chapter-and-sections;
}
*/
```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled deep numbering (on page 1503). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the `target-counters` CSS function to extract the entire context of the counters from the target. The `chapter-and-sections` built-in counter is already updated with both the chapter number and the nested topics:

```css
/*
 * [class ~="topic/xref"] :after {
    content: target-counters(attr(href), chapter-and-sections, ".") !important;
}
*/
```

This counter does not include the part number, so be careful when linking between parts (consider adding the target part number explicitly):

```css
/*
 * [class ~="topic/xref"] :after {
    content: "]" target-counter(attr(href), part, upper-roman) "/" target-counters(attr(href),
    chapter-and-sections, ".") "]" !important;
    color:blue;
}
*/
```

Related Information:

Numbering Types (on page 1503)
How to Include Topic Sections in TOC

To include topic sections in the table of contents, set the `args.css.param.numbering-sections` transformation parameter (on page 1401) to yes. In this case, they are numbered according to the numbering scheme set by the `args.css.param.numbering` parameter (on page 1503).

If you want to prevent topic sections from being numbered in your output, set the value of the `args.css.param.numbering-sections` parameter to no.

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```xml
<bookmap>
  ...
  <frontmatter>
  <booklists>
    <toc/>
    <figurelist/>
    <tablelist/>
  </booklists>
  </frontmatter>
  ...
  ...
</bookmap>
```

Related Information:
Table of Contents on a Page (Mini TOC) (on page 1517)
List of Tables/Figures (on page 1522)
Index (on page 1531)

Table of Contents - XML Fragment

In the merged map file (on page 1427), the `opentopic:map` contains a hierarchy of `topicref` elements, or other elements (such as `chapter` or `part`) that are specializations of `topicref`.

Each of the `topicref` elements include a `metadata` section that includes the topic title.

```xml
<bookmap ...

<oxy:front-page> ...
<oxy:front-matter> ...

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc ">
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div class="- bookmap/bookmap map map map bookmap" ...
```

```xml
<div class="- front-page/front-page front-page"> ...
</div>
```

```xml
<div class="- bookmap/frontmatter frontmatter"> ...
</div>
```

```xml
<div class=" toc/toc toc">
</div>
```

```xml
<div class="toc/toc-title toc-title" empty="true"/>
```

```xml
<div class="- topic/title bookmap/booktitle booktitle">
</div>
```

```xml
<div class="- topic/booklibrary booklibrary">
Retro Tools
</div>
```

```xml
<div class="- topic/mainbooktitle mainbooktitle">
Tasks
</div>
```

```xml
<div class="- topic/booktitlealt booktitlealt">
Product Tasks
</div>
```

```xml
<div class="- topic/navtitle navtitle">
Installing
</div>
```
Note:
The <oxy:toc-title> element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo-element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-toc.css.

Related Information:
Page Headers and Footers (on page 1439)

How to Increase TOC Depth

By default, only the first three levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see Table of Contents - Built-in CSS (on page 1512)) that hides topics on higher levels is:

```css
/* Hide sections below level 3. */
*[class ~="map/topicref"][is-chapter] >
*[class ~="map/topicref"]:not([is-chapter]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] {
```
If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

```css
*[class ~="map/topicref"] [is-chapter] >
*[class ~="map/topicref"]:not([is-chapter]) >
*{display:block;}
```

If the `args.css.param.numbering` parameter is set to a value other than `shallow`, you also need to add the following rules in your customization CSS:

```css
*{counter-increment: toc-chapter-and-sections;}
*{counter-reset: toc-chapter-and-sections;}
*{content: counters(toc-chapter-and-sections, ".") ". "}
How to Style the Table of Contents Entries

**Note:**
Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS *(on page 1424)*, add the following two selectors:

```css
/* The toc item label - the topic title */
*[class ~="map/topicref"] *[class ~="topic/navtitle"] { 
  font-style:italic;
  color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~="map/topicref"] *[class ~="topic/navtitle"]:after { 
  content: leader('-') target-counter(attr(href), page);
  color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```css
*[class ~="map/topicref"] *[class ~="map/topicref"] { 
  margin-left: 1em;
}
```

The numbers can be styled like this:

```css
*[class ~="map/topicref"] > *[class ~="map/topicmeta"]:before,
*[class ~="map/topicref"]
  > *[class ~="map/topicmeta"] > *[class ~="topic/navtitle"]:before{
    color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```css
*[class ~="map/topicref"][is-chapter = "true"] > *[class ~="map/topicmeta"] > *[class ~="topic/navtitle"]{
  font-size:2em;
}
```
How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named `table-of-contents`. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```css
@page table-of-contents: left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
@page table-of-contents: right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS (on page 1424):

```css
@page table-of-contents: left {
  @top-left {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
@page table-of-contents: right {
  @top-right {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
```

**Important:**

The first page from the table of contents does not have any content displayed in the header. The default CSS contains rules that disable the content. If you need to also display the numerals on the first page, use the following:

```css
@page table-of-contents:first: left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```
How to Make the Table of Contents Start on an Odd Page

In your customization CSS (on page 1424), add the following snippet for the `table-of-contents` page:

```css
@page table-of-contents {
    oxy-initial-page-number: auto-odd;
}
```

Related Information:
Double Side Pagination (on page 1524)

How to Display a Topic Before the Table of Contents

To display a topic before the `table-of-contents` page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```xml
<topicref href="pathToMyTopic" outputclass="before-toc">
</topicref>
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:
Controlling the Publication Content (on page 1610)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your customization CSS (on page 1424), add the following CSS selector:

```css
*[class ~="map/topicref"][is-chapter = "true"] > *[class ~="map/topicmeta"] > *[class ~="map/shortdesc"] {
```
Note:
If you need all the TOC item short descriptions to be visible, remove the \{is-chapter\} condition.

How to Remove Entries from the TOC

To remove entries from the table of contents, set the \@toc\="no" attribute on the topicrefs from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Hide the TOC

To hide the TOC, you have multiple options:

- [Recommended] Use a DITA \<bookmap\> instead of a \<map\>, and omit the \<toc\> element from the \<booklists\>. An example bookmap can be found in the DITA 1.3 Spec.
- Use the transformation parameter: hide.frontpage.toc.index.glossary (on page 1406).
- Use a display:none property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```html
*{\class \~\="map/map\"} > *{\class \~\="toc/toc\"} {
  display:none;
}
*{\class \~\="map/map\"} > *{\class \~\="toc/toc\"} > *{\class \~\="toc/title\"} {
  bookmark-label: none;
  -ah-bookmark-label: none;
}
```

Related Information:
Transformation Parameters (on page 1401)

Table of Contents on a Page (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmaps instead of regular maps.
- Set the args.chapter.layout transformation parameter to either of the following values: MINITOC or MINITOC-BOTTOM-LINKS.
Note:
If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

**Layout for MINITOC**

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.

---

**Chapter 1. Introduction**

**Topics:**

- About this framework.
- Description

**Description**

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

---

**Layout for MINITOC-BOTTOM-LINKS**

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter `<topicref>` in the map.
Chapter 1. Introduction

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Topics:

About this framework.
Description

About this framework.
The framework is DITA.

Description
The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```xml
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita" />
  <topicref href="topics/introduction-description.dita" />
</chapter>
```

The chapter-introduction.dita file provides the description content that is in the right side of the page. The children `<topicref>` elements generate the mini TOC links.

**Table of Contents for Chapters (Mini TOC) - XML Fragment**

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap the entire mini TOC and the description area.

**chapter/minitoc**

Wraps the entire structure, including the content of the chapter `<topicref>`.

**chapter/minitoc-links**

Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.
chapter/minitoc-desc

Contains the entire content of the topic file referenced by the chapter <topicref> element in the map.

When using the pdf-css-html5 transformation, this structure is converted to a set of HTML elements, preserving the class values:
DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-chapters-minitoc.css`.

How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links and put all the links in a colored rectangle with decimal numbers before them.

In your customization CSS (on page 1424), add the following selectors:
/* Change from inline to blocks to stack them one over the other. */

*[class="chapter/minitoc-desc"],
*[class="chapter/minitoc-links"] {
  display: block;
  width: 100%;
}

/* No need for the 'Topics:' label. */
*[class="chapter/minitoc-links"] *[class="topic/desc"] {
  display: none;
}

/* Add background for the links list. */
*[class="chapter/minitoc-links"] {
  background-color: silver;
  padding: 0.5em;
}

/* Remove the border and the padding from the description. We do not need that separator. */
*[class="chapter/minitoc-desc"] {
  border-left: none;
  padding-left: 0;
}

/* Add a number before each of the links. */
*[class="chapter/minitoc-links"] *[class="topic/link"] {
  display: list-item;
  list-style-type: decimal;
  margin-left: 1em;
}

Related Information:
How to Speed up CSS Development and Debugging (on page 1430)

List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the frontmatter or backmatter. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):
How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```
*{class~="placeholder/tablelist"} { 
  page:tablelist;
  color:green;
}
*{class~="placeholder/figurelist"} { 
  page:figurelist;
  color:green;
}
```

**Note:**

The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```
@page figurelist { 
  @top-left  { content: none; } 
  @top-center { content: "Figure List"; } 
  @top-right   { content: none; } 
}

@page figurelist:first { 
  @top-left  { content: none; } 
  @top-center { content: none; } 
  @top-right   { content: none; } 
}

@page tablelist { 
```
How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```xml
<entry class="- listentry/entry " href="#unique_6_Connect_42_fig_rjy_spn_xgb">
    <prefix class="- listentry/prefix ">Figure</prefix>
    <number class="- listentry/number ">4</number>
    <title class="- topic/title ">This is another figure</title>
</entry>
```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```css
* [class~="listentry/prefix"],
* [class~="listentry/number"] {
    display: none;
}
```

This works for both a list of tables and list of figures since the structure of each entry is the same.

To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```css
* [class="placeholder/figurelist"] * [class~="listentry/prefix"],
* [class="placeholder/figurelist"] * [class~="listentry/number"] {
    display: none;
}
```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.
Note:
For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: [INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css. You may choose to import this file from your customization CSS (on page 1424).

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (on page 1424), add the following:

```css
@page chapter {
    -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
    -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: `auto`, `auto-even`, `auto-odd`, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (on page 1424):

```css
@page chapter:blank, table-of-contents:blank {
    @top-left { content: none; }
    @top-center { content: none; }
    @top-right { content: none; }
    @bottom-left { content: none; }
    @bottom-center { content: none; }
    @bottom-right { content: none; }
}
```

Note:
This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.
How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (on page 1424), use the -oxy-force-page-count property with an even value:

```
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for -oxy-force-page-count include: even, odd, end-on-even, end-on-odd, auto, no-force.

How to Style the First page of a Chapter

You can use the :first page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the maptile string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (on page 1424), add the following:

```
@page chapter:first {
  @top-right-corner { content: string(maptile); }
  @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages

First, you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (on page 1432).

Next, add the column-count and column-gap properties to that page. For example:

```
@page chapter{
  column-count:2;
  column-gap:1in;
}
```
If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```css
*[class ~="topic/topic"] [is-chapter] > *[class ~="topic/title"] {  
column-span:all;
}
```

**Limitation:**
You cannot use multiple column configurations on the same page. Oxygen XML Author only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

### Change Layout for a Specific Topic

If you need to have a different column layout for just one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.
   ```html
   <topic outputclass="two_columns" ...>
   ```

2. Define a CSS rule that changes the `page` property for the matching element.
   ```css
   *[class ~="two_columns"],  
   *[outputclass ~="two_columns"] {  
   page: two_column_page !important;
   }
   ```

   **Tip:**
   In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

   **Note:**
   The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.
   ```css
   @page two_column_page {  
   column-count: 2;  
   }
   ```

   Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

### Change Column Breaks for Headings

If you need to start each topic on a new column, you can use the following technique:
Suppose you have the following map:

```xml
<map>
  <title>Map</title>
  <topicref href="first.dita"/>
  <topicref href="second.dita"/>
</topicref>
  <topichead navtitle="Topichead"/>
  <topicref href="second.dita"/>
</topichead>
</map>
```

You can use the following rules to get the chapter on the new column display:

```css
@page {
  column-count: 2;
}
*[class ~="topic/topic"] *[class ~="topic/topic"] > *[class ~="topic/title"] {
  -oxy-column-break-before: always;
}
*[class ~="topic/title"] + *[class ~="topic/topic"] > *[class ~="topic/title"] {
  -oxy-column-break-before: auto;
}
```

Each topic will be displayed on a new column except for topics that only have a title and no content.

**Related Information:**
- Page Formatting in Oxygen PDF Chemistry
- Multiple Page Formatting in Oxygen PDF Chemistry

**Bookmarks**

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

**PDF Bookmarks - Built-in CSS**

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-bookmarks.css`.

**How to Change the Bookmark Labels using the Navigation Title**

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.
This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

```
...<topicref href="topics/my_topic.dita" locktitle="yes">
<topicmeta>
  <navtitle>Introduction</navtitle>
</topicmeta></topicref>...
```

**Note:**
As a best practice, a `@locktitle` attribute with the value ‘yes’ is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

```
<topic id="other_topic" xml:lang="en-us">
  <title>Normal Title</title>
  <titlealts>
    <navtitle>Navigation Title</navtitle>
  </titlealts>
  <body>
  ...
```

**How to Control Bookmarks Depth and Sections Display in PDF.**

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example, to 2 levels), you can use the following CSS rules in your customization CSS *(on page 1424)*:

```
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
{ 
  bookmark-label:none;
}
```
These rules clear the labels generated by the titles starting with the depth of 3 (the topic nesting level is given by the selectors \*[class~="topic/topic"]).

By default, the PDF bookmarks also include the sections. If you need to remove them, you can use the following CSS rule in your customization CSS (on page 1424):

```
*{class ~="topic/topic"] > *{class ~="topic/title"],
*{class ~="topic/topic"] *{class ~="topic/topic"] *{class ~="topic/title"],
*{class ~="topic/topic"] *{class ~="topic/title"],
*{class ~="topic/topic"] *{class ~="topic/title"],
*{class ~="topic/topic"] *{class ~="topic/title"],
*{class ~="topic/title"] {
  bookmark-label: none;
}
```

How to Specify the Open/Closed PDF Bookmark State

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your customization CSS (on page 1424).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```
*{class="topic/topic"] > *{class="topic/title"],
*{class="topic/title"] {
  bookmark-state:open;
}
```

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS (on page 1424), add the following CSS rules:
**Important:**

This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```
*[class~="topic/topic"]:has([class~="topic/titlealts"]) > *[class~="topic/title"] {...}
```

**Related Information:**

Numbering (on page 1499)

**Index**

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```
<title>The topic title.</title>
<prelog>
<metadata>
  <keywords>
    <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
  </keywords>
</metadata>
</prolog>
<body>
    ......
```

or in the content itself:

```
... 
<p>Open the lid then turn the body pump to the right.  
<indexterm>Installing <indexterm>Water Pump</indexterm>  
</p>  
... 
```
If you are using a bookmap, you need to specify where the index list should be presented (for instance in the backmatter of the book. Technically, it is possible to also add it to the frontmatter, but this is unusual). This is done using a <indexlist> element in the <booklists> element (inside the <backmatter>):

```xml
<bookmap>
  ...
  <chapter href="tasks/troubleshooting.dita">
    ...
  </chapter>
  <backmatter>
    <booklists>
      <indexlist/>
    </booklists>
  </backmatter>
</bookmap>
```

For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

**Index - XML Fragment**

In the merged map file (on page 1427), the structure that holds the index tree is the opentopic-index:index.groups element.

```xml
<map class="- map/map ">
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title ">Request Support</title>
    ...
  </topic>
  <opentopic-index:index.groups id="d16e5548">
    ...
  </opentopic-index:index.groups>
</map>
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of opentopic-index:index.entry elements.
Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>`/<`oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
The index group content becomes:

```html
<div class="index/group group">
  <div class="index/label label">T</div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">table of contents</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e3988">[d16e3988]
    </div>
  </div>
</div>
<div class="index/entry entry">
  <div class="index/formatted-value formatted-value">change header</div>
  <div class="index/refid refid">
    <div class="index/link link" href="#d16e4176">[d16e4176]
  </div>
</div>
<div class="index/entry entry">
  <div class="index/formatted-value formatted-value">style</div>
  <div class="index/refid refid">
    <div class="index/link link" href="#d16e4120">[d16e4120]
  </div>
</div>
</div>
```

**Index - Built-in CSS**

All index styling is found in: [PLUGIN_DIR]css/print/p-index.css.
How to Style the Index Page Title and the Grouping Letters

In your customization CSS (on page 1424), add the following CSS rules:

```css
*{class ~="index/groups"} *{class ~="index/group"} *{class ~="index/label"} {
  font-size:1.5em;
  color:navy;
}

*{class ~="index/groups"}:before {
  content: "- Index - ";
  color:navy;
  font-size: 4em;
}
```

The result is:

- Index -

F
  footer 37
H
  header 37
T
  table of contents 32
  change header 35
  style 34

How to Style the Index Terms Labels

In your customization CSS (on page 1424), add the following CSS rule:

```css
*{class ~= 'index/groups'} *{class ~= 'index/formatted-value'} {
  font-style:oblique;
  color:gray;
}
```

The result is:
How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your customization CSS (on page 1424), add the following CSS rule:

```css
* [class~="index/formatted-value"],
* [class~="index/refid"] {
    display:inline;
}
/* Hide the sequences of links that actually do not contain links. */
* [class="index/group"] *[class="index/entry"] > *[class="index/refid"]{
    display:none;
}
* [class="index/group"] *[class="index/entry"] > *
* [class="index/refid"]:has(*[class="index/link"]){
    display:inline;
}
* [class="index/group"] *[class="index/entry"] {
    text-align:justify;
}
* [class="index/group"] *[class="index/entry"] > *
* [class="index/refid"]:before{
    content:leader(.'');
}
```

The output now contains the dots:
How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
* [class =~ "index/groups"] {
  counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```
* [class =~ "index/groups"] {
  counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (on page 1424):

```
@page index {
  @bottom-center {
    content: counter(page, decimal)
  }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:
You need to place the elements that have the following class on the same line:

- **index/formatted-value**
  - This is the text of the index term.

- **index/refid**
  - This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your customization CSS (on page 1424), add the following CSS rule:

```css
*[class~="index/formatted-value"],
*[class~="index/refid"]{
  display:inline-block;
}

*[class~="index/formatted-value"]{
  width:45%;
}

*[class~="index/refid"] {
  width:45%;
}
```
To avoid bleeding of the index term label, you may need to mark it as being hyphenated:
Appendices

The `<appendices>` element that is available in the DITA bookmap has a special behavior (based on its sibling nodes):

1. If the bookmap contains `<part>` elements, the `<appendices>` will behave as a part.
2. If the bookmap contains `<chapter>` (and no `<part>`) elements, the `<appendices>` will behave as a chapter.

**Note:**
The behavior includes page-break, numbering, and title rendering.

For example, if I define a bookmap with a `<part>` element, I will obtain:

```xml
<part>
  <chapter/>
  <topicref/>
  <chapter/>
</part>
<appendices> <!-- Appendices behaves like a Part -->
  <appendix/> <!-- Appendix behaves like a Chapter -->
  <appendix/>
</appendices>
```

For another example, if I define a bookmap with a `<chapter>` element only, I will obtain:

```xml
<chapter/>
  <topicref/>
  <chapter/>
<appendices> <!-- Appendices behaves like a Chapter -->
  <appendix/> <!-- Appendix behaves like a TopicRef -->
  <appendix/>
</appendices>
```

**Warning:**
If the `<appendices>` element is not defined and the `<appendix>` is used directly instead, then it will behave like a *Part* or *Chapter* using the same pattern as for `<appendices>`.

To activate hyphenation, see: How to Enable Hyphenation for Entire Map *(on page 1549).*
How To Control Page Break Within Appendices

If you define a bookmap with `<appendices>` and some `<appendix>` elements, you may want the parent `<appendices>` element to be on a separate page than its children. This is done automatically if the bookmap contains `<part>` elements. Otherwise, you may need to use the following in your CSS:

```
*'[topicrefclass =~ ^bookmap/appendix$']:first-of-type {
  page-break-before: always;
}
```

Footnotes

Footnotes are pieces of information that have several purposes, including citations, additional information (copyright, background), outside sources, and more. They are divided as follows:

- **The footnote call** - The number that remains in the content, usually superscripted.
- **The footnote marker** - The number displayed at the bottom of the page (the value matches the footnote call).
- **The footnote text** - The value of the `<fn>` element, also displayed at the bottom of the page.

Footnotes - Built-in CSS

Footnote properties are defined in [PLUGIN_DIR]/css/print/p-foot-notes.css.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers, use some colors, and change the footnote marker, add the following rules to your customization CSS:

```
*([class =~ ^topic/fn$]):footnote-call {
  font-weight: bold;
  color:red;
}
*([class =~ ^topic/fn$]):footnote-marker {
  content: counter(footnote) " / ";
  font-weight: bold;
  color:red;
}
```

To indent the footnote content displayed at the end of the page, add the following rules to your customization CSS:

```
*([class =~ ^topic/entry$]) > *([class =~ ^topic/fn$]) {
  padding-left: 1in;
}
```
How to Add a Separator Above the Footnotes

The @footnote part of a @page declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a leader. The leader uses a letter or a line style to fill the entire width of the page.

```xml
@page {
    margin: 0.5in;
    ...
    @footnote {
        content: leader(solid);
        color: silver;
    }
}
```

To create a dotted line, you can use the dot character: leader('\\'). Other commonly used characters are: "-" (dash) and "_" (underscore).

How to Reset the Footnotes Counter

It is possible to reset the footnote counter. For example, if you want to reset the counter at the beginning of each chapter, add one of the following rules to your customization CSS (on page 1424):

```xml
@page chapter {
    counter-reset: footnote 1;
}
```

```xml
*[class = "bookmap/chapter"],
*[class = "topic/topic"] [is-chapter] {
    counter-reset: footnote 1;
}
```

In a deep numbering context, you need to use the following rule instead:

```xml
*[class = "map/map"] [numbering ^= 'deep'] *[class = "topic/topic"] [is-chapter]:not([is-part]) {
    counter-reset: section1 0 footnote 1;
}
```

or can mark any element with an @outputclass value, match that value, and reset the counter at any point in your counter.
How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"
    exclude-result-prefixes="xs opentopic-func"
    version="2.0">

<!-- Match only top level tables (i.e tables that are not nested in other tables), that contains some footnotes. -->
<xsl:template match="*[contains(@class, 'topic/table')]
    [not(ancestor::*[contains(@class, 'topic/table')])]
    [//*[contains(@class, 'topic/fn')]]">
    <xsl:next-match>
        <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
    </xsl:next-match>
</xsl:template>

<!-- Create a list with all the footnotes from the current table. -->
<ol class="- topic/ol" outputclass="table-fn-container">
    <xsl:for-each select="//*[contains(@class, 'topic/fn')]">
        <li class="- topic/li" id="{if(@id) then @id else generate-id(.)}"
```
The footnotes that have an ID must be ignored, they are accessible only through existing xrefs (already present in the merged.xml file).

The above template already made a copy of these footnotes in the OL element so it is not a problem if markup is not generated for them in the cell.

The xrefs to footnotes with IDs inside table-cells. We need to recalculate their indexes if their referenced footnote is also in the table.

There is a reference in the table, recalculate index.
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2merged" file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:
7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
    ...
</publishing-template>`
8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

**Hyphenation**

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of the **PDF Chemistry** processor to perform hyphenation.

**Hyphenation Dictionaries**

The Oxygen XML Author provides built-in hyphenation patterns for the following languages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>de.CH</td>
<td>German (Switzerland)</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>en-GB</td>
<td>English (Great Britain)</td>
</tr>
<tr>
<td>es</td>
<td>Spanish</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>it</td>
<td>Italian</td>
</tr>
<tr>
<td>nb</td>
<td>Norwegian Bokmål</td>
</tr>
<tr>
<td>nl</td>
<td>Dutch</td>
</tr>
<tr>
<td>ro</td>
<td>Romanian</td>
</tr>
<tr>
<td>ru</td>
<td>Russian</td>
</tr>
<tr>
<td>sv</td>
<td>Swedish</td>
</tr>
<tr>
<td>th</td>
<td>Thai</td>
</tr>
<tr>
<td>pt</td>
<td>Portuguese</td>
</tr>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
</tbody>
</table>
The built-in hyphenation pattern license terms are listed in the XML files in the [CHEMISTRY_INSTALL_DIR]/config/hyph folder. Most of them comply with the *LaTeX* distribution policy.

**Installing New Hyphenation Dictionaries**

Oxygen XML Author uses the *TeX* hyphenation dictionaries converted to XML by the *OFFO* project: [https://sourceforge.net/projects/offo/](https://sourceforge.net/projects/offo/).

The `.xml` files allow you to access the licensing terms and you can use them as a starting point to create customized dictionaries (see *How to Alter a Hyphenation Dictionary (on page 1548)*).

The `.hyp` files are the compiled dictionaries that the Oxygen XML Author actually uses.

One simple way to add more dictionaries:

1. Download and extract the `offo-hyphenation-compiled.zip` file. This file is a bundle of many dictionary files.
2. Copy the `fop-hyph.jar` file to the `[OXYGEN_INSTALL_DIR]/lib` directory.
3. If you just need a single dictionary, place the `.hyp` or `.xml` file in the `[OXYGEN_INSTALL_DIR]/config/hyph` directory (create that directory if it is missing).

**How to Alter a Hyphenation Dictionary**

You can copy the dictionaries you need to change in another directory, then use the `-hyph-dir` parameter to refer them inside your transformation.

Each file is named with the language code and has the following structure:

```xml
<hyphenation-info>
  <hyphen-min before="2" after="3"/>

  <exceptions>
    o-mni-bus
    ...
  </exceptions>

  <patterns>
    préémi3nent.
    proémi3nent.
    surémi3nent.
    ....
  </patterns>
</hyphenation-info>
```
To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

**exceptions**

Contains the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-"), character. If a word does not contain this character, it will not be hyphenated.

For example, o-mni-bus will match the omnibus word and will indicate two possible hyphenation points.

>Note:

Compound words (i.e. e-mail) cannot be controlled by exception words.

**patterns**

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, tran3s2act indicates that the possible hyphenation points are "tran-s-act" and the preferable point is the first one, having the higher score of "3".

**How to Enable Hyphenation for Entire Map**

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. In your customization CSS (on page 1424), add:

```css
:root {
    hyphens: auto;
}
```
3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```css
*[class ~="topic/keyword"] {
    hyphens: none;
}
```

**How to Enable/Disable Hyphenation for an Element**

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. You have two options to control hyphenation inside an XML element:

   **CSS Approach**
Use the `hyphens` property.

For example, if you want to enable hyphenation in codeblocks:

```xml
*[class~="pr-d/codeblock"] {
    hyphens: auto;
}
```

If you want to disable hyphenation inside tables:

```xml
*[class~="topic/table"] {
    hyphens: none;
}
```

**Attribute Approach**

Use the `@outputclass="hyphens"` or `@outputclass="no-hyphens"` attributes/values.

For example, if you want to enable hyphenation in codeblocks:

```xml
<codeblock outputclass="hyphens">
    ...
</codeblock>
```

If you want to disable hyphenation inside tables:

```xml
<table outputclass="no-hyphens" ...>
    ...
</table>
```

**Note:**

The default built-in CSS enables hyphenation for tables:

```xml
*[class ~="topic/table"] {
    hyphens: auto;
}
```

**Related information**

How to Enable Line Wrap in Code Phrases *(on page 1603)*

How to Disable Hyphenation for a Word

**How to Define Hyphenation for a Specific Word**

1. Create a new hyphenation dictionary *(on page 1548).*
2. Add the word under the `<exceptions>` section using hard hyphen symbols between its segments.
3. To make sure the words from your document match against the ones from the "exceptions", make sure that you add capitalized/lower case variants as well.
How to Force or Avoid Line Breaks at Hyphens

It is possible to force or avoid line breaks inside words with hyphens (U+2010). This can be useful, for example, inside tables that have product references if you want the display to remain on a single line (or to split it on multiple lines). To achieve this, you can use the `-oxy-break-line-at-hyphens` property:

The accepted values are:

- **auto**
  
  Words are hyphenated automatically according to an algorithm that is driven by a hyphenation dictionary. This can lead to line breaks at hyphens.

- **avoid**
  
  Words are still hyphenated automatically except no line break will occur on hyphens.

- **always**
  
  Words are still hyphenated automatically except line breaks will be forced on hyphens.

**Example:**

Suppose you have a products table like this:

```xml
<table>
  <row>
    <cell>Product-1233-55-88</cell>
    <cell>120</cell>
  </row>
  <row>
    <cell>Product-1244-66-99</cell>
    <cell>112</cell>
  </row>
</table>
```

and the following rule in a CSS stylesheet:

```css
table {
  -oxy-break-line-at-hyphens: avoid;
}
```

In the output, the list of product references will be displayed in a single line. On the contrary, setting the property value to **always**, will force a break after each hyphen.
Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

**Related Information:**
Oxygen PDF Chemistry: Accessibility

**Accessibility - Built-in CSS**

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

**How to Create Fully Accessible Documents**

To make your documents fully accessible (PDF/UA1 compliant), do the following:

1. The accessibility standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your customization CSS (on page 1424). For instance, you can use:

   ```
   body { font-family: Arial }
   @page {
     @top-left {font-family: Arial }
     @top-right {font-family: Arial }
     @top-center {font-family: Arial }
     @top-left-corner {font-family: Arial }
     @top-right-corner {font-family: Arial }
     @bottom-left {font-family: Arial }
     @bottom-right {font-family: Arial }
     @bottom-center {font-family: Arial }
     @bottom-left-corner {font-family: Arial }
     @bottom-right-corner {font-family: Arial }
   }
   ```

2. Create a new transformation scenario (based on the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS built-in scenario).

3. In the Parameters tab, change the value of the `pdf.accessibility` parameter to yes.

4. Run the transformation.

**Archiving**

Your PDF files may need to be archived for security or legal reasons. In this case, the generated file must be compliant to the PDF/A ISO standard.
Related Information:
Oxygen PDF Chemistry: Archiving

How to Allow Document Archiving

To make your documents archive-able (PDF/A compliant), do the following:

1. The archiving standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your customization CSS (on page 1424). For instance, you can use:

```css
body { font-family: Arial }
@page {
    @top-left {font-family: Arial }
    @top-right {font-family: Arial }
    @top-center {font-family: Arial }
    @top-left-corner {font-family: Arial }
    @top-right-corner {font-family: Arial }
    @bottom-left {font-family: Arial }
    @bottom-right {font-family: Arial }
    @bottom-center {font-family: Arial }
    @bottom-left-corner {font-family: Arial }
    @bottom-right-corner {font-family: Arial }
}
```

2. Create a new transformation scenario, based on the DITA Map PDF - based on HTML5 & CSS built-in scenario.

3. In the Parameters tab, select a value for the pdf.archiving.mode parameter from the list.

4. Run the transformation.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

Notes:

- Before using a font, make sure you have the permissions to use it and make sure you comply with all the license terms.
- When installing a font on Windows, make sure you select the Install for all users option.

To use them in the customization CSS (on page 1424):
• You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
• You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
• You can use system fonts.

All these techniques are explained in: Oxygen PDF Chemistry User Manual: Fonts.

How to Avoid Characters Being Rendered as #

When the processor renders text with a font that does not include certain characters, those characters are replaced with the # symbol. This can easily be seen from Oxygen's Results view. For example:

```
[CH] Glyph "?" (0x7ae0) not available in font "Roboto-Regular".
```

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```
<dlentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```

If the font does not include this character, the output will look something like this:

```
# This is the right arrow.
```

To fix this you can either:

1. Install Arial Unicode MS font on your system. This is one of the PDF processor fallback fonts. Starting with version 24 there are additional fonts used as fallback as SimSun, Malgun Gothic and more, so if one of these are found on the system they will be used directly.
2. Specify the fallback font in your customization.

For the second case, if you use Times New Roman for the entire publication, you could add Symbol as the fallback font. In your customization CSS (on page 1424), add:

```
* {class ~ "topic/dlentry"} {
  font-family: "Times New Roman", Symbol;
}
```

To change the font for the entire publication, not just an element, you can use:

```
:root {font-family: "Times New Roman", Symbol !important; }
```

@page {
  @top-left {font-family: "Times New Roman", Symbol !important; }
}
Tip:
On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

Note:
It is also possible to use a generic family name as fallback, like serif, sans-serif or monospace, like this you will call upon the processor default fallback fonts system.

Warning:
Even if the message is a warning, sometimes it can lead to a failed transformation. This usually occurs for really special characters (different from letters or common characters).

How to Set Fonts in Titles and Content

Suppose that in your customization CSS (on page 1424), you have defined your font (for example, Roboto) using a Google web font:

https://fonts.googleapis.com/css2?family=Roboto:ital,wght@0,400;0,700;1,400;1,700&display=swap

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS (on page 1424), add an !important rule that associates a font to all the elements from the document:
Note:
If you want to use the :root selector instead of the * sector, without the !important qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, if you want to use another font for the document headings, your customization CSS (on page 1424) should contain the following rule:

```css
*[
  class ~="front-page/front-page-title",
  class ~="topic/title"
] {
  font-family: "Roboto", sans-serif !important;
  font-weight: bold;
}
```

Then, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: Debugging the CSS (on page 1426).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above * selector, you need to use more specific CSS selectors:

```css
*[class~="pr-d/codeph"],
*[class="topic/pre"] {
  font-family: monospace !important;
}
```

Important:
These settings do not apply to page margin boxes, only to the text inside the page. If you also want to change the font used in headers and footers, see: How to Change the Font of the Headers and Footers (on page 1441).

Related information
How to Change the Font of the Headers and Footers (on page 1441)

How to Use Fonts for Asian Languages
For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.
When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected, and so on until one is found that includes all the glyphs. A common font sequence for Asian languages is as follows:

```css
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (on page 1555).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the `-oxy-simulate-style:yes` CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry.

**How to Use Asian Fonts in Linux**

For Asian languages on Linux distributions, PDF Chemistry automatically uses DejaVu and Noto CJK as fallback fonts for Serif, Sans-Serif, and Monospace content.

**Warning:**

On some distributions, the Noto CJK fonts are not available. In this case, you need to install them using the system package manager:

- `fonts-noto-cjk` on Debian family distributions (e.g. Ubuntu).
- `google-noto-cjk-fonts` on Red Hat family distributions (e.g. CentOS).

**How to Add a New Asian Font**

If you want to add a specific font for Asian languages, you need to declare it inside your customization CSS (on page 1424). The following example uses the Noto Sans Tamil font-family:

```css
/* Font Declaration */
@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 400;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Regular.ttf);
}

@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 700;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Bold.ttf);
}
```
/* Font Usage */
*
* {
  font-family: sans-serif, "Noto Sans Tamil";
}

How to Set Fonts for Displaying Music

Music is rendered as normal text in most fonts, but some of them will render them as musical glyphs. For example, the MusGlyphs font converts the text to music and adjusts it to the surrounding text.

This font is divided in two sub-fonts that act for each of the following categories:

- **MusGlyphs** - Converts all characters that match a musical pattern into music glyphs. It should be used inside the elements that contain only music.
- **MusGlyphs-Text** - Converts only the text prefixed with the @ symbol into music glyphs. The remaining text is displayed normally.

To use this font, you simply need to declare each sub-font then use them in appropriate elements:

```css
@font-face {
  font-family: MusGlyphs;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs-Text.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: bold;
  src: url(../fonts/otf/musglyphs/MusGlyphs-TextBold.otf);
}

/*
* All the elements are displayed with the MusGlyphs-Text.
* If a text is prefixed with @, music will be displayed.
*/

body {

Comments, Highlights, and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 320. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

Note:

Comments with the Mark as Done flag selected appear with a check mark in the Comments section and with a Completed label (John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to no.

The comments and changes are included in the merged map file (on page 1427) either as XML elements `<oxy-insert>, <oxy-delete>, <oxy-comment>, <oxy-attributes>` in the case of the XML merged map, or as HTML elements with similar classes (oxy-insert, oxy-delete, oxy-comment, oxy-attributes) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

Tip:

These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.
Note:
The inserted text, deleted text, and deleted markup are included in the sticky notes, you can change this behavior by using the `show.changed.text.in.pdf.sticky.notes.content` parameter (on page 1408).

Related Information:
Transformation Parameters (on page 1401)
Debugging the CSS (on page 1426)

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in: `[PLUGIN_DIR]css/print/p-side-notes.css`.

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the merged map HTML file (on page 1427).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a `range` ([oxy-range-start](#) to [oxy-range-end](#)), the inserted text is highlighted by a `<span>` element with the class `oxy-insert-hl`, and the details are stored in a `<span>` element with the `oxy-insert` class.

```html
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-content">insert</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:38:29</span>
  <span class="oxy-tz">+02:00</span>
</span>

This is an insert!!

<span class="oxy-range-end" hr_id="1"/>
```

Comments

Similar to insertions, comments are defined in a `range` ([oxy-range-start](#) to [oxy-range-end](#)), the comment details in an element with the class `oxy-comment`, and the highlighted content is wrapped in the `oxy-comment-hl` element.
Note:
Comments that are marked as done have a flag="done" attribute:

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class oxy-attributes contains details about multiple attribute changes, each stored in an element with the class oxy-attribute-change.
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class oxy-delete-hl.

```html
<span class="oxy-range-start" id="sc_2" hr_id="2"/>
<span class="oxy-delete-hl">This is a deleted text. </span>
<span class="oxy-range-end" hr_id="2"/>
```

There is a structure that offers details about the deletion change, using the element with the class oxy-delete. This is linked to the above deletion range by the same ID value:

```html
<span class="oxy-delete" href="#sc_2" hr_id="2">
  <span class="oxy-author">dan</span>
  <span class="oxy-content"><img src="../img/ex.gif"></span>
  <span class="oxy-date">2018/03/14</span>
  <span class="oxy-hour">11:38:06</span>
  <span class="oxy-tz">+02:00</span>
</span>
```

Colored Highlights

To show some text as highlighted with a background color:

```html
<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>
```

How to Style Tracked Changes or Comments

Here are some examples showing how to customize tracked changes and highlighted text:

- If you want to change the highlighted text color from the document content, use the `@class="oxy-comment-hl"` attribute (or `@class="oxy-delete-hl"`, `@class="oxy-insert-hl"`):

  ```css
  .oxy-comment-hl {
    color:magenta;
  }
  ```

- If you want to change the range labels indicating the start or the end of a change (by default, formatted like this: “[n]...[/n]” where n is the change number), you can use the following selectors:

  ```css
  .oxy-range-start:before {
    content:'[START]';
    color:red;
  }
  .oxy-range-end:before {
  ```
If you want to only show the changes and comments highlights:

```
.oxy-range-start,
.oxy-range-end {
    display: none;
}
.oxy-insert,
.oxy-delete {
    display: none;
}
```

Note:
No comments will be displayed in the PDF Viewer Comments view after this modification.

How to Style Tracked Changes Shown as Footnotes

**Important:**
This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

Here are some examples showing how to customize footnotes:

- If you want to change the background color and the border of the comment footnote, add the following snippet in your customization CSS (on page 1424):

  ```
  .oxy-comment {
      background-color: inherit;
      border: 2pt solid yellow;
  }
  ```

  Similarly, you can style the other footnotes for `@class="oxy-attributes"`, `@class="oxy-delete"`, and `@class="oxy-insert"`.

- If you want to hide some footnotes (for example, the footnotes associated with the insertions, deletions, or attribute changes when your document contains a lot of tracked changes), add something like this in your customization CSS (on page 1424) (the following example results in the deletions and insertions being hidden, but the comments remain visible):

  ```
  .oxy-attributes,
  .oxy-delete,
  .oxy-insert{
  ```
How to Show Only Change Bars on Tracked Changes

It is possible to only display the change bars for tracked changes (inserted or deleted content) in the PDF document while hiding the other styling for the tracked changes. This is helpful if you want to see the document in a final version while still seeing change bars where content was inserted or deleted.

To achieve this, follow these steps:

1. Set the `show.changes.and.comments` parameter to `yes` and the `show.changes.and.comments.as.pdf.sticky.notes` parameter to `no`.

   **Step Result:** The first parameter causes tracked changes to be visible in your document and styled (e.g. insertions are blue and underlined, while deletions are red with a strike-through). Changing the second parameter to `no` causes the tracked changes to be displayed as a footnote instead of a PDF annotation.

2. Hide the footnotes by adding the following in your customization CSS *(on page 1424)*:

   ```css
   .oxy-attributes, .oxy-comment, .oxy-delete, .oxy-insert {
   float: initial;
   display: none;
   }
   ```

3. Remove the change range markers (the { and } symbols):

   ```css
   .oxy-range-start:before, .oxy-range-end:before {
   content: none;
   }
   ```

4. Remove the styling for the insertions and deletions:

   ```css
   .oxy-insert-hl{
   color: unset;
   text-decoration:none;
   }
   .oxy-delete-hl {
   content: "\200b";
   text-decoration:none;
   }
   .oxy-comment-hl{
   background-color:unset;
   ```
5. [Optional] You can improve the visibility of the change bars with this construct:

```css
.oxy-range-start[is-changebar]:before(100) {
  -oxy-changebar-color: red;
  -oxy-changebar-width: 3pt;
}
```

### Draft Watermarks

A watermark is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. Draft watermarks are used to indicate that a document is under construction or has not yet been approved.

### How to Add a Draft Watermark on All Pages

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (on page 1424):

```css
@page {
  background-image: url("draft.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}
```

If you have already set a background image for other pages (for example, the `front-page` or `table-of-contents`), the above selector won’t change them, as they are more specific.

The best practice is to use a different `draft.css` CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish the content as a draft, use the `draft.css` in your transformation scenario, otherwise directly reference the customization CSS (on page 1424).

**Related Information:**

Images and Figures (on page 1579)

### How to Add a Draft Watermark in the Foreground

If you want the watermark to be displayed above the text (in the foreground), instead of using the standard `background-image` property, you can use the `-oxy-foreground-image` property:
You can set a more specific selector if you just need to display the foreground in a subset group of pages (for example, `chapter`). In this case, the above selector will not change it since it is more specific.

**Note:**
The usage of SVG images is preferred because other image types suffer from **pixelation** and because foreground images are stretched to the full page size.

### How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a *Draft watermark* until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the `bookmeta/bookchangehistory` element).

```xml
<bookmeta>
  <author>John</author>
  <critdates>
    <created date="1/1/2015"/>
    <revised modified="3/4/2016"/>
    <revised modified="3/5/2016"/>
  </critdates>
  <bookchangehistory>
    <approved/>
  </bookchangehistory>
  ...
</bookmeta>
```

Use `oxy_xpath` every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the *Oxygen XPath Builder* view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```css
@page {
  background-image: url(oxy_xpath("if(/*[contains(@class, 'bookmap/approved')]) then '' else 'draft-watermark.png'"));
  background-position: center;
  background-repeat: no-repeat;
}
```

or use an element selector that restricts the watermark image only to the page area covered by that element:
Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```
<val>
  ...
  <prop action="flag" att="product" val="YourProd" backcolor="purple"/>
  ...
</val>
```

Related Information:
Change Bars
DITAVAL Elements

How to Flag Content Using Change Bars

As an example, to add a change bar (revision mark) for particular content, you can use the following in the DITAVAL file:

```
<val>
  <revprop action="flag"
    changebar="color:blue;style:solid;width:2pt;offset:1.25mm;placement:start" val="new"/>
</val>
```

This would result in any content that is marked with `@rev="new"` having a blue change bar.
How to Flag Content Using Images

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```xml
<val>
  <prop action="flag"
    att="product" val="MyProd"
    backcolor="blue"
    color="yellow" >

  <startflag imageref="startflag.jpg">
    <alt-text>This is the start of my product info</alt-text>
  </startflag>

  <endflag imageref="endflag.jpg">
    <alt-text>This is the end of my product info</alt-text>
  </endflag>

</prop>
</val>
```

Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (on page 1424) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (on page 1426).

Reusing the Styling for WebHelp and PDF Output

If you are using the pdf-css-html5 transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```html
<h1 class="title topic/title title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ...</p>
</div>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```html
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="- topic/body body">
  <p class="- topic/shortdesc shortdesc">When caring ...</p>
  <p class="- topic/p p">When caring for your flower garden you want ...</p>
</div>
```
It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```css
.shortdesc {
    font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

**Titles**

Titles in PDF can be classified into two categories:

- Table of contents titles, identified by the `map/topicref` and `topic/navtitle` class attributes.
- Content titles, that can be styled by matching the `topic/title` class attribute.

**How to Control Titles Layout**

By default, titles are rendered on a single line (with both the chapter/section number and title text). If the title is too long, the text wraps to the next line without any indentation.

```html
4.5.5 This is a long title
text that wraps.
```

If you want each line of the title to start at the same location (and indented), you need to set the value of the `args.css.param.title.layout` transformation parameter to `table`. This means that the chapter/section number is placed in one cell and title text is placed in another cell (resulting and indented text):

```html
4.5.5 This is a long title
text that wraps.
```

**How to Change Chapters Title Prefix**

**Changing Prefixes in Shallow Numbering**

In shallow numbering (default), to replace the "Chapter N." prefix, use the following rules in your customization CSS (on page 1424):

```css
/*[class =~ "map/topicref"]*[is-chapter]:not([is-part]) > *[class =~ "map/topicmeta"] > *[class =~ "topic/navtitle"]:before{
    content: "Module " counter(toc-chapter, decimal-leading-zero) " - " ;
}
/*[class =~ "topic/topic"]*[is-chapter]:not([is-part]) > *[class =~ "topic/title"]:before {
    content: "Module " counter(chapter, decimal-leading-zero) "\A" ;
}
```
Changing Prefixes in Deep Numbering

In deep numbering, to replace the "N." prefix, use the following rules in your customization CSS (on page 1424):

```css
*{class =~ "map/map"}[numbering ^= 'deep'] *{class =~ "topic/topic"}[is-chapter]:not([is-part]) > *{class =~ "topic/title"}:before,
*{class =~ "map/map"}[numbering ^= 'deep'] *{class =~ "topic/topic"}[is-chapter]:not([is-part])
*{class =~ "topic/topic"} > *{class =~ "topic/title"}:before {
    content: counters(chapter-and-sections, ".") "A";
}
```

How to Remove Parts and Chapter Title Prefixes

Removing Prefixes in Shallow Numbering

In shallow numbering (default), to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS (on page 1424):

```css
*{class =~ "map/topicref"} > *{class =~ "map/topicmeta"} > *{class =~ "topic/navtitle"}:before {
    display: none !important;
}
*{class =~ "topic/topic"} > *{class =~ "topic/title"}:before {
    display: none !important;
}
```

You can also choose to remove only the "Part N" prefix:

```css
*{class =~ "map/topicref"}[is-part] > *{class =~ "map/topicmeta"} > *{class =~ "topic/navtitle"}:before {
    display: none !important;
}
*{class =~ "topic/topic"}[is-part] > *{class =~ "topic/title"}:before {
    display: none !important;
}
```

Or to remove only the "Chapter NN" prefix:

```css
*{class =~ "map/topicref"}[is-chapter]:not([is-part]) > *{class =~ "map/topicmeta"} > *{class =~ "topic/navtitle"}:before {
    display: none !important;
}
*{class =~ "topic/topic"}[is-chapter]:not([is-part]) > *{class =~ "topic/title"}:before {
    display: none !important;
}
```
Removing Prefixes in Deep Numbering

In deep numbering, to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS (on page 1424):

```css
*[class ~="map/map"]*[numbering ^= 'deep']*[class ~="map/topicref"]>[class ~="map/topicmeta"]:before {
  display: none !important;
}
*[class ~="topic/topic"]>[class ~="topic/title"]:before {
  display: none !important;
}
```

How to Display Chapters Title on a Separate Page

You may want to display the chapters title on a separate page (for example, with a background). To do this, a new page should be defined in your customization CSS (on page 1424):

```css
@page chapter-title-page {
  background-image: url("resources/title-bg.png");
  background-repeat: no-repeat;
  background-size: 100% 100%;
  background-position: center;
}
```

After that, you need to replace the default "chapter" page definition with the one created before:

```css
*[class ~="topic/topic"]*[is-chapter] {
  page: chapter-title-page;
}
```

Then, you need to set it back on the content following the title:

```css
*[class ~="topic/topic"]*[is-chapter]>*[class ~="topic/title"] ~ *[class ~="topic/title"]{
  page: chapter;
}
```

Finally, you can customize the title color, size, and more:

```css
*[class ~="topic/topic"]*[is-chapter]:not([is-part])>*[class ~="topic/title"]{
  color: white;
  font-size: 32pt;
}
```

Default Chapter Page Definition (on page 1433)
Equations

This processor supports MathML equations.

How to Change the Font of MathML Equations

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```html
*{class ~="equation-d/equation-block"},
*{class ~="equation-d/equation-inline"}{
    font-family:"courier new";
    font-size:1.5em;
    padding:1em;
}
```

Note:
An equation can be rendered using multiple classes of fonts (e.g. the serif, sans serif, monospace, fraktur, and doublestruck classes. Depending on each of the equation symbols, a class is selected for it. The font specified in the CSS rule (as in the preceding example), applies only to the serif class. However, if a symbol codepoint is not covered by the currently selected class fonts, it falls back to the font specified in the CSS.

Attention:
Some of the fonts may not be supported. In that case, a default serif font is used.

Lists

This is the default layout for lists (values are in px):

Markers are displayed in the padding area, so they are not included in the principal block box.

The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists. To summarize:
• Setting the `padding-left` or `margin-left` properties on lists will move the whole list.
• Setting the `margin-left` property on list items will move the whole list.
• Setting the `padding-left` property on list items will only move the list item content (not the marker).

**Note:**
If the `padding-left` property is set on lists and the `margin-left` property is set on list items, the result will move the whole list with a combination of both padding and margin values.

**How to Align Lists with Page Margins**

It is possible to reposition the lists to align them with the rest of the text from the body.

The default CSS rules for the lists are as follows:

```css
ol {
    display: block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type: decimal;
    padding-left: 40px;
}
ul {
    display: block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type: disc;
    padding-left: 40px;
}
```

To align the lists, the following rules are sufficient in the customization CSS *(on page 1424)*:

```css
*[class~="topic/ol"],
*[class~="topic/ul"] {
    padding-left: 0;
    list-style-position: inside;
}
```

**Note:**
By default, the `list-style-position` property is set to `outside`.

**How to Style the List Markers**

For the media print, the default CSS rules for the list items use the `:marker` pseudo-class.
To eliminate the bold font weight for the items from ordered lists then add the following rules to your customization CSS (on page 1424):

```css
*[class~="topic/ol"] > *[class~="topic/li"]:marker {
    font-weight: normal;
}
```

For the unordered lists:

```css
*[class~="topic/ul"] > *[class~="topic/li"]:marker {
    font-weight: normal;
}
```

### How to Continue List Numbering

It is possible to continue the numbering of an ordered list even when the content is split on multiple `<ol>` elements.

You just need to define an `@outputclass` attribute on the lists where numbering should continue:

```xml
<ol @outputclass="continue">
    <li>First Item</li>
    <li>Second Item</li>
</ol>
<p>A paragraph</p>
<ol outputclass="continue">
    <li>Third Item</li>
</ol>
```

Then set the following content inside your CSS customization:

```css
*[class = "topic/ol"] {
    counter-reset: list-counter;
}
*[class = "topic/ol"][outputclass = "continue"] {
    counter-reset: none;
}
```
How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the list-style-type CSS Property.

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

```css
[class ~="topic/ol"] {
  list-style-type: lower-roman;
}
```

Change the Content of the :marker CSS Pseudo-Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the @outputclass attribute set to cyrillic:

```css
*[class ~="topic/ol"][@outputclass ~="cyrillic"] > *[class ~="topic/li"]:marker {
  width:3em;
}

*[class ~="topic/ol"][@outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(1):marker{ content:"а" }
*[class ~="topic/ol"][@outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(2):marker{ content:"б" }
*[class ~="topic/ol"][@outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(3):marker{ content:"в" }
*[class ~="topic/ol"][@outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(4):marker{ content:"г" }
```

**Important:**
This example will work only for lists up to 28 items. You will have to extend it for longer lists!

Links

Links allow the users to navigate through the documentation.

How to Change 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (on page 1424):

```
*[class = "topic/xref"] [href]:after,
*[class = "topic/link"] [href]:after {
    content: none !important;
}
```

Note:

A variant is to remove the "on page" label only and keep the page number:

```
*[class = "topic/xref"] [href]:after,
*[class = "topic/link"] [href]:after {
    content: " (" target-counter(attr(href), page) ")" !important;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```
*[class = "topic/entry"] *[class = "topic/xref"] [href]:after{
    content: none !important;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS (on page 1424), add this snippet:
How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (on page 1427) like this:

```xml
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link ">
      ...
      role="friend" scope="local" type="topic">
        <linktext class="- topic/linktext ">Salvia</linktext>
        <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>
```

If you need to hide these descriptions, add the following code in your customization CSS (on page 1424):

```css
* [class ~="topic/link"] > * [class ~="topic/desc"] { display: none; }
```

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

It is possible to group the links by target type (topic type) by setting the `args.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```
Related concepts
  Target Concept
Related tasks
  Target Task
```
Images are an important part of a publication.

Note:
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in [PLUGIN_DIR]css/print/p-figures-images.css.

```
*[class =~ "topic/image"] {
    prince-image-resolution: 96dpi;
    -ah-image-resolution: 96dpi;
    image-resolution: 96dpi;
    max-width: 100%;
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS (on page 1424), add the following snippet:

```
*[class =~ "topic/image"] {
    ...
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
    max-width: 6.5in;
}
```

Pay attention to images that have an image map (on page 1584) associated. The built-in rules set the max-width: auto for them to avoid scaling. Otherwise, it would cause a misalignment between the image and its clickable areas. These images are best to have a @width and @height attribute.
How to Change Image Resolution

How to Change the Resolution for Raster Images

This technique changes the size of all raster images from your documentation. It will not work for vector images, such as PDF or SVG.

The default resolution is 96 dpi (same as in web browsers). You can change it by adding the following in your customization CSS (on page 1424):

```css
*[class ~="topic/image"] {
    prince-image-resolution: 300dpi;
    -ah-image-resolution: 300dpi;
    image-resolution: 300dpi;
}
```

⚠️ Important:
The above selector does not apply to images from the `<imagemap>` element. You can use the following selector for that purpose:

```css
*[class ~="ut-d/imagemap"] > *[class ~="topic/image"] {
    ...
}
```

Make sure you verify the area shapes to match the new image boundaries. The pixels specified in the image map area coordinates are always 1/96 in. For more details, see: How to Use Image Maps (on page 1584).

How to Change the Resolution for Vector Images

This technique will change the size of all vector images (such as PDF or SVG) and will not affect raster images.

Vector images are rendered with a default resolution of 96 dpi. You can change this default value by setting the `image.resolution` transformation parameter (on page 1401) to another value (from 72, 120, 300 and 600).

How to Place Big Images on Rotated Pages

Wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1424), add:

```css
*[class=\"topic/image\"][outputclass='land'] {
    page: landscape-page;
}
```
Setting the `@outputclass` = 'land' attribute on the `<image>` element forces the image to be displayed on a new landscape page.

If you want to rotate the entire topic that contains the image, use:

```latex
*[class~="topic/topic"]*:has(*[class~="topic/body"] > *[class~="topic/image"][@outputclass="land"]),
*[class~="topic/topic"]*:has(*[class~="topic/body"] > *
* *[class~="topic/image"][@outputclass="land"]),
*[class~="topic/topic"]*:has(*[class~="topic/body"] > * > *
* *[class~="topic/image"][@outputclass="land"]) { page: landscape-page;
```

How to Place a Text and Image Side by Side

If you need to align text and an image side-by-side, you can use the following technique:

1. Organize your text and image inside a `<div>` element like this:

   ```html
   ...<div outputclass="side-by-side">
   <p> This will be in the left side, the next figure in the right. </p>
   <fig>
     <image href="cactus.jpeg"/>
   </fig>
   </div>
   ...
   ```

   **Note:**
   You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS *(on page 1424)*, add:

   ```css
   *[outputclass ~="side-by-side"] > *[class ~="topic/p"] { display:inline-block;
   width: 45%;
   }
   
   *[outputclass ~="side-by-side"] > *[class ~="topic/fig"] { display:inline-block;
   width: 45%;
   }
   ```

   The image should fill the entire width of the parent `<fig>` element:
By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```css
* [outputclass =~ "side-by-side"] > *[class =~ "topic/p"] { 
    vertical-align: top;
}
* [outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] { 
    vertical-align: top;
}
```

**Note:**

If your figure does not have a title, you can also set `font-size:0pt` to remove the font ascent and descent around the image rectangle.

```css
* [outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] { 
    vertical-align: top;
    font-size:0pt;
}
```

---

**How to Control the Image Size in Complex Static Content**

It is common to have text and images mixed together in a `:before` or `:after` pseudo-element. For example, for notes you may have both artwork and text:

```css
*[class =~ "topic/note"]::before { 
    content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- **Use the** `image-resolution` **CSS property:**

  ```css
  *[class =~ "topic/note"] { 
      image-resolution:300dpi;
  }
  ```

- **Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties.** You could use multiple `:before` pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the `:before` with the highest number in the brackets:
How to Center Images

DITA defines a @placement attribute for the `<image>` elements. The implicit value is inline. Suppose that you need to center the images that have the placement set to break (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS (on page 1424), add:

```css
* [class~="topic/fig"] {
    text-align: center;
}

/* Other images, with break placement. */
* [class~="topic/image"] [placement='break'] {
    display: block;
    text-align: center;
}

/*
Scaled images are getting a computed width attribute, so we can use the auto margins.
Auto margins function only if the block they apply to has a width.
*/
* [class~="topic/image"] [placement='break'] [width] {
    margin-left: auto;
    margin-right: auto;
    border: 2pt solid red;
}
```

How to Change/Reset the Figure Numbering

Note:
This topic is applicable for the DITA Map PDF - based on HTML5 & CSS DITA PDF - based on HTML5 & CSS transformation types.
There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

Figure NN. Lore Ipsum Title

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and the second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a :before selector on the `<figcaption>`:

```css
*[_class_ == "topic/topic"] [is-chapter] {
    counter-reset: figcount;
}

.fig--title-label{
    display:none;
}

*[_class_ == "topic/fig"] > .figcap:before{
    /* Add more styling or change the content if needed */
    content: "Figure " counter(figcount) ". ";
    counter-increment: figcount;
}
```

**How to Fix Missing Images**

If your images are not accessible, you may receive an error message in the transformation console like this:

Image not found. URI:file:/path/to/my/image

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`.

**How to Use Image Maps**

To use the DITA `<imagemap>` element in a PDF transformation, follow this procedure:
1. Start by determining the width and height of your image in *CSS pixels* and specify it on the `<image>` element using the `@width` and `@height` attributes.

**Notes:**

- A **CSS pixel** is 1/96 in, so if the image is created at a 96dpi resolution, one dot from the image is one pixel in the CSS space. If your image is displayed at another resolution *(on page 1580)*, then it is adjusted accordingly (for example, 192dpi results in two dots from the image being equal to one pixel in the CSS space).
- You can use other CSS units, including percentages. The percentages are solved relative to the image size and represent a way of creating responsive image maps.

**Warning:**

If you publish the content for both PDF and HTML web output, make sure you only use *pixels*, as some browsers only support these units.

**Example:**

Suppose you have a large image that is 6400x4800 dots, but you want to make it fit in a box of 640x480 CSS pixels. In the following snippet, this is done by specifying the width and height attributes. The areas must use coordinates relative to these values.

```xml
<imagemap>
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded" width="640" height="480">
    <alt>Gear Pump</alt>
  </image>
</imagemap>
```

2. In the map element, add areas (each with a shape and a set of coordinates):

```xml
<imagemap>
  ...
  ...
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>
  <area>
    <shape>poly</shape>
    <coords>568, 81, 576, 103, 468, 152, 455, 130</coords>
  </area>
</imagemap>
```
The type of areas are the ones defined in the HTML standard: circle, poly, rect, default. For more details, see: https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element.

**Warning:**
Areas coordinates are relative the image box and are not affected by the image resizing (change in image width/height or scaling), accordingly to the HTML specs:

“For historical reasons, the coordinates must be interpreted relative to the displayed image after any stretching caused by the CSS 'width' and 'height' properties (or, for non-CSS browsers, the image element's width and height attributes - CSS browsers map those attributes to the aforementioned CSS properties).”

**Tip:**
Adding the @scale attribute on the `<imagemap>` element will scale both the image and areas.

3. Verify how the shapes look in the output. You can make the shapes visible by one of the following methods:

- Using the `show.image.map.area.numbers` and `show.image.map.area.shapes` transformation parameters.
- Adding a CSS snippet to your customization. The shapes have the `image-map-shape` class, the bullet around the image map number (`image-map-number`), and the text inside the bullet (`image-map-number-text`). To make them translucent yellow:

```css
.image-map-shape {
    fill: yellow;
    fill-opacity: 0.5;
    stroke-opacity: 0.5;
}
/image-map-number-text {
    visibility: visible;
}
/image-map-number {
    fill: yellow;
    fill-opacity: 0.4;
```
Tip:

An SVG with links can be used as an alternative to the DITA `<imagemap>` element. Make sure that each link is a relative URI to an ID inside the publication content.

How to Hide the Image Map Links List

Below every image map, a list of links that point to the image map targets is displayed. This list can be hidden from the final output by using the following CSS selector:

```css
.imagemap--areas {
  display: none;
}
```

How to Use SVG Syntax Diagrams

The DITA `<syntaxdiagram>` element is supported by the PDF transformation. To use SVG syntax diagrams, follow this procedure:

1. Download the latest version of the `svg-syntaxdiagrams` plugin, unzip it, and copy all the folders into your `DITA-OT-DIR\plugins` folder (they all start with `com.`).
2. Open a command prompt inside `DITA-OT-DIR\bin` and run the `dita install` command.
3. You can now add your custom `<syntaxdiagram>` element in your topic, as in the following example:

```xml
<syntaxdiagram id="syntaxdiagram_ok4_clx_xnb">
  <title>CopyFile</title>
  <groupseq><kwd>COPYF</kwd></groupseq>
  <groupcomp><var>input-filename</var><kwd>*INFILE</kwd></groupcomp>
  <groupseq><var>output-filename</var><kwd>*OUTFILE</kwd></groupseq>
  <groupchoice><var>input-filename</var><kwd>*INFILE</kwd></groupchoice>
  <groupchoice><var>output-filename</var><kwd>*OUTFILE</kwd></groupchoice>
</syntaxdiagram>
```

4. Run the DITA Map PDF - based on HTML5 & CSS (or DITA PDF - based on HTML5 & CSS) transformation.

⚠️ Warning:

If you are not publishing the content for the first time, you may need to delete the `out/` and `temp/` folders to see the syntax diagram correctly in the `.merged.html` file.

Result: The PDF is generated and the syntax diagram is displayed as a referenced SVG file like this:
Videos

Videos can be referenced in a DITA topic by using the `<object>` element:

```
<object data="path/to/video.mp4" outputclass="video"/>
```

**Related information**

Oxygen PDF Chemistry User Guide: Videos

**How to Reference a Video Using a Key**

Videos can also be referenced in DITA topics by using a key.

The key must be defined in the DITA map like this:

```
<keydef keys="video" href="path/to/video.mp4" format="mp4"/>
```

The key is referenced in the topic with the `@datakeyref` attribute within the `<object>` element:

```
<object datakeyref="video" outputclass="video" width="480" height="270"/>
```

**How to Change Video Size**

It is possible to set the size for your videos directly from a custom CSS stylesheet (on page 1424):

```
.video {
    width: 480px;
    height: 270px;
}
```

**Related information**

Oxygen PDF Chemistry User Guide: Change the Video Size

**How to Change the Videos Cover**

By default, a placeholder is displayed in place of the video. When clicked, this placeholder launches the video. A popup is presented in Acrobat Reader to enable the Multimedia content (the document must be trusted for the video to launch).

It is possible to change this placeholder with a custom one by using the `-oxy-video-cover` property:

```
.video {
    -oxy-video-cover: url("files/cover.png");
}
```
How to Center Videos

It is possible to center the videos by centering their containers like this:

```css
.video-container {
    text-align: center;
}
```

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables:

- [PLUGIN_DIR]/css/core/-table-html-cals.css
- [PLUGIN_DIR]/css/print/p-tables.css

How to Avoid a Table Exceeding the Page Width

The DITA specification indicates that tables should have a fixed layout. This can be done in two different ways:

1. **Using proportional or relative measures** - It includes percent values and shares values (i.e. "3*" or "12*").
2. **Using fixed measures** - It includes all the values followed by units (i.e. `in`, `pt`, `px`, and others).

**Important:**

- Although the specification allows you to combine these values, it is highly recommend that you only use one method at a time. Combining both methods could lead to a table exceeding the page width and will make the content unreadable.
- If all of the column width values are not declared in the table, the shares values (e.g. "2.5") will not be used.

How to Handle Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `orient = 'land'` attribute on the table element will force the table to be on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):
Note:
The landscape-page page layout is defined in the [PLUGIN_DIR]/css/print/p-pages-and-headers.css file.

If you want to rotate the entire topic that contains the big table, use:

```html
*{class="topic/table"}[data-cols='5'],
*{class="topic/table"}[data-cols='6'],
*{class="topic/table"}[data-cols='7'],
*{class="topic/table"}[data-cols='8'],
*{class="topic/table"}[data-cols='9'],
*{class="topic/table"}[data-cols='10'] {
  page: landscape-page;
  max-width: 100%;
  max-height: 100%;
  width: 100%;
  page-break-before: avoid;
}
```
Tip:
It is also possible to import the [PLUGIN_DIR]/css/print/p-optional-auto-rotate-wide-tables.css stylesheet into your custom CSS.

How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the `overflow-wrap` property to force the word to break:

```css
*[class="topic/table"] { 
  overflow-wrap: break-word;
}
```

Related Information:
Hyphenation (on page 1547)
How to Enable/Disable Hyphenation for an Element (on page 1549)

How to Fix Small Images in Table

Tables contained in the output of DITA Map PDF - based on HTML5 & CSS (and DITA PDF - based on HTML5 & CSS) transformations have an automatic layout by default. This means that DITA-OT defines a preferred size on them, optimizing their width/height inside the content to make them as small as possible.

If, for example, you have a two-column table without defined column widths and one column contains images while the other column contains text, the table in the generated PDF will have its first column shrunk with smaller images and an enlarged second column (to occupy the least amount of space in the output).
To avoid this, you must *unset* the default image `max-width` so that the original size of the image will be used instead:

```css
*[class ~= "topic/image"] { 
  max-width: unset;
}
```

### How to Center Tables

You can center the tables by using margins `auto`, while the table caption (title) can be centered using the `text-align` property:

```css
*[class = "topic/table"] { 
  margin-left:auto;
  margin-right:auto;
  width: 50%;
  border: 1pt solid blue;
}

*[class = "topic/table"] *[class = "topic/title"]{
  text-align:center;
}
```

### How to Remove the Table NN Label

For the DITA Map PDF - based on HTML5 & CSS transformation scenario, the label for a table's title is wrapped in a span element with the class: `table--title-label`.

```html
<table ... >
  ...
  <caption class="- topic/title title tablecap">
    <span class="table--title-label">Table</span>
    <span class="table--title-label-number">1. </span>
    <span class="table--title"">The title of the table</span>
  </caption>
  ...
</table>
```

To hide it, set its display to none:

```css
.table--title-label { 
  display:none;
}
```

For the direct transformation, use:

```css
*[class = "topic/table"] > *[class = "topic/title"]:before { 
  content: none;
}
```
How to Customize Rows, Columns and Cells

Common Use-Cases

Here are some common table use-cases and the CSS selectors for customizing table rows, columns, and cells. These example uses the background-color CSS property but any CSS property can be used (border, margin, padding, etc.).

• Select all non-header cells:

```
* [class =~ "topic/tbody"] * [class =~ "topic/entry"] {
  background-color: lightgray;
}
```

• Select some table rows (using :nth-of-type() pseudo-class):

```
/* Select all even rows. */
* [class =~ "topic/tbody"] * [class =~ "topic/row"]:nth-of-type(even) {
  background-color: lightgray;
}
/* Select the fourth row. */
* [class =~ "topic/tbody"] * [class =~ "topic/row"]:nth-of-type(4) {
  background-color: yellow;
}
```

• Select specific table columns (using :nth-of-type() pseudo-class):

```
/* Select all odd columns. */
* [class =~ "topic/tbody"] * [class =~ "topic/entry"]:nth-of-type(odd) {
  background-color: lightgray;
}
/* Select the second column. */
* [class =~ "topic/tbody"] * [class =~ "topic/entry"]:nth-of-type(2) {
  background-color: yellow;
}
```

Applying Properties to Specific Elements

If you need to apply some properties to specific elements, you can use the DITA @outputclass attribute:

```
<table frame="none">
  <title>Flowers</title>
  <tgroup cols="3">
    <colspec colname="c1" colnum="1" colwidth="171pt"/>
    <colspec colname="c2" colnum="2" colwidth="99pt"/>
    <colspec colname="c3" colnum="3" colwidth="150pt"/>
  </tgroup>
  <thead>
    <row>
<entry>Flower</entry>
<entry>Type</entry>
<entry>Soil</entry>
</row>
</thead>
<tbody>
<row>
<entry>Chrysanthemum</entry>
<entry outputclass="colored">perennial</entry>
<entry>well drained</entry>
</row>

<row>
<entry>Gardenia</entry>
<entry>perennial</entry>
<entry>acidic</entry>
</row>

<row outputclass="colored">
<entry>Gerbera</entry>
<entry>annual</entry>
<entry>sandy, well-drained</entry>
</row>
</tbody>
</table>

In this case, the selector will be based on this `outputclass`:

```
* [class =~ "topic/table"] * [outputclass =~ "colored"] {
    background-color: yellow;
}
```

**How to Add Stripes to a Table**

To create a striped look for your tables, you can use the following CSS rules:

```
/* Header background and foreground */
* [class =~ "topic/table"] [outputclass =~ "stripes"] > *
    [class =~ "topic/thead"] > *[class =~ "topic/row"] {
    background-color: blue;
    color: white;
}

/* A default background for the entire table body */
* [class =~ "topic/table"] [outputclass =~ "stripes"] > *
    [class =~ "topic/tbody"] {
    background-color: #eeeeee;
```
The above rules assume that tables that are to be painted with stripes are marked with an `@outputclass` attribute:

```xml
<table outputclass="stripes">...
</table>
```

If you want to make all tables look the same, you can ignore this attribute and remove the `@outputclass="stripes"` simple selector from the above rules.

**CAUTION:** Applying stripes and thin cell borders can cause rendering issues in the PDF renderer on screen display devices. For more information, see Disappearing Thin Lines or Cell Borders (on page 1652).

How to Display Borders on a Split Cell

By default, if a cell extends onto a second page, its bottom and top borders are discarded. To display these borders, you need to add the following property in your CSS customization:

```css
*cos\[class \-= "topic/entry"] {  
-ox-borders-conditionality: retain;  
}
```

How to Rotate Content from a Table Cell

In DITA CALS tables, you can rotate the content of a cell by setting the `@rotate` attribute to 1.

In the following example, the Sport, All terrain, and Family header cells are rotated.
The built-in CSS matches the cells with this attribute and applies the following properties:

<table>
<thead>
<tr>
<th>Car Name</th>
<th>Sport</th>
<th>All terrain</th>
<th>Family</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tesla Model S</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Nissan Leaf</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Dacia Duster</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
To change the vertical alignment of the content (for example, to move it to the middle of the cell), use the following in your CSS customization:

```
*{class="topic/entry"}[rotate='1'] {  
  vertical-align:middle;
}
```

The resulting output will be:

<table>
<thead>
<tr>
<th>Car Name</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sport</td>
</tr>
<tr>
<td>Tesla Model S</td>
<td>X</td>
</tr>
<tr>
<td>Nissan Leaf</td>
<td></td>
</tr>
<tr>
<td>Dacia Duster</td>
<td>X</td>
</tr>
</tbody>
</table>

To make the text wrap (for instance, the "All terrain" could be split on two lines), you need to inhibit the whitespace preservation from the built-in CSS. In this case, all spaces will create a line break in the rotated layout. Thus, you can add this in your customization:

```
*{class="topic/entry"}[rotate='1'] {  
  vertical-align:middle;
  white-space:normal;
}
```

The resulting output will be:
How to Add Horizontal Lines to a Choice Table

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```
*[^class~="topic/entry"][^rotate='1'] { 
    padding-left: 2em;
}
```

### Note:

The padding and borders set on the table cells are not rotated (only the content of the cell is rotated). You can use `padding-left` (for instance) to move the labels to the horizontal axis.

```
*[^class~="topic/entry"][^rotate='1'] { 
    padding-left: 2em;
}
```
Programming Elements

*Programming Elements* are used to render lines of programming code. These elements have preserved line endings and use a monospace font in the output.

How to Enable Syntax Highlight in Code Blocks

**Note:**

This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- `language-json`
- `language-yaml`
- `language-xml`
- `language-bourne`
- `language-c`
- `language-cmd`
- `language-cpp`
- `language-csharp`
- `language-css`
- `language-dtd`
- `language-ini`
- `language-java`
- `language-javascript`
- `language-lua`
- `language-perl`
- `language-powershell`
- `language-php`
- `language-python`
- `language-ruby`
Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1424):

```css
.hl-keyword {
  color: red !important;
}
.hl-comment {
  color: blue !important;
}
```
How to Add Line Numbering in Code Blocks

Note:
This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can add line numbering to make your code snippets easier to read. In the DITA topics, set the @outputclass attribute on the <codeblock> elements to the show-line-numbers value.

Note:
It is possible to use the @outputclass="show-line-numbers" together with any of the language @outputclass value (e.g. @outputclass="language-java show-line-numbers").

For example, for a java snippet:

```xml
<codeblock outputclass="show-line-numbers">
public void convert(String systemId, InputStream is) {
  return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```html
<pre class="+ topic/pre pr-d/codeblock pre-codeblock show-line-numbers" outputclass="show-line-numbers" xml:space="preserve">
</pre>

And in the output, it is rendered as:

```java
1
2  public void convert(String systemId, InputStream is) {
3     return new FileInputStream();
4  }
5
```

How to Display Whitespaces in Code Blocks

Note:
This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.
You can display whitespace characters in code blocks to visualize indentation in the PDF. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-whitespace` value.

For example, for a java snippet:

```xml
<codeblock outputclass="show-whitespace">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```html
<pre class="+ topic/pre pr-d/codeblock pre codeblock show-whitespaces" outputclass="show-whitespaces" xml:space="preserve">
public·void·convert(String·systemId,·InputStream·is)·{
    ···return·new·FileInputStream();
}
</pre>
```

And in the output, it is rendered as:

```xml
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
```

### How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (on page 1424):

```css
*{class="pr-d/codeblock"} {
    white-space: pre;
}
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations (on page 1612).
How to Enable Line Wrap in Code Phrases

By default, line wrapping does not apply on inline elements, which could cause some lines of code to bleed out of the page. To allow line wrapping, the property should be set on the parent block with the following rule in your customization CSS (on page 1424):

```css
*:has(*[class ~='pr-d/codeph']) {
  overflow-wrap: break-word;
}
```

Notes:

- It is possible to use `hyphens: auto` instead of `overflow-wrap: break-word`.
- It is possible to use the same rule for software domain elements (e.g. `<filepath>` or `<cmdname>`).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```sh
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```sh
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```sh
$gist = ls -l * | count -n \
| some more
```

Note:

For Linux/macOSX, the continuation character is the backslash \. For Windows, this is the shift character ^.

The command-line processor will now recognize that the first line is continuing on to the next one.
Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (note, tip, fastpath, restriction, important, remember, attention, caution, danger, other).

For information on how to add and manage mixed content before the note icons and labels, see How to Control the Image Size in Complex Static Content (on page 1582).

How to Change Note Icons

The recommended icon format is SVG. The default size of the note icons is 24x24 px.

To change the default icons for notes that do not have a @type attribute, add the following rule to your customization CSS (on page 1424):

```css
div.note {
  background-image: url("../img/note.svg");
}
```

For a note with a @type attribute set to warning, caution, or trouble, add the following corresponding CSS rule:

```css
div.warning {
  background-image: url("../img/warning.svg");
}
div.caution {
  background-image: url("../img/caution.svg");
}
div.trouble {
  background-image: url("../img/troubleshooting.svg");
}
```

For a note with @type attribute set to other and @othertype attribute set to Safety, add the following CSS rule:

```css
div.note[type="other'"][othertype="Safety"] {
  background-image: url("../img/life-preserver.svg");
}
```

How to Change Note Colors

To change the color of the default icons for notes that do not have a @type attribute, add the following rule to your customization CSS (on page 1424):

```css
*[class~="topic/note'"]:not([class~="hazard-d/hazardstatement'"]) {
  background-color: #50bbff;
}
```

For a note with a @type attribute set to restriction, add the following CSS rule:
For a note with `@type` attribute set to `other` and `@othertype` attribute set to `Safety`, add the following CSS rule:

```css
/*[class~="topic/note"][type = "other"][@othertype = Safety] {
    background-color: #ffaa00;
}
```

**Hazard**

_Hazards_ (embodied by the `<hazardstatement>` element) contain warning information. They are based on ANSI Z535 and ISO 3864 standards and may have various values set for the type (note, tip, fastpath, restriction, important, remember, attention, caution, notice, danger, warning, other).

**How to Customize Other Type Hazards**

It is possible to create custom hazard types by using the `@type` and `@othertype` attributes. For example, to add a high voltage hazard in a microwave manual:

```xml
<hazardstatement id="hazardstatement_vzy_zdc_syb" type="other" othertype="HIGH_VOLTAGE">
  <messagepanel id="messagepanel_wzy_zdc_syb">
    <typeofhazard>Electrical Shock</typeofhazard>
    <howtoavoid>Do not disassemble or repair the microwave yourself.</howtoavoid>
  </messagepanel>
  <hazardsymbol id="hazardsymbol_z4t_gjc_syb" href="electricity_icon.svg"/>
</hazardstatement>
```

Tip:

SVG images are preferred for the `<hazardsymbol>` and you should set both `@height="1em"` and `@width="1em"` to obtain a rendering that is similar to default hazards.

To customize the hazard, add the following rules to your customization CSS (on page 1424):

```css
/* Change the header color. */
*[@othertype ~="HIGH_VOLTAGE"] .hazardstatement--other {
  content: "HIGH VOLTAGE"; /* Change the hazard text */
  background-color: #d84b20;
  color: unset;
}

/* Show logo in the header. */
*[@othertype ~="HIGH_VOLTAGE"] .hazardstatement--other::before {
  padding: .5rem;
}
```
Tasks provide step-by-step instructions that enable a user to perform an operation.

**How to Add Requirements Labels**

It is possible to add tasks headings by setting the `args.gen.task.lbl` parameter in the transformation. However, *Machinery Tasks* have some extra required elements. It is possible to add labels for these requirements by adding the following rules to your *customization CSS (on page 1424)*:

```css
*{class ~="taskreq-d/reqconds"}:before,
*{class ~="taskreq-d/reqpers"}:before,
*{class ~="taskreq-d/supequip"}:before,
*{class ~="taskreq-d/supplies"}:before,
*{class ~="taskreq-d/spares"}:before,
*{class ~="taskreq-d/safety"}:before {
  font-weight: bold;
  padding-left: 20px;
}
```
Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (on page 1424):

```xml
a:has(dfn[@class = "abbreviated-form"]) {
    color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
}
```
This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

**Trademarks**

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```xml
<tm tmtype="tm">My Product Name</tm>
```

Depending on the value of the `@tmtype` attribute, a different symbol is appended to the text: (®, ™, or ℠).

The structure of the merged HTML document the CSS will apply to is:

```html
<span class="- topic/tm tm" tmtype="tm">My Product Name</span><span class="- topic/tmmark tmark "™"></span>
```

**How to Style the Trademark Element Text**

To change the style of the entire trademark text, you can match the `topic/tm` class like this:

```css
/*[class ~= "topic/tm"] { 
  font-weight: bold; 
}
```

**How to Style the Trademark Symbol**

To change the aspect of the trademark symbol, you can use the `topic/tmmark` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```css
/*[class ~= "topic/tmmark"] { 
  vertical-align: super; 
  font-size: smaller; 
}
```

**Styling Through Custom Parameters**

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while
the value of the parameter will become the attribute value. The namespace of these synthetic attributes is:

When using the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformations, the generated attribute will be in no namespace.

**Notes:**

- Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

### How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, notices, or the preface).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the `topicrefs` at level 2 or more:

```
:root[only-chapters-in-toc='yes'] *[class =~ "toc/toc"]
    > *[class =~ "map/topicref"] > *[class =~ "map/topicref"] { display:none; }
```

The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

### How to Change the Page Size Using a Parameter

In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page {
    size: oxy_xpath('/*/@[local-name()="page-size"][1]');
}
```

### How to Change the Cover Page Using a Parameter

In the following example, a custom parameter is used to set the path of the cover page. The parameter points to an image by using its URL and is defined in the transformation scenario as:
Then in the CSS, the attribute value is extracted and used as follows:

```css
@page front-page {
    background-image: url(oxy_xpath('/*/@*[local-name()="cover-page"][1]'));
}
```

### Controlling the Publication Content

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a *preface*, *frontmatter*, or *backmatter* with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA `<bookmap>` element.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```xml
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
    <booktitle>
        <mainbooktitle>Publication Title</mainbooktitle>
        <booktitlealt>A very short description of the publication</booktitlealt>
    </booktitle>
</bookmap>
```

Then you may define a *frontmatter*. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```xml
<frontmatter>
    <topicref href="topics/abstract.dita"/>
    <booklists>
        <toc/>
    </booklists>
    <topicref href="topics/foreword.dita"/>
</frontmatter>
```
Next, the topics are grouped into chapters:

```xml
...<chapter href="topics/installation.dita"/>
...```

At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes"/>
    </glossarylist>
    <figurelist/>
    <tablelist/>
  </booklists>
  <topicref href="topics/thanks.dita"/>
</backmatter>
```

As you can see, the bookmap offers much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (on page 1482) topic).

### How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter `hide.frontpage.toc.index.glossary`. See: Transformation Parameters (on page 1401).

**Related Information:**

- How to Remove Entries from the TOC (on page 1517)
- How to Hide the TOC (on page 1517)
**How to Make Chapters Look Like Individual Publications**

**Note:**
This topic is only applicable for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the `args.css.param.numbering` (on page 1499) command-line parameter.

In addition to numbering, you can force the creation of a chapter TOC (on page 1517).

**XSLT Extensions for PDF Transformations**

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1:** Makes some changes on the merged map (on page 1427) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

   **Note:**
   Use this when you need to filter DITA content.

2. **Stage 2:** Transforms the merged map (on page 1427) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

   **Note:**
   Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a Publishing Template or a DITA-OT extension plugin.

**How to Use XSLT Extension Points for PDF Output from a Publishing Template**

This section contains some common examples of customizations using both XSLT and CSS stylesheets. These stylesheets must be used as CSS resources and XSLT extension points inside an Oxygen Publishing Template.
Tip:
The XSLT extension points are called on specific files during two different phases of the process: 
merged2merged (on page 1398) and merged2html5 (on page 1399).

How to Style Codeblocks with a Zebra Effect

A possible requirement for your `<codeblock>` elements could be to alternate the background color on each line. Some advantages of this technique is that you can clearly see when text from the `<codeblock>` is wrapped.

Note:
Adding this styling will remove syntax highlights on codeblocks.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, 'pr-d/codeblock')]">
        <xsl:variable name="nm">
            <xsl:next-match/>
        </xsl:variable>
        <xsl:apply-templates select="$nm" mode="zebra"/>
    </xsl:template>

    <xsl:template match="node() | @*" mode="zebra">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*" mode="#current"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the <codeblock> structure. For example:

```css
.zebra {
  padding: 0;
}

.zebra > *:nth-of-type(odd) {
  background-color: lightgray;
}
```

7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:
8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

How to Remove the Related Links Section

Suppose that you want the related links sections to be removed from the PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/related-links ')]">
        <!-- Remove. -->
    </xsl:template>
</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:
6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

How to Wrap Words in Markup

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="text()">

        <xsl:variable name="txt">
            <xsl:next-match/>
        </xsl:variable>

        <xsl:analyze-string regex="([^\-]+)" select="$txt">
        <!-- A word -->
        <xsl:choose>
            <xsl:when test="contains(., '-')">
                <!-- A compound word -->
                <code class="compound-word">
                    <xsl:value-of select="."/>
                </code>
            </xsl:when>
            <xsl:otherwise>
            </xsl:otherwise>
        </xsl:choose>
        </xsl:analyze-string>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```
<extension id="com.oxygenxml.pdf.css.xsl.merged2merged"
file="xslt/merged2mergedExtension.xsl"/>
```

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

How to Convert Definition Lists into Tables

Suppose you want your definitions lists (\texttt{<dl>}) to be displayed as tables in your PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an \texttt{xslt} folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:
<xsl:template match="*[contains(@class, 'topic/table')]">
    <!-- Match only top level tables (i.e tables that are not nested in other tables), that contains some footnotes. -->
    <xsl:next-match>
        <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
    </xsl:next-match>

    <!-- Create a list with all the footnotes from the current table. -->
    <ol class="- topic/ol " outputclass="table-fn-container">
        <xsl:for-each select=".//*[contains(@class, 'topic/fn')]">
            <li class="- topic/li " id="{if(@id) then @id else generate-id(.)}" outputclass="table-fn">
                <xsl:apply-templates select="node()"/>
            </li>
        </xsl:for-each>
    </ol>
</xsl:template>

<!-- The footnotes that have an ID must be ignored, they are accessible only through existing xrefs (already present in the merged.xml file). -->

The above template already made a copy of these footnotes in the OL element so it is not a problem if markup is not generated for them in the cell.

<xsl:template match="*[contains(@class, 'topic/entry')]/*/[@id]">
    <!-- The xrefs to footnotes with IDs inside table-cells. We need to recalculate their indexes if their referenced footnote is also in the table. -->
</xsl:template>

<!--

The footnotes that have an ID must be ignored, they are accessible only through existing xrefs (already present in the merged.xml file).

The above template already made a copy of these footnotes in the OL element so it is not a problem if markup is not generated for them in the cell.

-->
<xsl:param name="top-level-table" tunnel="yes"/>
<xsl:variable name="destination" select="opentopic:func:getDestinationId(@href)"/>
<xsl:variable name="fn" select="

$top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"
"/>
<xsl:choose>
  <xsl:when test="$fn">
    <!-- There is a reference in the table, recalculate index. -->
    <xsl:variable name="fn-number" select="
      index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"
    "/>
    <xsl:copy>
      <xsl:apply-templates select="@*"/>
      <xsl:apply-templates select="node() except (text(), *[contains(@class, 'hi-d/sup')])"/>
      <sup><xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@*"/>
        <xsl:value-of select="$fn-number"/>
      </sup>
    </xsl:copy>
  </xsl:when>
  <xsl:otherwise>
    <!-- There is no reference in the table, keep original index. -->
    <xsl:next-match/>
  </xsl:otherwise>
</xsl:choose>
</xsl:template>

<!--
The footnotes without ID inside table-cells. They are copied in the OL element, but have no xrefs pointing to them (because they have no ID), so xrefs are generated. -->
<xsl:template

match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')][not(@id)]">
  <!-- Determine the footnote index in the document order. -->
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="fn-number" select="
    index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"
  "/>
  <xref type="fn" class="- topic/xref "
    href="#|generate-id(.)" outputclass="table-fn-call">
    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->
    <sup class="+ topic/ph hi-d/sup ">
      <xsl:value-of select="$fn-number"/>
    </sup>
  </xref>
</xsl:template>
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```
<publishing-template>

<pdf>

<xslt>

<extension

    id="com.oxygenxml.pdf.css.xsl.merged2merged"

    file="xslt/merged2mergedExtension.xsl"/>

</xslt>

</pdf>

</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```
/* Customize footnote calls, inside the table. */

*[outputclass =~ 'table-fn-call'] {

    line-height: none;
}

/* Customize the list containing all the table footnotes. */

*[outputclass =~ 'table-fn-container'] {

    border-top: 1pt solid black;

    counter-reset: table-footnote;
}

/* Customize footnotes display, below the table. */

*[outputclass =~ 'table-fn'] {

    font-size: smaller;

    counter-increment: table-footnote;
}

*[outputclass =~ 'table-fn']::marker {

    font-size: smaller;

    content: "(" counter(table-footnote) ")";
}

/* Customize xrefs pointing to footnotes with IDs. */

*[class =~ "topic/table"] *[class =~ "topic/xref"][type = 'fn'] {

```
7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <resources>
            ...
            <css file="css/custom.css"/>
        </resources>
    </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

10. Click OK to save the changes and run the transformation scenario.

How to Wrap Scientific Numbers in Tables Cells

In your PDF output, you may need to wrap scientific numbers on two lines when they are included in table cells.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.

How to Use a Bullet for Tasks that Contain a Single Step

If a DITA Task document only contains one list item (a single <step> element), you probably want it to be rendered the same as an unordered list (displayed with a bullet instead of a number), as in the following example:
<steps>
  <step>
    <cmd>My single step</cmd>
  </step>
</steps>

Normally, the output will be rendered as:

1. The step

instead of:

   o The step

To change the default rendering so that a single step will be rendered with a bullet instead of a number, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

  <xsl:template match="*[contains(@class, ' task/step ')]*[count(./*[contains(@class, ' task/step ')]) = 1]">
    <xsl:copy>
      <xsl:copy-of select="@*"/>
      <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')"/>
      <xsl:apply-templates/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:
6. Create a <code>css</code> folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the <em>glossary</em> structure. For example:

```css
* [outputclass =~ "single"] {
    list-style-type: circle !important;
    margin-left: 2em;
}
```

7. Open the template descriptor file (on page 1414) associated with your publishing template (the <code>.opt</code> file) and reference your custom CSS file in the <code>resources</code> element:

```xml
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

### How to Change the Critical Dates Format

By default, the dates are entered in a <em>YYYY-MM-DD</em> format (where <em>YYYY</em> is the year, <em>MM</em> is the number of the month, and <em>DD</em> is the number of the day). You can change the format (for example, to something like <em>January 1, 2020</em>) using an XSLT extension.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an <code>xslt</code> folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named <code>merged2mergedExtension.xsl</code>) with the following content:
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">
    <xsl:template match="*[contains(@class, 'topic/created')]/@date | *[contains(@class, 'topic/revised')]/@modified">
        <xsl:attribute name="{name()}">
            <xsl:value-of select="format-date(., '[MNn] [D01], [Y0001]')"/>
        </xsl:attribute>
    </xsl:template>
</xsl:stylesheet>

5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2merged"
                file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
    </pdf>
</publishing-template>

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

Formatting Dates and Times in XSLT

How to Remove Links from Terms

Your topics might contain multiple references to the same <term>. These terms can further be explained in the glossary. In this case, you may want to only keep the first occurrence of this term to be a link to the glossary and display the other terms as text.

To add this functionality, use an Oxygen Publishing Template and follow these steps:
1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/term ')]" name="topic.term">
        <!-- Save the current @href value -->
        <xsl:variable name="current-href" select="@href"/>
        <!-- Get the closest parent topic -->
        <xsl:variable name="closest-parent" select="ancestor::*[contains(@class, ' topic/topic ')][1]"/>
        <!-- Get the first <term> having the same href -->
        <xsl:variable name="first-term-with-same-href" select="($closest-parent//*
            *[contains(@class, ' topic/term ')][@href=$current-href])[1]"/>

        <!-- Call the HTML5 default template -->
        <xsl:variable name="result">
            <xsl:next-match/>
        </xsl:variable>

        <!-- Call the copy template that will remove the links -->
        <xsl:apply-templates select="$result" mode="remove-extra-links">
            <xsl:with-param name="is-first-term-with-same-href" select="generate-id(.) = generate-id($first-term-with-same-href)" tunnel="yes"/>
        </xsl:apply-templates>
    </xsl:template>

    <xsl:template match="node() | @*" mode="remove-extra-links">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*" mode="#current"/>
        </xsl:copy>
    </xsl:template>

    <xsl:template match="a" mode="remove-extra-links">
        <xsl:param name="is-first-term-with-same-href" tunnel="yes"/>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.

How to Display Glossary as a Table

Suppose you want to display the content of your Glossary as a table, to condense the information for one entry on a single line.

Remember:
Make sure all the glossary is contained within a single <glossgroup> element.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:dita2html="http://dita-ot.sourceforge.net/ns/200801/dita2html"
    exclude-result-prefixes="xs dita2html"
    version="2.0">
    <!-- Create a table that will contain all the glossentries contained in the glossgroup. -->
    <xsl:template name="gen-topic">
      <xsl:param name="nestlevel" as="xs:integer">
        <xsl:choose>
          <!-- Limit depth for historical reasons, could allow any depth. -->
          <!-- Previously limit was 5. -->
          <xsl:when test="count(ancestor::*[contains(@class, ' topic/topic ')]) > 9">
            9
          </xsl:when>
          <xsl:otherwise>
            <xsl:sequence select="count(ancestor::*[contains(@class, ' topic/topic ')])"/>
          </xsl:otherwise>
        </xsl:choose>
      </xsl:param>
      <xsl:choose>
        <xsl:when test="parent::dita and not(preceding-sibling::*)">
          <!-- Do not reset xml:lang if it is already set on <html> -->
          <!-- Moved outputclass to the body tag -->
          <!-- Keep ditaval based styling at this point -->
          <!-- (replace DITA-OT 1.6 and earlier call to gen-style) -->
          <xsl:apply-templates
            select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/@style"
            mode="add-ditaval-style"/>
        </xsl:when>
        <xsl:otherwise>
          <xsl:call-template name="commonattributes">
            <xsl:with-param name="default-output-class" select="concat('nested', $nestlevel)"/>
          </xsl:call-template>
        </xsl:otherwise>
      </xsl:choose>
      <xsl:call-template name="gen-toc-id"/>
      <xsl:call-template name="setidaname"/>
    </xsl:template>
</xsl:stylesheet>
```
<xsl:when test="contains(@class, 'glossgroup/glossgroup')">
  <!-- Custom processing for glossgroup. -->
  <xsl:apply-templates select="*[contains(@class, 'topic/title')]"/>

  <table class="- glossgroup/table table">
    <thead class="- glossgroup/thead thead">
      <tr class="- glossgroup/row row">
        <th class="- glossgroup/entry entry">Acronym</th>
        <th class="- glossgroup/entry entry">Term</th>
        <th class="- glossgroup/entry entry">Full Term</th>
        <xsl:if test="exists(//*[contains(@class, 'glossentry/glossdef')])">
          <th class="- glossgroup/entry entry">Definition</th>
        </xsl:if>
      </tr>
    </thead>
    <xsl:apply-templates select="*[contains(@class, 'glossentry/glossentry')]"/>
  </table>

  <xsl:apply-templates select=""/>
  * except (*[contains(@class, 'topic/title')]
    | *[contains(@class, 'glossentry/glossentry')])"/>
</xsl:when>

<xsl:otherwise>
  <!-- Default processing. -->
  <xsl:apply-templates/>
</xsl:otherwise>
</xsl:choose>
</xsl:template>

<!-- Create a row for each glossentry. -->
<xsl:template
  match="*[contains(@class, 'glossentry/glossentry')]"
  [parent::*[contains(@class, 'glossgroup/glossgroup')]]">
  <xsl:variable name="glossentry" as="node()">
    <xsl:next-match/>
  </xsl:variable>
  <tr>
    <xsl:copy-of select="$glossentry/@*"/>
    <xsl:copy-of select="$glossentry/*[contains(@class, 'glossentry/glossterm')]"/>
  </tr>
</xsl:template>

<!-- Custom processing for glossgroup. -->
<xsl:apply-templates select="*[contains(@class, 'topic/title')]"/>
<xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossSurfaceForm')]/">
</xsl:copy-of>
<xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossdef')]/">
</xsl:copy-of>
<xsl:copy-of
    select="$glossentry/* except $glossentry/*[contains(@class, 'glossentry/glossterm')
    or contains(@class, 'glossentry/glossAlt')
    or contains(@class, 'glossentry/glossSurfaceForm')
    or contains(@class, 'glossentry/glossdef')]/">
</xsl:copy-of>
</tr>
</xsl:template>

<!-- Process only glossBody's children nodes. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossBody')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <xsl:apply-templates/>
</xsl:template>

<!-- Create a cell for each glossterm, glossSurfaceForm and glossAlt. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossterm')
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
*[contains(@class, 'glossentry/glossSurfaceForm')]
[ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
*[contains(@class, 'glossentry/glossAlt')]
[ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <xsl:variable
        name="glossContent" as="node()">
        <xsl:next-match/>
    </xsl:variable>
    <td>
        <xsl:copy-of
            select="$glossContent/@*"/>
        <xsl:copy-of
            select="normalize-space(string-join($glossContent//text()))"/>
    </td>
</xsl:template>

<!-- Create a cell for each glossdef. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossdef')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <td>
        <xsl:copy-of
            select="$glossContent/@*"/>
        <xsl:copy-of
            select="normalize-space(string-join($glossContent//text()))"/>
    </td>
</xsl:template>

<!-- Create a cell for each glossdef. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossdef')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <td>
        <xsl:copy-of
            select="$glossContent/@*"/>
        <xsl:copy-of
            select="normalize-space(string-join($glossContent//text()))"/>
    </td>
</xsl:template>
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
...
<pdf>
...
<xslt>
<extension
id="com.oxygenxml.pdf.css.xsl.merged2html5"
file="xslt/merged2html5Extension.xsl"/>
</xslt>
</pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
/* Remove glossSurfaceForm */
	th{display: none;}

*[class ~="glossgroup/table"] { width: 100%; border: 1px solid black; border-collapse: collapse; }

*[class ~="glossgroup/table"] th { background-color: lightgray; }

*[class ~="glossgroup/table"] th, *
*[class ~="glossgroup/table"] td {
border: 1px solid black;
padding: 0.3em !important;
vertical-align: inherit !important;
}

/* Remove glossSurfaceForm */
```
Note:
The <glossSurfaceForm> removal part is optional. It is present as an example of how to fully remove a column.

7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      ...
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

### How to Include Sections in the Mini TOC

By default, the Mini TOC only displays the child topics of a given chapter topic. To add the possibility of also displaying the child sections, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
                 xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
                 xmlns:opentopic="http://www.idiominc.com/opentopic"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="#all">
```
<xsl:template match="*[contains(@class, ' topic/topic ')]">
  <xsl:choose>
    <xsl:when test="
      ($args.chapter.layout = 'MINITOC' or
       $args.chapter.layout = 'MINITOC-BOTTOM-LINKS') and
       oxy:is-chapter(/, oxy:get-topicref-for-topic(/, @id)) and
       *[contains(@class, ' topic/topic ')]"
      <!-- Minitoc. -->
      <xsl:copy>
        <xsl:apply-templates select="@*"/>
        <xsl:apply-templates select="*[contains(@class, ' topic/title ')]"/>
        <xsl:apply-templates select="*[contains(@class, ' topic/prolog ')]"/>
        <xsl:apply-templates select="*[contains(@class, ' topic/titlealts ')]"/>
        <div>
          <xsl:choose>
            <xsl:when test="$args.chapter.layout = 'MINITOC'">
              <xsl:attribute name="class">- topic/div chapter/minitoc</xsl:attribute>
              <xsl:call-template name="generate-minitoc-links"/>
              <xsl:call-template name="generate-minitoc-desc"/>
            </xsl:when>
            <xsl:when test="$args.chapter.layout = 'MINITOC-BOTTOM-LINKS'">
              <xsl:attribute name="class">- topic/div chapter/minitoc-bottom</xsl:attribute>
              <xsl:call-template name="generate-minitoc-desc"/>
              <xsl:call-template name="generate-minitoc-links"/>
            </xsl:when>
          </xsl:choose>
        </div>
        <xsl:apply-templates select="*[contains(@class, ' topic/topic ')]"/>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <!-- No minitoc. -->
      <xsl:next-match/>
    </xsl:otherwise>
  </xsl:when>
</xsl:choose>
</xsl:template>

The chapter topic content. This has the role of describing the chapter.

<!--
 The chapter topic content. This has the role of describing the chapter.
 -->

<xsl:template name="generate-minitoc-desc">
  <div class="- topic/div chapter/minitoc-desc ">
<xsl:apply-templates select="
  *[not(contains(@class, ' topic/title ')) and
  not(contains(@class, ' topic/prolog ')) and
  not(contains(@class, ' topic/titlealts ')) and
  not(contains(@class, ' topic/topic ')) and
  not(contains(@class, ' topic/section '))
]="/>
</div>
</xsl:template>

<!--
Child links.
--> -->
<xsl:template name="generate-minitoc-links">
  <div class="- topic/div chapter/minitoc-links ">
    <related-links class="- topic/related-links ">
      <linklist class="- topic/linklist ">
        <desc class="- topic/desc ">
          <ph class="- topic/ph chapter/minitoc-label ">
            <xsl:call-template name="getVariable">
              <xsl:with-param name="id" select="'Mini Toc'"/>
            </xsl:call-template>
          </ph>
        </desc>
        <xsl:apply-templates select="*[contains(@class, ' topic/topic ') | descendant-or-self::*[contains(@class, ' topic/section ')]" mode="in-this-chapter-list"/>
      </linklist>
    </related-links>
  </div>
</xsl:template>

<xsl:template match="*[contains(@class, ' topic/topic ') or contains(@class, ' topic/section ')]" mode="in-this-chapter-list">
  <xsl:variable name="link-type" select="
    if (contains(@class, ' topic/section ')) then
      'section'
    else
      'topic'"
  />
  <link class="- topic/link " href="#[@id]" type="{$link-type}" role="child">
    <linktext class="- topic/linktext ">
      <xsl:value-of select="*[contains(@class, ' topic/title ')]="/>
    </linktext>
  </link>
</xsl:template>
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.mergedmerged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
    <parameters>
      <parameter name="args.chapter.layout" value="MINITOC"/>
    </parameters>
  </pdf>
  ...
</publishing-template>
```

Note:
This solution works also with args.chapter.layout set to MINITOC-BOTTOM-LINKS.

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

**How to Add a Link to the TOC**

For making the navigation easier in the PDF, you may want to add a link that sends the reader back to the table of contents. To add this link, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"/>
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
          id="com.oxygenxml.pdf.css.xsl.merged2html5"
          file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
@page chapter:first: left: right {  
  @top-right {  
    content: "Back to Table of Contents";  
    -oxy-link: "#toc-anchor";  
    color: #337ab7;
  }
}

@page chapter: left: right {  
  @top-right {  
    content: "Back to Table of Contents";  
    -oxy-link: "#toc-anchor";  
    color: #337ab7;
  }
}
```
7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

**How to Repeat Note Titles After a Page Break**

Suppose that you have large notes that split between pages or columns and you want the note icon and title to be displayed on the next page/column. To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1420).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xm="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xm"
    version="2.0">

<!-- Display notes titles and content in table cells. -->
<xsl:template match="*" mode="process.note.common-processing">
  <xsl:param name="type" select="/type"/>
  <xsl:param name="title"/>
  <xsl:call-template name="getVariable">
    <xsl:with-param name="id" select="concat(upper-case(substring($type, 1, 1)), substring($type, 2))"/>
  </xsl:call-template>
</xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:
<extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
table.note th, table.note td {
    text-align: left;
    padding: .75em .5em .75em 3em;
}

table.note {
    background-repeat: no-repeat;
    background-image: url("../img/note.svg");
    background-position: .5em .5em;
    border: 1px solid;
}

table.note.note_other {
    background-image: none;
}

table.warning {
    background-image: url("../img/warning.svg");
}

table.caution {
    background-image: url("../img/caution.svg");
}

table.trouble {
    background-image: url("../img/troubleshooting.svg");
}

table.important {
    background-image: url("../img/important.svg");
}

table.attention {
    background-image: url("../img/attention.svg");
}

table.notice {
    background-image: url("../img/notice.svg");
}

table.remember {
    background-image: url("../img/remember.svg");
}

table.fastpath {
    background-image: url("../img/fastpath.svg");
}

table.restriction {
    background-image: url("../img/restriction.svg");
}

table.danger {
    background-image: url("../img/danger.svg");
}

table.tip {
    background-image: url("../img/tip.svg");
}

table.note {
    background-color: rgba(0, 120, 160, 0.09);
    border-color: #0078A0;
}

table.note_danger,
    table.note_caution {
            background-color: rgba(255, 202, 45, 0.1);
    border-color: #606060;
}

table.note_warning,
```
table.note_attention,  
    table.note_important {
        background-color: rgba(255, 202, 45, 0.1);  
        border-color: #FFCA2D;
    }

    table.note_restriction {
        background-color: rgba(255, 226, 225, 0.32);  
        border-color: #FF342D;
    }

7. Open the template descriptor file (on page 1414) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```
<publishing-template>
    ...
    <pdf>
        ...
        <resources>
            <css file="css/custom.css"/>
        </resources>
    </pdf>
    ...
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

**How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin**

The examples in this section demonstrate how to use XSLT extension points from a DITA-OT plugin.

Instead of directly adding plugins inside the embedded DITA-OT, it is highly recommended to use an external Oxygen Publishing Engine so that you will not lose any of your customizations anytime you upgrade the product in the future.

You just need to follow these steps before starting your custom DITA-OT plugins:

1. Download the Oxygen Publishing Engine and unzip it inside a folder where you have full write access.
2. Create your custom plugin(s) inside the DITA-OT-DIR\plugins\ folder.
3. Go to Options > Preferences > DITA, set the DITA Open Toolkit option to Custom, and specify the path to the unzipped folder.

⚠️ **Warning:**
The path must end with: oxygen-publishing-engine.
How to Style Codeblocks with a Zebra Effect

Suppose you want your codeblocks to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a <div> for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.codeblocks">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5">
       file="custom_codeblocks.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, custom_codeblocks.xsl) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 exclude-result-prefixes="xs"
                 version="2.0">

     <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
       <div class='zebra'>
         <xsl:analyze-string regex="\n" select="."/>
         <xsl:matching-substring/>
         <xsl:non-matching-substring>
           <div><xsl:value-of select="."/></div>
         </xsl:non-matching-substring>
       </div>
     </xsl:template>
   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.
5. Create a custom CSS file with rules that style the codeblock structure. For example:

   ```css
   div.zebra {
     font-family: courier, fixed, monospace;
   }
   ```
6. Edit a DITA Map PDF - based on HTML5 & CSS transformation scenario and reference your custom CSS file (using the `args.css` parameter).

7. Run the transformation scenario.

How to Remove the Related Links Section

Suppose you want the related links sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).

2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.related.links">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged"
              file="custom_related_links.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_related_links.xsl`) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:xs="http://www.w3.org/2001/XMLSchema"
                   exclude-result-prefixes="xs"
                   version="2.0">

     <xsl:template match="*[contains(@class, ' topic/related-links ')]">
       <!-- Remove. -->
     </xsl:template>

   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

How to Use Custom Parameters in XSLT Stylesheets

Suppose you want to add an attribute with a custom value inside a `<div>` element.
To add this functionality using a DITA-OT plugin, follow these steps:

1. In the $DITA-OT-DIR\plugins$ folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.param`).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.css.param">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5.parameters" file="params.xml"/>
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom.xsl"/>
   </plugin>
   ``

   **Note:**
   The `com.oxygenxml.pdf.css.xsl.merged2html5` extension point can also be called from a Publishing Template.

3. Create a params.xml file that specifies the name of the custom attribute with the following content:

   ```xml
   <dummy xmlns:if="ant:if">
     <param name="custom-param" expression="${custom.param}" if:set="custom.param"/>
   </dummy>
   ``

4. Create your customization stylesheet (for example, `custom.xsl`) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:xs="http://www.w3.org/2001/XMLSchema"
                   exclude-result-prefixes="xs"
                   version="2.0">
     <xsl:param name="custom-param"/>

     <xsl:template match="*[contains(@class, ' topic/div ')]">
       <div>
         <xsl:call-template name="commonattributes"/>
         <xsl:call-template name="setid"/>
         <xsl:if test="$custom-param">
           <xsl:attribute name="custom" select="$custom-param"/>
         </xsl:if>
         <xsl:apply-templates/>
       </div>
     </xsl:template>
   </xsl:stylesheet>
   ``

5. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.
6. Duplicate the DITA Map PDF - based on HTML5 & CSS transformation scenario, then in the Parameters tab click **New** to create a new parameter (e.g. named `custom.param` with the value of `customValue`).

7. Run the transformation scenario.

Adding parameters to existing XSLT steps

---

**DITA-OT Extension Points**

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the `plugin.xml` file. For more information, see DITA Open Toolkit Extension Points.

**Related Information:**

XSLT Extensions for PDF Transformations (on page 1612)

---

**How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin**

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the `args.css` parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the `com.oxygenxml.pdf.css.init` extension point and set the value of the `extension.css` ANT property to the path of the custom CSS file:

1. In your `plugin.xml` file, add:

   ```xml
   <feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
   ```

2. Create a file named `init.xml` with the following ANT content:

   ```xml
   <root>
   <property name="extension.css"
             value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"/>
   <!-- add here more init stuff if needed -->
   </root>
   ```
Note:
The name of the root element does not matter. The content of this element will be copied in an initialization template.

Important:
Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

Related Information:
How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin (on page 1642)

Localization
DITA-OT supports more than 40 languages. The full list of supported languages (and their codes) is available here: https://www.dita-ot.org/3.6/topics/globalization-languages.html.

There are two ways to switch the labels to a specific language:

- Set the `@xml:lang` attribute on the DITA maps and/or topics root element with one of the supported values (e.g. de, fr-FR, ru, zh-CN).
- Set the `default.language` parameter in the transformation dialog box to the desired language code.

Tip:
It is recommended that you do this customization on a DITA-OT distribution deployed outside of the Oxygen installation. Otherwise, you will lose the customization when upgrading Oxygen. You can contact the Oxygen support team to ask for the Oxygen Publishing Engine package.

How to Customize CSS Strings
Some of the labels come from CSS files located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory. These strings can be overridden directly from a custom CSS stylesheet. Simply identify (by debugging the CSS) and copy the rules that apply on your content and change their values. For example:

```css
*[^class ^= "toc/title"]|^empty|^:before {
    content: "Agenda";
}
```
Note:
If you want to use a language without a corresponding `p-i18n-xx.css` stylesheet, follow these instructions:

1. Copy one of the available stylesheets (located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory) into your CSS customization (other than the English one because it does not have the `:lang` pseudo-class since it is the default language).
2. For each rules, replace the `:lang(xx)` pseudo-class with your expected language code, then replace each property value with the expected label.

Related information
Debugging the CSS (on page 1426)

How to Modify Existing Strings
If the label you want to modify is not available from the CSS, you need to modify the XML strings. The default XML strings are available at the following two locations:

- `DITA-OT-DIR/plugins/org.dita.base/xsl/common`
- `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/resources/localization`

To modify the generated text, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses English, but you can adapt it for any language:

1. In the `DITA-OT-DIR/plugins\folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css"/>
  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
</plugin>
```
3. Create a `pdf-extension-strings.xml` file with the following content:
4. Copy the strings you want to change from the default files to the `strings-en-us.xml` file, then replace their values:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Table">Array</str>
</strings>
```

**Warning:**
Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the **Run DITA-OT Integrator** transformation scenario *(on page 1066)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.

6. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

### How to Add New Strings

Some strings are not translated in all languages. In this case, they will appear in English. To add a new language for a given string, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses Polish, but you can adapt it for any language:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).

2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.css.localization">
     <require plugin="com.oxygenxml.pdf.css"/>

     <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `pdf-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
   <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
   <lang xml:lang="pl-pl" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

4. Copy the strings you want to change from the default files to the `strings-pl-pl.xml` file, then replace their values:
5. Use the Run DITA-OT Integrator transformation scenario (on page 1066) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Security

You can restrict the use of the PDF files by specifying a set of permissions. For example, you may want to set a password on the document, restrict the available actions inside the PDF reader, or encrypt the PDF content.

The pdf.security.* parameters listed in the Transformation Parameters (on page 1401) section can be used for this purpose.

How to Protect PDF Files by Setting Security Permissions

For example, to permit only the users that have a password to access the document and also to restrict their printing and copying capability, you can use the following parameter combination:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.security.owner.password</td>
<td>&lt;OWNER PASSWORD&gt;</td>
<td>People using this password will be able to open the document, with full permissions.</td>
</tr>
<tr>
<td>pdf.security.user.password</td>
<td>&lt;USER PASSWORD&gt;</td>
<td>People using this password will be able to open the document, but they will not be able to print.</td>
</tr>
<tr>
<td>pdf.security.restrict.print</td>
<td>yes</td>
<td>Restricts users from printing.</td>
</tr>
<tr>
<td>pdf.security.restrict.copy</td>
<td>yes</td>
<td>Restricts users from copying content.</td>
</tr>
</tbody>
</table>

Important:

If you specify just the user password (without an owner password), then the people using it will be considered owners, and no restrictions will apply to them.
Troubleshooting

There are cases when the PDF CSS-based processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Damaged PDF File

Problem

It is possible to get a PDF that cannot be opened in the PDF viewer. In this case, you might get an error similar to:

- Error: PDF file is damaged - attempting to reconstruct xref table...
- Error: Couldn't find trailer dictionary
- Error: Couldn't read xref table

Cause

This usually means that your PDF viewer does not support a PDF version greater than 1.4. The main difference with newer PDF versions is that the xref table is compressed in a stream and is not available as a table.

Solution

You need to re-run the PDF transformation with the `pdf.version` parameter set to 1.4.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception`, `Unknown host`, `Error parsing`.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note:

If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.
Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note:
If the problem is caused by a remote font, see Using Local Fonts.

Failed to Run Pipeline: The Entity Cannot Be Resolved Through Catalogs

Problem
You can get a Failed to run pipeline error message that looks something like this:

Failed to run pipeline: The entity SOME_ENTITY cannot not be resolved through catalogs.
For security reasons files that are not listed in the DITA-OT catalogs and are not located in the DITA-OT directory are not read

Cause
This happens when the security checks that are implemented in the default transformation have blocked the reading of files that are not part of the DITA-OT (Oxygen Publishing Engine) installation directory and not part of the transformed DITA map.

Solution
If the origin of the transformed content is known and trusted, you can disable these checks by setting the args.disable.security.checks transformation parameter to yes.

Disappearing Thin Lines or Cell Borders

Problem
There are cases where thin lines disappear from the PDF viewer at certain zoom levels.

Cause
This is caused by the limited resolution of the display, while a printer has a superior resolution and there should be no problem printing thin lines on paper.

Solution
If the primary PDF target is the display, then you have to use thicker lines in your CSS customization (for example, avoid using 1px and use 1pt or larger instead).

If you are using Adobe Acrobat Reader, then you can enhance the display of thin lines. This behavior can be changed by going to Edit > Preferences > Page Display > Enhance Thin Lines. Deselecting this option
makes thin lines displayed as a row of gray pixels (through antialiasing) and they do not disappear. You can experiment by selecting and deselecting the option.

**Glossary Entries Referenced Using 'glossref' are not Displayed**

**Problem**

I have a `<glossgroup>` that contains multiple `<glossentry>` elements and all the entries are referenced using `<glossref>` elements inside my map. When I add an `<abbreviated-form>` element linked to one of my `<glossentry>` elements (using a `@keyref`), the entry is not resolved in the PDF output.

**Solution**

Make sure every `<glossentry>` has an `@id`. Then, for each `<glossentry>`, declare a `<glossref>` element like this:

```xml
<glossref href="concepts/glossary.dita#flowers.genus" print="yes" keys="genus"/>
```

**Important:**

For bookmaps, the `<glossref>` elements should be declared in a separate `ditamap`.

**The format-date() XPath Function Does Not Respect the Specified Locale**

**Problem**

Formatting a date using another language code, as in this example:

```xml
title:before {
  content: oxy_xpath('format-date(current-date(), "[Mn] [Y]", "ru", (), ())');
}
```

results in an output like: `[Language: en]september 2019`, with the date being formatted in English.

**Cause**

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support languages other than English.

**Solution**

As a solution, you can either switch to a more language-neutral format that avoids the months names:

```xml
title:before{
  content: oxy_xpath('format-date( current-date(), 
    "[M] [Y]", 
    "en", 
    (), 
    ()
  )');
}
```

or you can use a more complex XPath expression like this:

```xml
title:before{

```
content: oxy_xpath("let $cm:= format-date(current-date(), 'Mn') \nreturn concat( \nif ($cm= 'January') then 'JAN' else \nif ($cm= 'February') then 'FEB' else \nif ($cm= 'March') then 'MAR' else \nif ($cm= 'April') then 'APR' else \nif ($cm= 'May') then 'MAY' else \nif ($cm= 'June') then 'JUNE' else \nif ($cm= 'July') then 'JUL' else \nif ($cm= 'August') then 'AUG' else \nif ($cm= 'September') then 'SEPT' else \nif ($cm= 'October') then 'OCT' else \nif ($cm= 'November') then 'NOV' else '' \n, \n' ', \nformat-date(current-date(), 'Y0001') \n) ");

Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.

**Highlights Span Unexpectedly to the End of the Page**

**Problem**

Tracked changes and highlights span beyond what is expected.
**Cause**

If the change tracking insertions, comments, or highlights span over an area that is larger than expected, the markup that signals their end is missing.

**Solution**

To fix this, open the topic where the highlights start and check if the XML processing instructions that define the end of the highlighted interval are correct (it is easiest to see them in **Text** mode). The intervals are defined as follows:

For highlights:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="140,255,140"?>
<?oxy_custom_end?>
```

For comments:

```xml
<?oxy_comment_start author="dan" timestamp="20201102T092905+0200" comment="Test"?>
<?oxy_comment_end?>
```

For inserted text:

```xml
<?oxy_insert_start author="dan" timestamp="20201102T093034+0200"?>
<?oxy_insert_end?>
```

Make sure all the ending processing instructions are located before the root element end tag.

**Unexpected Page Break Before or After an Element**

**Problem**

A page break is present before or after an element that has `page-break-before` or `page-break-after` (break-before or break-after) set to `avoid`.

**Cause**

An empty element (for example `<p>` or `<shortdesc>`) is present before or after the element with the break set to avoid.

**Solution**

Either remove the empty element from the DITA source topic or set the display to `none` using the following CSS rule:

```css
*[class =~ "topic/shortdesc"]:empty {
    display: none;
}
```
XSL FO-based DITA to PDF Customization

Oxygen XML Author comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2816) to PDF output. Oxygen XML Author includes a built-in DITA Map PDF - based on XSL-FO transformation scenario (on page 1060) that converts DITA maps to PDF using an xsl:fo processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the customization.dir parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

Tip:

Some sample plugins are available on GitHub that could help you to get started with creating a plugin:

- Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
- Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title

Using a Customization Directory

One way to customize the PDF output generated by the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the customization.dir parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire DITA-OT-DIR\plugins\org.dita.pdf2\Customization directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (on page 1657) for a specific example of how you can modify contents of the directory to embed a logo in the output.

Tip:

For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.

3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.
Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book for the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060).

1. Create a customization directory (on page 1656) (if you have not already done so).
2. Create a \cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, C:\Customization\common\artwork\logo.png).

   Important:
   Make sure that your logo image is named: logo.png.

3. Rename Customization\catalog.xml.orig to: Customization\catalog.xml.

4. Open the catalog.xml in Oxygen XML Author and uncomment this line:

   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->

   It now looks like this:

   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

5. Rename the file Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl

6. Open the custom.xsl file in Oxygen XML Author and create the template called createFrontCoverContents for DITA-OT 4.1.1.

   Tip:
   You can copy the same template from DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl and modify it in whatever way necessary to achieve your specific goal. This new template in the custom.xsl file will override the same template from DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl.

Example:

For example, the custom.xsl could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">
7. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.
Customizing the Header and Footer in PDF Output

This procedure should only be used for the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060).

The XSLT stylesheet DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called insertBodyOddFooter or insertBodyEvenFooter.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common-vars/en.xml. These resource files contain variables (such as Body odd footer) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. Create a customization directory (on page 1656) (if you have not already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Using a Customization Directory (on page 1656)
Adding a Watermark to PDF Output

To add a watermark to the PDF output of a **DITA Map PDF - based on XSL-FO** transformation scenario *(on page 1060)*, follow this procedure:

1. **Create a customization directory** *(on page 1656)* (if you have not already done so).
2. **Create a `cfg\common\artwork` directory structure in your customization directory** and copy your watermark image to that directory *(for example, `C:\Customization\cfg\common\artwork\watermark.png`)*.
3. **Rename the** `Customization\catalog.xml.orig` **file to** `Customization\catalog.xml`.
4. **Open the** `catalog.xml` **in Oxygen XML Author** and **uncomment** this line:
   ```xml
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/--> 
   ```
   The uncommented line should look like this:
   ```xml
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```
5. **Rename the file**: `Customization\fo\xsl\custom.xsl.orig` **to**: `Customization\fo\xsl\custom.xsl`.
6. **Open the** `Customization\fo\xsl\custom.xsl` **file in Oxygen XML Author** to overwrite two XSLT templates:
   - The first template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:
   ```xml
   <fo:static-content flow-name="odd-body-header">
     <fo:block-container absolute-position="absolute"
      top="-2cm" left="-3cm" width="21cm" height="29.7cm"
      background-image="{concat($artworkPrefix,"Configuration/OpenTopic/cfg/common/artwork/watermark.png")}">
     <fo:block/>
     </fo:block-container>
   </fo:block>
 </fo:block-container>
<fo:block xsl:use-attribute-sets="__body_odd__header">
  <xsl:call-template name="insertVariable">
    <xsl:with-param name="theVariableID" select="'Body odd header'"/>
    <xsl:with-param name="theParameters">
      <prodname>
        <xsl:value-of select="$productName"/>
      </prodname>
      <heading>
        <fo:inline xsl:use-attribute-sets="__body_odd__header__heading">
          <fo:retrieve-marker retrieve-class-name="current-header"/>
        </fo:inline>
      </heading>
    </xsl:with-param>
  </xsl:call-template>
</fo:block>
```
The second template to override is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xsl` and adding the `block-container` element that references the watermark image file:

```xml
<xsl:template name="createFrontMatter_1.0">
  <fo:page-sequence master-reference="front-matter"
      xsl:use-attribute-sets="__force__page__count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
      <fo:block-container absolute-position="absolute"
          top="-2cm" left="-3cm" width="21cm" height="29.7cm"
          background-image="{concat($artworkPrefix,'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
        <fo:block/>
      </fo:block-container>
      <fo:block xsl:use-attribute-sets="__frontmatter">
        <!-- set the title -->
        <fo:block xsl:use-attribute-sets="__frontmatter__title">
          <xsl:choose>
            <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
              <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
            </xsl:when>
            <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
              <xsl:apply-templates select="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]"/>
            </xsl:when>
            <xsl:when test="$map//*[contains(@class, ' map/map ')]/@title">
              <xsl:value-of select="$map//*[contains(@class, ' map/map ')]/@title"/>
            </xsl:when>
            <xsl:otherwise>
7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1060), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

**Related Information:**
Adding a Watermark in DITA Map to XHTML Output (on page 2704)

**Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author**

You can embed *Edit* links in the **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1060) output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:
1. Edit a DITA Map PDF - based on XSL-FO transformation scenario (on page 1060) and open the Parameters tab.

2. Set values for the following parameters:
   - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
   - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. &tags-mode=no-tags).

3. Run the transformation scenario.

**Result:** In the PDF output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

### Force Page Breaks Between Two Block Elements in PDF Output

The following procedure works for the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060).

Suppose that in your DITA content you have two block elements (on page 2814), such as two paragraphs:

```xml
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (on page 2819) that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```xml
<p>First para</p>
<pagebreak/>
<p>Second para</p>
```

2. Locate the DITA Open Toolkit distribution and in the plugins directory create a new plugin folder (for example, DITA-OT-DIR/plugins/pdf-page-break).

3. In this new folder, create a new plugin.xml file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youremail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.
4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. Install your plugin in the DITA Open Toolkit. (on page 2748)

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060) output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario.
2. In the Parameters tab, set the value of the `show.changes.and.comments` parameter to `yes`. If you also want to display change bars for inserted or deleted content in the PDF, set the `show.changebars` parameter to `yes`. If you want to only show the `changebars`, without other styling of the changes, you should set both the `show.changes.and.comments` and `show.changes.and.comments.as.changebars.only` parameters to `yes`.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - `ct.insert.color` - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. `#FFFFFF`). The default value is `blue`.
   - `ct.delete.color` - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. `#FFFFFF`). The default value is `red`.
   - `ct.comment.bg.color` - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. `#FFFFFF`). The default value is `yellow`.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a DITA map (on page 2816) is transformed using the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060) and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.
The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version (on page 1137).

**DITA-OT PDF Font Mapping**

The DITA-OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```xml
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be `monospace`, but `monospace` is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this `monospace` alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```xml
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the `monospace` has a `logical-font` definition and if so, it will use the `physical-font` specified there:

```xml
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
</logical-font>
```

**Important:**

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to Helvetica.

**Related information**

http://www.elovirta.com/2016/02/18/font-configuration-in-pdf2.html

**Adding Libraries to the Built-in FO Processor (DITA-OT)**

Starting with Oxygen XML Author version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA Map PDF - based on XSL-FO transformation scenario (on page 1060). For older version of Oxygen XML Author, use the following procedures to enable such support.
Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR (on page 2817) from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the fop-hyph.jar library.

Adding Support for PDF Images

1. Download the fop-pdf-images JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the JCGM page and download the jcgm-image-0.1.1.jar and jcgm-core-0.2.0.jar libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug the DITA Map PDF - based on XSL-FO transformation scenario (on page 1060), follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124), go to XML > XML Catalog, click Add, and select the file located at DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml. If there are other custom DITA-OT PDF customization plugins that contain XML catalogs, references to those XML catalogs might need to be added as well.
2. Open the map in the DITA Maps Manager (on page 2472) and create a DITA Map PDF - based on XSL-FO transformation scenario.
3. Edit the scenario, go to the Parameters tab and change the value of the clean.temp parameter to no.
4. Run the transformation scenario.
5. Open the stage1.xml file located in the temporary directory and format and indent (on page 537) it.
6. Create a transformation scenario for this XML file by associating the topic2fo_shell_fop.xsl stylesheet located at DITA-OT-DIR\plugins\org.dita.pdf2.fop\xsl\fo\topic2fo_shell_fop.xsl. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets topic2fo_shell_xep.xsl or topic2fo_shell_axf.xsl located in the corresponding plugin folders.

Note:
For validation purposes, you need to add the main debugged stylesheet (usually topic2fo_shell_fop.xsl) to the Main Files folder (on page 403) in the Project view.

7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).
8. Click the Parameters button:
a. Set the `locale` parameter (e.g. with the value of `en_GB`).
b. Set the `work.dir.url` parameter with the value `${cfdu}`.
c. Set the `customizationDir.url` parameter to point to either your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this:

```
file://c:/path/to/<term keyref="glossentry_dita_ot_dir"/>/plugins/org.dita.pdf2cfg
```

9. You need to reference the extra commonly used JAR libraries by clicking the Extensions button and using wildcards to add a reference to all libraries in this folder: DITA-OT/plugins `com.oxygenxml.common\lib\*`.

10. Apply the transformation to continue the debugging process.

**Note:**
For externally configured DITA Open Toolkit installations or when using custom plugins based on the base PDF2 plugin, the paths to resources described above may need to be adjusted accordingly.

**Related information**
- How to Enable Debugging for FO Processor Transformations *(on page 1138)*

### DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   
   You could start from a copy of the file [DocBook XSL directory]/fo/titlepage.templates.xml (for example, [OXYGEN-INSTALL-DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml) and customize it. More information about the spec file can be found [here](#).

2. Generate a new XSLT stylesheet from the title spec file from the previous step.
   
   Apply [DocBook XSL directory]/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer.
   
   The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:

   ```
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.
   
   The path to the logo image must be inserted in the `book/info/mediaobject` structure of the XML document.
5. Apply the customization layer to the XML document.
   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Author and set the customization layer in the XSL URL property of the scenario (on page 1075).

Related Information:
Video demonstration for creating a DocBook customization layer in Oxygen XML Author.
12. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note:

If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- child::* - Selects all children of the root node.
- ./name - Selects all <name> elements and descendants of the current node.
- /catalog/cd[price>10.80] - Selects all the <cd> elements that have a <price> element with a value larger than 10.80.
- //prolog - Finds all <prolog> elements.
- //prolog[@platform='mac'] - Finds all <prolog> elements that have the @platform attribute value set to mac.
- //child::prolog - Selects all <prolog> elements and the child content.
- /*[count(/accountNumber) > 5] - Searches for instances where more than 5 <accountNumber> elements are found.
- collection('file:/C:/path/to/folder/?select=*.xml')/*[not(/prolog)] - Finds a list of all XML files that do not contain any <prolog> elements.

To find out more about XPath, see http://www.w3.org/TR/xpath.

Related Information:
Find/Replace in Multiple Files (on page 418)
Find/Replace Dialog Box (on page 413)

XPath Toolbar

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of the XPath Core Function Library.
XPath Toolbar

Oxygen XML Author provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

**Figure 321. XPath Toolbar**

![XPath Toolbar](image)

The XPath toolbar includes the following features:

### XPath version chooser drop-down menu

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include *XPath 1.0*, *XPath 2.0*, *XPath 2.0 SA*, *XPath 3.1*, *XPath 3.1 SA*.

**Note:**
The *XPath 2.0 SA* and *XPath 3.1 SA* options have some limitations. These options only offer information about the beginning part of the matching result. For example, if you search for an element, it will only highlight the start tag.

**Warning:**
Oxygen XML Author uses Saxon to execute XPath 3.1 expressions, but implements a part of the 3.1 functions. When using a function that is not implemented, Oxygen XML Author can return a compilation error.

### XPath scope menu

Oxygen XML Author allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- **Current file** - Currently selected file only.
- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files that are opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map that is open in the DITA Maps Manager view (on page 2472).
- **Opened archive** - Files that are opened in the Archive Browser view (on page 1678).
- **Working sets** - The selected working sets (on page 2821).

At the bottom of the scope menu the following scope configuration actions are available:
Configure XPath working sets - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2821).

XPath file filter - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the Include archive option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

History drop-down list

The XPath combo box keeps a history of the last 15 expressions that were used so that you can easily choose them again.

Settings menu

The following actions are available in this drop-down menu:

XPath update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate XPath as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when you edit huge documents (on page 451) or when the scope is other than Current file.

XPath Options

Opens the Preferences page of the currently selected processing engine.

Switch to XPath Builder View

Opens the XPath Builder view (on page 1672).

Note:

During the execution of an XPath expression, the XPath toolbar displays a Stop button. Use this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the XPath Builder view (on page 1672).
XPath Builder View

The XPath/XQuery Builder view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the XPath/XQuery Builder view and the current file is an XSLT document, Oxygen XML Author executes the expressions over the XML document in the associated scenario.

Note:
If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. You can also open it simply by pressing the Switch to XPath Builder View button that is located on the XPath toolbar (on page 1669).

The upper part of the view contains the following actions:

XPath version chooser drop-down menu
A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note:
The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note:
Oxygen XML Author uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Author returns a compilation error.
Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the Results view (on page 530) view.

🌟 Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Author automatically groups favorites in folders named after the method of execution.

🔍 History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the 🟢 Clear history action from the bottom of the list to remove them.

⚙️ Settings drop-down menu

Contains the following three options:

🔹 Update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

.Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

⚠️ Note:

This option and the automatic validation are disabled when you edit huge documents (on page 451) or when the scope is other than Current file.

🔹 OPTIONS

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Author allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- 📚 Current file - Currently selected file only.
- 📚 Project - All the files in the project.
- 📚 Selected project resources - The files selected in the project.
- 📚 All opened files - All files that are opened in the application.
• **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map that is open in the DITA Maps Manager view (on page 2472).

• **Opened archive** - Files that are opened in the Archive Browser view (on page 1678).

• **Working sets** - The selected working sets (on page 2821).

At the bottom of the scope menu the following scope configuration actions are available:

• **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2821).

• **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

**Figure 322. XPath/XQuery Builder View**

![XPath/XQuery Builder View](image)
While you edit an XPath or XQuery expression, Oxygen XML Author assists you with the following features:

- **Content Completion Assistant (on page 2815)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Editor > Syntax Highlight (on page 220).

- **Automatic validation of the expression as you type.**

- **Function signature and documentation balloon, when the cursor is located inside a function.**

The usual edit actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of the top editable part of the view.

**Related Information:**
XPath Expression Results View (on page 1675)

**XPath Expression Results View**

When you run an XPath expression, Oxygen XML Author displays the results of its execution in the Results view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Author displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system ID, right-click the header of any column in the Results view and select Group by "Resource" or Group by "System ID". If no information regarding location is available, Oxygen XML Author displays Not available in the Location column. Oxygen XML Author displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

The Results view also includes various toolbar and contextual menu actions. For more information, see Results View (on page 530).
Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press Enter. This action returns all the `chapter` nodes of the DocBook book in the Results View. Click a record in the Results View to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Author adds a result in the Results View for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Figure 323. XPath Results Highlighted in Editor Panel with Character Precision
XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through XML Catalogs (on page 2821). These catalogs are configured in the XML Catalog preferences (on page 230) pages and the XML Parser preferences (on page 232).

Example:

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an XML catalog, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```
let $docs := collection(iri-to-uri{
   "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
   parser=ro.sync.xml.parser.CatalogEnabledXMLReader")
```

XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the XPath toolbar (on page 1669)) and namespace URIs go to the XPath preferences page (on page 249) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

⚠️ Important:

If you define a default namespace, Oxygen XML Author binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `<level>` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.
13.

Working with Archives

Oxygen XML Author includes a useful Archive Browser view (on page 1678) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (on page 2817)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (on page 2817)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

Resources

For more information about working with an EPUB archive in Oxygen XML Author, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Browsing Archives

Oxygen XML Author includes a helper view called the Archive Browser that allows you to view the contents and structure of an archive, and it offers a variety of toolbar and contextual menu actions. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

To open an archive in the Archive Browser view, use one of the following methods:

- Open an archive from the Project view (on page 385).
- Select an archive in one of the file chooser dialog boxes in Oxygen XML Author (such as the Open dialog box).
- Drag an archive from a system file explorer and drop it in the Archives Browser view.
When displaying an archive, the Archive Browser view locks the archive file. It is then automatically unlocked when the Archive Browser view is closed.

Tip:
If a file is not recognized by Oxygen XML Author as a supported archive type, you can add it in the Archive preferences page (on page 281).

Figure 324. Archive Browser

Archive Browser Toolbar Actions

The following actions are available on the Archive Browser toolbar:

- **Open Archive menu**
  Provides access to the Open Archive action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the Archive preferences page (on page 281) to add a new extension. The submenu keeps a list of recently open archive files and a Clear history action that allows you to delete the list.

- **Close**
  Closes the browsed archive and unlocks the archive file.

- **Validate (available for EPUB archives only)**
  Checks the EPUB archive to see if its content and structure is valid.

- **New folder**
  Creates a folder as child of the selected folder in the browsed archive.
New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note:
You can also add files in the archive by dragging them from the file browser or the Project view (on page 385) and dropping them in the Archive Browser view.

Delete

Deletes the selected resource in the browsed archive.

Open in System Application

Opens the selected resource in the default system application that is associated with that type of file.

Archive Options

Opens the Archive preferences page (on page 281).

Archive Browser Contextual Menu Actions

The following additional actions are available from the contextual menu for resources in the Archive Browser view:

Open

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note:
On macOS, the Add file action is also available and it allows you to add one file at a time.
Rename

Renames a resource in the archive.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to search for and replace specific pieces of text inside the archive.

Cut

Cuts the selected archive resource.

Copy

Copies the selected archive resource.

Paste

Pastes a file or folder into the archive.

Delete

Removes a file or folder from archive.

Preview

Previews an image contained in the archive. See the Image Preview (on page 451) topic for more details.

Copy location

Copies the URL location of the selected resource.

Refresh

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

Resources

For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

https://www.youtube.com/embed/OIGTNQwOCl8

Working with Archive Files

Oxygen XML Author includes support for working with various types of archives, including the following:
• **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
• **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
• **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the Archive Browser view (on page 1678), their internal components are expanded:

• Document content (XHTML and image files).
• Packaging files.
• Container files.

**Figure 325. EPUB File Displayed in the Archive Browser View**

When an archive is expanded in the Archive Browser view (on page 1678), you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes back to the archive. You can also use the **Open in System Application** action to open the archive in the default system application that is associated with that type of file.
EPUB-Specific Validation

When working with EPUB archives, the Archive Browser (on page 1678) includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Author uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

Resources

For more information about working with an EPUB archive in Oxygen XML Author, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Related information

The Archive Browser View (on page 1678)
EPUB Document Type (Framework) (on page 1035)

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New or click New on the main toolbar.
2. Choose your particular type of archive template. For example, select one of the ODF, OOXML, or EPUB templates.
3. Click Create and choose the name and location of the file.
4. Click Save.
   A skeleton archive is saved on disk and open in the Archive Browser view (on page 1678).

Tip:
Use toolbar and contextual menu actions to edit, add, and remove resources from the archive.
For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive in the Archive Browser view (on page 1678) and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Messages preferences page (on page 297).
Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in the Archive Browser (on page 1678).
2. Open the document.xml file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. **DOCX DITA** to migrate to DITA.
   b. **DOCX TEI P5** to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

**Tip:**
Oxygen XML Author also includes a built-in transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
Databases and SharePoint

Oxygen XML Author provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Author. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Author offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Author helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Author include:

- IBM DB2 (on page 1691)
- Microsoft SQL Server (on page 1695)
- Oracle Database (on page 1699)
- PostgreSQL (on page 1704)
- eXist (on page 1707)
- MarkLogic (on page 1712)
- MySQL (on page 1718)
- Generic JDBC (on page 1720)
- JDBC-ODBC (on page 1721)
- BaseX (on page 1722)
- WebDAV (on page 1727)
- Microsoft SharePoint (on page 1732)

Data Source Explorer View

The Data Source Explorer view displays your database connections. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside...
relational databases. Oxygen XML Author supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

**Figure 326. Data Source Explorer View**

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project view (on page 385)**, a file browsing application, or another database.

**Toolbar Actions**

The following actions are available in the toolbar of this view:

- **Filters**
  
  Opens the **Data Sources / Table Filters preferences page (on page 271)**, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

- **Configure Database Sources**

  Opens the **Data Sources preferences page (on page 267)** where you can configure both data sources and connections.

**Database-Specific Contextual Menu Actions**

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.
For more information on the specific actions that are available, see the topics in this section for each specific type of database.

### Related Information:

**Data Sources Preferences** *(on page 267)*

---

**Table Explorer View**

Relational databases tables in the [Data Source Explorer view](on page 1685) can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a [Table node](on page 1685) or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Author attempts to update the database with the new cell content.

![Figure 327. Table Explorer View](image)

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: ![key symbol].
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the **Limit the number of cells** option in the **Data Sources Preferences** page *(on page 271)*). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).
• If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure propID contains LONG values. If a character or string is inserted, the cell will look like this:

Figure 328. Cell Containing an Invalid Value

If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure 329. Duplicate Entry for Primary Key

Table Explorer Contextual Menu Actions

Common editing actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the Table Explorer view, also includes the following actions:

Set NULL

Sets the content of the cell to null. This action is not available for columns that cannot have a value of null.
Insert row
Inserts an empty row in the table.

Duplicate row
Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row
Commits the selected row.

Delete row
Deletes the selected row.

Copy
Copies the content of the cell.

Paste
Pastes copied content into the selected cell.

Table Explorer Toolbar Actions
The toolbar of the Table Explorer view also includes the following actions:

Export to XML
Opens the Export Criteria dialog box.

Refresh
Performs a refresh for the sub-tree of the selected node.

Insert row
Inserts an empty row in the table.

Duplicate row
Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row
Commits the selected row.

Delete row
Deletes the selected row.

Data Source Explorer View (on page 1685)
Database Connection Support

Oxygen XML Author offers support for a variety of Relational and Native XML database connections. The database drivers and connections for various types of database are configured in the Data Sources preferences page (on page 267) and once configured, the database connections can be viewed and managed in the Data Source Explorer view (on page 1685). Oxygen XML Author also includes a Database perspective (on page 336) that helps you to manage databases.

The database support in Oxygen XML Author offers a variety of capabilities, including:

- Browsing the structure of databases in the Data Source Explorer view (on page 1685).
- Viewing relational tables in the Table Explorer view (on page 1687).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Author offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Author also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, MariaDB).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Author offers support for the most commonly used native XML databases, including:

- eXist
- MarkLogic
- Oracle XML DB
- Base X
IBM DB2 Database Connections

Oxygen XML Author includes support for IBM DB2 database connections. Oxygen XML Author allows you to browse the structure of an IBM DB2 database in the Data Source Explorer view (on page 1685), open tables in the Table Explorer view (on page 1687), and perform various operations on the resources in the repository.

Figure 330. IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Author for configuring a DB2 data source (on page 1692).
2. Configure IBM DB2 Data Source drivers (on page 1692).
3. **Configure an IBM DB2 Server Connection** *(on page 1693)*.

4. To view your connection, go to the **Data Source Explorer view** *(on page 1685)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(on page 2818)*.

### How to Configure IBM DB2 Data Source Drivers

**Note:**
Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the [IBM website](https://www.ibm.com) and in the **DB2 Clients and Development Tools** category select the **DB2 Driver for JDBC and SQLJ** download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. **Open the Preferences dialog box (Options > Preferences)** *(on page 124)* and go to **Data Sources**.
4. Click the **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

**Figure 331. Data Source Drivers Configuration Dialog Box**

5. Enter a unique name for the data source.
6. Select **DB2** in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

   The IBM DB2 driver files are:
   - `db2jcc.jar`
   - `db2jcc_license_cisuz.jar`
   - `db2jcc_license_cu.jar`

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to configure your IBM DB2 connection (on page 1693).

### How to Configure an IBM DB2 Connection

**Note:**
The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box (Options > Preferences) (on page 124) and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

**Figure 332. Connection Configuration Dialog Box**
3. Enter a unique name for the connection.
4. Select an IBM DB2 data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1685), depending on the node where it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1687).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1685), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**
  **Register**
  Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.
**Schema Level Nodes**

**Unregister**

Removes the selected schema from the XML Schema Repository.

**View**

Opens the selected schema in Oxygen XML Author.

**Microsoft SQL Server Database Connections**

Oxygen XML Author includes support for Microsoft SQL Server database connections. Oxygen XML Author allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1685), open tables in the Table Explorer view (on page 1687), and perform various operations on the resources in the repository.

**Configuring a Microsoft SQL Server Connection**

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (on page 1695).
3. Configure a MS SQL Server Connection (on page 1696).
4. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

**How to Configure Microsoft SQL Server Data Source Drivers**

**Note:**

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
   
   The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select SQLServer in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called *sqljdbc.jar*.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Microsoft SQL Server connection (on page 1696).

How to Configure a Microsoft SQL Server Connection

**Note:**
The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the **+ New** button in the Connections panel.

The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the SQL Server data source in the Data Source drop-down menu.
5. Enter the connection details.

   a. Enter the URL of the SQL Server server.
      If you want to connect to the server using Windows integrated authentication, you must add
      ;integratedSecurity=true to the end of the URL. The URL will look like this:
      
      "jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;"

      **Note:**
      For integrated authentication, leave the User and Password fields empty.

   b. Enter the user name for the connection to the SQL Server.

   c. Enter the password for the connection to the SQL Server.

6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).
Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1685), depending on the node where it is invoked:

**Refresh**
Performs a refresh on the selected node.

**Disconnect (available on Connection nodes)**
Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

**Configure Database Sources (available on Connection nodes)**
Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

**Edit (available on Table nodes)**
Opens the selected table in the Table Explorer view (on page 1687).

**Export to XML (available on Table nodes)**
Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1685), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

**XML Schema Repository Level Nodes**

**Register**
Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

**Schema Level Nodes**

**Add**
Adds a new schema to the XML Schema files.

**Unregister**
Removes the selected schema from the XML Schema Repository.

**View**
Opens the selected schema in Oxygen XML Author.
Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Author comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Author allows you to browse Oracle repositories in the Data Source Explorer view (on page 1685), open tables in the Table Explorer view (on page 1687), and perform various operations on the resources in the repository.

Related Information:
Using XQuery with Oracle XML DB

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (on page 1699).
3. Configure an Oracle 11g Connection (on page 1700).
4. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

How to Configure Oracle 11g Data Source Drivers

Note:
Available in the Enterprise edition only.
To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the **Preferences** dialog box (**Options** > **Preferences**) (**on page 124**) and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

**Figure 336. Data Source Drivers Configuration Dialog Box**

4. Enter a unique name for the data source.
5. Select **Oracle** in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.
   
   The Oracle driver file is called `ojdbc5.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Oracle connection (**on page 1700**).

**How to Configure an Oracle 11g Connection**

**Note:**

Available in the Enterprise edition only.
To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) *(on page 124)* and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

![Connection Configuration Dialog Box](image)

3. Enter a unique name for the connection.
4. Select the **Oracle 11g** data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** *(on page 1685)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(on page 2818)*.

### Oracle Database Contextual Menu Actions

#### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** *(on page 1685)*, depending on the node where it is invoked:
**Refresh**

Performs a refresh on the selected node.

**Disconnect (available on Connection nodes)**

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

**Configure Database Sources (available on Connection nodes)**

Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

**Edit (available on Table nodes)**

Opens the selected table in the Table Explorer view (on page 1687).

**Export to XML (available on Table nodes)**

Opens the Export Criteria dialog box.

### Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1685), the various nodes in Oracle database connections include the following additional contextual menu actions:

**XML Schema Repository Level Nodes**

**Register**

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. **Local scope** means that the schema is visible only to the user who registers it. **Global scope** means that the schema is public.

**Note:**

Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLElement tables that conform to the registered schemas. For XMLElement columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLElement tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
• INSERT ANY TABLE
• DELETE ANY TABLE
• DROP ANY TABLE
• ALTER ANY TABLE
• DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container
Adds a new child container to the current one.

Add resource
Adds a new resource to the folder.

Container Level Nodes

Add container
Adds a new child container to the current one.

Add resource
Adds a new resource to the folder.

Delete
Deletes the current container.

Properties
Shows various properties of the current container.

Resource Level Nodes

Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.
Rename
Renames the current resource

Move
Moves the current resource to a new container (also available through drag and drop).

Delete
Deletes the current container.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties
Shows various properties of the current container.

Compare
Compares two selected resources using the Compare Files tool (on page 456).

PostgreSQL Database Connections
Oxygen XML Author includes support for PostgreSQL database connections. Oxygen XML Author allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (on page 1685), open tables in the Table Explorer view (on page 1687), and perform various operations on the resources in the repository.
Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to [https://jdbc.postgresql.org/download/](https://jdbc.postgresql.org/download/) and download the PostgreSQL JDBC driver specific for your server version.
2. Configure PostgreSQL Data Source drivers (on page 1705).
3. Configure a PostgreSQL Connection (on page 1706).
4. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

How to Configure PostgreSQL Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to [https://jdbc.postgresql.org/download/](https://jdbc.postgresql.org/download/) and download the PostgreSQL JDBC3 driver specific for your server version.
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

4. Enter a unique name for the data source.
5. Select PostgreSQL in the driver Type drop-down list.
6. Click the Add Files button and select the PostgreSQL driver file that you downloaded.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue to configure your PostgreSQL connection (on page 1706).

How to Configure a PostgreSQL Connection

To configure a connection to a PostgreSQL server, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.

The dialog box for configuring a database connection is displayed.

Figure 339. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the PostgreSQL data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the PostgreSQL server.
   b. Enter the user name for the connection to the PostgreSQL server.
   c. Enter the password for the connection to the PostgreSQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).
### PostgreSQL Contextual Menu Actions

#### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1685), depending on the node where it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  
  Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  
  Opens the selected table in the Table Explorer view (on page 1687).

- **Export to XML (available on Table nodes)**
  
  Opens the Export Criteria dialog box.

#### Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1685), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

- **Resource Level Nodes**

  **Compare**

  Compares two selected resources using the Compare Files tool (on page 456).

### eXist Database Connections

#### Attention:

Oxygen XML Author has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

Oxygen XML Author includes support for eXist database connections. Oxygen XML Author allows you to browse the structure of a eXist database in the Data Source Explorer view (on page 1685) and perform various operations on the resources in the repository.
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

**Important:**
To create an eXist connection using this wizard, Oxygen XML Author expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.

**Attention:**
The connection details dialog box has a Libraries path where it will download JAR libraries from the eXist server. If you are using Oxygen XML Author version 25.0 or older with eXist version 6.2.0 or newer and the final connection to the server does not work, you need to remove
all libraries with the pattern log4j-*.jar from the folder of downloaded libraries because they may interfere with the logging in Oxygen XML Author.

3. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

Attention:
Oxygen XML Author has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

How to Configure an eXist Connection Manually

Attention:
For this manual procedure, you need to already have an eXist database server installed. Also, Oxygen XML Author has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

Tip:
There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (on page 1708).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Author supports eXist database server versions up to and including version 5.0. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Author.
   - The exist.jar file located in the base directory (if present, depending on the server version).
   - All JAR files in the lib/core/ directory (if present) or all JAR files located in the lib directory except for the JAR libraries with the pattern log4j-*.jar, which may interfere with the logging in Oxygen XML Author.
6. Click the OK button to finish the data source configuration.
Step 2: Configure an eXist Connection

To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URI to the installed eXist engine in the XML DB URI field.
   b. Set the user name in the User field.
   c. Set the password in the Password field.
   d. Enter the start collection in the Collection field.

   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

Resources

For more information about running XQuery against an eXist XML database, watch our video demonstration:

https://www.youtube.com/embed/Yoc5h1zSddA

eXist Contextual Menu Actions

While browsing eXist database connections in the Data Source Explorer view (on page 1685), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus
back to the **Data Source Explorer** view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Save As**

Allows you to save the selected resource as a file on disk.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Find/Replace in Files**

Opens the **Find/Replace in Files** dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

**Compare**

Compares two selected resources using the **Compare Files** tool (on page 456).

### MarkLogic Database Connections

Oxygen XML Author Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection (on page 1714), you can use the **Data Source Explorer** view (on page 1685) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view (on page 1685) allows you to open and edit these modules.
Note:
To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the directory creation property of the database is set to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules manually, using the XQuery function xdm:directory-create(). For example, for two documents with the /code/modules/main.xqy and /code/modules/imports/import.xqy IDs, run the following query:

```
(xdm:directory-create('/code/modules/'), xdm:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow to you to spot possible issues without the need of actually executing the XQuery script.

Modules Container

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this Modules container.

Note:
You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a Requests container. In this container, Oxygen XML Author displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire Requests container at the end of your session, right-click it and use the Cancel all requests action (on page 1717).
Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Author Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic Data Source drivers (on page 1714).
3. Configure a MarkLogic Connection (on page 1715).
4. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

Related Information:

How to Configure MarkLogic Data Source Drivers

Notes:

• Available in the Enterprise edition only.
• Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
4. Click the + New button in the Data Sources panel.
5. Enter a unique name for the data source.
6. Select MarkLogic from the driver Type drop-down list.
7. Click the Add Files button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is marklogic-xcc-{server_version}.jar, where {server_version} is the MarkLogic server version.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection (on page 1715).

How to Configure a MarkLogic Connection

Notes:

- Available in the Enterprise edition only.
- Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the Data Source drop-down menu.
5. Enter the connection details.
   a. The host name or IP address of the installed MarkLogic engine in the XDBC Host field. Oxygen XML Author uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is digest, so make sure to change it to basic.
   b. Set the port number of the MarkLogic engine in the Port field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the Use it to execute queries action (on page 1716) from Data Source Explorer.
   c. Set the user name to access the MarkLogic engine in the User field.
   d. Set the password to access the MarkLogic engine in the Password field.
e. Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer view (on page 1685)**. The **Database** field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view (on page 1685)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2818)**.

**MarkLogic Contextual Menu Actions**

While browsing MarkLogic connections in the **Data Source Explorer view (on page 1685)**, the various nodes include the following contextual menu actions:

### Connection Level Nodes

- **Configure Database Sources**
  
  Opens the **Data Sources preferences page (on page 267)** where you can configure both data sources and connections.

- **Disconnect (when connected)**
  
  Stops the connection.

- **Refresh**
  
  Performs a refresh on the selected node.

- **Find/Replace in Files**
  
  Opens the **Find/Replace in Files dialog box (on page 418)** that allows you to find and replace text in multiple files from the connection.

### Container Level Nodes

- **Enable Debug Mode**
  
  Switches the server to a debugging mode.

- **Use it to Execute Queries**
  
  The server will be used to process XQuery expressions against it.

- **Refresh**
  
  Performs a refresh on the selected node.

### Module or Folder Level Nodes

- **Export**
Allows you to export the folder on the remote connection to a local folder.

**Refresh**

Performs a refresh on the selected node.

**Requests Level Nodes**

**Refresh**

Performs a refresh on the selected node.

**Cancel all requests**

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire Requests container at the end of your sessions.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Refresh**

Performs a refresh on the selected node.

**Compare**

Compares two selected resources using the Compare Files tool (on page 456).

**Related Information:**
Configuring a MarkLogic Database Connection (on page 1714)
MySQL Database Connections

Oxygen XML Author includes support for MySQL database connections. Oxygen XML Author allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1685), open tables in the Table Explorer view (on page 1687), and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL Data Source drivers (on page 1718).
2. Configure a MySQL Connection. (on page 1719)
3. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select Generic JDBC in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
   
   The driver file for the MySQL server is called `mysql-com.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your MySQL connection *(on page 1719)*.

**How to Configure a MySQL Connection**

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box (**Options** > **Preferences**) *(on page 124)* and go to Data Sources.
2. Click the **+ New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the MySQL data source in the Data Source drop-down list.
5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

Generic JDBC Database Connections

Oxygen XML Author includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC Data Source drivers (on page 1721).
2. Configure a Generic JDBC Connection (on page 1721).
3. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).
How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Author comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (on page 1721).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: jdbc: <subprotocol>:<subname>.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).

JDBC-ODBC Database Connections

Oxygen XML Author includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Author comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:
1. Open the **Preferences** dialog box ([Options > Preferences]) (on page 124) and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

**Figure 344. Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select **JDBC-ODBC Bridge** in the **Data Source** drop-down list.
5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** (on page 1685) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2818).

**BaseX Database Connections**

Oxygen XML Author includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Author allows you to browse the structure of a BaseX database in the **Data Source Explorer view** (on page 1685) and perform XQuery executions.
How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to [http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server](http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server). The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server is using. The default port for BaseX WebDAV is 8984.

2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: [http://localhost:8984/webdav/TEST/etc/factbook.xml](http://localhost:8984/webdav/TEST/etc/factbook.xml).

3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Author as described in [How to Configure a WebDAV Connection](on page 1727). The WebDAV URL should resemble this: [http://{hostname}:{port}/webdav/](http://{hostname}:{port}/webdav/). If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: [http://localhost:8984/webdav](http://localhost:8984/webdav)
   - User: admin
   - Password: admin

4. Once the WebDAV connection is created, to view your connection, go to the [Data Source Explorer view](on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the [Database perspective](on page 2818).

BaseX Contextual Menu Actions

While browsing BaseX connections in the [Data Source Explorer view](on page 1685), the various nodes include the following contextual menu actions:

- **Connection Level Nodes**
  - ![Configure Database Sources](icon.png)
    - Opens the [Data Sources preferences page](on page 267) where you can configure both data sources and connections.
  - ![Disconnect (when connected)](icon.png)
    - Stops the connection.
  - **New Folder**
    - Creates a new folder on the connection.
  - **Import Files**
    - Allows you to add a new file on the connection, in the current folder.
  - ![Refresh](icon.png)
    - Performs a refresh on the selected node.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.
Open in System Application

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the Compare Files tool (on page 456).

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

Important:
The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.
BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (on page 1726). The BaseX XQJ API-specific files that must be added in the configuration dialog box are xqj-api-1.0.jar, xqj2-0.1.0.jar and basex-xqj-1.2.3.jar (the version names of the JAR file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the lib sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection (on page 1727).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **serverName**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Author and create an XQuery Transformation (on page 1145). In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on macOS. Restart Oxygen XML Author after configuring the environment variables.
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
4. Enter a unique name for the data source.
5. Select XQuery API for Java (XQJ) in the Type combo box.
6. Click the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   Oxygen XML Author detects any implementation of javax.xml.xquery.XQDataSource and presents it in Driver class field.
7. Select the most suited driver in the Driver class combo box.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure the XQJ connection (on page 1727).

**How to Configure an XQJ Connection**

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources (on page 1726) in the Data Source combo box.
5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the OK button to finish the connection configuration.

**WebDAV Connections**

Oxygen XML Author includes support for WebDAV server connections. Oxygen XML Author allows you to browse the structure of a WebDAV connection in the Data Source Explorer view (on page 1685) and perform various operations on the resources in the repository.

**How to Configure a WebDAV Connection**

By default, Oxygen XML Author contains built-in data source drivers for WebDAV connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the Data Source Explorer view (on page 1685).

To configure a WebDAV connection, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field WebDAV URL.
   b. Set the user name that is used to access the WebDAV repository in the User field.
   c. Set the password that is used to access the WebDAV repository in the Password field.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1685) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2818).
   For more information about the WebDAV support in Oxygen XML Author, watch our video demonstration:
WebDAV Contextual Menu Actions

While browsing WebDAV connections in the Data Source Explorer view (on page 1685), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the Data Sources preferences page (on page 267) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut
Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource
Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the Compare Files tool (on page 456).

SQL Execution Support

The database support in Oxygen XML Author includes support for writing SQL statements, syntax highlighting, folding (on page 2816), and dragging and dropping from the Data Source Explorer view (on page 1685). It also includes transformation scenarios for executing the statements, and the results are displayed in the Table Explorer view (on page 1687).

Drag and Drop from Data Source Explorer View

Dragging operations from the Data Source Explorer view (on page 1685) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support (on page 1690) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

   Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

4. Select the type of statement from the pop-up menu.

   Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

   ◦ SELECT `field1`, `field2`, ..., FROM `catalog`.`table` (for example: SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc`)

   ◦ UPDATE `catalog`.`table` SET `field1`=, `field2`=,... (for example: UPDATE `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`=)
Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **INSERT INTO `catalog`.`table` ( `field1`, `field2`, ... ) VALUES ( , ) (for example: INSERT INTO `camera`.`cameraDesc` ( `DEPT`, `DEPTNAME`, `LOCATION`) VALUES ( , ))**

- **DELETE FROM `catalog`.`table` (for example: DELETE FROM `camera`.`cameraDesc`)**

**SQL Validation**

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

**Executing SQL Statements**

The steps for executing an SQL statement on a relational database are as follows:

1. **Configure a transformation scenario (on page 1040)** using the Configure Transformation Scenario(s) action from the toolbar or the Document > Transformation menu.

   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.

2. **Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.**

   For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

**Restriction:**

When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the Parameters button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver.
for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

   The result of a SQL transformation is displayed in a view (on page 530) at the bottom of the Oxygen XML Author window.

4. View more complex return values of the SQL transformation in a separate editor panel.

   A more complex value returned by the SQL query (for example, an `XMLTYPE` or `CLOB` value) cannot be displayed entirely in the result table.

   a. Right-click the cell containing the complex value.

   b. Select the action **Copy cell** from the contextual menu.

      The action copies the value in the clipboard.

   c. Paste the value into an appropriate editor.

      For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Author.

### Integration with Microsoft SharePoint

**Restriction:**

The SharePoint integration is only available in the Enterprise edition of Oxygen XML Author.

Oxygen XML Author provides support for browsing and managing SharePoint connections in the **Data Source Explorer view** (on page 1685) and there is also a specialized **SharePoint Browser view** (on page 1737). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

There are two types of integrations that are possible:

- **SharePoint Online** - A new implementation that uses the **SharePoint REST API v.2** and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.

- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).
How to Configure a SharePoint Connection

By default, Oxygen XML Author contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view or SharePoint Browser view (on page 1737).

There are two types of possible SharePoint connections:

- **SharePoint Online** - A new implementation that uses the SharePoint REST API v.2 and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

**SharePoint Online Connection**

To configure a SharePoint connection, follow these steps:

1. Open the **Connection** dialog box using one of these methods:
   - Select **New SharePoint Online Connection** from the **Settings** drop-down menu in the SharePoint Browser view (or using the quick action (on page 1737)).
   - Open the **Preferences** dialog box (Options > Preferences) (on page 124), go to Data Sources. Select **SharePoint Online** in the Data Sources pane and in the Connections pane, click the **New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint Online** is selected in the Data Source combo box.
4. Enter the Tenant URL for your SharePoint repository and click **OK**.
In the **SharePoint Browser** view *(on page 1737)*, you can select your connection using the **Site** drop-down menu. Then select **Log in with Microsoft account** from the left pane (or user drop-down menu on the right side of the view) to open Microsoft’s log in page in your default browser. Once authenticated, your repository content should be displayed in the view. If you have problems with the log-in process, see **Troubleshooting SharePoint Online Connections** *(on page 1734)*.

**Note:**

If you are still logged in when you close Oxygen XML Author, the authentication persists the next time the application is started. If, for some reason, the authentication fails to recover the access token, an error is displayed in the **Results** pane at the bottom of the application. If this happens, you need to re-authenticate Oxygen XML Author by using the **Log in with Microsoft account** action.

**SharePoint Connection (Older Version)**

To configure a SharePoint connection, follow these steps:

1. Open the **Connection** dialog box using one of these methods:
   - Select **New SharePoint Connection** from the **Settings** drop-down menu in the **SharePoint Browser** view (or using the quick action *(on page 1737)*).
   - Open the **Preferences** dialog box (Options > Preferences) *(on page 124)*, go to Data Sources. Select **SharePoint** in the Data Sources pane and in the Connections pane, click the **New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint** is selected in the Data Source combo box.
4. Fill-in the connection details:
   a. Enter the **SharePoint URL** for your SharePoint repository.
   b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
   c. Set the user name to access the SharePoint repository in the **User** field.
   d. Set the password to access the SharePoint repository in the **Password** field.
5. Click **OK**.

**Troubleshooting SharePoint Online Connections**

**Allowed SharePoint Online Sites**

SharePoint Online sites supported by Oxygen XML Author have the following syntax:

- `https://tenant.SharePoint.com`
- `https://tenant.SharePoint.com/sites/siteName`
- `https://tenant.SharePoint.com/sites/siteName/subsiteName1/..../subsiteNameK`
- `https://tenant.SharePoint.com/teams/siteName`
- `https://tenant.SharePoint.com/teams/siteName/subsiteName1/..../subsiteNameK`
Authentication Workflow Problems

Once you configure the SharePoint Online Connection (on page 1733) and use the Log in with Microsoft account action, the action will open the default browser for authentication. If this is the first time you access this SharePoint site, you will have to Grant Permissions to Oxygen XML Author (on page 1735).

If the authentication is successful, the browser should display the Authentication complete page:

![Authentication complete](image)

Attention:

If you cannot get past the This page isn't working response while using Google Chrome, try using a different browser.

Once you go back to Oxygen XML Author, in the SharePoint Browser you should see your username details and be able to browse the repository.

Grant Permissions to Oxygen XML Author

When you first Log in and access your SharePoint server, you may need to grant SharePoint Enterprise Application permissions for the Oxygen XML Author application to:

- View your basic profile.
- Maintain access to data you have given access to.
- Edit or delete items in all site collections.

The Permissions requested form will appear when you first authenticate to your SharePoint server from Oxygen XML Author.

If you have administrative privileges, you are able to grant permissions directly from the form:
If you do not have admin rights to give Oxygen XML Author permissions to access the SharePoint server, the Permissions requested form will suggest that you contact the administrator for your SharePoint account so that they can grant the permissions.

The SharePoint global administrator should log in to https://portal.azure.com/, navigate to Manage Azure Active Directory > Enterprise applications, and approve the request under the Admin consent requests category.
The administrator can also check the **User settings** category and configure the **Users can request admin consent to apps they are unable to consent to** options and policies.

More consent settings can be configured by the admin under the **User consent settings** category.

**SharePoint Browser View**

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

**Getting Started**

When you first open the view, it includes some quick actions to help you get connected to your SharePoint repository (on page 1733) (these actions are also available in the **Settings** drop-down menu).
The SharePoint Browser View Interface

The header stripe of the SharePoint Browser view includes:

Site drop-down menu

Use this drop-down to select and connect to an already defined SharePoint connection (on page 1733).

User drop-down menu

This drop-down includes:

- **Log in with Microsoft account** (if logged out) - Opens the Microsoft login page in your default browser and authenticates Oxygen XML Author.
- **Log out** (if logged in) - Logs out of your Microsoft account and the authorization between Oxygen XML Author and Microsoft is revoked.
- **Help** - Opens the online user guide to a topic relevant to the current context.

Settings drop-down menu

This drop-down includes:

- **New SharePoint Online Connection** - Opens the Connection dialog box with the SharePoint Online data source automatically selected.
- **New SharePoint Connection** - Opens the Connection dialog box with the SharePoint (older version) data source automatically selected.
- **Configure Database Sources** - Opens the Database Sources preferences page where you can configure your SharePoint connection.
- **Layout** - Use this option to choose the layout for the view. You can choose between: Automatic, Vertical, and Horizontal.

Once you are connected, the view is separated into two panes. The left pane is a navigation area that presents the SharePoint site structure in a tree-like fashion with the following node types:
When a folder node is selected in the left pane, the right pane displays the contents of the folder (either folders or files).

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Figure 348. Column Filter**

Checking Documents In and Out

To check out a document from the server, right-click the file and select **Check Out**. You can discard the previous checkout operation, making the file available for editing to other users, by selecting **Discard Check Out**.

To check in a document that has been checked out, right-click the file and select **Check In**. For SharePoint Online connections, you only have the option to enter a comment and click the **Check In** button to process it. For SharePoint (older version), you can also choose the check in type (**Minor Version**, **Major Version**, or **Overwrite**).

**Related Information:**
How to Configure a SharePoint Connection (on page 1733)

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the **Data Source Explorer view** (on page 1685) or the **SharePoint Browser view** (on page 1737), the following contextual menu actions are available, depending on the type of node:

- **Connection Nodes** (Data Source Explorer view only)
  - **Configure Database Sources**
    - Opens the **Data Sources preferences page** (on page 267) where you can configure both data sources and connections.
  - **Log in with Microsoft Account** (when not connected)
Opens the Microsoft login page in your default browser and authenticates Oxygen XML Author.

**Disconnect (when connected)**
Stops the connection.

**Refresh**
Performs a refresh on the selected node.

**Find/Replace in Files**
Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

**Site Nodes / Sub-site Nodes**

**Copy location**
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Refresh**
Performs a refresh on the selected node.

**Find/Replace in Files**
Opens the Find/Replace in Files dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

**Folder Level Nodes**

**New File or New Document**
Creates a new file on the connection, in the current folder.

**New Folder**
Creates a new folder on the connection.

**Import Folders**
Imports folders on the server.

**Import Files**
Allows you to add a new file on the connection, in the current folder.

**Rename**
Renames the current resource

**Delete**
Deletes the current container.

**Refresh**
Performs a refresh on the selected node.

**Find/Replace in Files (Data Source Explorer view only)**

Opens the **Find/Replace in Files** dialog box (on page 418) that allows you to find and replace text in multiple files from the connection.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application (Data Source Explorer view only)**

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Check Out**

Checks out the selected document on the server.

**Check In**

Checks in the selected document on the server. This action opens the **Check In** dialog box. For SharePoint Online connections, you only have the option to enter a comment and click the **Check In** button to process it.

For SharePoint (older version), the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to add a comment for a file that you check in.

**Discard Check Out**

Discards the previous checkout operation, making the file available to other users.

**Important:**

Due to some API restrictions, the **Discard Checkout** action may not work when SharePoint Online connections are made directly to a sub-site.
Browsing for Remote Files with SharePoint Online

The Open URL dialog box (used for browsing remote files) includes support for connecting to a SharePoint Online server, with controls similar to the SharePoint Browser view (on page 1737). To open this dialog box, go to File > Open URL (or click the Open URL toolbar button), then choose the Browse for remote file option from the drop-down menu.

Figure 349. Open URL Dialog Box for SharePoint Online

The displayed dialog box is composed of the following:

Server Type

Specifies the type of server (SharePoint Online in this case).
Note:
If you select SharePoint On-Premises, the controls are similar to those for WebDav and other servers (on page 369).

Server URL
Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

User drop-down menu
This drop-down includes:

- **Log in with Microsoft account** (if logged out) - Opens the Microsoft login page in your default browser and authenticates Oxygen XML Author.
- **Log out** (if logged in) - Logs out of your Microsoft account and the authorization between Oxygen XML Author and Microsoft is revoked.
- **Help** - Opens the online user guide to a topic relevant to the current context.

Browse
Use this button to retrieve the data from the server. Once the authentication completes, the files from the server will be available in the dialog box.

File URL
You can use this combo box to directly specify the URL to be opened or saved. This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

MS Azure Active Directory Authentication
It is possible to use your MS Azure Active Directory credentials for SharePoint authentication. To configure the application to use your *client ID* and *client secret*, set the following Oxygen system properties (on page 322):

- `com.oxygenxml.azure.active.directory.client.id` - Specifies a custom *client ID*.
- `com.oxygenxml.azure.active.directory.client.secret` - Specifies a custom *client secret*.

Your application should allow the following API permissions:

**Table 16. API Permissions - Microsoft Graph**

15. Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Author offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (on page 1040).

Import from Text Files

Oxygen XML Author includes the possibility of importing text files (.txt or .csv file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to File > Import/Convert > Text File to XML. A Select text file dialog box is displayed.
2. Select the URL of the text file (.txt or .csv file extensions).
3. Select the encoding of the text file.
4. Click the Next button. The Import Criteria dialog box is displayed.
5. Configure the settings for the conversion.

   a. Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.

   b. The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content ( symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( symbol). Clicking a second time causes the column data to be ignored ( symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

   c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

e. **Import Settings** - Clicking this button opens the **Import preferences page (on page 256)** that allows you to configure more import options.

f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

g. **Open in editor** - If selected, the new XML document created from the imported text file is opened in the editor.

h. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Import** to generate the XML document.

**Import from MS Excel Files**

Oxygen XML Author provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Author **Smart Paste mechanism (on page 594)** by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Author also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method in Author Mode**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Author **Smart Paste mechanism (on page 594)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Grid Mode Method**

The **Grid** mode in Oxygen XML Author displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Author.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select **Insert row** or **Insert column**, depending on the structure of the copied cells.

5. Paste the copied cells from the clipboard into the newly inserted cells in **Grid** mode.

6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Author might ignore that cell.

**Import Wizard Method**

To use the **Import** wizard to import an Excel file into an XML file, follow these steps:

1. Go to **File > Import/Convert > MS Excel file to XML**.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.
3. Click the **Next** button to proceed to the next stage of the wizard.

**Figure 351. Import Wizard**

![Import Wizard](image)
4. Configure the settings for the conversion. This stage of the wizard offers the following options:

**Import settings section**

- Presents the input data in a tabular form. By default, all data items are converted to element content (eldon symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (eldon symbol). Clicking a second time causes the column data to be ignored (eldon symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

- **First row contains field names**

  If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

- **Customize**

  This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

- **Import Settings**

  Clicking this button opens the Import preferences page (on page 256) that allows you to configure more import options.

- **Import formatted data (as displayed in Excel)**

  If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

- **XML Import Preview panel**

  Contains an example of what the generated XML document will look like.

- **Open in editor**

  If selected, the new XML document created from the imported file is opened in the editor.

- **Save in file**

  If selected, the new XML document is saved in the specified path.

5. Click **Import** to generate the XML document.
Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to File > Import/Convert > Database Data to XML to start the Import wizard.

   This opens a Select database table dialog box that lists all the defined database connections:

   ![Select Database Table Dialog Box](Image)

2. Select the connection to the database that contains the appropriate data.
Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the Configure Database Sources button.

   The Preferences/Data Sources option page is opened.

4. Click Connect.

5. In the list of sources, expand a schema and choose the required table.

6. Click the Next button.

   The Import Criteria dialog box is opened with a default query string in the SQL Query pane.

   **Figure 353. Import from Database Criteria Dialog Box**

   ![Import from Database Criteria Dialog Box](image)

7. Configure the settings for the conversion.

   a. SQL Preview - If this button is pressed, the Settings pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to
attribute values (= symbol). Clicking a second time causes the column data to be ignored (X symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

c. **Import Settings** - Clicking this button opens the **Import preferences page (on page 256)** that allows you to configure more import options.

d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

e. **Open in editor** - If selected, the new XML document created from the imported file is opened in the editor.

f. **Save in file** - If selected, the new XML document is saved in the specified path.

g. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Import** to generate the XML document.

### Import from HTML Files

Oxygen XML Author offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Author also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Author **Smart Paste mechanism (on page 594)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Import Wizard Method**

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import/Convert > HTML File to XHTML**. The **Import HTML to XHTML** wizard is displayed.
2. Enter the URL of the HTML document.
3. Select the type of the resulting XHTML document:
4. Click the **OK** button.

**Result:** The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

### Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Author also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

**Important:** Starting with version 26, the dynamic conversion protocol is disabled by default. To enable it, you must set the `com.oxygenxml.enable.convert.url.protocol` system property (on page 330) to the value of `true`.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (*excel*) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (*xslt*) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```xml
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `!/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog (on page 2821)* support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the *XML catalog.*
A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map (on page 2816) with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
```

the `resources/sample.xls` path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a DITA map.

A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Author. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.
  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=v1!/urn:files:sample.xml
  ```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.
  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;pl=v1!/urn:files:sample.xml
  ```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.
  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of JAR (on page 2817) libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:
  ```java
  public void convert(String systemID, String originalSourceSystemID,
                      InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```
• **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
```

• **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

• **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

• **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is UTF8. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

• **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (Reload (F5) from the toolbar) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;....!/urn:files:test.csv
```

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow round-tripping content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```
Important:
If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Author to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the Libraries button in the Advanced tab of the transformation scenario.

16. Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Author includes built-in, configured frameworks (on page 2817) for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use-case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced users who are familiar with API development can also create custom Author mode operations (on page 1804) for a particular framework.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip:
A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating a Framework through the Configuration Dialog

The easiest way to create a custom framework (on page 2817) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (on page 1915) with your team.

To create a custom framework by extending an existing one, follow these steps:
1. In a location where you have full write access, create a folder structure similar to this:
   `custom_frameworks/dita-extension`.

2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Locations (on page 139). Add the path to your `custom_frameworks` folder in the Additional frameworks directories list and click OK or Apply to save your changes.

3. Go to the Document Type Association preferences page (on page 138) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 140) where you can define the set of rules and settings for your custom framework.

4. Give the extension an appropriate name, select External for the Storage option, click the browsing button (卞) to specify the location of the custom directory you created in step 1.

5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (on page 140) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (on page 1757) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.

6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

   **Results:** You now have a fully functional framework that can be shared with others (on page 1915).

**Related information**

- Sharing a Framework (on page 1915)
- Webinar: Creating Frameworks Using an Extension Script

**Creating a Framework Using an Extension Script**

A custom framework (on page 2817) (document type) can be created using a special XML descriptor file, either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it. You can then easily share the custom framework (on page 1915) with your team.

The easiest way to create such a descriptor is to use the New document wizard (on page 351) and choose the Extend Framework Script or Create Framework Script template.

**Tip:**
To see a visual, detailed look at how to create frameworks with an extension script, watch our webinar: Creating Frameworks Using an Extension Script (some samples are also available on that events page).
Creating a Custom Framework Starting from an Existing Framework

To create a custom framework by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
custom_frameworks/dita-extension.

2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Locations (on page 139). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click the New button on the toolbar and select the Extend Framework Script template. Save it inside the previously configured framework path (e.g. custom_frameworks/dita-extension).

4. Set the @base attribute on the script element to the value of the name of the extended framework (e.g. DITA).

   **Note:**
   Removing the @base attribute will create a framework from scratch.

5. Edit the script as described in Framework Extension Script File (on page 1760).

To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the resulting framework structure.

   **Note:**
   If you want to use the framework in an older Oxygen XML Author version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the Compile Framework Extension script action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

Creating a Custom Framework Without a Base Framework

To create a custom framework without starting from an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
custom_frameworks/dita-extension.

2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Locations (on page 139). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click the New button on the toolbar and select the Create Framework Script template. Save it inside the previously configured framework path, custom_frameworks/dita-extension.

4. Edit the script as described in Framework Extension Script File (on page 1760).
To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the newly generated framework structure.

Note:
If you want to use the framework in an older Oxygen XML Author version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the [Compile Framework Extension script](on page 16) action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

### Related information
- [Sharing a Framework](on page 1915)
- [Webinar: Creating Frameworks Using an Extension Script](on page 351)

## Framework Extension Script File
The framework extension file is used to describe a new framework configuration. Optionally, you can extend an existing built-in framework configuration (such as DITA or DocBook) and then make additions and changes to it.

The easiest way to create such a file is to use the [New document wizard](on page 351) and choose the [Extend Framework Script](on page 351) or [Create Framework Script](on page 351) template.

The following examples assume that the newly created framework extends a built-in one.

### Basic Information
Once you have created a new script file, you need to:

- Specify the name of the framework using the `<name>` element. Optionally, you can also add a description using the `<description>` element.
- If you want to extend an existing framework (such as DITA or DocBook), specify the name of the extended framework using the `@base` attribute on the `<script>` element.
- The `<priority>` element might be needed to instruct Oxygen XML Author to use this new framework instead of the one being extended or another framework that matches the same document.

### Example: Extending the Built-in DITA Framework
```
<script
    xmlns="http://www.oxygenxml.com/ns/framework/extend"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.oxygenxml.com/ns/framework/extend
    base="DITA">
    <name>My custom DITA framework</name>
    <description>A custom framework based on the built-in DITA framework</description>
```

Changing the Association Rules

Oxygen XML Author identifies the type of a document when the document matches at least one of the association rules.

Example: Instructing the Built-in Associations to Inherit None to Add Your Own

```xml
<associationRules inherit="none">
  <addRule rootElementLocalName="concept"/>
  <addRule fileName="test.xml"/>
</associationRules>
```

Setting the Initial Editing Mode

You can set the default editing mode that is loaded when a document is opened for the first time. For example, if the files are usually edited in the Author mode, you can set it as the initial page. For more details on the possible values, see Document Type Configuration Dialog Box - Initial Edit Mode (on page 141).

Example: Setting the Initial Editing Mode to Author

```xml
<initialPage>Author</initialPage>
```

Changing the Classpath

The Classpath tab displays a list of folders and JAR (on page 2817) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework (on page 2817) translation files. Oxygen XML Author loads the resources looking in the folders in the order they appear in the list.

Example: Customizing and Extending the Classpath Inherited From the Base Framework

```xml
<classpath inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/resources_2x" position="before"/>
  <removeEntry path="${baseFramework}/refactoring"/>
</classpath>
```

Notice:
Relative paths in the framework extension file are automatically resolved to the location of the script file.
Note:
When removing entries with framework editor variables, take into consideration how they were added in the base framework.

- An entry present in the base framework with the path \${framework}/file can be removed using an identical path or by using the \${baseFramework} variable: \${baseFramework}/file.
- An entry present in the base framework with the path \${frameworkDir}/file can be removed using an identical path or by using the \${baseFrameworkDir} variable: \${baseFrameworkDir}/file.

Sharing a Plugin Class Loader

If your framework uses the same JAVA extensions/classes as a plugin (on page 2819), it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

```xml
<classpath parentClassLoaderID="com.oxygenxml.git.plugin"/>
```

Setting a Default Schema

You can specify a default schema for Oxygen XML Author to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

**Example: Setting a Default XML Schema Relative to the Script Location**

```xml
<defaultSchema schemaType="xmlschema" href="xsd/my-schema.xsd"/>
```

Changing XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an internet connection may not be available, an XML Catalog (on page 2821) may be used to map the web location to a local file system entry.

**Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework**

```xml
<xmlCatalogs inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/catalog.xml" position="before"/>
  <removeEntry path="${baseFramework}/oldCatalog.xml"/>
</xmlCatalogs>
```
Notice:
Relative paths in the framework extension file are automatically resolved to the location of the script file.

Changing the Document Templates
You can create your own custom document templates or remove templates inherited from the base framework.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```xml
<documentTemplates inherit="all">
    <!-- Contribute this resource before the ones inherited from the base framework to make them appear first in the list. -->
    <addEntry path="${framework}/newTemplates" position="before"/>
    <removeEntry path="${baseFramework}/oldTemplates"/>
</documentTemplates>
```

Notice:
Relative paths in the framework extension file are automatically resolved to the location of the script file.

Adding New Transformation Scenarios and Removing Existing Ones
You can create new transformation scenarios and export them in one of the following locations:

- The Transformation Scenarios View (on page 1163).
- The Configure Transformation Scenario(s) Dialog Box (on page 1157).
- The Transformation Tab (on page 165).

Example: Importing New Transformation Scenarios
The @href attribute from the <addScenarios> element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The ${framework} editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<transformationScenarios>
    <addScenarios href="scenarioExport.scenarios"/>
    <removeScenario name="DITA HTML5"/>
    <defaultScenarios>
        <name>DITA</name>
    </defaultScenarios>
</transformationScenarios>
```
Adding New Validation Scenarios and Removing Existing Ones

You can create new validation scenarios and export them in one of the following locations:

- The Configure Validation Scenario Dialog Box (on page 770).
- The Validation Tab (on page 166).

Example: Importing New Validation Scenarios

The @href attribute from the <addScenarios> element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The ${framework} editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<validationScenarios>
  <addScenarios href="validationScenarioExport.scenarios"/>
  <removeScenario name="DITA"/>
  <defaultScenarios>
    <name>DITA Validation</name>
    <name>XML Validation</name>
  </defaultScenarios>
</validationScenarios>
```

Customizing the Author Mode Through New CSS Files

The Author mode layout is driven by CSS rules. To customize it, you need to create new CSS files and add them in the new framework.

Example: Using Larger Fonts in Titles

```xml
<author>
  <css>
    <removeCss path="${framework}/base.css"/>
    <!-- Adding CSS after the ones in the base gives the opportunity to override rules from previous CSSs. -->
    <addCss path="${framework}/titles.css" position="after"/>
  </css>
</author>
```

The ${framework}/titles.css file contains a rule like this:
Example: Creating an Alternate CSS That Activates When the User Selects it in the Styles Menu

```xml
<author>
  <css>
    <addCss path="${framework}/pink.css" title="Pink titles" alternate="true"/>
  </css>
</author>
```

The `${framework}/pink.css` file contains a rule like this:

```css
/*[class='topic/title'] { 
  font-size: larger;
}
```

Control How CSS Styles are Handled in the Author mode

The Author mode layout is driven by CSS rules. You can configure how CSS styles are handled in the framework by using the following attributes in the script file:

**selectMultipleAlternateCSS**

If set to `true`, any number of alternate CSS files can be activated and they will be applied like layers. If set to false, the alternate styles are treated like a main CSS style and only one can be selected at a time.

**Example: Using the selectMultipleAlternateCSS Attribute in the Script**

```xml
<css selectMultipleAlternateCSS="true"/>
```

**mergeDocumentCSS**

Controls how CSS files are handled if there are CSS styles specified in the document. If set to true, they will be merged with the CSS files from the framework. If set to false, they will be ignored.

**Example: Using the mergeDocumentCSS Attribute in the Script**

```xml
<css mergeDocument="true"/>
```

**Example: Changing the styling in the author mode**

We add a new CSS located in the new framework directory and we remove a CSS contributed by the base framework.

```xml
<author>
  <css>
```

Defining Author Actions for the New Framework

Create external author actions (on page 1774), save them in a specific subdirectory of your particular framework directory (on page 1777), and they will be loaded automatically.

Removing Author Actions from the Base Framework

Suppose that the base framework configuration defines some author actions (on page 1774) that are added in the main menu (on page 157), contextual menu (on page 157), toolbar (on page 160), or content completion window (on page 160). If you do not want to inherit one of these actions in the new framework and you also want to remove it from all the GUI elements, you can use the `<removeAction>` element:

```xml
<author>
  <authorActions>
    <removeAction id="action.to.remove"/>
  </authorActions>
</author>
```

Note:

If the new framework has an external author action (on page 1774) with the same ID as one of the actions specified in a `<removeAction>` element, the action will not be removed from the GUI elements (menus, toolbars, content completion window).

Replacing Author Actions from the Base Framework

Suppose that the base framework configuration defines some author actions (on page 1774) that are added in the main menu (on page 157), contextual menu (on page 157), toolbar (on page 160), or content completion window (on page 160). If you want to keep one of these actions in all the GUI elements, but to perform differently in the new framework, just create an external author action (on page 1774) with the same ID as the action to replace and save it in the specific subdirectory within your new framework directory (on page 1777).

Author Toolbar Configuration

The Author mode-specific toolbars for the new framework can be customized by:
• Adding or removing actions from toolbars.
• Changing toolbar groups by adding or removing actions.
• Creating new toolbars and action groups.

Example: Customizing the Toolbar

```xml
<author>
  <toolbars>
    <toolbar>
      <!-- Remove an action inherited from the base framework. -->
      <removeAction id="bold"/>

      <!-- Insert an action into an existing group -->
      <group name="${i18n(link)}">
        <addAction id="insert.note"/>
      </group>

      <!-- Add actions, separators and new groups-->
      <separator/>
      <addAction id="insert.note"/>
      <group name="New group">
        <addAction id="insert.note"/>
        <addAction id="insert.table"/>
      </group>
    </toolbar>
  </toolbars>
</author>
```

Note:
If you create a toolbar or group configuration and a toolbar/group with the same name already exists in the base framework, you will change the one inherited instead of creating a new one. You can inspect the names of the existing toolbars/groups inherited from the base framework in the Toolbar Subtab (on page 160).

Example: Creating a New Toolbar

A new toolbar is created if the @name attribute does not match a toolbar inherited from the base.

```xml
<author>
  <toolbars>
    <toolbar name="Extra Toolbar">
      <!-- Add actions, separators and new groups-->
    </toolbar>
  </toolbars>
</author>
```
Example: Adding an Action in the Toolbar at a Specific Location

You can insert items (actions or groups) relative to other items already present in the toolbar because they were inherited from the base framework configuration. The @anchor attribute specifies either the ID of an action or the name of a group already present in the toolbar and the @position attribute specifies whether the new item should be added before or after it.

Note:
If the @anchor attribute is missing, the entries will be added either first or last, according to @position value.

Author Menu and Contextual Menu Configuration

The Author mode-specific menus for the new framework can be customized by:

- Adding or removing actions and submenus.
- Changing existing submenus by adding or removing actions.

Example: Customizing the Contextual Menu
<!-- Contribute to an existing submenu -->
<submenu name="${i18n(section)}">
  <addAction id="paragraph"/>
</submenu>

<!-- Remove a submenu inherited from the base framework. -->
<removeSubmenu name="${i18n(link)}"/>
</contextualMenu>

Note:
The framework main menu is configured similarly, inside a <menu> container.

Tip:
You can inspect the names of the submenus inherited from the base framework in the Contextual Menu Subtab (on page 157) and Menu Subtab (on page 157).

Example: Adding an Action in the Contextual Menu at a Specific Location

You can insert new actions and submenus relative to other actions and submenus already present in the menu because they were inherited from the base framework configuration. The @anchor attribute specifies the ID of an Author mode action or a name of a submenu already present in the menu and the @position attribute specifies whether the new action should be added before or after it.

Note:
If the @anchor attribute is missing, the entries will be added either first or last, according to @position value.

<contextualMenu>
  <addAction id="insert.note" anchor="edit.image.map" position="before"/>
  <submenu name="Table menu" anchor="${i18n(insert)}" position="after">
    <addAction id="insert.table"/>
  </submenu>
</contextualMenu>

Configuring the Content Completion in Author Mode

You can replace content completion entries obtained from the associated schema with Author mode actions (on page 1774).
In the `<authorActions>` container, you can specify the Author mode actions to be contributed. Optionally, you can mark them as a replacement for an existing schema proposal with the `@replacedElement` attribute.

The `<schemaProposals>` element allows you to remove proposals detected from the associated schema through the `<removeProposal>` element. If some proposals were removed in the base framework configuration and you want them re-added, you can do so through the `<addProposal>` element.

**Example: Customizing the Content Completion Assistant**

```xml
<contentCompletion>
  <authorActions>
    <addAction id="insert.note" replacedElement="note" inCCWindow="true"/>
  </authorActions>

  <schemaProposals>
    <removeProposal renderName="table"/>

    <!-- The base framework removed the "list" element proposal. We want it back... -->
    <addProposal renderName="list"/>
  </schemaProposals>
</contentCompletion>
```

**Using Framework Extension Points**

The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type. Libraries that contain the implementations must be present in the classpath of your framework (on page 1761). The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

**Example: Setting a Custom Extensions Bundle**

```xml
<extensionPoints>
  <extension
    name="extensionsBundleClassName"
    value="ro.sync.ecss.extensions.dita.map.DITAMapExtensionsBundle"/>
</extensionPoints>
```

**Reusing Parts of the Script Using XInclude**

Elements in the script can be specified in dedicated files that can then be referenced using XInclude in the script.

**Example: Using XInclude to Reference Elements in the Script**

```xml
<script xmlns="http://www.oxygenxml.com/ns/framework/extend">
  <name>New framework</name>
</script>
Notice:
Relative paths in the framework extension file are automatically resolved to the location of the script file.

Customizing the Author Mode Editing Experience for a Framework

You can customize the editing experience in Author mode for you and any other user who shares the same framework. This includes the ability to configure actions, menus, toolbars, icons, structure insertion shortcuts, and content completion proposals specifically for a particular framework (on page 2817) (document type). Advanced users who are familiar with API development can also create custom Author mode operations (on page 1804) for a particular framework.

Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Author provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2818) and multiple alternate CSS styles (on page 2814). This makes it easy to change the look of the document as it appears in Author mode.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Note:
When altering a CSS file configured as a stylesheet for the current document framework, you can quickly check its effects in the Author mode by using the Reload document action that is available on the toolbar.

Managing the CSS Styles

The main (on page 2818) and alternate (on page 2814) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (on page 140). To access it, follow these steps:

1. Open the Preferences dialog box (on page 124).
2. Go to Document Type Association.
3. Select the appropriate document type and click the Edit button.
Important:
If you do not have access rights to the folder where the framework (on page 2817) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (on page 1915).

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (on page 146) of the Author tab.

Figure 354. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box

You can Add, Edit, or Delete styles from this dialog box to manage the main (on page 2818) and alternate (on page 2814) styles associated to the particular document type. You can also change the order of the styles by using the Move Up and Move Down buttons. This also changes the order that they appear in the Styles drop-down menu. The alternate styles are combined with the main CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the alternate style that is listed last in this list takes precedence, since it is the last one to be combined (applied as a layer).

The URI column shows the path of each CSS file. The names listed in the Styles drop-down menu match the values in the Title column. The value in the Alternate column determines whether it is a main or alternate CSS.
If the value is *no*, it is a *main* CSS. If the value is *yes*, it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the *Styles* drop-down menu.

**Note:**
To group alternate styles into categories (submenus), use a vertical bar character (|) in the *Title* column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the *Styles* drop-down menu, while the text after the final vertical bar is rendered as the name of the style inside the submenu.

**Example:** Suppose that you want to add two alternate stylesheets in separate submenus, with the *Title* column set to *My Styles|User Assistance|Hints* and *My Styles|User Actions|Inline Actions*, respectively.

<table>
<thead>
<tr>
<th>URI</th>
<th>Title</th>
<th>Alternate</th>
</tr>
</thead>
<tbody>
<tr>
<td>${framework}/css/hints/hints.css</td>
<td>*My Styles</td>
<td>User Assistance</td>
</tr>
<tr>
<td>${framework}/css/actions/actions.css</td>
<td>*My Styles</td>
<td>User Actions</td>
</tr>
</tbody>
</table>

Oxygen XML Author will add a *My Styles* submenu with two submenus (*User Assistance* that contains the *Hints* style, and *User Actions* that contains the *Inline Actions* style) in the *Styles* drop-down menu.

The *Enable multiple selection of alternate CSSs* checkbox (on page 146) at the bottom of the pane must be selected for the *alternate CSS styles* (on page 2814) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the *alternate* styles are treated like *main CSS styles* (on page 2818) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

- Adding an extra CSS to customize the DITA visual editor
Creating and Customizing Author Mode Actions for a Framework

There are several possibilities for creating new Author mode actions:

- You can create new actions for a framework or edit existing ones using the Actions subtab of the Document Type configuration dialog box (on page 140). In this case, the actions are stored internally in the *.framework file.
- You can export existing actions from the Document Type configuration dialog box (on page 140) into individual XML files or use a built-in template to create a new XML file that defines a single action. In this case, the actions are stored externally as separate XML files. The benefits of using this approach are explained in the Creating or Editing Actions Using an Individual XML File for Each Action (on page 1774) section below.

Creating or Editing Actions Using the Document Type Configuration Dialog Box

To add or configure Author mode actions for a framework (on page 2817) (document type) using the Document Type configuration dialog box (on page 140), follow this procedure:

1. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Types Association, and select the framework.
2. Select your framework and click the Edit button (or you can use the Duplicate or Extend button to create an extension of the framework (on page 1757)).
3. In the resulting Document Type configuration dialog box (on page 140), go to the Author tab, then the Actions subtab.
4. To create a new action, click the + New button. To edit an existing action, select the action and click the 🍀 Edit button.

   **Step Result:** In either case, this opens the Action configuration dialog box (on page 148) where you can configure numerous aspects of the action.
5. Once you are finished, click OK several times to exit the configuration dialog box.

**Result:** Your changes are stored in the *.framework file for your particular framework.

Creating or Editing Actions Using an Individual XML File for Each Action

It is possible to work with Author mode actions outside the Document Type configuration dialog box (on page 140) and store them externally from the *.framework file. You can either export existing actions or use a template to create a new action from scratch. The benefits of using this approach are:

- You can share, copy, or reuse each individual action across multiple projects or frameworks.
- It is easier to develop and test action configurations. After configuring the XML file that defines an action, you can test its functionality by opening a document from your particular framework and invoking the action to see if it works as expected. If you did not get the desired result, you can simply repeat the process until you are happy with the result without having to navigate through the framework configuration dialog box.
Exporting Actions

To export existing Author mode actions into individual XML files, follow this procedure:

1. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Types Association, and select the framework.
2. Select your framework and click the Edit button (or you can use the Duplicate or Extend button to create an extension of the framework (on page 1757)).
3. In the resulting Document Type configuration dialog box (on page 140), go to the Author tab, then the Actions subtab.
4. [Important] Make sure the Storage option (on page 141) in the top part of the dialog box is set to External and the external location must be a subdirectory of your current framework directory (see the Notes About the Storage Path section (on page 1777)).
5. Select the action (or multiple actions) you want to export, right-click, and use the Export action (this action is also located at the bottom of the table of actions).

   **Step Result:** If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have _externalAuthorActions at the end of the folder name) inside your current framework directory.
6. [Important] Click OK several times to confirm your changes and exit the Preferences dialog box. The files will not be created until you exit this dialog box.

   **Step Result:** Each exported action is extracted from the framework configuration file and exported as an individual XML file.
7. To configure and test a particular action, you can open its corresponding XML file in Oxygen XML Author, make changes, save the file, then open a document from your framework, test the action and repeat until you get the desired result.

   **Note:**
   You can add or edit the action files outside of Oxygen XML Author, but you will need to restart the application each time to reload the changes.

Creating New Actions

To create a new Author mode action outside the framework configuration dialog box, follow these steps:

1. Open the New document wizard (on page 351), search for a template called Author Action, and choose a storage path and file name. Remember that ultimately, it must be saved in a subdirectory of your particular framework directory (see the Notes About the Storage Path section (on page 1777)). Complete the creation process.
**Step Result:** The resulting XML file contains some hints and it is an example of an action configuration that will insert a new paragraph.

2. Configure the action as needed and save your changes.

---

**Note:**

You can use XInclude to reuse different fragments (such as XPath expressions or configured operations between actions).

**Example: Reusing and XPath Expression**

```xml
<a:operations>
  <a:operation id="InsertFragmentOperation">
    <a:xpathCondition>
      <xi:include href="expression.txt"
        xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
    </a:xpathCondition>
    <a:arguments>
      <a:argument name="insertLocation">
        <xi:include href="expression.txt"
          xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
      </a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Where the content of the `expression.txt` file is `self::para`.

**Example: Reusing an Entire Operation**

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <xi:include href="operation.xml" xpointer="element(/1/1)"
    xmlns:xi="http://www.w3.org/2001/XInclude"/>
</a:operations>
```

Where the content of `operation.xml` is:

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <a:operation id="ToggleSurroundWithElementOperation">
    <a:xpathCondition>ancestor-or-self::p</a:xpathCondition>
    <a:arguments>
      <a:argument name="element"><i/></a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```
Step Result: At this point, the action has been created but it needs to be added to the UI (in a toolbar or menu).

3. Add the new action to a UI component. For example, to add it in a toolbar, open the **Document Type configuration dialog box** *(on page 140)*, go to the **Author** tab, then the **Toolbar** subtab *(on page 160)*, and add the action.

4. To test the action, you can open a document from your framework and test the action. If you don't get the desired result, open the action file, make changes, then test them again. Repeat until you get the desired result.

Note:
You can add or edit the action files outside of Oxygen XML Author, but you will need to restart the application each time to reload the changes.

Notes About the Storage Path

As mentioned above, it is imperative that the action configuration files be stored in a specific subdirectory of your particular framework directory.

There are two possible naming conventions for this subdirectory:

- `{framework_directory}/externalAuthorActions` - If there are multiple framework subdirectories inside `{framework_directory}`, using this path structure will make the actions available to all of them.
- `{framework_directory}/{framework_file_name}_externalAuthorActions` - Using this path structure will make the actions only available in the framework stored inside the `{framework_file_name}.framework` file.

Note:
When exporting actions from the UI *(on page 1775)*, this is the directory structure that is used.

Action Configuration Tips

- If an action is configured to insert a fragment that contains entities, you need to wrap it in **CDATA** markup.
- For a list of default operation, see **Built-in Author Mode Operations** *(on page 1778)*.

Resources

For more information about customizing **Author** mode actions, see the following resources:

- Webinar: **Improving the Authoring Experience Through Custom Actions**.
- Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**.
Built-in Author Mode Operations

This topic lists the default operations for the Author mode.

**ChangeAttributeOperation**

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom Author mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name**
  - The attribute local name.

- **namespace**
  - The attribute namespace.

- **elementLocation**
  - The XPath location that identifies the element.

- **value**
  - The new value for the attribute. If empty or null the attribute will be removed.

- **editAttribute**
  - If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

- **removeIfEmpty**
  - The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

**ChangeAttributesOperation**

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom Author mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  - The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  - The names of the attributes to add, modify, or remove, separated by the new-line character (`\n`). The values can be local names or Clark notations.
values

The new attributes values, each on a new line, separated by the new-line character (\n). An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

removeIfEmpty

The possible values are `true` (default) and `false`. `True` means that the attribute will be removed if an empty value is provided.

ChangePseudoClassesOperation

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

setLocations

An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes set. If it is not defined, then the element at the cursor position will be used.

setPseudoClassNames

A space-separated list of pseudo-class names that will be set on the matched nodes.

removeLocations

An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes removed. If it is not defined, then the element at the cursor position will be used.

removePseudoClassNames

A space-separated list of pseudo-class names that will be removed from the matched nodes.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

DeleteElementOperation

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

DeleteElementsOperation

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

ExecuteCommandLineOperation

This operation allows you to start a process executing a given command line. It has the following arguments:
The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

**workingDirectory**

The path to the directory where the command line is executed. The default value is "." (current directory).

**cmdLine**

The command line to be executed (accepts editor variables *(on page 1795)*).

**showConsole**

If set to true, the console panel will be displayed in Oxygen XML Author. The default value is false.

**wait**

If set to true, the command line will wait for the operation to finish. The default value is false.

### ExecuteCustomizableTransformationScenarioOperation

Allows you to run a publishing transformation scenario configured at framework level with a specified set of parameters.

---

*Notice:*

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

---

It supports the following arguments:

**scenarioName**

The name of the transformation scenario to execute.

**scenarioParameters**

Provided parameters for the transformation scenario. The parameters are inserted as name=value pairs separated by line breaks. The set parameters are taken into account for XSLT, DITA, Chemistry, and ANT transformation scenario types.

**markInProgressXPathLocation**

XPath expression that identifies the element(s) on which a specific -oxy-transformation-in-progress pseudo class is set before transformation is started. The pseudo class is reset when the transformation ends or is cancelled. If this XPath expression is not defined, the current node is used.

**markOthersInProgressXPathLocation**
XPath expression that identifies other elements on which a specific `oxy-transformation-in-progress-others` pseudo class is set before the transformation is started. The pseudo class is reset when the transformation ends.

**ExecuteMultipleActionsOperation**

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Author.

- **actionIDs**
  The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

**ExecuteMultipleWebappCompatibleActionsOperation**

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

**ExecuteTransformationScenariosOperation**

This operation allows running one or more transformation scenarios defined in the current document type association (on page 2815), in the project options, or in the global options. A use case would be to add a toolbar button that triggers publishing to various output formats. The argument of the operation is:

- **scenarioNames**
  The list of scenario names that will be executed, separated by new lines.

**ExecuteValidationScenariosOperation**

This operation allows running one or more validation scenarios defined in the current document type association (on page 2815), in the project options, or in the global options. The single argument for the operation is:

- **scenarioNames**
  The list of scenario names that will be executed, separated by new lines.

**InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

- **fragment**
  The XML fragment containing the MathML content that should be inserted.
InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation (on page 1801).

InsertOrReplaceFragmentOperation

Similar to InsertFragmentOperation (on page 1782), except it removes the selected content before inserting the fragment. Also, the insertPosition parameter has another possible value: Replace. If this value is used, the operation deletes the node selected by the XPath expression denoted by the insertLocation parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation (on page 1801).

InsertOrReplaceTextOperation

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

- **text**
  The text section to insert.

InsertXIncludeOperation

Insert an XInclude element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

JSOperation

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see https://github.com/oxygenxml/javascript-sample-operations.

Notice:
For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API. However, it can be used when configuring an Action for Author mode using the Document Type Configuration dialog box (on page 151).

This operation accepts the following parameter:

- **script**
  The JavaScript content to execute. It must have a function called doOperation(), which can use the predefined authorAccess variable. The authorAccess variable has access to the entire ro.sync.ecss.extensions.api.AuthorAccess Java API.
The following example is a script that retrieves the current value of the \texttt{type} attribute on the current element, allows the end-user to edit its new value and sets the new value in the document:

```javascript
function doOperation(){
    //The current node is either entirely selected...
    currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
    if(currentNode == null){
        //or the cursor is placed in it
        caretOffset = authorAccess.getEditorAccess().getCaretOffset();
        currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    }
    //Get current value of the @type attribute
    currentValue = "";
    currentValueAttr = currentNode.getAttribute("type");
    if(currentValueAttr != null){
        currentValue = currentValueAttr.getValue();
    }
    //Ask user for new value for attribute.
    newValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentValue);
    if(newValue != null){
        //Create and set the new attribute value for the @type attribute.
        attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newValue);
        authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
    }
}
```

\textbf{Tip:}

You can call functions defined inside a script called \texttt{commons.js} from your custom script content so that you can use that external script file as a library of functions. Note that this \texttt{commons.js} file must be placed in the root of the \texttt{framework} directory (for example, \texttt{[OXYGEN\_INSTALL\_DIR]/frameworks/dita/commons.js}) because that is the only location where Oxygen XML Author will look for it.

\textbf{MoveCaretOperation}

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

\texttt{xpathLocation}
An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.

**position**

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

**selection**

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: **None**, **Element**, and **Content**.

**MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

**sourceLocation**

XPath expression that identifies the content to be moved.

**deleteLocation**

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the **sourceLocation** parameter will also identify the node to be deleted.

**surroundFragment**

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

**targetLocation**

XPath expression that identifies the location where the node must be moved to.

**insertPosition**

Argument that indicates the insert position.

**moveOnlySourceContentNodes**

When set to **true**, only the content of the source element is moved.

**processTrackedChangesForXpathLocations**

When nodes are located via an XPath expression and the nodes are deleted with **Change Tracking (on page 2821)** enabled, they are considered as being present by default (thus, the **change tracking** is ignored). If you set this argument to **true** and **change tracking** is enabled,
deleted nodes will be ignored when the XPath locations are computed (thus, the *change tracking* is NOT ignored).

alwaysPreserveTrackedChangesInMovedContent

When set to `true`, tracked changes are included when a copied fragment is inserted in a document, regardless of the current state of the *Track Changes* feature.

OpenInSystemAppOperation

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

resourcePath

An XPath expression that, when executed, returns the path of the resource to be opened. *Editor variables* *(on page 313)* are expanded in the value of this parameter, before the expression is executed.

isUnparsedEntity

Possible values are `true` or `false`. If the value is `true`, the value of the `resourcePath` argument is treated as the name of an unparsed entity.

ReloadContentOperation

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

markAsNotModified

The possible values are `true` and `false`. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to `true` to prevent the editor from showing the content as modified.

RemovePseudoClassOperation

An operation that removes a pseudo-class from an element. Accepts the following parameters:

name

Name of the pseudo-class to be removed.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.
The XPath location that identifies the element. If it is not defined, then the element at the cursor position is used. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

**Example:**

Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```xml
paragraph:myClass{
    font-size:2em;
    color:red;
}
paragraph{
    color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName**
  - The new element name.

- **elementLocation**
  - The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**ReplaceElementContentOperation**

An operation that replaces the content of the element at the cursor location (or fully selected element). The operation accepts the following parameters:

- **fragment**
  - Specifies the fragment that will be inserted as the element content.

- **elementLocation**
  - An XPath expression that identifies the element. If it is not defined, then the element at the cursor position is used.
SetPseudoClassOperation

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation**
  An XPath expression that identifies the element that will have the pseudo-class set. If it is not defined, then the element at the cursor position is used.

- **name**
  The pseudo-class local name.

- **includeAllNodes**
  The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

StopCurrentTransformationScenarioOperation

Allows you to stop the transformation scenario that is currently running.

**Notice:**

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (on page 1803).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header**
  The text that is placed before the selection.

- **footer**
  The text that is placed after the selection.
**TogglePseudoClassOperation**

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name**
  
  Name of the pseudo-class to be toggled on/off.

- **includeAllNodes**

  The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

- **elementLocation**

  The XPath location that identifies one or more elements that will have the pseudo class toggled. If it is not defined, then the element at the cursor position is used.

**Example:**

```
paragraph:myClass{
  color:red;
}
paragraph{
  color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered `paragraph` element.

**ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- **element**

  The element to wrap or unwrap content.

- **schemaAware**

  This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try
to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**ToggleCommentOperation**

This operation allows for commenting or un-commenting the selected content. It does not have any arguments. If the selection is text, the operation wraps the selection in a comment. If the selection is a comment, the operation removes the comment.

**UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

- **unwrapElementLocation**
  
  An XPath expression that identifies the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

**XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in Author mode.

**Notice:**

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

- **script**
  
  The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the ${framework} (on page 319) or ${frameworkDir} (on page 320) editor variables to refer the scripts from the framework directory.

  The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

  ```
  declare variable $oxyxq:selection external;
  ```

  In the example below (on page 1790), you can see how this argument is used.

- **externalParams**

  A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:
You can pass custom values for each parameter by setting the `externalParams` to `$param1=value1,param2=value2`.

**expandXincludeReferences**

Makes all Xinclude elements transparent to the XQuery transformer. When the Xinclude references are transparent, the XQueryUpdateOperation can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the Xinclude elements are not transparent.

An example of an XQuery Update Script that converts paragraphs to list items:

```xquery
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(: This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)

declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :) 
let $toProcess := if (empty($oxyxq:selection)) then 
  (.)
else 
  ($oxyxq:selection)
return if (not(empty($toProcess))) then 
  {
    (: Create the list :) 
    let $ul :=
      <ul>
      {for $sel in $toProcess 
        return 
          <li>{$sel}}</li>
      }
    </ul>
  }
</ul>
```
return

   (  
   (: Delete the processed nodes :)  
   for $sel in $toProcess
   return
   delete node $sel,
   (: Inserts the constructed list :)  
   insert node $ul
   before $toProcess[1]
   )
   )
else
   ()

XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

Notice:
For Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

sourceLocation

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations where you want to look at an ancestor of the current element and make decisions in the script based on that. To do this, you can set the sourceLocation to point to an ancestor node then use the oxy:current-element() function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">

    <xsl:template match="/">
        <xsl:apply-templates select="oxy:current-element()"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element, but we can use information from the entire XML -->
    </xsl:template>
</xsl:stylesheet>
```
targetLocation

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">
  <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The $[framework] editor variable (on page 319) can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the framework directory to a resource from the framework.

action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the $[caret] editor variable (on page 318) in the inserted content.

expandEditorVariables
Parameter controlling the expansion of editor variables (on page 313) returned by the script processing. Expansion is enabled by default.

**suspendTrackChanges**

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (on page 2821) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xml
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

**escapeEntityRefs**

Escapes entity references in processed content to plain text and unescapes them back in the returned content.

**XSLTOperation Example: Sort a list with respect to the language declared on the root element:**

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```xml
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The XSLTOperation needs to be configured as follows:

- sourceLocation is set to /* so that the script has access to the root element and its children.
- targetLocation is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 exclude-result-prefixes="xs oxy version="2.0"">
<xsl:template match="/">
  <!-- sourceLocation parameter was set to /* to have a larger context. We can pinpoint the element that contained the caret using the oxy:current-element() function. -->
  <xsl:apply-templates select="oxy:current-element()"/>
</xsl:template>

<xsl:template match="ul">
  <!-- Because the sourceLocation parameter was set to /* we now have access to the root element and its attributes. -->
  <xsl:variable name="lang" select="/*/@xml:lang"/>
  <xsl:variable name="collationURI">
    <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=', $lang)"/>
  </xsl:variable>
  <xsl:copy>
    <xsl:copy-of select="@*"/>
    <!-- Copy the list items, but sorted. -->
    <xsl:apply-templates select="li">
      <xsl:sort collation="{$collationURI}" select="text()"/>
    </xsl:apply-templates>
  </xsl:copy>
</xsl:template>

<!-- This copy template will handle the contents of the list items. -->
<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:apply-templates select="@* | node()"/>
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

**Using Entities and Xincludes with the XSLTOperation**

- **Entities** are treated as plain text and not expanded.
- **Xincludes** are resolved in the result, and you can alter the XML obtained afterward using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.
Editor Variables in Author Mode Operations

Author mode operations can include parameters that contain the following editor variables (on page 313):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

  Note: The ${caret} editor variable is available only for parameters that take XML content as values. It is replaced with the ${UNIQUE_CARET_MARKER_FOR_AUTHOR} macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id) editor variable. You can set the following parameters:
  - 'message' - The displayed message. Note the quotes that enclose the message.
  - 'default-value' - Optional parameter. Provides a default value.
  - '@id' - Optional parameter. Used for identifying the variable to reuse the answer using the ${answer(@id)} editor variable.
  - 'type' - Optional parameter (defaults to generic), with one of the following values:

  Note: The title of the dialog box will be determined by the type of parameter and as follows:
  - For url and relative_url parameters, the title will be the name of the parameter and the value of the 'message'.
  - For the other parameters listed below, the title will be the name of that respective parameter.
  - If no parameter is used, the title will be "Input".
Notice:
Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

\${ask( \ 'Provide a date', generic, \ '${date(yyyy-MM-dd\'T\'HH:MM)}' \ )}

| Parameter | Format: \${ask('message', generic, 'default')}
| --- | ---
| **generic** (default) | **Description:** The input is considered to be generic text that requires no special handling.

**Example:**
- \${ask('Hello world!')} - The dialog box has a *Hello world!* message displayed.
- \${ask('Hello world!', generic, 'Hello again!')} - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *Hello again!*.  

| Parameter | Format: \${ask('message', url, 'default_value')}
| --- | ---
| **url** | **Description:** Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.

**Example:**
- \${ask('Input URL', url)} - The displayed dialog box has the name *Input URL*. The expected input type is URL.
- \${ask('Input URL', url, 'http://www.example.com')} - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.

| Parameter | Format: \${ask('message', relative_url, 'default')}
| --- | ---
| **relative_url** | **Description:** Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Author tries to make the URL relative to that of the document you are editing.

**Note:**
If the \$ask editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.

**Example:**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>${ask('File location', relative_url, 'C:/example.txt')</strong>}</td>
<td>The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the currently edited document location.</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td><strong>Format:</strong> ${ask('message', password, 'default')}&lt;br&gt;&lt;br&gt;<strong>Description:</strong> The input is hidden with bullet characters.&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;- ${ask('Input password', password)} - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.&lt;br&gt;- ${ask('Input password', password, 'abcd')} - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default <strong>abcd</strong> value.</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${ask('Operating System', combobox, ('win': 'Microsoft Windows'; 'macos': 'macOS'; 'lnx': 'Linux/UNIX'), 'macOS')}</td>
<td>The fault value is indicated by macOS, as in the following example:</td>
</tr>
<tr>
<td>${ask('Mobile OS', combobox, ('ios': 'iOS'; 'and': 'Android'), 'Android')}</td>
<td>▪ ${\text{ask('Mobile OS', combobox, ('ios': 'iOS'; 'and': 'Android'), 'Android')}}$</td>
</tr>
<tr>
<td>${ask('Mobile OS', combobox, ($\text{xpath}_\text{eval}{(\text{for } $pair$ in (['ios', 'iOS'], ['and', 'Android']) \text{return } \text{'}</td>
<td></td>
</tr>
<tr>
<td>Format: ${ask('message', editable_combobox, ('real_value1': 'rendered_value1'; ...; 'real_valueN': 'rendered_valueN'), 'default')}</td>
<td>Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td>Note: The list of real_value:rendered_value pairs can be computed using ${\text{xpath}_\text{eval()}}$.</td>
<td></td>
</tr>
<tr>
<td>Note: The <code>default</code> parameter specifies the default-selected value and can match either a key or a value.</td>
<td></td>
</tr>
<tr>
<td>Example: ▪ ${\text{ask('Operating System', editable_combobox, ('win': 'Microsoft Windows'; 'macos': 'macOS'; 'lnx': 'Linux/UNIX'), 'macos')}$ - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ ${\text{ask('Operating System', editable_combobox, ($\text{xpath}_\text{eval}{(\text{for } $pair$ in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) \text{return } \text{'}</td>
<td></td>
</tr>
<tr>
<td>Format: ${ask('message', radio, ('real_value1': 'rendered_value1'; ...; 'real_valueN': 'rendered_valueN'), 'default')}</td>
<td>The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
<tr>
<td>Example: ▪ ${\text{ask('Operating System', editable_combobox, ('win': 'Microsoft Windows'; 'macos': 'macOS'; 'lnx': 'Linux/UNIX'), 'macos')}$ - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ ${\text{ask('Operating System', editable_combobox, ($\text{xpath}_\text{eval}{(\text{for } $pair$ in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) \text{return } \text{'}</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a <code>rendered_value</code> and will return an associated <code>real_value</code>.</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>

**Note:**
The list of `real_value`: `rendered_value` pairs can be computed using `${xpath_eval()}`.

**Note:**
The `default` parameter specifies the default-selected value and can match either a key or a value.

**Example:**

- `${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}` - The dialog box has the name `Operating System`. The radio button group allows you to choose between the three operating systems.  
  **Note:** In this example, macOS is the default-selected value and if selected, it would return macOS for the output.

- `${ask('Operating System', radio, (${xpath_eval(for $pair in ('win', 'Microsoft Windows';'macos', 'macOS';'lnx', 'Linux/UNIX') return $pair?1 || $pair?2 || ';')}, 'ios')}`

- `${timestamp}` - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

- `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.

- `${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

- `${cfn}` - Current file name without the extension and parent folder. The current file is the one currently open and selected.

- `${cfne}` - Current file name with extension. The current file is the one currently open and selected.

- `${cf}` - Current file as file path, that is the absolute file path of the currently edited document.

- `${cfd}` - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
• ${frameworksDir} - The path (as file path) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the Document Type Association > Locations preferences page.

• ${pd} - The file path to the folder that contains the current project file (.xpr).

• ${oxygenInstallDir} - Oxygen XML Author installation folder as file path.

• ${homeDir} - The path (as file path) of the user home folder.

• ${pn} - Current project name.

• ${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.

• ${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.

• ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

**Note:**
This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: [http://www.w3.org/TR/xmlschema-2/#date](http://www.w3.org/TR/xmlschema-2/#date). For details about xs:datetime, go to: [http://www.w3.org/TR/xmlschema-2/#dateTime](http://www.w3.org/TR/xmlschema-2/#dateTime).

**How to Find More Information About the Arguments of an Operation**

If you need to find more information about the arguments of an operation, there are several places where this information is available:

• In the API documentation for the particular operation.

• By invoking the getArguments() method on the operation.

• In the source code of the operation.

• In Oxygen XML Author:
  1. Go to Options > Preferences > Document Type Association, select a document type and click the New, Edit, Duplicate, or Extend button (on page 138).
  2. Go to the Author tab and then the Actions subtab. At the bottom of this subtab, click + New to open the Action dialog box (on page 148).
  3. Locate the Operation field and click the Choose button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click OK).

The arguments for the operation will now be displayed in the Action dialog box (on page 148).
Arguments of InsertFragmentOperation

*fragment*

This argument has a textual value. This value is parsed by Oxygen XML Author as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

- **Prefixes that are not bound explicitly**

For instance, the fragment:

```xml
<x:item id="dty2"/>
&ent;
<x:item id="dty3"/>
```

Can be correctly inserted in the document: ('|' marks the insertion point):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [ 
  <!ENTITY ent "entity"> 
]>
<x:root xmlns:x="nsp">
  | 
</x:root>
```

Result:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [ 
  <!ENTITY ent "entity"> 
]>
<x:root xmlns:x="nsp"> 
  <x:item id="dty2"/>
  &ent;
  <x:item id="dty3"/>
</x:root>
```
• **Default namespaces**

If there is a default namespace declared in the document and the document fragment (on page 2815) does not declare a namespace, the elements from the fragment are considered to be in no namespace.

For instance, the fragment:

```xml
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  |
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the *insertLocation*. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `$careset` editor variable (on page 318). The possible values of this action are true and false.
**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**insertEvenIfInvalid**

The possible values of this argument are `true` and `false`. If `true`, the content that would make the document invalid is accepted. If `false` and the insertion is not valid, the operation will not be executed and an error message will be displayed.

**Arguments of SurroundWithFragmentOperation**

**fragment**

The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
  <A/>
  <B>
    <C/></C>
  </B>
</F>
```

and the document:

```xml
<doc>
  <X/></X>
  <Y/></Y>
  <Z/></Z>
<doc>
```

Considering the selected content to be surrounded is the sequence of elements \( \bar{x} \) and \( \bar{y} \), then the result is:

```xml
<doc>
  <F>
    <A>
      <X/></X>
      <Y/></Y>
    </A>
    <B>
      <C/></C>
    </B>
  </F>
</doc>
```
Since the element was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**Note:**
If the first leaf is not the desired location for the surrounded fragment, you can use `ro.sync.ecss.extensions.commons.operations.InsertOrReplaceFragmentOperation` and set the following arguments:

- **fragment**
  The XML fragment that will surround the selection. Use the `${selection}` editor variable in the location you want to place the surrounded fragment.

- **schemaAware**
  Set it to `false` to avoid moving the fragment if it is not valid at the given location.

**schemaAware**
This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**Note:**
If a selection exists, the surround with fragment operation is not schema aware.

### Adding a Custom Operation to an Existing Framework

This task explains how to add a custom **Author** mode operation to an existing framework (document type).

1. Set up a sample project by following the instructions for installing the SDK.

   **Tip:**
   The SDK contains a sample framework project called `oxygen-sample-framework`.

2. A variety of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.

3. Pack the operation class inside a Java JAR library.
4. Copy the JAR library to your framework directory (for example, 
{OXYGEN_INSTALL_DIR}/frameworks/[FRAMEWORK_DIR]).

5. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type 
Association, and edit the document type (you need write access to the {OXYGEN_INSTALL_DIR}) to 
open the Document Type configuration dialog box (on page 140).
   a. In the Classpath tab, add a reference to your JAR library (for example, ${framework}/
customAction.jar).
   b. Go to the Author tab, then go to the Actions subtab.
   c. Click the ➕ New button and use the Action dialog box (on page 148) to create a new action that 
      uses your custom operation.
   d. Mount the action to the toolbars or menus. You can also define a shortcut key.

6. Share the modifications (on page 1915) with your colleagues. The files that should be 
   shared are your customAction.jar library and the .framework configuration file from the 
   {OXYGEN_INSTALL_DIR}/frameworks/[FRAMEWORK_DIR] directory.

Related Information:
AuthorOperation API

Example: Configuring the Insert Section Action for a Framework

This topic describes the procedure for defining the Insert Section action for a custom framework (on page 
2817). It is assumed that the icon files, § (Section16.gif) for the menu item and § (Section20.gif) 
for the toolbar, are already available. Although you could use the same icon size for both the menu 
and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These 
files should be placed in your custom framework directory ( {OXYGEN_INSTALL_DIR}\frameworks \\{CUSTOM_FRAMEWORK_DIR}).
1. Set the **ID** field to **insert_section**. This is a unique action identifier.

2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.

3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The **letter** is visually represented by underlining the first letter from the menu item name having the same value.

4. Add a **Description**.

5. Set the **Large icon (20x20)** field to **${framework}/Section20.gif**. A good practice is to store the image files inside the **framework** directory and use **editor variable** (on page 313) **${framework}** to make the image relative to the **framework** location.

   If the images are bundled in a **JAR** (on page 2817) archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

   If the image file **Section20.gif** is located in the **images** directory inside the **JAR** archive, you can reference it by using **/images/Section20.gif**. The **JAR** file must be added into the **Classpath** list.

6. Set the **Small icon (16x16)** field to **${framework}/Section16.gif**.

7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S (Meta+Shift+S on macOS)**. This will be the key combination to trigger the action using the keyboard only.

   The shortcut is enabled only by adding the action to the main menu of **Author mode** (on page 1808), which contains all the actions that the author will have in a menu for the current document type.
8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a `<book>`, `<article>`, or another `<section>`.

   a. Set the XPath expression field to:

   ```
   local-name()='section' or local-name()='book' or local-name()='article'
   ```

   b. Set the `invoke operation` field to `InsertFragmentOperation` built-in operation, designed to insert an XML fragment at the cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the Author Default Operations (on page 1778) section. This set can be expanded with your own Java operation implementations.

   c. Configure the arguments section as follows:

   ```
   <section xmlns="http://www.oxygenxml.com/sample/documentation">
   <title/>
   </section>
   ```

   - `insertLocation` - leave it empty. This means the location will be at the cursor position.
   - `insertPosition` - select "Inside".

### Example: Configuring the Insert Table Action for a Framework

This topic describes the procedure for defining the Insert Table action for a custom framework (on page 2817). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action (on page 1805), you will use the `InsertFragmentOperation` built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom `framework` directory ({`OXYGEN_INSTALL_DIR\framework\[CUSTOM_FRAMEWORK_DIR]\}).

1. Set ID field to `insert_table`.
2. Set Name field to `Insert table`.
3. Set Menu access key field to `t`.
4. Set Description field to `Adds a table element`.
5. Set Toolbar icon to `${framework} / toolbarIcon.png`.
6. Set Menu icon to `${framework} / menuIcon.png`.
7. Set Shortcut key to `Ctrl + Shift + T` (Command + Shift + T on macOS).
8. Set up the action's functionality:
   
a. Set **XPath expression** field to `true()`.  
   `true()` is equivalent with leaving this field empty.

b. Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML 
   fragment to the cursor position.

c. Configure operation's arguments as follows:

   **fragment** - set it to:

   ```xml
   <table xmlns="http://www.oxygenxml.com/sample/documentation">
   <header>
   <td/> <td/> <td/>
   </header>
   <tr><td/> <td/> <td/></tr>
   <tr><td/> <td/> <td/></tr>
   </table>
   ```

   **insertLocation** - to add tables at the end of the section use the following code:

   ```xml
   ancestor::section/*[last()]
   ```

   **insertPosition** - Select **After**.

**Using Retina/HiDPI Icons for the Actions from a Framework**

Higher resolution icons can also be included in customized frameworks (on page 2817) for rendering 
them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type 
Configuration dialog box (on page 140) (from the Action dialog box (on page 148)) or from an API 
(ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (on page 1896)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution 
images and they are identified by a scaling factor that is included in the name of the image files. For instance, 
icons with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (`@2x` or `@3x`) in the Action dialog box (on page 
148) or the XMLNodeRendererCustomizer API (on page 1896). When using a Retina or HiDPI display, Oxygen 
XML Author automatically searches the folder of the *normal* icon for a corresponding image file with a Retina 
scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used 
instead.

**Related Information:**
Retina/HiDPI Images in Author Mode (on page 706)

**Customizing the Menu for a Framework**

Defined actions can be grouped into customized menus in the Oxygen XML Author menu bar.
1. Open the Document Type configuration dialog box (on page 140), select your custom framework (on page 2817), and go to the Author tab.

2. Go to the Menu subtab. In the left side you have the list of actions and some special entries:
   - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
   - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.

3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then click the Edit button.

4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then click the Add as child button. Change the submenu name to Table, using the Edit button.

5. Select the Insert section action in the left panel section and the Table label in the right panel section, then click the Add as sibling button.

6. Now select the Insert table action in the left panel section and the Table in the right panel section. Click the Add as child button.

**Figure 356. Configuring the Menu**

When opening a test document for a custom framework in Author mode, the menu you created is displayed in between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).
Customizing the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the Author editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the Document Type configuration dialog box (on page 140) for the particular framework (on page 2817) and go to the Author tab. Next, go to the Contextual Menu subtab.
2. Follow the same steps as explained in the Configuring the Main Menu (on page 1808), except changing the menu name because the contextual menu does not have a name.

Note:
You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and framework-specific ones) are grouped together under the same submenu.
To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** submenu and the **Insert section** action.

**Customizing the Content Completion Assistant for Author Mode Only**

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- **Content Completion Assistant (on page 2815)** window
- **Elements view (on page 615)**
- **Insert Element** menus (from the **Outline view (on page 521)** or breadcrumb **(on page 584)** contextual menus)

You can use the content completion customization support in a custom **framework (on page 2817)** by following this procedure:

1. Open the **Document type configuration dialog box (on page 140)** for your custom **framework** and select the **Author** tab. Next, go to the **Content Completion** tab **(on page 160)**.

![Figure 359. Customize Content Completion](image)

The top side of the **Content Completion** section contains the list with all the actions defined within the custom **framework** and the list of actions that you decided to include in the **Content Completion Assistant** list of proposals. The bottom side contains the list with all the items that you decided to remove from the **Content Completion Assistant** list of proposals.

2. If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and click the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. A **Content Completion Item** dialog box appears, giving you the possibility to select where to provide the selected action.
3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

![Figure 360. Content Completion Item Dialog Box](image)

![Figure 361. Remove Item Dialog Box](image)

**Note:**
In the Item name drop-down menu, `<SPLIT>` refers to the action of splitting the element and creating a new one, while `<ENTER>` refers to the action of inserting a new line.

**Related Information:**
Customizing the Content Completion Assistant Using a Configuration File (on page 1818)
Customizing the Toolbars for a Framework

This procedure describes how to add defined actions to a toolbar for a custom framework (on page 2817). You can also create additional custom toolbars with existing or custom actions.

1. Open the Document Type configuration dialog box (on page 140) for your custom framework and select the Author tab.

2. Go to the Toolbar subtab.

**Figure 362. Configuring the Toolbar**

The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called Separator allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the Add as child or Add as sibling button.

**Result:** When opening a document for the particular framework in Author mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:**

If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the Author mode, right-click the main toolbar, select Configure Toolbars, and make sure the appropriate toolbar (such as the Author Custom Actions toolbar) is selected.
Note:
A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Customizing Text-to-Markup Shortcut Patterns

Some built-in frameworks include a configuration file that defines shortcut patterns that can be used in Author mode to automatically insert a certain XML structure. More specifically, the XML structure (fragment) automatically replaces a specific prefix pattern. For example, if you are editing a DITA document using the built-in DITA framework, entering a hyphen (-) followed by a space at the beginning of a paragraph would automatically replace them with an unordered list element (<ul>) with a child list item element (<li>). This is made possible by the AutoCorrect mechanism in Oxygen XML Author.

It is possible to customize the particular configuration file (structureAutocorrect.xml) to define your own markup insertion shortcut patterns by following these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 144) add a link to that resources folder (if it does not already exist).
3. Create a new structureAutocorrect.xml file or edit an existing one (this file already exists in the resources folder of particular document types and you can use an existing file as a starting point for your customization).
4. Make the appropriate changes to your structureAutocorrect.xml file. The file should look like this:

   ```xml
   <structure-autocorrect>
     <!-- Unordered lists -->
     <prefix-replacement prefix="-"> <ul><li/></ul> </prefix-replacement>
     <!-- Ordered lists -->
     <prefix-replacement prefix="1."> <ol><li/></ol> </prefix-replacement>
     <!-- Code block -->
     <prefix-replacement prefix="```"> <codeblock/> </prefix-replacement>
   </structure-autocorrect>
   ```
Using this example, when a user enters one of the defined prefixes at the start of an element that allows the corresponding fragment, Oxygen XML Author will automatically replace the prefix with its corresponding fragment. For example, entering a hyphen (\-) at the beginning of a paragraph followed by a space would automatically replace them with an unordered list element \(<ul>\) with a child list item element \(<li>\). Any subsequently added content would be placed inside the first node/element that does not have a child node/element (in this example, the cursor would be placed in the first \(<li>\) element).

5. Save the file in the resources folder for the particular document type, using the fixed name: \(\text{structureAutocorrect.xml}\) (for example, \(\text{OXYGEN\_INSTALL\_DIR}/\text{frameworks/dita/resources/structureAutocorrect.xml}\)).

6. Restart the application and open a document for your particular framework to test your customization.

**Note:** Once the file is created, changes that you make to it are processed by Oxygen XML Author when you press the Reload toolbar button.

### Customizing Smart Paste Support

The **Smart Paste feature (on page 594)** preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support **Smart Paste (on page 595)** in Oxygen XML Author. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylessheet for a particular document type (framework (on page 2817)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

**How to Customize the Smart Paste Mapping**

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named resources in the following path structure:

   \(/\text{frameworks/ [Document Type]}/\text{resources}\)

2. Create an XSLT file named xhtml2content.xsl and save it in the resources folder for the particular framework.

   For example: \(/\text{frameworks/ [Document Type]}/\text{resources/xhtml2content.xsl}\)

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (on page 1817) section below.
Tip:
The built-in DITA framework includes an *xhtml2ditaDriver.xsl* file (in 
\([OXYGEN_INSTALL_DIR]/frameworks/dita/resources\)) that imports various other
stylesheets that apply cleanup and handle the conversion from the pasted HTML content to
DITA. If you are using a custom extension of the DITA framework, you can copy the entire
contents of the built-in *dita/resources* folder and customize the stylesheets according to
your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen
XML Author.

**Result:** When you paste content from external applications (such as a web browser or and Office document)
to a document that is open in **Author** mode, and that matches the particular **framework**; the styling from the
*xhtml2content.xsl* stylesheet will be applied on the clipboard contents.

**Customized Smart Paste Stylesheet Sample:**

```xml
<xsl:stylesheet version="1.0"
    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xhtml="http://www.w3.org/1999/xhtml"
    xmlns="urn:hl7-org:v3"
    exclude-result-prefixes="xsl xhtml">

    <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

    <xsl:template match="xhtml:b | xhtml:strong">
        <content styleCode="bold">
            <xsl:apply-templates select="@* | node()"/>
        </content>
    </xsl:template>

    <xsl:template match="*">
        <xsl:apply-templates select="@* | node()"/>
    </xsl:template>

    <xsl:template match="@* | node()">
        <xsl:copy>
            <xsl:apply-templates select="@* | node()"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

**inTableContext**

The custom XSLT stylesheet receives this parameter with a value of **true** if the end-user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the currently edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the resources folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste
(automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>
  <!-- True to check if the entire sequence of words which get pasted are
  converted to the target vocabulary. If the check fails, the content
  will be inserted as a simple sequence of words without any formatting. -->
  <checkEntireContentIsFullyPreserved>true</checkEntireContentIsFullyPreserved>
</pasteOptions>
```

Customize the Content Completion Assistant

Oxygen XML Author gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 2815). Oxygen XML
Author also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Author:

- You can add, modify, or remove actions that are proposed for each particular document type (framework (on page 2817)) by using the Content Completion subtab in the Document Type Association configuration dialog box (on page 160). To access this subtab, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 138), click on the Author tab, and then the Content Completion subtab.

  Note:
  This works only for Author visual mode.

- You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Customizing the Content Completion Assistant for Author Mode Only (on page 1811)

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (<li>) accepts more than 60 child elements. Oxygen XML Author includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (<li>) to only accept paragraph elements (<p>). In this case, the Content Completion Assistant (on page 2815) should not offer any element other than a paragraph (<p>) when a list item (<li>) is inserted into a document. It would also be helpful if the required child element (<p>) was automatically inserted whenever a list item (<li>) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be complicated in some cases. Fortunately, Oxygen XML Author offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2815), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 144) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.

b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 144) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 144), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc_config.xml) uses <elementProposals> elements. This element allows you to customize or filter the child elements and attributes for an element.
**Warning:**

Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

**Elements:**

To control the elements that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, `*title*` matches all the `<title>` elements in the document, while `chapter/title` matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[a and b or c and d]
*[a and (b or c) and d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1;elementName2;elementName3`
- `//xs:localName`
- `//xs:documentation[@lang="en"]`

**Note:**

Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:
Other Important Notes:

- If the @path attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use possibleElements (on page 1822) or rejectElements (on page 1823) to specify or restrict particular elements for a framework (on page 2817).

For example, suppose that in your DITA documents, you want to restrict your users from using <image> and <fig> elements because you do not want images to be included in your output. The configuration file should look like this:

```xml
<elementProposals rejectElements="image fig" />
```

Since the @path attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- If the particular document type has name namespaces, the @path should contain the qualified name. For example, in TEI documents, if you want to set a list of possible attributes for the <span> element, you need to use a qualified name like this (notice the declaration of the namespace prefix "t" and its usage):

```xml
<config xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns="http://www.oxygenxml.com/ns/ccfilter/config"
    xmlns:t="http://www.tei-c.org/ns/1.0">
  ...
  <elementProposals path="t:span" possibleAttributes="type"/>
</config>
```

- **insertElements** - A space-separated sequence of child element names. Each time the element specified in the @path attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, insertElements="b i" will insert exactly one <b> element, followed by an <i> element. An empty value (""") means that no child elements should be inserted.

  **Note:**

  If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the @path attribute. For example, "b i codeph ph" means that the Content Completion Assistant will contain these four elements when
invoked on the element specified in the `@path` attribute. The following other possible values are also supported:

- **NONE**: There will be no proposals in the content completion list.
- **ALL**: All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
- **INSERTED**: The proposals will be the same list of elements that are defined in the `@insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals possibleElements="b i codeph ph" />
```

- **rejectElements**: A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

```
Note:

This setting makes the application behave as if the rejected elements were not allowed by the schema in that location. Most of the toolbar actions take the schema into account when inserting content. If the inserted content is not allowed by the schema in that particular location, the application tries to find another location within close proximity where the content is allowed.

For example, suppose you reject the insertions of images in paragraphs. If a user has the cursor inside a paragraph and uses the toolbar action that inserts an image, the image will be inserted after the current paragraph rather than at the current location.

If you want to avoid having users insert an element directly from the content completion mechanism and want them to use a toolbar action instead, it is better to use the Document Type Configuration (on page 160) dialog box to remove the element.
```

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals rejectElements="image fig imagemap foreign" />
```

- **contentType**: Forces an element to have an imposed content type. The possible values are: `elementOnly, mixed, or empty`.

```xml
<elementProposals path="section" insertElements="title p" contentType="elementOnly"/>
```
• **merge** - By default, if there are multiple element proposal rules that match the current element context, then only the rule that has the most specific path is used. By setting the `merge` attribute to `true` on the proposal rules that might match the same element context, all the rules will be applied. Example:

```xml
<elementProposals
path="/*[not(@xml:lang='ja')]//*"
merge="true"/>

<elementProposals
path="/[@xml:lang!='he']/"*
merge="true"
 />
```

**Attributes:**

To control the **attributes** that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

• **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `<title>` elements in the document, while "chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 205).

**Note:**

If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes (on page 1825)` or `rejectAttributes (on page 1825)` to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```xml
<elementProposals
possibleAttributes=""
 id domains href scope format type conref
 props keyref class""/>
```

Since the `@path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

• **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```xml
<elementProposals
path="ol/li" insertAttributes="product platform"/>
```
• **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```xml
<elementProposals path="ol/li">
  <insertAttribute name="platform" value="test"/>
</elementProposals>
```

• **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type"/>
```

• **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the **Content Completion Assistant** will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals rejectAttributes="importance platform product"/>
```

**Other Important Notes About the Configuration File**

⚠️ **Important:**

- By default, the element names that do not have a namespace prefix are considered from **no-namespace**. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `@elementPath` and `@model` attributes.
- This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the □ **Reload (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured `elementProposals`, the first one in sequence takes precedence. Therefore, make sure you place the more specific `elementProposals` (those with a longer path) first in your configuration file.
- Simple wildcard patterns can be used in the following attributes: `@possibleElements`, `@rejectElements`, `@possibleAttributes`, and `@rejectAttributes`. For example, `code*`, `*block`, `con*ref`, `_`.
- **Editor variables** (on page 313) can be used in the `@value` attribute of the `<insertAttribute>` element. For example:
Examples: Configuring the Element Proposals

• Example 1: Automatically Insert Elements

Suppose that you want to automatically insert a paragraph element (\texttt{<p>}) whenever a DITA ordered list item element (\texttt{<ol/li>}) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```xml
<elementProposals path="ol/li" insertElements="p"
    possibleElements="_INSERTED_"/>
```

Tip:
This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the Content Completion Assistant, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Customizing the Author Mode Editing Experience for a Framework (on page 1771).

• Example 2: Insert Complex Element Structure

For a more complex example, suppose that you want to insert a complex structure whenever a DITA \texttt{<prolog>} element is inserted.

For instance, if you want to insert the following structure inside \texttt{<prolog>} elements:

```xml
<prolog>
  <author></author>
  <metadata>
    <keywords>
      <keyword></keyword>
      <keyword></keyword>
    </keywords>
```

Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex elementProposals patterns are defined, you should avoid infinite recursions.
the configuration file should include the following:

```xml
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords" insertElements="keyword, keyword"/>
```

**Example 3: Limit Possible Elements**

Suppose that you also want to limit the proposals for the `<keywords>` element to only allow the user to insert `<audience>` or `<keyword>` elements. The configuration file should include the following:

```xml
<elementProposals path="prolog/metadata/keywords" possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting `<image>` elements inside DITA list item elements (`<li>`), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="li" rejectElements="image" />
```

**Examples: Configuring the Attributes Proposals**

**Example 1: Automatically Insert Attributes**

Suppose that you want to insert an `@id` attribute (with an empty value) whenever a DITA list item element (`<li>`) is inserted. The configuration file should include the following:

```xml
<elementProposals path="li" insertAttributes="id"/>
```

**Example 2: Limit Possible Attributes**

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`<li>`) is inserted. The configuration file should look like this:

```xml
<elementProposals path="li" insertAttributes="id" possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting `@conref` attributes inside DITA topics (`<topic>` element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="topic" rejectAttributes="conref" />
```
Oxygen XML Author includes support for configuring the proposed values that appear in the Content Completion Assistant. To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the Content Completion Assistant.

For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an @xml:lang attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 144) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 144) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: $cc_config.xml$ (for example, $OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml$).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

**Tip:**
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

**Attention:**
In the Classpath tab (on page 144), if you have references to multiple resources folders, each with its own $cc_config.xml$ file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

### Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file ($cc_config.xml$) includes a series of $valueProposals$ instructions that will match an element or attribute name and has the following attributes:

- **path** - A path within the document that matches the element or attribute that will have its content completion proposals changed. For example:
  
  - `path="title"` matches all the `<title>` elements in the document.
  - `path="chapter/title"` matches only the `<title>` elements that are direct children of the `<chapter>` element.
  - `path="@xml:lang"` matches all the `@xml:lang` attributes in the document.
  - `path="title/@xml:lang"` matches only the `@xml:lang` attributes that appear on `<title>` elements.

You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr ! = "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.
**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

*[@a and @b or @c and @d]*
*[@a and (@b or @c) and @d]*

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`
- `//xs:documentation[@lang="en"]`

**Note:**
Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:

```xml
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
    path="db5:listitem" insertElements="db5:para"/>
```

- **editable** - Specifies the editable state of the attribute values, as reflected in the Attributes view (on page 609) and the In-place Attributes Editor (on page 612). The possible values for the `@editable` attribute are:
  - `true` - The attribute values can be edited by choosing from a combo box or manually providing a value.
  - `false` - The attribute values cannot be edited.
  - `onlyAllowedItems` - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

The new value proposals are specified in the `<valueProposals>` element through:

- One or more `<item>` elements, which are grouped inside an `<items>` element.

**Tip:**
The `<item>` element can have a `@listValue` attribute, which can be set to `true` if you want those items to be part of a list attribute value (such as `attr="item1 item2"`).

- An `<xslt>` element that references an XSLT script that gets executed and must return an `<items>` element.

The behavior of the `<items>` or `<xslt>` elements are specified with the help of the `@action` attribute, which can have any of the following values:
• **append** - Adds new values to appear in the proposals list (default value).
• **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
• **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source. An `<xslt>` element must be used in this situation.

```xml
<valueProposals path="x:lg" xmlns:x="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>
```

**Note:**

`valueProposals` offers more flexibility compared to the old `match` element that was marked as deprecated.

```xml
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```

**Other Important Notes About the Configuration File**

**Important:**

• This configuration file only affects the content completion assistance, not validation.
• To test the effects of your changes, you should Refresh the source document (on page 737).

**Example: Specifying Values Directly**

If you want to specify the values directly, the configuration file should look like this:

```xml
<!-- Replaces the values for an element with the local name "lg", from the given namespace -->
<valueProposals path="x:lg" xmlns:x="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>

<!-- Adds two values for an attribute "type", from no namespace -->
<valueProposals path="@type" editable="onlyAllowedItems">
  <items>
```
Example: Using Attribute Conditions

The possible values of an attribute depend on the value of another attribute from the same element:

```xml
<valueProposals path="property[@name='color']">
  <items>
    <item value="red"/>
    <item value="blue"/>
  </items>
</valueProposals>

<valueProposals path="property[@name='shape']">
  <items>
    <item value="rectangle"/>
    <item value="square"/>
  </items>
</valueProposals>
```

Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

ℹ️ Tip:

You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the **Content Completion Assistant** is invoked.

🔍 Note:

A comprehensive XSLT sample is included in the **Content Completion Configuration** document template (in the **Framework Templates > Oxygen Extensions** section of the **New document wizard** [on page 351]).
Note:

If \texttt{@useCache} is set to \textit{false}, then the XSLT will be invoked any time the proposals are needed. If \texttt{@useCache} is set to \textit{true}, then the XSLT is executed once and the obtained proposals are kept in a cache and returned every time the proposals are requested again. You can use the \textit{Validate} action to drop the cached values and recompute them.

Configuring Proposed Values in the Context Where the Content Completion was Invoked

**Web Author Customization Note:**

This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element where the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, \textit{color}) and other values for another property (for example, \textit{shape}). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```

The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <valueProposals path="property/@value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </valueProposals>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:param name="documentSystemID" as="xs:string"/>
```

The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context where the content completion was invoked.

**Related information**
- Configuring the Proposals for Elements and Attributes *(on page 1819)*
- Customizing the Rendering of Elements *(on page 1834)*

**Customizing the Rendering of Elements**

In addition to the support for configuring the proposals that appear in the *Content Completion Assistant*(on page 2815), Oxygen XML Author also includes support for customizing how the elements are rendered. You can do this by using the *XMLNodeRendererCustomizer API extension*(on page 1896), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`<p>`) to be rendered as "Paragraph" instead of "p" in the various components in *Author* mode (such as in the *[Outline view](on page 521)*, *[Elements view](on page 615)*, *[Attributes view](on page 609)*, and the breadcrumb navigation bar). To achieve this, you can use the `<elementRenderer>` element in the configuration file.
Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2815), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 144) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 144) before the one from the base framework.

   If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.
Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 144), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the <render> element inside a <elementRenderings> element to specify how element names, their annotations, and their icons are rendered.

The <elementRenderings> element supports the @platform attribute, which can have one of the following values:

- webapp
  The element renderings are only applied to Oxygen XML Web Author.

- standalone
  The element renderings are only applied to standalone distributions of Oxygen.

- eclipse
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.

Note:
If the @platform attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the <render> element:

- element
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from noNamespace.

- as
  Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 576), and the Outline (on page 521), Elements (on page 615), and Attributes (on page 609) views). This attribute is optional. If it is missing, the name of the element is used.
If you want to translate this label into another language, use the \$\{i18n(key_name)\} editor variable (on page 320). The following code snippet shows how the DITA paragraph elements (p) can be translated:

```xml
<elementRenderings>
  <render element="p" as="\$\{i18n(cc_p)\}"/>
</elementRenderings>
```

Note:
The cc_p id is a key that identifies the translations available for the paragraph element.

iconPath

Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 521) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Author to load "frameworks/$ (framework)/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash /, and the image file will be searched for in the Oxygen XML Author classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Author JAR file resources.

xml:lang (Deprecated)

It is recommended to use the \$\{i18n(key_name)\} editor variable (on page 320) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple <render> elements for the same @element attribute (element name) and the @xml:lang attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

Note:
The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (p) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```
You can also use the configuration file to customize the annotations for elements. For this purpose, the `<render>` element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

`annotation`

This element can be used within the `<render>` element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (on page 576), and the Outline (on page 521), Elements (on page 615), Attributes (on page 609) views), as well as the tooltips that are displayed when you hover over elements in Text mode. You can use HTML content to style the annotations (see the example below (on page 1839)).

**Note:**
If this element is missing, the styling for the annotations for that element is collected from the associated schema (on page 601).

**Tip:**
The annotations can also be translated in the configuration file. For example:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}">
    <annotation>${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```

Other Important Notes About the Configuration File for Rendering Elements

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the ✂️ Reload (F5) action to test your customizations.
- If the framework (on page 2817) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: `${oXygenInstallDir}frameworks/${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
- If an XMLNodeRendererCustomizer API extension (on page 1896) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer
implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.

- The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

**Example: Changing the Rendering of an Element**

Suppose that you want to render the name of the DITA `<title>` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```

- Schema Annotations in Author Mode (on page 601)
- Customizing Annotations in the Content Completion Assistant (on page 1839)

**Customizing Annotations in the Content Completion Assistant**

Oxygen XML Author gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (on page 2815) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 615). If you hover over attributes in the Attributes view (on page 609) you also see information about each attribute, gathered from the same schema.
If you have a framework configuration (on page 140) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name:

   contentCompletionElementsMap.xml.

4. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Author will locate your mapping file by doing one of the following:

   - In the Classpath tab add a link to the newly created folder.

   - In the Catalogs tab add a new catalog file (on page 808). The selected file needs to contain the following:

     ```xml
     <?xml version="1.0" encoding="UTF-8"?>
     <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
     <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
       <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
     </catalog>
     ```

     where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

   **Note:** If Oxygen XML Author finds a mapping file in both locations, the one in the Catalogs tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.
In the Content Completion Assistant (on page 2815), you should see the additional annotations for each element.

**Translating Annotations**

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Author looks for several filename formats to determine the information to load for the content completion annotations. These files that begin with the name `contentCompletionElementsMap`, are located in the `styleguide` folder for each built-in framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`).

For example, for English, the files are loaded in the following order (from specific to more general):

- `contentCompletionElementsMap_en_US.xml` or `contentCompletionElementMap_en_UK.xml`, and so on
- `contentCompletionElementsMap_en.xml`
- `contentCompletionElementsMap.xml`

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the `styleguide` folder for your framework):

- `contentCompletionElementsMap_de_DE.xml`
- `contentCompletionElementsMap_de.xml`

**Related Information:**

Customizing the Rendering of Elements (on page 1834)

**Customizing the Content Completion Assistant for Author Mode Only**

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- Content Completion Assistant (on page 2815) window
- Elements view (on page 615)
- Insert Element menus (from the Outline view (on page 521) or breadcrumb (on page 584) contextual menus)

You can use the content completion customization support in a custom framework (on page 2817) by following this procedure:
1. Open the **Document type configuration dialog box (on page 140)** for your custom framework and select the **Author** tab. Next, go to the **Content Completion tab (on page 160)**.

![Figure 363. Customize Content Completion](image)

The top side of the **Content Completion** section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the **Content Completion Assistant** list of proposals. The bottom side contains the list with all the items that you decided to remove from the **Content Completion Assistant** list of proposals.

2. If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and click the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. A **Content Completion Item** dialog box appears, giving you the possibility to select where to provide the selected action.

![Figure 364. Content Completion Item Dialog Box](image)
3. If you want to exclude a certain item from the **Content Completion** proposals, you can use the **Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

![Figure 365. Remove Item Dialog Box](image)

**Note:**

In the **Item name** drop-down menu, `<SPLIT>` refers to the action of splitting the element and creating a new one, while `<ENTER>` refers to the action of inserting a new line.

**Related Information:**

- Customizing the Content Completion Assistant Using a Configuration File (on page 1818)

**Configuring Transformation Scenarios for a Framework**

When distributing a **framework** (on page 2817) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the **framework** configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

To create a transformation scenario for your **framework**, follow these steps:

1. Create an **xsl** folder inside your custom **framework** directory  
   
   ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).

   The folder structure for the documentation **framework** should be:

   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
   schema
   css
   ```
2. Create an xsl file and save it in the xsl folder. To help you get started, you can use the sample sdf.xsl file found in the sample framework customization package.

3. Open the Preferences dialog box (Options > Preferences) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type Configuration dialog box (on page 140), and choose the Transformation tab. Click the New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

In the New scenario dialog box, fill in the following fields:

- Set the XSL URL field to path of your custom stylesheet (for example, ${framework}/xsl/mycustom.xsl).

4. Change to the Output tab. Configure the fields as follows:

- Set the Save as field to ${cfd}/${cfn}.html. This means the transformation output file will have the name of the XML file and the html extension and will be stored in the same folder.
- Select the Open in Browser/System Application option.

Note: To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences), go to Global, and set it in the Default...
Select the Saved file option.

5. Click the OK button to save the new scenario.

Now the scenario is listed in the Transformation tab:

![Figure 367. Transformation Tab](image)

To test the transformation scenario that you just created, you can use the sample sdf.xml file found in the sample framework customization package. Click the Apply Transformation Scenario(s) button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

### Configuring Validation Scenarios for a Framework

You can distribute a framework (on page 2817) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:**

If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using ‘Main Files’ Support (on page 400) or Modular Contextual XML Editing Using ‘Main Files’ Support (on page 811).

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association.
2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 140), then choose the Validation tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario...
(when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.

3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.

Figure 368. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the Browse drop-down button to browse for a local, remote, or archived file.
- Use the Insert Editor Variable button to insert an editor variable (on page 313) or a custom editor variable (on page 322).
Figure 369. Insert an Editor Variable

File type

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the URL of the file to validate field.

Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 239), XML Schema preferences page (on page 234)).

- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the Validate and Check for Completeness action (on page 2516) in the DITA Maps Manager, but for a local file rather than an entire DITA map (on page 2816)).

- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the Validate and Check for Completeness action (on page 2516) in the DITA Maps Manager).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the Validate and Check for Completeness action (on page 2516) in the DITA Maps Manager).

- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option (on page 2521)).
Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 757). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 221), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

Settings

Depending on the selected validation engine, clicking the Settings button either opens the Specify Schema dialog box or the Configure validation engine dialog box.

* Specify Schema Dialog Box

This dialog box allows you to specify a custom schema to be used for the validation process.

![Specify Schema Dialog Box](image)

The Specify Schema dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document (on page 798).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down,
the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (on page 2817) to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

- **Configure Validation Engine Dialog Box**

  This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the Validate and Check for Completeness action (on page 2516) in the DITA Maps Manager).

**Note:**

The options presented in the Configure validation engine dialog box depends on type of validation engine. For example, when configuring the DITA-OT Project Validation and Completeness Check validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).
Figure 371. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(on page 769)*.

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.
Include remote resources
Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters
The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 2472). Clicking the Details icon opens a topic in the Oxygen XML Author User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder
If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2820) folder.

Report links to topics not referenced in DITA maps
Checks that all the topics referenced by other topics are also linked in the DITA map. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic
If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.
For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```xml
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes [key scopes](on page 2637) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a [key scope](on page 2637) on the second occurrence.

**Report unreferenced key definitions**

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**
Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspece>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 186) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Author will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 313) button, or the browsing actions in the Browse drop-down list.
Advanced Tip:
Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTEXTensionFunctionUtil.

- **Move Up**
  Moves the selected validation unit up one spot in the list.

- **Move Down**
  Moves the selected validation unit down one spot in the list.

- **Add**
  Adds a new validation unit to the list.

- **Remove**
  Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.

5. Click **Ok**.
   The newly created validation scenario is now included in the list of scenarios in the **Validation tab (on page 166)**. You can use the **Default** checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

**Customizing New Document Templates for a Framework**

You can create your own custom document templates and attach them to a custom **framework (on page 2817)**. You can then **share the custom framework (on page 1915)** so that all users will have access to the templates in the **New document wizard (on page 351)**.

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

Tip:
You can use **editor variables (on page 313)** in the template file content and they will be expanded when the files are opened. Also, see **Customizing Document Templates (on page 360)** for other template customization tips (for example, you could **add placeholders or hints (on page 363)** to assist authors).
2. Save the new template in a directory (for example, called templates) within your custom framework directory.

![Attention:](image.png)
The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 362) section.

3. Open the Document Type configuration dialog box (on page 140) for that specific framework, go to the Templates tab (on page 163), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, $(frameworkDir)/templates). Binding to an absolute file (e.g., C:some_dir\templates) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.

5. To test the template, open the new document wizard (New toolbar button or File > New) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Customizing Document Templates (on page 360)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 2821) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 2817) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

   **Example:**

   Create a new XML file called catalog.xml and save it in your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

   ```xml
   <?xml version="1.0"?>
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/SDF/abs.xsd" url="schema/abs.xsd"/>
     <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
   ```
2. Add catalog files to your custom framework using the Catalogs tab (on page 164) from the Document Type configuration dialog box (on page 140).

To test the catalog settings, restart Oxygen XML Author and try to validate a new sample document for your custom framework. There should be no errors.

Example:

The schema that validates the document refers the other file abs.xsd through an import element:

```xml
<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
    schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The @schemaLocation attribute references the abs.xsd file:

```xml
xs:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
    http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```xml
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the abs.xsd file located in the schema directory (note that the schema directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Localizing Frameworks

Oxygen XML Author supports framework (on page 2817) localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Author in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, follow this procedure:

1. Create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
</translation>
```
Oxygen XML Author matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `<languagelist>` tag for the corresponding framework is used.

2. The `translation.xml` file must be stored in a directory named `i18n` located in the framework folder. You also need to add a reference to the `i18n` directory in the `Classpath` list corresponding to the edited document type (on page 144).

```xml
<key value="list">
  <comment>List menu item name.</comment>
  <val lang="en_US">List</val>
  <val lang="de_DE">Liste</val>
  <val lang="fr_FR">Liste</val>
</key>
```

3. After you create this file, you can use the keys defined in it to customize the name and description of the following:
   - Actions
   - Menu entries
   - Contextual menus
   - Toolbars
   - Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 140), go to Author > Actions, and rename the bold action to `${i18n(translation_key})`. Actions with a name format other than `${i18n(translation_key})` are not localized. `Translation_key` corresponds to the key from the `translation.xml` file.

4. Next, open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This is an example of an entry in the `translation.xml` file:
To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
    content: "${i18n(title.key)} : ";
}
```

**Tip:**
You can enter any language you want in the `<languagelist>` tag and any number of keys.

**DocBook Example:**

The translation.xml file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type, the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the oxygen-sample-framework module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

**Framework Java Extensibility Guide**

Advanced users can extend the functionality of custom frameworks and Author mode. The Oxygen SDK is also available to provide developers the ability to extend the functionality of Oxygen XML Author.

You can add extensions (on page 2819) to your custom framework (on page 2817) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 140).
Note:
It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2073).

Related Information:
Extending Oxygen With the SDK (on page 2039)
SDK Common Use Cases (on page 2104)

Configuring an Extensions Bundle

All extensions (on page 2819) that are provided by Oxygen XML Author are includes in a single bundle.

Note:
The individual extensions can still be set (open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 2815) rules defined for the custom framework (on page 2817) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the {OXYGEN_INSTALL_DIR}/lib folder.
2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   For example:
   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```
3. A Document Type ID and a short description should be defined by implementing the getDocumentTypeID and getDescription methods. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   For example:
   ```java
   public String getDocumentTypeID() {
   }
   ```
public String getDescription() {
    return "A custom extensions bundle used for the Simple Document" +
        "Framework document type";
}

4. [Optional] To be notified about the activation of the custom Author Extension in relation with an open document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener. The custom Author Extension state listener should be provided by implementing the createAuthorExtensionStateListener method.

For example:

public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of ro.sync.ecss.extensions.api.AuthorExtensionStateListener can be found in Implementing an Author Extension State Listener (on page 1873).

If Schema-Aware mode (on page 179) is active in Oxygen XML Author, all actions that can generate invalid content will be redirected toward the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing ro.sync.ecss.extensions.api.InvalidEditException. The actions that are forwarded to this handler include typing, delete, or paste.

For more details about this handler, see Handling Schema-Aware Editing Events (on page 1910).

5. [Optional] You can customize the content completion proposals by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is ro.sync.contentcompletion.xml.SchemaManagerFilter. The filter can be applied on elements, attributes, or on their values. The createSchemaManagerFilter method is responsible for creating the content completion filter. A new SchemaManagerFilter will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration.

For example:

public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 1866) section.

6. [Optional] The Author mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `@id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```java
public ElementLocatorProvidercreateElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 1890) section.

7. [Optional] The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the Author editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in Author mode for both Oxygen XML Author Eclipse plugin and standalone application. The Text mode corresponding listener is available only for Oxygen XML Author Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the Author mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 1868) section.

8. [Optional] Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the `ref` element and the attribute indicating the referenced resource is `location`. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 1869) section.

9. [Optional] To be able to dynamically customize the default CSS styles for a certain ro.sync.ecss.extensions.api.node.AuthorNode, an implementation of ro.sync.ecss.extensions.api.StylesFilter can be provided. The extensions bundle method responsible for creating the StylesFilter is createAuthorStylesFilter. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process. For example:

public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}

See the Configuring CSS Styles Filter (on page 1889) section for more details about the styles filter extension.

10. [Optional] To edit data in custom tabular format, implementations of the ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider and the ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are createAuthorTableCellSpanProvider and createAuthorTableColumnWidthProvider. For example:

public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 1882) and Configuring a Table Column Width Provider (on page 1876) sections.
If the functionality related to one of the previous extension points does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return `null`.

11. **[Optional]** An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time the `oxy_link-text()` function (on page 1992) is encountered in the CSS styles associated with an element. For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a **JAR (on page 2817)** file.
13. Copy the **JAR** file into your custom **framework** directory (for example, `frameworks/sdf`).
14. Add the **JAR** file to the class path. To do this, open the **Preferences** dialog box (**Options > Preferences**) (on page 124), go to **Document Type Association**, select the document type (for example, `SDF`), click the **Edit** button, select the **Classpath** tab, and click the **Add** button. In the displayed dialog box, enter the location of the **JAR** file relative to the Oxygen XML Author **frameworks** folder.
15. Register the Java class by going to the **Extensions** tab. Click the **Choose** button and select the name of the class (for example, `SDFExtensionsBundle`).

**Note:**
The complete source code for **framework** customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

- `ExtensionsBundle` Javadoc
- Sample DITA (framework) extension that sets a custom ExtensionsBundle implementation for customizing links

**Adding a Custom Image Decorator for Author Mode**

The **AuthorImageDecorator** extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.
How to Implement an \textit{AuthorImageDecorator}

To implement your own \textit{AuthorImageDecorator}, follow this procedure:

1. Implement the \texttt{ro.sync.ecss.extensions.api.AuthorImageDecorator} interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle \textit{(on page 1859)}, you can return the \textit{AuthorImageDecorator} implementation using the \texttt{ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()} method.
   b. Specify the \textit{AuthorImageDecorator} in the \textit{Author image decorator} individual extension in the \texttt{Extensions tab (on page 167)} of the \textit{Document Type configuration dialog box (on page 140)} for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     * (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     * ro.sync.exml.view.graphics.Rectangle,
     * ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorAccess, boolean)
     */
    @Override
    public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
        Rectangle originalSize, AuthorNode element,
        AuthorAccess authorAccess, boolean wasAnnotated) {
        if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
            g.drawString(
                "[Double-click to edit image]",
                // Draw near the top-left corner
                x + 15,
                y + 15);
        }
    }
```
Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (on page 2817) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 2817). The following methods can be implemented to accomplish this: assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()

- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (on page 2814) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: boolean copyAttributeOnSplit(String attrQName, AuthorElement element)

Tip:

The ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework (on page 2817). You can also check out the DITA and DocBook implementations of ro.sync.ecss.extensions.api.UniqueAttributesRecognizer to see how they were implemented and connected to the extensions bundle.
Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```java
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

    // You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Author or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the filterAttributes method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAttribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the SDFSchemaManagerFilter checks if the element from the current context is the table element and adds the frame attribute to the table list of attributes.

    /**
     * Filter attributes of the "table" element.
     */
    public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
                                               WhatAttributesCanGoHereContext context) {
        CIAttribute frameAttribute = new CIAttribute();
        frameAttribute.setName("frame");
        frameAttribute.setRequired(false);
    }
}
```
The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements,
                                      WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
                if (elements != null) {
                    for (Iterator<CIElement> iterator =
                        elements.iterator(); iterator.hasNext();) {
                        CIElement element = iterator.next();
                        // Remove the 'td' element
                        if ("td".equals(element.getQName())) {
                            elements.remove(element);
                            break;
                        }
                    }
                } else {
                    elements = new ArrayList<CIElement>();
                }
            }
        }
        // Insert the 'th' element in the list of content completion proposals
        CIElement thElement = new SDFElement();
        thElement.setName("th");
        elements.add(thElement);
    }
    return elements;
}
```
The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

**Interfaces for the Drag and Drop Listener**

- **ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener**
  Receives callbacks from the standalone application for Drag And Drop in Author mode.

- **com.oxygenxml.editor.editors.author.AuthorDnDListener**
  Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.

- **com.oxygenxml.editor.editors.TextDnDListener**
  Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 1912).

Customizing Smart Paste Support (on page 1815)
Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the referenced resource is `location`. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;
   import ro.sync.ecss.extensions.api.node.AuthorNode;

   public class ReferencesResolver implements AuthorReferenceResolver {
       
       public boolean hasReferences(AuthorNode node) {
           boolean hasReferences = false;
           if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
               AuthorElement element = (AuthorElement) node;
               if ("ref".equals(element.getLocalName())) {
                   AttrValue attrValue = element.getAttribute("location");
                   hasReferences = attrValue != null;
               }
           }
           return hasReferences;
       }
   }
   ```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

   ```java
   public String getDisplayName(AuthorNode node) {
       String displayName = "ref-fragment";
       if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
           AuthorElement element = (AuthorElement) node;
           return displayName;
       }
   }
   ```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

   ```java
   public String getDisplayName(AuthorNode node) {
       String displayName = "ref-fragment";
       if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
           AuthorElement element = (AuthorElement) node;
           return displayName;
       }
   }
   ```
if ("ref".equals(element.getLocalName())) {
    AttrValue attrValue = element.getAttribute("location");
    if (attrValue != null) {
        displayName = attrValue.getValue();
    }
}
return displayName;

4. The method resolveReference resolves the reference of the node and returns a SAXSource with the parser and its input source. It takes AuthorNode as an argument that represents the node that needs the reference resolved, the systemID of the node, the AuthorAccess with access methods to the Author mode data model and a SAX EntityResolver that resolves resources that are already opened in another editor or resolve resources through the XML Catalog (on page 2821). In the implementation, you need to resolve the reference relative to the systemID, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringValue = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringValue));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if (inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                    XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                    xmlReader.setEntityResolver(entityResolver);
```
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                systemID = attrValue.getValue();
            }
        }
    }
    return systemID;
}
```
AttrValue attrValue = element.getAttribute("location");

if (attrValue != null) {
    String attrStringVal = attrValue.getValue();

    try {
        URL absoluteUrl = new URL(node.getXMLBaseURL(),
                                    authorAccess.getUtilAccess().correctURL(attrStringVal));
        systemID = absoluteUrl.toString();
    } catch (MalformedURLException e) {
        logger.error(e, e);
    }
}

return systemID;

In the listing below, the XML document contains the ref element:

<ref location="referenced.xml">Reference</ref>

When no reference resolver is specified, the reference has the following layout:

Figure 372. Reference with no specified reference resolver

<table>
<thead>
<tr>
<th>Reference without a reference resolver</th>
</tr>
</thead>
<tbody>
<tr>
<td>b&gt;Referenced</td>
</tr>
</tbody>
</table>

When the above implementation is configured, the reference has the expected layout:

Figure 373. Reference with reference resolver

<table>
<thead>
<tr>
<th>Reference with a reference resolver</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference</td>
</tr>
<tr>
<td>📂 Edit referenced content</td>
</tr>
<tr>
<td>Referred paragraph</td>
</tr>
</tbody>
</table>

Note:

The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.
Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
    private OptionListener sdfOptionListener;

    public void activated(AuthorAccess authorAccess) {
        // Get the value of the option.
        String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", "");
        // Use the option for some initializations...

        // Add an OptionListener.
        authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

        // Add author DocumentListeners.
        sdfAuthorDocumentListener = new SDFAuthorListener();
        authorAccess.getDocumentController().addAuthorListener(sdfAuthorDocumentListener);

        // Add MouseListener.
        sdfMouseListener = new SDFAuthorMouseListener();
        authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

        // Add CaretListener.
        sdfCaretListener = new SDFAuthorCaretListener();
        authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

        // Other custom initializations...
    }
}
```

When the association rules of the framework (on page 2817) (document type) configuration match that of a document open in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. 
The `authorAccess` parameter received by the `activated` method can be used to gain access to specific `Author` mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed `Author Extension` need to be stored or retrieved, a reference to the `ro.sync.ecss.extensions.api.OptionsStorage` can be obtained by calling the `getOptionsStorage` method from the `authorAccess`. The same object can be used to register `ro.sync.ecss.extensions.api.OptionListener` listeners. An option listener is registered in relation with an option `key` and will be notified about the value changes of that option.

An `AuthorListener` can be used if events related to the `Author` mode document modifications are of interest. The listener can be added to the `ro.sync.ecss.extensions.api.AuthorDocumentController`. A reference to the document controller is returned by the `getDocumentController` method from the `authorAccess`. The document controller can also be used to perform operations involving document modifications.

To provide access to the `Author` mode component-related functionality and information, the `authorAccess` has a reference to the `ro.sync.ecss.extensions.api.access.AuthorEditorAccess` that can be obtained when calling the `getEditorAccess` method. At this level, `AuthorMouseListener` and `AuthorCaretListener` can be added to provide notification of mouse and cursor events that occur in the `Author` editor mode.

The `deactivation` event is received when another `framework` is activated for the same document, the user switches to another editor mode or the editor is closed. The `deactivate` method is typically used to unregister the listeners previously added on the `activate` method and to perform other actions. For example, options related to the deactivated `Author Extension` can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption("sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);
}
```
Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Author offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
// Other actions...

} // Other actions...

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Author offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
table{
    display:table;
    border:1px solid navy;
    margin:1em;
    max-width:1000px;
    min-width:150px;
}

tr, header{
    display:table-row;
}

header{
    background-color: silver;
    color:inherit
}

td{
    display:table-cell;
    border:1px solid navy;
```
Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Author, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 1882).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Author. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 1876).

The table from the example does not make use of the attributes `@colsep` and `@rowsep` (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 1885).

### Configuring a Table Column Width Provider

In a custom framework (on page 2817), the `<table>` element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 1875), if you use the table element attribute `width` Oxygen XML Author can determine the table width automatically. In this example the table has `<col>` elements with `@width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
    implements AuthorTableColumnWidthProvider {

    public void init(AuthorElement tableElement) {
        this.tableElement = tableElement;
        AuthorElement[] colChildren = tableElement.getElementsByTagName("customcol");
        if (colChildren != null && colChildren.length > 0) {
            // Process column width determination
        }
    }
```

2. Method `init` is taking as argument an `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element. In our case the column widths are specified in `<col>` elements from the `<table>` element. In such cases you must collect the span information by analyzing the `<table>` element.
for (int i = 0; i < colChildren.length; i++) {
    AuthorElement colChild = colChildren[i];
    if (i == 0) {
        colsStartOffset = colChild.getStartOffset();
    }
    if (i == colChildren.length - 1) {
        colsEndOffset = colChild.getEndOffset();
    }
    // Determine the 'width' for this col.
    AttrValue colWidthAttribute = colChild.getAttribute("width");
    String colWidth = null;
    if (colWidthAttribute != null) {
        colWidth = colWidthAttribute.getValue();
        // Add WidthRepresentation objects for the columns this 'customcol'
        // specification spans over.
        colWidthSpecs.add(new WidthRepresentation(colWidth, true));
    }
}

3. The method isTableAcceptingWidth should check if the table cells are a <td> element.

    public boolean isTableAcceptingWidth(String tableCellsTagName) {
        return "td".equals(tableCellsTagName);
    }

4. The method isTableAndColumnsResizable should check if the table cells are a <td> element. This method determines if the table and its columns can be resized by dragging the edge of a column.

    public boolean isTableAndColumnsResizable(String tableCellsTagName) {
        return "td".equals(tableCellsTagName);
    }

5. Methods getTableWidth and getCellWidth are used to determine the table and column width. The table layout engine will ask this ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property display:table-cell. The implementation is simple and just parses the value of the width attribute. The methods must return null for the tables / cells that do not have a specified width.

    public WidthRepresentation getTableWidth(String tableCellsTagName) {
        WidthRepresentation toReturn = null;
        if (tableElement != null && "td".equals(tableCellsTagName)) {
            AttrValue widthAttr = tableElement.getAttribute("width");
            if (widthAttr != null) {
String width = widthAttr.getValue();
    if (width != null) {
        toReturn = new WidthRepresentation(width, true);
    }
    return toReturn;

public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;

6. Methods commitTableWidthModification and commitColumnWidthModifications are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
    int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);
                authorDocumentController.setAttribute("width", new AttrValue(newWidth),
                    tableElement);
            } else {
                throw new AuthorOperationException("Cannot find the table element.");
            }
        } else {
            throw new AuthorOperationException("Cannot find the table element.");
        }
    }
}

public void commitColumnWidthModifications
(AuthorDocumentController authorDocumentController,
WidthRepresentation[] colWidths, String tableCellsTagName)

    throws AuthorOperationException {
        if ("td".equals(tableCellsTagName)) {
            if (colWidths != null && tableElement != null) {
                if (colsStartOffset >= 0 && colsEndOffset >= 0
                    && colsStartOffset < colsEndOffset) {
                    authorDocumentController.delete(colsStartOffset, colsEndOffset);
                }

                String xmlFragment = createXMLFragment(colWidths);

                int offset = -1;
                AuthorElement[] header = tableElement.getElementsByLocalName("header");
                if (header != null && header.length > 0) {
                    // Insert the cols elements before the 'header' element
                    offset = header[0].getStartOffset();
                }

                if (offset == -1) {
                    throw new AuthorOperationException("No valid offset to insert column width");
                }

                authorDocumentController.insertXMLFragment(xmlFragment, offset);
            }
        }
    }

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();

    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol");
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=" + width.getWidthRepresentation() + """);
        }

        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=" + ns + """);
        }

        fragment.append("/>");
    }

    return fragment.toString();
}
7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```java
public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}
```

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

In the listing below, the XML document contains the table element:

```xml
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
    <customcol width="20%"/>

    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>

    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
        <td row_span="2">cs=1, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>

    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
    </tr>
</table>
```
When no table column width provider is specified, the table has the following layout:

**Figure 374. Table layout when no column width provider is specified**

![Table layout when no column width provider is specified](image)

When the above implementation is configured, the table has the correct layout:

**Figure 375. Columns with custom widths**

![Columns with custom widths](image)

**Note:**

The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.
Configuring a Table Cell Span Provider

In a custom framework (on page 2817), the `<table>` element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 1875), you need to indicate Oxygen XML Author a method to determine the cell spanning. If you use the `@rowspan` and `@colspan` attributes, Oxygen XML Author can determine the cell spanning automatically. In the following example, the `<td>` element uses the `@row_span` and `@column_span` attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
        implements AuthorTableCellSpanProvider {

    2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `<table>` element. In such cases, you must collect the span information by analyzing the `<table>` element.

        public void init(AuthorElement table) {
        }

    3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

        public Integer getColSpan(AuthorElement cell) {
            Integer colSpan = null;

            AttrValue attrValue = cell.getAttribute("column_span");
            if(attrValue != null) {
                // The attribute was found.
                String cs = attrValue.getValue();
                if(cs != null) {
                    try {
                        colSpan = new Integer(cs);
                    } catch (NumberFormatException ex) {
                        // The attribute value was not a number.
                    }
                }
            }
        }
```
4. The row span is determined in a similar manner:

```java
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;
    AttrValue attrValue = cell.getAttribute("row_span");
    if(attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if(rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}
```

5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

**Note:**

The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
    </header>
</table>
```
When no table cell span provider is specified, the table has the following layout:

![Figure 376. Table layout when no cell span provider is specified](image)

When the above implementation is configured, the table has the correct layout:
Figure 377. Cells spanning multiple rows and columns.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 2817), the <table> element has separators between rows. As explained in Configuring Tables (on page 1875), you need to indicate a method to determine the way rows and columns are separated. If you use the @rowsep and @colsep cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Author can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class simple.documentation.framework.TableCellSepProvider. This class must implement the ro.sync.ecss.extensions.api.AuthorTableCellSepProvider interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

2. The init method takes the ro.sync.ecss.extensions.api.node.AuthorElement interface that represents the XML <table> element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table
model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

```java
public void init(AuthorElement table) {
}
```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}
```

Note:
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

5. In the example below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>H1</td>
        <td>H2</td>
        <td>H3</td>
        <td>H4</td>
    </header>
    <tr>
        <td>C11</td>
    </tr>
</table>
```
When the borders for the `<td>` element are removed from the CSS, the row separators become visible:

**Figure 378. Row separators provided by the Java implementation.**

<table>
<thead>
<tr>
<th>H1</th>
<th>H2</th>
<th>H3</th>
<th>H4</th>
</tr>
</thead>
<tbody>
<tr>
<td>C11</td>
<td>C12</td>
<td>C13</td>
<td>C14</td>
</tr>
<tr>
<td>C21</td>
<td>C22</td>
<td>C23</td>
<td>C24</td>
</tr>
<tr>
<td>C31</td>
<td>C32</td>
<td>C33</td>
<td>C34</td>
</tr>
</tbody>
</table>

**Note:**
The complete source code for `framework` customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

**Customizing Attribute Value Editors**

The `CustomAttributeValueEditor` extension point allows you to customize the attribute value editing mechanisms in Oxygen XML Author. It changes the `Browse` button found in the attribute editors to an `Edit` button. When a user clicks the `Edit` button, your custom attribute value editor will be presented.
The Edit button can be accessed in the following attribute editors:

- The Attributes view in Author mode (on page 609) (when the Expand button is used to reveal an expanded panel).
- The Attributes view in Text mode (on page 524) (when the Expand button is used to reveal an expanded panel).
- The In-place Attributes Editor (on page 612) when invoked in Author mode.
- The In-place Attributes Editor invoked in the Outline view (on page 521).

**How to Implement a CustomAttributeValueEditor**

To implement your own CustomAttributeValueEditor, follow this procedure:

1. Extend the ro.sync.ecss.extensions.api.CustomAttributeValueEditor abstract class.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1859), you can return the 
      CustomAttributeValueEditor implementation using the 
      ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor() method.
   b. Specify the CustomAttributeValueEditor in the Author custom attribute value editor individual 
      extension in the Extensions tab (on page 167) of the Document Type configuration dialog box 
      (on page 140) for your particular document type.

**Example**

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
     * (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
     */
```
```java
@override
public String getAttributeValue(EditedAttribute attribute, Object parentComponent) throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog
        ("Set a new value for " + attribute.getAttributeQName() + ":");
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
 * (ro.sync.ecss.extensions.api.EditedAttribute)
 */
@Override
public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
}
}
```

Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

![Example dialog box](image)

Customizing the CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the Author mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Author or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `<table>` element:

```java
package simple.documentation.framework;
```
import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Customizing Elements that Wrap Profiled Content

For each framework (on page 2817) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 1891) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.
Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface. As an alternative, your class could extend `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, the default implementation.

**Note:**
The complete source code of the `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, `ro.sync.ecss.extensions.commons.IDElementLocator` or `ro.sync.ecss.extensions.commons.XPointerElementLocator` can be found in the `oxygen-sample-framework` project.

Default Link Target Reference Finder

The `DefaultElementLocatorProvider` implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values *(on page 1892)*.
- XPointer element() scheme *(on page 1893)*.

The method `getElementLocator` determines what `ElementLocator` should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null `IDTypeVerifier` will always be provided if a schema is associated with the document type.

The `link` string argument is the anchor *(on page 2814)* part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    }
    return elementLocator;
}
```
catch (ElementLocatorException e) {
    logger.warn("Exception when create element locator for link: 
    + link + ". Cause: " + e, e);
}
return elementLocator;
}

**ID Element Locator**

The *IDElementLocator* is an implementation of the abstract class
*ro.sync.ecss.extensions.api.link.ElementLocator* for links that use an *ID*.

The constructor only assigns field values and the method *endElement* is empty for this implementation.

The method *startElement* checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is *xml:id*.
- The attribute type is ID.

The attribute type is checked with the help of the method *IDTypeVerifier.hasIDType*.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                    ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
    return elementFound;
}
```
XPointer Element Locator

_XPointerElementLocator_ is an implementation of the abstract class _ro.sync.ecss.extensions.api.link.ElementLocator_ for links that have one of the following XPointer _element()_ scheme patterns:

- **_element (elementID)_**
  
  Locate the element with the specified ID.

- **_element (/1/2/3)_**
  
  A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

- **_element (elementID/3/4)_**
  
  A child sequence appearing after a _NCName_ identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes (/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer _element()_ scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }

        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            }
        }
    }
}```
The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are:

- `uri`:
  The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- `localName`:
  Local name of the element.

- `qName`:
  Qualified name of the element.

- `atts`:
  Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current
element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName,
                             String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if(xpointerElement.equals(atts[i].getValue())){
                if(idVerifier.hasIDType(
                    localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }
    }

    if (xpointerPathDepth == startElementDepth){
        // check if xpointer path matches with the current element path
        linkLocated = true;
        try {
            int xpointerIdx = xpointerPath.length - 1;
            int stackIdx = currentElementIndexStack.size() - 1;
            int stopIdx = startWithElementID ? 1 : 0;
            while (xpointerIdx >= stopIdx && stackIdx >= 0) {
```
```java
int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
int currentElementIndex =
    ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
if(xpointerIndex != currentElementIndex) {
    linkLocated = false;
    break;
}
xpointerIdx--;
stackIdx--;
}
}
catch (NumberFormatException e) {
    logger.warn(e,e);
}
return linkLocated;
}
```

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

### Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the **Outline view (on page 521)** in **Author** mode, **breadcrumb navigation bar (on page 584)** in **Author** mode, **Outline view (on page 521)** in **Text** mode, **Content Completion Assistant (on page 2815)** window, or **DITA Maps Manager view (on page 2472)**.

**Note:**

Oxygen XML Author uses `XMLNodeRendererCustomizer` implementations for the following **frameworks (on page 2817)**: DITA, DITA Map, DocBook 4, DocBook 5, TEI, XHTML, XSLT, and XML Schema.
There are two methods to provide an implementation of `ro.sync.exml.workspace.api.node.customizer/XMLNodeRendererCustomizer`:

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the Document type configuration dialog box (on page 140) (`Extensions bundle` field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration dialog box (on page 140) (`XML node renderer customizer` field in the Individual extensions section of the Extensions tab).

**Support for Retina/HiDPI Displays**

To support Retina or HiDPI displays, the icons provided by the `XMLNodeRendererCustomizer` should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 706).

For example, for the `<title>` element, if the `XMLNodeRendererCustomizer` returns the path `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file (`myImg@2x.png`) should be added to the same images directory (`${framework}/images/myImg@2x.png`). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (on page 706) section.

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

**Related Information:**
- Customizing the Rendering of Elements (on page 1834)
- Using Retina/HiDPI Icons for the Actions from a Framework (on page 1808)

**Customizing Author Operations**

Oxygen XML Author Author mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (on page 1778)) and the execution of XPath expressions on the current document edited in Author mode. However, there are situations where you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a+ server for some kind of processing.
• Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
• You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Author Author mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Author website. It includes the source code of the Author mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Author XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:**
Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Author. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run a version of Oxygen XML Author with a Java 11 virtual machine but the Java classes of your custom Author mode operations are compiled with a Java 12 or later virtual machine, then the custom operations cannot be loaded and used by the Java 11 virtual machine.

⚠️ **Important:**
From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Author and ONLY if such extensions are used from inside Oxygen XML Author. To use such extensions outside of Oxygen XML Author (for example, a 3rd-party application that has Oxygen XML Author built in to it), an additional license must be purchased to use the SDK according the Oxygen XML SDK Licensing Policy.

**Related Information:**

AuthorOperation.html
Extending Oxygen With the SDK (on page 2039)

**Example 1 - Simple Use of a Dialog Box from an Author Mode Operation**

In this example, functionality is added for inserting images in a custom framework (on page 2817). The images are represented by the `<image>` element. The location of the image file is represented by the value of the `@href` attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.
1. Set up a sample project following this set of instructions. The framework project is `oxygen-sample-framework`.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`.

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.

- The `getArguments` method is used by Oxygen XML Author when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.

- The `getDescription` method is used by Oxygen XML Author when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
    AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();

    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + "/>";

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
    }
```
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Important:
Make sure you always specify the namespace of the inserted fragments.

3. Package the compiled class into a JAR file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
        <jar destfile="sdf.jar" basedir="classes">
            <fileset dir="classes">
                <include name="**/*"/>
            </fileset>
        </jar>
    </target>
</project>
```
4. Copy the `sdf.jar` file into your custom framework directory
   `\{OXYGEN_INSTALL_DIR\}\frameworks\[CUSTOM_FRAMEWORK_DIR]\`.

5. Add the `sdf.jar` to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select SDF, and click the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 140) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory `\{OXYGEN_INSTALL_DIR\}\frameworks\[CUSTOM_FRAMEWORK_DIR]\`.

8. Define the action's properties:
   - Set ID to insert_image.
   - Set Name to Insert image.
   - Set Menu access key to letter i.
   - Set Toolbar action to `${framework}/toolbarImage.png`.
   - Set Menu icon to `${framework}/menuImage.png`.
   - Set Shortcut key to Ctrl (Meta on macOS)+Shift+i.

9. Next, set up the operation. You want to add images only if the current element is a `section`, `book` or `article`.
   - Set the value of XPath expression to `local-name()='section' or local-name()='book' or local-name()='article'`
   - Set the Invoke operation field to `simple.documentation.framework.InsertImageOperation`.
10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

**Example 2 - Operations with Arguments - Report from Database Operation**

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the **database connection string**, the **user name**, the **password** and the **SQL expression**.

1. Set up a sample project following this set of instructions. The framework project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface.
```java
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation {

    3. Now define the operation's arguments. For each of them, you will use a String constant representing the argument name:

        private static final String ARG_JDBC_DRIVER = "jdbc_driver";
        private static final String ARG_USER = "user";
        private static final String ARG_PASSWORD = "password";
        private static final String ARG_SQL = "sql";
        private static final String ARG_CONNECTION = "connection";

    4. You must describe the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

        public ArgumentDescriptor[] getArguments() {
            ArgumentDescriptor args[] = new ArgumentDescriptor[] {
                new ArgumentDescriptor(
                        ARG_JDBC_DRIVER,
                        ArgumentDescriptor.TYPE_STRING,
                        "The name of the Java class that is the JDBC driver."),
                new ArgumentDescriptor(
                        ARG_CONNECTION,
                        ArgumentDescriptor.TYPE_STRING,
                        "The database URL connection string."),
                new ArgumentDescriptor(
                        ARG_USER,
                        ArgumentDescriptor.TYPE_STRING,
                        "The name of the database user."),
                new ArgumentDescriptor(
                        ARG_PASSWORD,
                        ArgumentDescriptor.TYPE_STRING,
                        "The database password."),
                new ArgumentDescriptor(
                        ARG_SQL,
                        ArgumentDescriptor.TYPE_STRING,
                        "The SQL statement to be executed.")
            };

            return args;
        }
```
These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the `doOperation` method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map) throws IllegalArgumentException, AuthorOperationException {
    // Collects the arguments.
    String jdbcDriver = (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection = (String)map.getArgumentValue(ARG_CONNECTION);
    String user = (String)map.getArgumentValue(ARG_USER);
    String password = (String)map.getArgumentValue(ARG_PASSWORD);
    String sql = (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();
    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql), caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: " + e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load ' " + jdbcDriver + "'", e);
    }
}
```

6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure that the fragment is well-formed.

```java
private String getFragment(String jdbcDriver, String connectionURL, String user,
    String password, String sql) throws SQLException, ClassNotFoundException {
    Properties pr = new Properties();
```
pr.put("characterEncoding", "UTF8");
pr.put("useUnicode", "TRUE");
pr.put("user", user);
pr.put("password", password);

// Loads the database driver.
Class.forName(jdbcDriver);

// Opens the connection
Connection connection = DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement = connection.createStatement();
ResultSet resultSet = statement.executeQuery(sql);

StringBuffer fragmentBuffer = new StringBuffer();
fragmentBuffer.append("<table xmlns="
+ "'http://www.oxygenxml.com/sample/documentation'">");

// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
```java
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
collection.close();
return fragmentBuffer.toString();
}
```

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

7. Package the compiled class into a JAR (on page 2817) file.
8. Copy the JAR file and the JDBC driver files into your custom framework directory (`{OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (on page 138), select SDF and click the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 140) and click the + Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author frameworks folder.
10. Go to the Actions subtab. The action properties are:
   - Set ID to clients_report.
   - Set Name to Clients Report.
   - Set Menu access key to letter r.
   - Set Description to Connects to the database and collects the list of clients.
   - Set Toolbar icon to `\{framework\}/TableDB20.png` (the TableDB20.png icon is stored in the frameworks/sdf folder).
   - Leave empty the Menu icon.
   - Set shortcut key to Ctrl + Shift + C (Command + Shift + C on macOS).
11. The action will work only if the current element is a section. Set up the operation as follows:
   - Set XPath expression to:
     ```xml
     local-name()='section'
     ```
   - Use the Java operation defined earlier to set the Invoke operation field. Click the Choose button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: jdbc://<database_host>:<database_port>/<database_name>.
The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

**Figure 380. Java Operation Arguments Setup**

To test the action, open or create an XML file and place the cursor at a valid location. Then click the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.
Handling Author Mode Action Events

The `AuthorActionEventHandler` extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press Enter instead of it opening the Content Completion Assistant (on page 2815).

How to Implement an `AuthorActionEventHandler`

To implement your own `AuthorActionEventHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1859), you can return the `AuthorActionEventHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the `AuthorActionEventHandler` in the Author action event handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses Enter in Author mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the `handleEvent` method inserts the new line at the current cursor position.
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

/**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
 (AuthorAccess, AuthorActionEventType)
 */
@Override
public boolean canHandleEvent(AuthorAccess authorAccess,
AuthorActionEventType type) {
    boolean canHandle = false;

    if (type == AuthorActionEventType.ENTER) {
        AuthorDocumentController documentController =
authorAccess.getDocumentController();
        int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
        try {
            AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
            if (nodeAtOffset instanceof AuthorElement) {
                AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                    canHandle = true;
                }
            }
        } catch (BadLocationException ex) {
            if (logger.isDebugEnabled()) {
                logger.error(ex.getMessage(), ex);
            }
        }
    }

    return canHandle;
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
 (ro.sync.ecss.extensions.api.AuthorAccess,
ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
 */
@Override
public boolean handleEvent(AuthorAccess authorAccess,
Handling Schema-Aware Editing Events

The AuthorSchemaAwareEditingHandlerAdapter extension point allows you to handle certain Author mode actions in various ways. For example, implementing the AuthorSchemaAwareEditingHandlerAdapter makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Author when pasting content (through the use of some specific methods (on page 1911)).

How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema-Aware Editing option (on page 180) must be set to On or Custom in the Schema-Aware preferences page (on page 179). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Author to use this newly created implementation, configure an extensions bundle (on page 1859) and return the AuthorSchemaAwareEditingHandlerAdapter implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter() method.

Example

Typing events can be handled using the handleTyping method. For example, the AuthorSchemaAwareEditingHandler checks if the schema is not a learned one, was loaded successfully, and if
the **Smart paste and drag and drop** option *(on page 180)* is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter
    extends AuthorSchemaAwareEditingHandler {

    /**
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     *      (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
        throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager =
            authorAccess.getDocumentController().getAuthorSchemaManager();
        if (!authorSchemaManager.isLearnSchema() &&
            !authorSchemaManager.hasLoadingErrors() &&
            authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment =
                    authorAccess.getDocumentController().createNewDocumentTextFragment
                        (String.valueOf(ch));
                handleTyping = handleInsertionEvent
                    (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
            } catch (AuthorOperationException e) {
                throw new InvalidEditException
                    (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
            }
        }
        return handleTyping;
    }

    Note:
    The complete source code for framework customization examples can be found in the oxygen-
    sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML
    Author website.

Methods for Improving the Paste Mechanism

*getAncestorDetectionOptions*

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Author will propose solutions to make it valid. As a possible solution, Oxygen XML Author might surround the pasted content in a sequence of ancestor elements. This
getAncestorDetectionOptions method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Author. For example, when pasting an element inside an empty element with the same name, this canBeReplaced method allows Oxygen XML Author to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

AuthorDocumentFragment Class

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The AuthorExternalObjectInsertionHandler extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own AuthorExternalObjectInsertionHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the AuthorExternalObjectInsertionHandler in the Author external object Insertion handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.
   b. Otherwise, you can configure an extensions bundle (on page 1859), then return the AuthorExternalObjectInsertionHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler() method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

   ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)

   and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 144) in the Document Type configuration dialog box (on page 140) for your particular document type.
Example

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}
```

Tip:
For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 1815).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 1859), you can return the EditPropertiesHandler implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.

b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (on page 167) of the Document Type configuration dialog box (on page 140) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
      return "Sample implementation that handles properties for a table element.";
  }

  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties(ro.sync.ecss.extensions.api.node.AuthorNode)
   */
  @Override
  public boolean canEditProperties(AuthorNode authorNode) {
      // If this node is an image element we can edit its properties.
      return "image".equals(authorNode.getDisplayName());
  }

  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties(ro.sync.ecss.extensions.api.node.AuthorNode, ro.sync.ecss.extensions.api.AuthorAccess)
   */
  @Override
  public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
      // If we receive this call then it surely an image.
      AuthorElement imageElement = (AuthorElement) authorNode;
      String currentValue = "";
      AttrValue altValue = imageElement.getAttribute("alt");
  }
```
if (altValue != null) {
    currentValue = altValue.getValue();
}
String newValue = JOptionPane.showInputDialog((Component) authorAccess.getWorkspaceAccess().getParentFrame(),
    "Alternate text",
    currentValue);

if (newValue != null) {
    authorAccess.getDocumentController().setAttribute("alt", new AttrValue(newValue), imageElement);
}
}

Example result: If a user were to double-click an `<image>` tag icon in Author mode, the following dialog box would be displayed that allows the user to edit the alternate text property for the image:

![Dialog box for editing alternate text](image)

Sharing a Framework

You can create a custom framework by extending a built-in document type (on page 1757) (such as DITA or DocBook) using the Document Type Association preferences page (on page 138), make modifications to it, and then share the extension with your team.

Sharing the Extended Framework

There are several ways that you can share the extended custom framework (on page 1757) with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project view (on page 385) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 1757), if you have not already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
4. Go to Options > Preferences > Document Type Association > Locations (on page 139) and select Project Options (on page 2819) at the bottom of the page.

5. In the Additional frameworks directories list, add an entry using the $pd editor variable (on page 320) like this: $pd/custom_frameworks.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their Project view (on page 385), the new framework becomes available in the list of document types.

- Pack and deploy the extended framework as an add-on (on page 1916).
- Distribute the directory of the extended framework (on page 1757) to the other members of your team. They will simply copy that directory to their /frameworks directory. The new framework will be available in their list of document types when Oxygen XML Author starts.

To test the extended framework, the other members of your team can check the list of document types in the Document Type Association preferences page (on page 138) to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

Packing and Deploying Frameworks as Add-ons

In Oxygen XML Author, custom framework (on page 2817) can be packed and deployed as an add-on.

Packing a Framework as an Add-on

This procedure is suitable for developers who want a better control over the add-on (on page 2819) package or those who want to automate some of the steps:

1. Pack the full custom framework (on page 1757) (or an extension of a framework) as a ZIP file or a Java Archive (on page 2817). Note that you should pack the entire root directory not just its contents.

2. [Optional] If you created a Java Archive at the previous step, digitally sign the package. You will need a certificate signed by a trusted authority. To sign the JAR, you can either use the jarsigner command-line tool inside Oracle's Java Development Kit ([JDK_DIR]/bin/jarsigner.exe) or if you are working with Apache Ant (on page 2814), you can use the signjar task (a front for the jarsigner command-line tool). The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate, you can generate one yourself using the keytool command-line utility.

   Note:
   This approach is recommended for tests since anyone can create a self-signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Author provides by going to File > New and selecting the Oxygen add-ons update site template. The products the add-on is compatible with can be specified in the template. Once deployed, this descriptor file is referenced as update site.
Deploying an Add-on

To deploy an add-on, copy the ZIP or Java Archive (on page 2817) file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.

Oxygen XML Add-on Repositories

Basic Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a framework (on page 2817). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip:
A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Author needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Author detects the schema, see Associating a Schema to XML Documents (on page 798).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, test_report.xsd defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
    <xs:element name="report">
        <xs:complexType>
```

<xs:sequence>
  <xs:element ref="title"/>
  <xs:element ref="description"/>
  <xs:element ref="results"/>
</xs:sequence>
</xs:complexType>
</xs:element>
<xs:element name="title" type="xs:string"/>
<xs:element name="description"/>
<xs:complexType>
  <xs:sequence maxOccurs="unbounded">
    <xs:element name="line">
      <xs:complexType mixed="true">
        <xs:sequence minOccurs="0" maxOccurs="unbounded">
          <xs:element name="important" type="xs:string"/>
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:sequence>
</xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
<xs:element name="results">
  <xs:complexType>
    <xs:sequence maxOccurs="unbounded">
      <xs:element name="entry">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="test_name" type="xs:string"/>
            <xs:element name="passed" type="xs:boolean"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:schema>
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional “bold” and “italic” sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a `table-row` style. Similarly, the `row` elements must contain elements with a `table-cell` style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

**report**

The root of a report document. It should be rendered as a box that contains all other elements. To achieve this, the display type is set to `block`. Additionally, some margins are set for it. The CSS rule that matches this element is:

```
report{
  display:block;
  margin:1em;
}
```

**title**

The title of the report. Usually titles have a large font. The `block` display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```
title {
  display:block;
  font-size:2em;
}
```

**description**

Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the `block` display. Also, the background color is changed to make it standout.
A line of text in the description. A specific aspect is not defined and it just indicates that the display should be `block` style.

```css
line {
  display: block;
}
```

Defines important text from the description. Since it can be mixed with text, its display property must be set to `inline`. Also, the text is emphasized with `bold` to make it easier to spot.

```css
important {
  display: inline;
  font-weight: bold;
}
```

Displays the list of `test_names` and the results for each one. To make it easier to read, it is displayed as a `table`, with a green border and margins.

```css
results{
  display: table;
  margin: 2em;
  border: 1px solid green;
}
```

The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```css
entry {
  display: table-row;
}
```

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
}
```
The full content of the CSS file `test_report.css` is:

```css
report {
  display:block;
  margin:1em;
}

description {
  display:block;
  background-color:#EEEEFF;
  color:black;
}

line {
  display:block;
}

important {
  display:inline;
  font-weight:bold;
}

title {
  display:block;
  font-size:2em;
}

results{
  display:table;
  margin:2em;
  border:1px solid green;
}
```
XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Author can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.
This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="test_report.xsd">
    <title>Automated test report</title>
    <description>
        <line>This is the report of the test automatically ran.
            Each test suite is ran at 20:00h each day.
            Please <important>check</important> the failed ones!</line>
    </description>
    <results>
        <entry>
            <test_name>Database connection test</test_name>
            <passed>true</passed>
        </entry>
        <entry>
            <test_name>XSLT Transformation test</test_name>
            <passed>true</passed>
        </entry>
        <entry>
            <test_name>DTD validation test</test_name>
            <passed>false</passed>
        </entry>
    </results>
</report>
```

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    <description>
        ......
    </description>
```
If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

### Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type ([framework (on page 2817)](on page 2817)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action.

#### Step 1: Organize Framework Files

First, create a new folder for your customized framework ([framework (on page 2817)](on page 2817)). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
oxygen
  frameworks
    sdf
      schema
      css
```

The `frameworks` directory is the container where all the Oxygen XML Author framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a `framework` directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Author installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the `frameworks` directory of the newly installed application and start Oxygen XML Author by running the provided start-up script files.

You should copy the created schema files `abs.xsd` and `sdf.xsd`, `sdf.xsd` being the main schema, to the `schema` directory and the CSS file `sdf.css` to the `css` directory.

#### Step 2: Extend an Existing Framework

The easiest way to create a custom framework ([framework (on page 2817)](on page 2817)) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box ([Options > Preferences](on page 124)) and go to Document Type Association > Locations ([on page 139](on page 139)). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page ([on page 138](on page 138)) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.
Step Result: This opens the Document Type Configuration dialog box (on page 140) where you can define the set of rules and settings for your custom framework.

3. Give the extension an appropriate name, select External for the Storage option, click the browsing button (➡️) to specify the location of your custom framework directory.
4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

Results: You now have a fully functional framework that you can continue to customize.

Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 2817), suppose the documents are either articles or books, and composed of sections. The sections may contain <title>, <para>, <figure>, <table>, and other <section> elements. To complete the picture, each section includes a <def> element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">

    <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
        schemaLocation="abs.xsd"/>

</xs:schema>
```

Next, the structure of the sections is defined. They all start with a <title>, then have the optional <def> element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
    <xs:sequence>
        <xs:element name="title" type="xs:string"/>
        <xs:element ref="abs:def" minOccurs="0"/>
    </xs:sequence>
</xs:complexType>
```
The paragraph contains text and other custom styling markup, such as bold (`<b>`) and italic (`<i>`) elements.

```xml
<xs:element name="para" type="doc:paragraphType"/>
```

The `<image>` element has an attribute with a reference to the file containing image data.

```xml
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The `<table>` element contains a header row and then a sequence of rows (`<tr> elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```xml
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
           targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
  <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

**Step 4: Associate the Schema to the Framework**

In the bottom section of the **Document Type** configuration dialog box *(on page 140)*, there are a series of tabs. The **Schema** tab refers to the schema that is used for validation of the documents that match the defined association rules.

**Important:**
If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this **Schema** tab is not used for validation or content completion.
Schema Type

Select from the combo box the value XML Schema.

Schema URI

Enter the value of the schema location (for example, `$(framework)/schema/sdf.xsd`). Use the `${frameworks}` editor variable (on page 320) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Author installations.

⚠️ Important:
The `${frameworks}` variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 2817).

Step 5: Create a Custom CSS

If you read the Framework Customization Overview (on page 1917) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: `book, article, section, title, figure, table, image`. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: `b, i`. These will have inline display.

```css
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
  display:block;
}

/* Horizontal flow */
b,i {
  display:inline;
}
```
Important:

Having block display children in an inline display parent results in Oxygen XML Author changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight: bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo-elements will be used, plus the CSS counters. First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:

```css
book,
article{
    counter-reset: sect;
}
```

The sect counter is incremented with each section, that is a direct child of a book or an article element.

```css
book > section,
article > section{
    counter-increment: sect;
}
```
The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the \texttt{sect} counter and a dot.

\begin{verbatim}
book > section > title:before, 
article > section > title:before{
    content: "Section " counter(sect) ". "
}
\end{verbatim}

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

\begin{verbatim}
section{
    margin-left:1em;
    margin-top:1em;
}
\end{verbatim}

\textbf{Figure 383. A sample of nested sections and their titles.}

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

\textbf{Styling Inline Elements}

The "bold" style is obtained by using the \texttt{font-weight} CSS property with the value \texttt{bold}, while the "italic" style is specified by the \texttt{font-style} property:

\begin{verbatim}
b {
    font-weight: bold;
}
\end{verbatim}
Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Author supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Author.

The `image` element has the required `@href` attribute of type `xs:anyURI`. The `@href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Author identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Author handles both absolute and relative specified URLs. If the image has an `absolute` URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is `relative` specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```
The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the Author mode:

```css
imagedata[entityref] {
    content: url(unparsed-entity-uri(attr(entityref)));}
```

To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```css
imagedata[width] {
    width: attr(width, length);
}
```

**Figure 384. Samples of images in Author**

**Step 6: Associate the Custom CSS to the Framework**

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file (on page 146).

**Step 7: Testing the Framework Customization**

To test the new framework (on page 2817) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an `xsi:schemaLocation` attribute. Instead, Oxygen XML Author will detect its associated document type and use the specified schema.
When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be an error.

Invalid content was found starting with element 'title2'. One of '{}("http://www.oxygenxml.com/sample/documentation":title)′ is expected.

Undo the tag name change, go to Author mode, and Oxygen XML Author should load the CSS from the document type association (on page 2815) and create a layout similar to this:

Figure 385. Example: Testing a Framework Customization

CSS Support in Author Mode

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language. Also, Oxygen XML Author has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 1757).
Resources

To see a visual demonstration of various advanced customization possibilities (including ideas for tailoring the editing experience using CSS), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

Associating a CSS with an XML Document

Associating a Stylesheet with an XML Document

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

- Insert the `xml-stylesheet` processing instruction with the `@type` attribute at the beginning of the XML document. The easiest way to do this is by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the Document > XML Document menu.

CSS example:

```xml
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```xml
<?xml-stylesheet type="text/css" href="test.less"?>
```

- Add a new CSS or LESS file to a framework (on page 2817) (document type). To do so, open the Preferences dialog box (Options > Preferences) (on page 124) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Click the New button to add a new CSS or LESS file.

Note:

The built-in frameworks are read-only, so you need to Extend (on page 138) or Duplicate (on page 138) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.
For information about associating a CSS to a framework (document type), see Configuring and Managing Multiple CSS Styles for a Framework (on page 1771).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 2821) URI mappings to determine an indirect CSS referenced location.

**Example: CSS Import**

For example, if you can have a CSS import, such as:

```html
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 2821) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 230):

```xml
<uri name="http://host/path/to/location/custom.css"
     uri="/path/to/custom.css"/>
```

**Adding a Custom Default CSS for Every XML Document**

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 2821) file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
     uri="/path/to/custom.css"/>
```
This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

**Editor Variables in CSS Imports**

You can use various **editor variables** *(on page 313)* in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

**Example: Editor Variable in a CSS Import**

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA **framework** *(on page 2817)* folder where the `custom.css` is placed. In the **Document Type Association preferences page** *(on page 138)*, you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the `framework()` function.

**Note:**

If you use editor variables like `${cfdu}` (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

**Displaying Processing Instructions from Other XML Editors**

By default, some external processing instructions are hidden (for example, certain processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be **associated with the current document using a CSS** *(on page 1934)* like this:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end]
{
    display:block !important;
}
```

**Specifying Media Types in the CSS**

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the
Oxygen XML Author Author mode and ignored in other media types. This can be accomplished by using the oxygen media type.

**Example: oxygen Media Type**

```css
b{
  font-weight:bold;
  display:inline;
}
@media oxygen{
b{
  text-decoration:underline;
}
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Author Author mode.

You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Author in Windows, and another set of style rules for macOS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

**Example: os and platform Properties**

```css
@media oxygen AND (os:"win") AND (platform:"standalone") {
p{
  content:"PPP";
}
}
```

**Related information**

@media Rule (on page 1938)

**CSS At-Rules**

Oxygen XML Author supports some of the standard at-rules specified by CSS Level 2.1 and 3. The @media rule also include support for some style rules that are specific to Oxygen XML Author.
@font-face At-Rule

Oxygen XML Author allows you to use custom fonts in the Author mode by specifying them in the CSS using the @font-face media type. Only the src and font-family CSS properties can be used for this media type.

Example: @font-face Rule

```css
@font-face {
    font-family: "Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src: url("BaroqueScript.ttf");
}
```

@media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Author supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode. For more information, see Specifying Media Types in the CSS (on page 1936).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode when a dark theme is used (for example, Graphite).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode on a Windows High Contrast Theme with a white background.

Example: @media Rule

```css
@media oxygen{
    b{
        text-decoration:underline;
    }
}
@media oxygen-high-contrast-white{
```
Supported Properties

Oxygen XML Author also supports a few properties to set specific style rules that depend upon the size of the visible area in Author mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in Author mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in Author mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```css
@media (min-width:500px) {
  p{
    content:'XXX';
  }
}
@media (max-width:700px) {
  p:after{
    content:'yyy';
  }
}
```

Standard W3C CSS Supported Features

Oxygen XML Author supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties.

Supported CSS Selectors

**Tip:**

CSS rules that match attributes are always more specific than element selectors. For more information, see https://drafts.csswg.org/selectors-3/#specificity.

The following table lists the CSS selectors that are supported in Oxygen XML Author:
<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any element (E) (i.e. an element with the local name (E))</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any (F) element that is a descendant of an (E) element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any (F) element that is a child of an element (E).</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type (E) if it is in (human) language (c) (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any (F) element immediately preceded by a sibling element (E).</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any (F) element preceded by a sibling element (E).</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any (E) element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any (E) element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any (E) element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[lang=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
<td>Matches any (E) element whose &quot;lang&quot; attribute has a hyphen-separated list of values beginning (from the left) with &quot;en&quot;.</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo-elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element (E) when (E) is the first child of its parent.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An E element that does not match simple selector s.</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (on page 1945).</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements that will have the :focus pseudo-class applied. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E:marker</td>
<td>The marker pseudo-class</td>
<td>CSS Level 4</td>
<td>The ::marker pseudo-element represents the automatically generated marker box of a list item.</td>
</tr>
</tbody>
</table>
| E:#myid       | The ID selector                | CSS Level 2 | Matches any E element with ID equal to "myid".

**Important:**
Limitation: In Oxygen XML Author the match is performed only taking into ac-

<td>CSS Level 4</td>
</tr>
</tbody>
</table>

**Namespace Selector**

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Author uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```xml
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:

```css`
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

```
sync\|A
```
Represents the name A in the http://sync.example.org namespace.

*B

Represents the name B in ANY namespace, including NO NAMESPACE.

C

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `<def>` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```css
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

```css
abs|def
```

Represents the name "def" in the http://www.oxygenxml.com/sample/documentation/abstracts namespace.

```css
abs|def:before
```

Represents the :before pseudo-element of the "def" element from the http://www.oxygenxml.com/sample/documentation/abstracts namespace.

**Subject Selector**

Oxygen XML Author supports the subject selector described in CSS Level 4 (currently a working draft at W3C http://www.w3.org/TR/selectors4/). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

**Example:**

```css
table! > caption {
    border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:
This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

**Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

**Related information**

:has Relational Pseudo-Class (on page 1945)

:has Relational Pseudo-Class

Oxygen XML Author supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]), as described in Subject Selector (on page 1944). Oxygen XML Author also
supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```css
table:has({ tbody > thead} {  
  border: 1px solid red;
})
```

This example will result in a border being drawn for the table elements that contain at least an `<thead>` element in the `<tbody>` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (`PI`) in the child hierarchy of a subject selector.

For example:

```javascript
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{  
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>  
  <title>A title</title>  
  <?important level='high'?>  
</chapter>
```

**Descendant Selectors Limitation**

⚠️ **Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```
Supported CSS Properties

Oxygen XML Author validates all CSS 2.1 properties, but does not render aural and paged categories properties in Author mode, as well as some of the values of the visual category that are listed below under the Ignored Values column. For the Oxygen XML Author-specific (extension) CSS properties, see CSS Extensions (on page 1960).

</table>

<length> - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see the W3 CSS Level 3 length type specifications.

**Related Information:**
CSS Extensions (on page 1960)

**Transparent Colors**

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**

```css
.personnel:before {
  display:block;
  padding: 1em;
  font-size: 1.8em;
}
```
attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
    content: "[Audience Level: " attr(audience) "]";
}
```

If the `<title>` element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Author, the use of attr() function is available not only for the content property, but also for any other property. This is similar to the CSS Level 3 working draft: http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional. The arguments of the function are:

```
attr(attribute_name, attribute_type, default_value)
```

**attribute_name**

The attribute name. This argument is required.

**attribute_type**

The attribute type. This argument is optional. If it is missing, argument’s type is considered string. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Author accepts one of the following types:

**color**

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Author supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFEEFF.

**url**
The value is a URL pointing to a media object. Oxygen XML Author supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

**integer**

The value must be interpreted as an integer.

**number**

The value must be interpreted as a float number.

**length**

The value must be interpreted as an integer.

**percentage**

The value must be interpreted relative to another value (length, size) expressed in percents.

**em**

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

**ex**

The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**
The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: **attr Function

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The `<para>` elements have `@bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);
```

The `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);
```

The complete CSS rule is:

```css
para{
  display:block;
  background-color: attr(bg_color, color);
  font-size: attr(font_size, em);
  margin:attr(space, em);
}
```

The document is rendered as:
CSS Level 3 target-counter() and target-counters() Functions

The CSS Level 3 functions `target-counter` and `target-counters` can be used as values for the `content` property to retrieve counter values and display information obtained from a target at the end of a link.

The `target-counter` Function

This function retrieves the value of the innermost counter with a given name.

```
target-counter ( <fragment> , <counter-name> [ , <counter-style> ] ? )
```

- **fragment**
  - The URI fragment pointing to the ID of the target element.
- **counter-name**
  - The name of the counter. This argument is required.
- **counter-style**
  - This optional argument can be used to format the result.

Example:

HTML:

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
  </ol>
</nav>
```
<li class="frontmatter"><a href="#intr_01">Introduction</a></li>
<li class="bodymatter"><a href="#chap_01">Chapter One</a></li>

CSS:

```
.frontmatter a::after { content: leader('.') target-counter(attr(href), page, lower-roman) }
.bodymatter a::after { content: leader('.') target-counter(attr(href), page, decimal) }
```

Result:

```
 Preface............vii
 Introduction........xi
 Chapter One........1
```

The **target-counters** Function

This function fetches the value of all counters of a given name from the end of a link and formats them by inserting a given string between the value of each nested counter.

```
target-counter ( <fragment> , <counter-name> , <delimiter> [ , <counter-style> ] ? )
```

- **fragment**
  
The URI fragment pointing to the ID of the target element.

- **counter-name**
  
The name of the counter. This argument is required.

- **delimiter**
  
The string to be inserted between the value of each nested counter. This argument is required.

- **counter-style**
  
This optional argument can be used to format the result.

https://www.w3.org/TR/css-gcpm-3/#target-counters
calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```css
elem {
  width: calc(100% - 1em);
}
```

For more information, see: [https://drafts.csswg.org/css-values-3/#calc-notation](https://drafts.csswg.org/css-values-3/#calc-notation)

Custom CSS Properties (CSS Variables)

*Custom properties* (also referred to as *CSS variables*) are properties defined by CSS authors that contain specific values to be reused throughout a document.

Complex websites have many CSS rules, often with a lot of repeated values. For example, the same color might be used in dozens of different places, requiring a global search-and-replace operation if that color needs to be changed. Custom properties allow a value to be stored in one place, then referenced in multiple other places. An additional benefit is semantic identifiers. For example, `--main-text-color` is easier to understand than `#00ff00`, especially if this same color is also used in other contexts.

*Custom properties* follow the same rules as other CSS properties, so you are able to define and use them at multiple levels, following standard CSS cascading and specificity rules.

Usage

A custom property name begins with a double hyphen (--) and its value that can be any valid CSS value. You use the custom property value by specifying your custom property name inside the `var()` function, in place of a regular property value:

```
Defining a Custom Property
```

```css
.element {
  --main-bg-color: brown;
  background-color: var(--main-bg-color);
}
```

**Note:**

Custom property names are case sensitive: `--my-color` will be treated as a separate custom property from `--My-color`.

Inheritance of Custom Properties

If you define a custom property on an element, you will be able to access it on all of its descendents.
Inheritance

```xml
<one>
  <two>
    <three/>
    <four/>
  </two>
</one>
```

```css
one {
  --color:green;
}

three {
  --color:red;
}

* {
  color: var(--color);
}
```

Result:

- `<one>` has the color green.
- `<two>` has the color green.
- `<three>` has the color red.
- `<four>` has the color green.

Custom Properties Fallback Values

The `var()` function has two arguments. The first argument is the name of the custom property to be substituted. The second argument (optional) is a fallback value, which is used as the substitution value when the referenced custom property is invalid or undefined.

Specifying a Fallback Value

```css
one {
  color: var(--color, blue);
}

one {
  color: var(--color, var(--fallback-color, red));
}
```
Dependencies

A custom property can reference the value of another custom property through the `var()` function.

A Custom Property Safely Using a Variable

```css
:root {
  --border-color: red;
  --main-border: 1px solid var(--border-color, green);
}

p {
  border: var(--main-border);
}
```

Combining Custom Variables with `calc()`

```css
:root {
  --foo: 10px;
  --bar: calc(var(--foo) + 10px);
}

p {
  font-size: var(--bar);
}
```

⚠️ CAUTION:
This can create cyclic dependencies where two or more custom properties each attempt to reference each other.

An Invalid Situation of Variables Depending on Each Other

```css
:root {
  --color: var(--bg-color);
  --bg-color: var(--color);
}
```

CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Author CSS extensions are useful.

Examples of how they can be used:

- Property for marking *foldable elements (on page 2816)* in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
• Constructing a URL from a relative path location.
• String processing functions.

Built-in CSS Selectors

When Oxygen XML Author renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

**List of CSS Selector Contributed by Oxygen XML Author**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

    -oxy-link: attr(xlink:href) !important;
}

/*No direct display of the MathML and SVG images.*/
svg|svg{
    display:inline !important;
    white-space: -oxy-trim-when-ws-only !important;
}

/*EXM-28827 SVG can contain more than one namespace in it*/
svg|svg * {
    display:none !important;
    white-space:normal !important;
}

mml|math{
    display:inline !important;
    white-space: -oxy-trim-when-ws-only !important;
}

mml|math mml|*{
    display:none !important;
    white-space: normal !important;
}

/*Text direction attributes*/
*[dir='rtl'] { direction:rtl; unicode-bidi:embed; }
*[dir='rlo'] { direction:rtl; unicode-bidi:bidi-override; }

*[dir='ltr'] { direction:ltr; unicode-bidi:embed; }
*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
/*
 * EXM-40349
 * In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of styling.
 */

oxy|processing-instruction[oxy-placeholder] {
  visibility: -oxy-collapse-text;
  -oxy-display-tags:none;
}

oxy|processing-instruction[oxy-placeholder]:before {
  background-color: rgba(192, 192, 192, 0.2) !important;
  color: rgb(0, 0, 0.6) !important;
  font-weight:bold;
  /* When there isn’t an associated CSS the NO_CSS rules hide the PIs. @see AuthorViewport.CSS_ERROR_END */
  display: -oxy-morph;
  content: attr(content) !important;
}

@media oxygen-high-contrast-black, oxygen-dark-theme{
  oxy|processing-instruction[oxy-placeholder]:before {
    background-color: rgba(0, 0, 0, 0.15) !important;
    color: rgb(156, 156, 156) !important;
  }
  /* ====================================
  * built-in oXygen elements
  */
  oxy|comment {
    color: #a2a2a2 !important;
    background-color: transparent !important;
  }
}
Example:

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```css
oxy|entity {
    background-color: inherit !important;
}
```

### Additional CSS Selectors

Oxygen XML Author provides support for selecting additional types of nodes. These custom selectors apply to: `document`, `doctype`, `processing-instruction`, `comment`, `CDATA sections`, `entities`, and `reference sections`. Processing-instructions are not displayed by default. To display them, open the **Preferences** dialog box (Options > Preferences) (on page 124), go to Editor > Author, and select Show processing instructions.

**Note:**

The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with the `!important` flag. For this reason, you have to set the `!important` flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the **Author** mode extensions namespace at the beginning of the stylesheet documents:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

```css
oxy|document {
    display:block !important;
}
```

- **oxy|doctype** - The following example changes the rendering of `doctype` sections:

```css
oxy|doctype {
    display:block !important;
    color:blue !important;
}
• **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```css
oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the following construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

• **oxy|comment** - The XML comments displayed in Author mode can be changed using the `oxy|comment` selector:

```css
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

• **oxy|cdata** - The `oxy|cdata` selector matches CDATA sections:

```css
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

• **oxy|entity** - The `oxy|entity` selector matches the entity content:

```css
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
}```
To match particular entities, use the `oxy|entity` selector in expressions such as:

```html
oxylentity[name='amp'],
oxylentity[name='lt'],
oxylentity[name='gt'],
oxylentity[name='quot'],
oxylentity[name='apos'],
oxylentity[name='#']{
  -oxy-display-tags: none;
}
```

- `oxy|reference` - The `references to entities, XInclude, and DITA @conref and @conkeyref` attributes are expanded by default in Author mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

You can use the `reference` property to customize the way these references are rendered in Author mode:

```html
oxy|reference {

  border:1px solid gray !important;
}
```

In the Author mode, content is highlighted when text contains comments (on page 624) and changes (if Track Changes (on page 624) was active when the content was modified).

If this content is referenced, the Author mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the `oxy|reference[comments], oxy|reference[changeTracking], and oxy|reference[changeTracking][comments]` selectors.

**Note:**
Two artificial attributes (comments and changeTracking) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

  ```html
  oxy|reference[comments]:before {
      content: "Comments: " attr(comments) !important;
  }
  ```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector:
Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

```css
oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
}
```

![Figure 387. Example: A Document Rendered Using these Rules](image)

**Additional CSS Properties**

Oxygen XML Author provides various additional CSS properties to extend the standard CSS properties.
Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

-oxy-append-content Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-append-content property adds content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello";
}
element:before{
    -oxy-append-content: " World!";
}
```

The content shown before the element will be **Hello World!**.

-oxy-prepend-content Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-prepend-content prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello!"
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the element will be **I said: Hello!**.

Collapse Text: -oxy-collapse-text Property Value

Used to collapse the content of an element.
Oxygen XML Author allows you to set the value of the visibility property to -oxy-collapse-text, meaning that the content of that element is not rendered. If an element is marked as -oxy-collapse-text you are not able to position the cursor inside it and edit it. The purpose of -oxy-collapse-text is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:

```xml
<title>
    <content:oxygen_textfield(edit, '#text', columns, 40);
    visibility:-oxy-collapse-text;
</title>
```

**Cyrillic Counters: -oxy-lower-cyrillic Property Values**

Used to style lists with Cyrillic counters.

Oxygen XML Author allows you to set the value of the list-style-type property to Cyrillic counters. For example, -oxy-lower-cyrillic-ru, -oxy-lower-cyrillic-uk, -oxy-upper-cyrillic-ru or -oxy-upper-cyrillic-uk, meaning that you can have Russian and Ukrainian counters.

**Example: Cyrillic Counters**

Counting list items with Cyrillic symbols:

```xml
<li>
    <display:list-item;
    list-style-type:-oxy-lower-cyrillic-ru;
</li>
```

**Display Tag Markers: -oxy-display-tags Property**

Used to specify whether or not tag markers are displayed.

Oxygen XML Author allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named -oxy-display-tags, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode (on page 576).
- **default** - The tag markers will be created depending on the current display mode (on page 576).
- **inherit** - The value of the property is inherited from an ancestor element.
Example: -oxy-display-tags Property

In this example, the `para` element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.

```css
docbook {  
  -oxy-display-tags: none;  
  display: block;  
  margin: 0.5em 0;  
}

para::before{  
  content: "[";  
}

para::after{  
  content: "]";  
}
```

Editable: -oxy-editable Property

Used to inhibit editing the content of a particular element.

If you want to inhibit the editing of the content of a certain element, you can set the `-oxy-editable` CSS property to `false` (the deprecated `editable` property is also supported).

Floating Toolbar: -oxy-floating-toolbar Property

Used to display a configured floating toolbar in Author mode.

The `-oxy-floating-toolbar` property is used to configure and display a floating toolbar in Author mode. It accepts a space-separated list of the following functions:

- `oxy_button`
- `oxy_buttonGroup`
- `oxy_textfield`
- `oxy_combobox`
- `oxy_label`
Note:
The "|" text value can be used to add a separator between elements of the toolbar.

It must be used in conjunction with the -oxy-selected and -oxy-selection-inside pseudo-classes. The -oxy-selected pseudo-class is automatically set on an element that is fully selected and the -oxy-selection-inside pseudo-class is automatically set on an element that has a selection inside.

Example 1:

```xml
p:-oxy-selection-inside {
    -oxy-floating-toolbar:
        oxy_button(actionID, 'bold')
        oxy_button(actionID, 'italic')
        oxy_button(actionID, 'underline')
}
```

This results in a floating toolbar that contains bold, italic, and underline actions presented in Author mode every time text inside a paragraph element is selected.

Example 2:

```xml
p:-oxy-selected {
    -oxy-floating-toolbar:
        oxy_label(text, "Platform: ")
        oxy_combobox{
            edit, '@platform',
            editable, false,
            values, 'windows, mac, linux',
            labels, 'Windows, MacOS, Linux'
        }
}
```

This results in a floating toolbar that contains a Platform: label and a drop-down menu used to change the value of the @platform profiling attribute. This is presented in Author mode every time a paragraph element is fully selected.

Example 3:

```xml
[conref]:-oxy-selected, [conkeyref]:-oxy-selected {
    -oxy-floating-toolbar:
        oxy_button(actionID, 'add_edit_content_reference')
        oxy_button(actionID, 'remove_content_reference')
        "|"
        oxy_button(actionID, 'conref.replace')
}
```
This results in a floating toolbar that contains **Edit Content Reference**, **Remove Content Reference**, and **Replace Reference with Content** actions presented in **Author** mode every time an element with a `@conref` or `@conkeyref` attribute is fully selected.

**Folding Elements: -oxy-foldable / -oxy-folded / -oxy-not-foldable-child**

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Author allows you to declare some elements to be *foldable* ([on page 2816](#)). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Author marks the *foldable* content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:

- **Toggle Fold**
  - Toggles the state of the current fold.

- **Collapse Other Folds**
  - Folds all the elements except the current element.

- **Collapse Child Folds**
  - Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  - Unfolds all child elements of the currently selected element.

- **Expand All**
  - Unfolds all elements in the current document.

**-oxy-foldable Property**

This property defines whether or not the content for an element can be *folded* by the user. To define that an element's content can be *folded*, use the `-oxy-foldable: true` property.

**-oxy-folded Property**

This property is used in conjunction with the `-oxy-foldable` property and it defines the elements that are *folded* by default. To define an element to be *folded* by default, use the `-oxy-folded: true` property.

**Note:**

Since the `-oxy-folded` property works in conjunction with the `-oxy-foldable` property, the `-oxy-folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

**-oxy-not-foldable-child Property**

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The `-oxy-not-foldable-child` property is used to identify the child element that is...
kept visible. As its value, it accepts an element name or a list of comma-separated element names. The first occurrence of each child element specified in the list of element names will be identified as the not-foldable child and displayed. If the element is marked as foldable (-oxy-foldable:true;) but it does not have the -oxy-not-foldable-child property or none of the specified non-foldable children exist, then the element is still foldable. In this case, the element kept visible when folded will be the before pseudo-element.

**Example: Folding DocBook Elements**

All the elements below can have a `<title>` child element and are considered to be logical sections. You mark them as being foldable leaving the `<title>` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
  -oxy-foldable:true;
  -oxy-not-foldable-child: title;
}
```

**Note:**
The foldable, folded, and not-foldable-child properties are deprecated and the equivalent with the -oxy prefix should be used instead.

**Links: -oxy-link Property**

Used to specify that a particular element should be considered a link.

Oxygen XML Author allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.
To define the element that should be considered a link, you must use the `oxy-link` property on the `:before` or `:after` pseudo-element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`.

**Example: DocBook Link Elements**

The following elements are defined to be links on the `:before` pseudo-element and their values are defined by the value of an attribute.

```
*[href]:before{
    oxy-link:attr(href);
    content: "Click * attr(href) " for opening";
}

ulink[url]:before{
    oxy-link:attr(url);
    content: "Click to open: " attr(url);
}

click[targetdoc]:before{
    oxy-link: attr(targetdoc);
    content: "Click to open: " attr(targetdoc);
}
```

**Link Navigation: -oxy-link-activation-trigger Property**

Used to specify how hyperlinks are handled in Author mode.

The `-oxy-link-activation-trigger` property is used to specify when hyperlinks are clickable in Author mode. This is helpful for those who are used to the hyperlink activation procedure in other applications (for example, apps that use `Ctrl+Click` (Command+Click on macOS) to activate hyperlinks.

The possible values are:

- **click** - Hyperlinks are opened when a user mouse-clicks the link icon or text.
- **modifier-click** - Hyperlinks are opened when a user holds down `Ctrl` (Command on macOS) and mouse-clicks the link icon or text.
- **auto** - The hyperlink strategy is determined automatically, depending on the context.
- **inherit** - The value is inherited from the parent element.

**Morph Elements: -oxy-morph Property Value**

Used to specify that an element should be displayed inline.

Oxygen XML Author allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline (on page 2817) if all its children are inline.
Example: **-oxy-morph** Property Value

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (on page 2817) or block (on page 2814) behavior, depending on the behavior of its child elements:

```css
wrapper{
  display:-oxy-morph;
}
```

### Placeholders for Empty Elements: **-oxy-placeholder-content** Property

Used to configure placeholders for empty elements.

Oxygen XML Author displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option (on page 175) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (**-oxy-placeholder-content** and **-oxy-show-placeholder**).

**-oxy-placeholder-content** CSS Property

To control the displayed pseudo-content for empty elements, you can use the **-oxy-placeholder-content** CSS property.

The following example would change the `<keyword>` element to be displayed as `key`:

```css
keyword{
  -oxy-placeholder-content:"key";
}
```

#### Note:

This CSS property accepts the `$i18n(key)` (on page 320) localization editor variable, as in the following example:

```css
-oxy-placeholder-content:$i18n(id);"
```

**-oxy-show-placeholder** CSS Property

The **-oxy-show-placeholder** property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if before or after content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the Show placeholders for empty elements option (on page 175) (if before and after content is not declared).
- **no** - Never display placeholders.
Note:
Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

Related information
Using Placeholders in Document Templates (on page 360)

**Style Elements: -oxy-style Property**

Used to configure the style of particular elements.

Oxygen XML Author allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
*{
  -oxy-style:attr(style);
}
```

Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

**Tip:**
The `@style` attribute is supported by default in HTML5 documents.

**Tags Color: -oxy-tags-color Property**

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Author does not display element tags. You can use the Partial Tags button from the Author toolbar to control the amount of displayed markup (on page 576).

To configure the default background and foreground colors of the tags, open the Preferences dialog box (Options > Preferences) (on page 124), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (on page 177) and Tags foreground color (on page 177) options.

If you want to be more specific and configure the colors using a CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.
Example:

```xml
para {
    -oxy-tags-color:white;
    -oxy-tags-background-color:green;
}
title {
    -oxy-tags-color:yellow;
    -oxy-tags-background-color:black;
}
```

Custom CSS Functions

Oxygen XML Author provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

Arithmetic Functions

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>oxy_add (param1, ..., paramN, 'returnType')</td>
<td>Adds the values of all parameters from param1 to paramN.</td>
</tr>
<tr>
<td>oxy_subtract (param1, param2, ..., paramN, 'returnType')</td>
<td>Subtracts the values of parameters param2 to paramN from param1.</td>
</tr>
<tr>
<td>oxy_multiply (param1, ..., paramN, 'returnType')</td>
<td>Multiplies the values of parameters from param1 to paramN.</td>
</tr>
<tr>
<td>oxy_divide (param1, param2, 'returnType')</td>
<td>Performs the division of param1 to param2.</td>
</tr>
<tr>
<td>oxy_modulo (param1, param2, 'returnType')</td>
<td>Returns the reminder of the division of param1 to param2.</td>
</tr>
</tbody>
</table>

Note:
The `returnType` can be 'integer', 'number', or any of the supported CSS measuring types.

Example: `oxy_multiply` Function

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:
Actions: oxy_action() Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action() function is frequently used from the oxy_button() function (on page 2006) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (framework configuration) but the oxy_action() function allows you to define it directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action() function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (on page 313).
- **operation** - The name of the Java class implementing the ro.sync.ecss.extensions.api.AuthorOperation interface. There is also a variety of predefined operations (on page 1778) that can be used.
- **arg-<string>** - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed). The argument value supports editor variables (on page 313).
- **ID** (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Note:**

If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations (on page 1778). If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed). The argument value supports editor variables (on page 313).
- **ID** (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action function inside an oxy_button form control (on page 2006):**

```
oxo_button{
    action, oxy_action{
        name, 'Insert',
        description, 'Insert an element after the current one',
        icon, url('insert.png'),
        operation,
        'InsertFragmentOperation',
        arg-fragment, '<element>${caret}</element>',
```
Example: oxy_action Function

You can also create a button form control directly from an oxy_action function:

```java
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After',
    showIcon, true)
```

Tip:
A code template is available to make it easy to add the oxy_action function with the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_action code template.

Related information
Button Form Control (on page 2006)

Action Lists: oxy_action_list() Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from the oxy_buttonGroup() function (on page 2009) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the oxy_action_list() function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action_list() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (on page 1982). The following properties are supported in the oxy_action() function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (on page 313).
• **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 1778) that can be used.

**Note:**
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations (on page 1778). If the class is not found in this package, then it will be loaded using the specified name.

• **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed). The argument value supports editor variables (on page 313).

• **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```xml
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list{
      oxy_action{
        name, 'Insert a new paragraph',
        description, 'Insert an element after the current one',
        operation, 'InsertFragmentOperation',
        arg-fragment, '<p></p>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
      },
      oxy_action{
        name, 'Delete',
        description, 'Deletes the current element',
        operation, 'DeleteElementOperation'
      }
    }
  }
}

```

**Tip:**
A code template is available to make it easy to add the `oxy_action_list` function with the Content Completion Assistant (on page 2815) by pressing **Ctrl + Space** and select the `oxy_action_list` code template.
Attributes Concatenation: `oxy_attributes()` Function

This function concatenates the attributes for an element and returns the serialization.

**Syntax:**

```plaintext
oxy_attributes()
```

**Example: `oxy_attributes` Function**

```plaintext
element{
    content:oxy_attributes();
}
```

For instance, if you have the following XML fragment:

```xml
<element att1="x" xmlns:a="2" x="\"/>,
```

the CSS function will display:

```plaintext
att1="x" xmlns:a="2" x=""
```

Base URL: `oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the xml:base context of the current node. See the XML Base specification for more details.

**Example: `oxy_base-uri` Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```plaintext
image[href]{
    content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

Capitalization: `oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.

**Syntax:**

```plaintext
oxy_capitalize(text)
```
The text in which the first letter will be capitalized.

**Example: oxy_capitalize Function**

```css
*:before{
  content: oxy_capitalize(oxy_name()) *: *
}
```

This would insert the capitalized qualified name as static text content before the element.

**Compound Actions: oxy_compound_action() Function**

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 2006) or the `oxy_buttonGroup()` form control function (on page 2009).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 1982).

You can use three optional properties (`name`, `description`, `icon`) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first `oxy_action` function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the `oxy_getActionName` function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the `oxy_getActionDescription` function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an editor variable (on page 313). If you want to reuse the icon of an action already defined in your framework, you can use the `oxy_getActionIcon` function.

The `oxy_getActionName`, `oxy_getActionDescription`, and `oxy_getActionIcon` functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- **fallback** (optional) - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

**Example: oxy_compound_action Function**

```css
oxy_button{
  action,
```
oxy_compound_action({
    name, oxy_getActionName('framework.id', 'Fallback'),
    description, ' Inserts a paragraph and uses form controls to edit its @audience attribute',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    oxy_action(
        name, 'Insert',
        description, ' Insert an element after the current one ',
        operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, '<p audience=''></p>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
    ),
    oxy_action(
        name, 'Activate edit mode',
        description, ' Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute ',
        operation, 'SetPseudoClassOperation',
        arg-name, 'edit-mode-on',
        arg-elementLocation, '.'
    )
),
showIcon, true)

Tip:
A code template is available to make it easy to add the oxy_compound_action function with the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and selecting the oxy_action_list code template.

Related information
Actions: oxy_action() Function (on page 1982)
Button Form Control (on page 2006)

Concatenation: oxy_concat() Function
This function concatenates the received string arguments.

Syntax:

oxy_concat(str_1, str_2)

str_1 ... str_n

The string arguments to be concatenated.
Example: \texttt{oxy\_concat} Function

If an XML element has a \texttt{@padding-left} attribute:

\begin{verbatim}
<p padding-left="20">...</p>
\end{verbatim}

and you want to add a padding before it with that specific amount specified in the attribute value:

\begin{verbatim}
* [padding-left]{
  padding-left: oxy_concat(attr(padding-left), "px");
}
\end{verbatim}

Get Text: \texttt{oxy\_getSomeText(text, length)} Function

This function allows you to truncate a long string and to set a maximum number of displayed characters.

Syntax:

\begin{verbatim}
 oxy_getSomeText (text, length, endsWithPoints)
\end{verbatim}

\texttt{text}

Displays the actual text.

\texttt{length}

Sets the maximum number of characters that are displayed.

\texttt{endsWithPoints}

Specifies if the truncated text ends with ellipsis.

Example: \texttt{oxy\_getSomeText} Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

\begin{verbatim}
* [longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
\end{verbatim}

Indexing: \texttt{oxy\_indexOf()} Function

This function is used to define searches.

The \texttt{oxy\_indexOf()} function has two signatures:

Syntax 1:

\begin{verbatim}
 oxy_indexof (text, toFind)
\end{verbatim}

Returns the index within \texttt{text} string of the first occurrence of the \texttt{toFind} substring.

\texttt{text}
Text to search in.

toFind

The searched substring.

Syntax 2:

```
oxy_indexof (text, toFind, fromOffset)
```

Returns the index within `text` string of the first occurrence of the `toFind` substring. The search starts from `fromOffset` index.

**text**

Text to search in.

**toFind**

The searched substring.

**fromOffset**

The index to start the search from.

**Example: oxy_indexof Function**

```
oxy_indexof('abcd', 'bc') returns 1.
```

```
oxy_indexof('abcdbc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```latex
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Label: oxy_label() Function**

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are `property name - property value` pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
• **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element that was used to insert it.

• **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  ◦ `font-weight`, `font-size`, `font-style`, `font`
  ◦ `text-align`, `text-decoration`
  ◦ `width`
  ◦ `color`, `background-color`
  ◦ `link` - For more information about this property, see the *link property section (on page 1977).*

```html
element{
  content: oxy_label(text, "Label Text", styles,
                     "font-size:2em;color:red;link:attr(href);"交付);
}
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```css
* {
    width: 40%;
    text-align: center;
}
```

Then refer that file with an `@import` directive, as follows:

```html
elem {
  content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")交付;
}
```

**CAUTION:**
Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:**
The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a **built-in form control (on page 2000)** function to create a form control based layouts.

**Example: oxy_label Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:
Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```xml
person:before {
  content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
  oxy_textfield(edit, '@name', columns, 20) "\A *
  oxy_label(text, "Address:", styles, "width:200px")
  oxy_textfield(edit, '@address', columns, 20)
}
```

**Tip:** A code template is available to make it easy to add the `oxy_label` function with the *Content Completion Assistant (on page 2815)* by pressing `Ctrl + Space` and select the `oxy_label` code template.

---

### Last Occurrence: `oxy_lastindexof()` Function

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

**Syntax 1:**

```xml
oxy_lastindexof(text, toFind)
```

Returns the index within `text` string of the rightmost occurrence of the `toFind` substring.

- **text**
  - Text to search in.
- **toFind**
  - The searched substring.

**Syntax 2:**

```xml
oxy_lastindexof(text, toFind, fromOffset)
```

The search starts from `fromOffset` index. Returns the index within `text` string of the last occurrence of the `toFind` substring, searching backwards starting from the `fromOffset` index.

- **text**
Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search backwards from.

Example: _oxy_lastindexOf Function_

```plaintext
oxy_lastindexOf('abcdbc', 'bc') returns 4.
oxylastindexOf('abcdbcddbc', 'bc', 2) returns 1.
```

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```plaintext
image[longdesc]{{
    content: oxy_substring(attr(longdesc), 0,
             oxy_lastindexOf(attr(longdesc), "Appendix"));
}
```

Link Text: _oxy_link-text() Function_

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the _oxy_link-text()_ function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 2817), go to Configuring an Extensions Bundle (on page 1859).

DITA Support

For DITA, the _oxy_link-text()_ function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

DocBook Support

For DocBook, the _oxy_link-text()_ function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

Example: _oxy_link-text Function_

For the following XML and associated CSS fragments the _oxy_link-text()_ function is resolved to the value of the `@xreflabel` attribute.
If the text from the target cannot be extracted (for instance, if the @href is not valid), you can use an optional argument to display fallback text.

```
*[class="map/topicref"]:before{
    content: oxy_link-text("Cannot find the topic reference");
    link:attr(href);
}
```

**Local Name: oxy_local-name() Function**

This function evaluates the local name of the current node.

It does not have any arguments.

**Example: oxy_local-name Function**

To insert the local name as static text content before the element, use this CSS selector:

```
*:before{
    content: oxy_local-name() " ";
}
```

**Lowercase: oxy_lowercase() Function**

This function transforms the text received as argument to lower case.

**Syntax:**

```
oxy_lowercase ( text )
```

text

The text to be lower cased.

**Example: oxy_lowercase Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
    content: oxy_lowercase(oxy_name()) ": ";
}
```
Name: oxy_name() Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

Example: oxy_name Function

To insert a qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_name() "":";
}
```

Parent URL: oxy_parent-url() Function

This function evaluates the parent URL of a URL received as string.

Syntax:

```
oxy_parent-url ( URL )
```

URL

The URL as string.

Replace: oxy_replace() Function

This function is used to replace a string of text.

The oxy_replace() function has two signatures:

Syntax 1:

```
oxy_replace ( text, target, replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- text
  
The text in which the replace will occur.

- target
  
The target string to be replaced.

- replacement
  
The string replacement.

Example: Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:
Syntax 2:

oxy_replace (text, target, replacement, isRegExp)

This function replaces each substring of the text that matches the target string with the specified replacement string.

- **text**
  The text in which the replace will occur.

- **target**
  The target string to be replaced.

- **replacement**
  The string replacement.

- **isRegExp**
  If true the target and replacement arguments are considered regular expressions, if false they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

image[title]{
  content:oxy_replace(attr(title), \s+, ", true)
}

**Substring of Text: oxy_substring() Function**

This function is used to return a string of text.

The oxy_substring() function has two signatures:

**Syntax 1:**

oxy_substring (text, startOffset)

Returns a new string that is a substring of the original text string. It begins with the character at the specified index and extends to the end of text string.

- **text**
  The original string.
**startOffset**

The beginning index, inclusive.

**Syntax 2:**

```
substring (text, startOffset, endOffset)
```

Returns a new string that is a substring of the original `text` string. The substring begins at the specified `startOffset` and extends to the character at index `endOffset` - 1.

- **text**
  
The original string.

- **startOffset**
  
The beginning index, inclusive.

- **endOffset**
  
The ending index, exclusive.

**Example: oxy_substring Function**

- `oxy_substring('abcd', 1)` returns the string `'bcd'`.
- `oxy_substring('abcd', 4)` returns an empty string.
- `oxy_substring('abcd', 1, 3)` returns the string `'bc'`.

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```xml
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value: oxy_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

```
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:
```

```xml
http://www.example.com/a simple example.html
```

**Unparsed Entity URI: oxy_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.
Syntax:

```xml
oxy_unparsed-entity-uri (unparsedEntityName)
```

`unparsedEntityName`

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity:

```css
imagedata[entityref] { 
    content: oxy_url(oxy_unparsed-entity-uri(attr(entityref))); 
}
```

**Uppercase: oxy_uppercase() Function**

This function transforms the text received as argument to upper case.

Syntax:

```xml
oxy_uppercase (text)
```

`text`

The text to be capitalized.

**Example: oxy_uppercase Function**

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_uppercase(oxy_name()) " ";
}
```

**URL: oxy_url() Function**

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Author uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables *(on page 313)* (built-in or custom).

Syntax:
oxy_url (base_location, loc_1, loc_2)

**base_location**

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

**loc_1 ... loc_n (optional)**

Strings representing relative location path components.

**Examples: oxy_url Function**

The following function receives String objects as input parameters:

```
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```
image[href] {
  content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 313) as the first parameter to point to the Oxygen XML Author installation location:

```
image[href] {
  content: oxy_url('${oxygenHome}', 'logo.png');
}
```

**Related information**

Editor Variables (on page 313)

**XPath: oxy_xpath() Function**

This function is used to evaluate XPath expressions.

**Syntax:**

```
 oxy_xpath [XPathExpression [, processChangeMarkers, value ] [, evaluate, value ]]
```
It evaluates the given XPath 3.1 expression using the latest Saxon XSLT processor bundled with the application and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content.

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there is a change in the document. This is the default evaluation value.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

Important:
If the edited XML document is large, using dynamic XPath evaluation may induce performance issues while editing the content.

When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

Example: `oxy_xpath` Function
The following example counts the number of words from a paragraph (including tracked changes (on page 2821)) and displays the result in front of it:

```xml
para:before{
  content:
  concat("|Number of words: ",
  oxy_xpath(
    "count(tokenize(normalize-space(string-join(text(), ' ')), ' ')), ' ')",
    processChangeMarkers,
    true),
    "| ");
}
```

The `oxy_xpath()` function supports editor variables (on page 313), as in the following example:

```xml
* {
  content:
  oxy_concat("Result: ",
  oxy_xpath('count(collection("${cfdu}/?select=*.xml"))'))
};
```

You can split the XPath expression on multiple lines by adding a backslash before each new line:

```xml
* {
  content: oxy_xpath('count(
    collection(
      "${cfdu}/?select=*.xml"))'))
}
```

**Form Controls**

Oxygen XML Author provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Author also supports custom form controls in Java (on page 2032).

**How to Add a Built-in Form Control in Author Mode**

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 2017), its dedicated function is `oxyDatePicker`.
3. Associate the CSS file with the XML document in one of the following ways:
If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 1771). This approach is recommended if you intend on sharing the customization with others.

If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 1934).

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**
- Custom CSS Functions (on page 1981)
- Label: oxy_label() Function (on page 1989)
- Dynamically Add Form Controls Using a Styles Filter (on page 2123)
- Editing Processing Instructions Using Form Controls (on page 2034)

**Audio File Player Form Control**

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3'), width, 400px)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_audio Form Control**

```javascript
object {
  content:
    oxy_audio{
      href, 'resources/audio.mp3',
      width, 200px,
    }
}
```

**Tip:**

To insert a sample of the oxy_audio form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_audio code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Custom CSS Functions (on page 1981)
URL: oxy_url() Function (on page 1997)

Browser Form Control

The oxy_browser built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Author workspace.

The oxy_browser form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_browser Form Control

```xml
object {
    content:
        oxy_browser{
            href, 'http://example.page',
            width, 600px,
            height, 400px;
        }
}
```
Tip:
To insert a sample of the oxy_browser form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_browser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Interacting with the Oxygen XML Author Workspace

The oxy_browser form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the oxy_browser form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Author Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

Important:
This will only work if the loaded HTML is located inside a framework or plugin directory (on page 139), such as: [OXYGEN_INSTALL_DIR]/frameworks/ or [OXYGEN_INSTALL_DIR]/plugins/.

The following global variables can be used:

- **authorAccess** - This object is an instance of ro.sync.ecss.extensions.api.AuthorAccess.
- **contextElement** - An instance of ro.sync.ecss.extensions.api.node.AuthorNode. The form control is added over this node.
- **fcArguments** - A java.util.Map implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
   "ro.sync.ecss.extensions.api.node.AttrValue",
   ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
   "counter", newAttrValue, contextElement);
```

You can also specify the constructor signature:
var newAttrValue = apiHelper.newInstance(
   "ro.sync.ecss.extensions.api.node.AttrValue
   (java.lang.String, java.lang.String, boolean)",
   ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute("counter", newAttrValue, contextElement);
...

For more information, open the form-controls.xml file in the [OXYGEN_INSTALL_DIR]/samples/form-controls directory and go to section 11.1 - Interacting with the Oxygen Workspace.

Warning:
On macOS, you need to use asynchronous calls to the API, due to the following JDK bug: https://bugs.openjdk.java.net/browse/JDK-8087465. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: sync() and async().

// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
   // On Mac, methods that change the document must be executed asynchronously.
   ctrl.async();
   ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
   ctrl.sync();
}

Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the bridgeReady() method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

   function bridgeReady () {
      // We declare a member function for each method of the
      // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
      var handler = {
         attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();

            if (node.equals(contextElement) && attrName === "counter") {
               ...
            }
         }
      }
   }
init();
}

contentDeleted : function(event) {},
contentInserted : function(event) {}
};

// We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
// delegate its methods to the JS object's functions.
// We assign the listener to a global variable so that we can remove it later on,
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
    "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);
}

2. Since a listener was added on the document, it is important to remove it once the form control is not
used anymore. When a form control is discarded, the dispose() JavaScript function is invoked, so if
you have any cleanup to do, make sure you define a function with this name and remove any previously
created listeners in it.

/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}

Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above (on page 2003), you can debug
the script by using the following guidelines:

- Calls to alert("message.to.present") or console.log("message.to.present") will be presented in the
  Results panel (on page 530).
- You can install the Firebug extension by executing the following script:

```javascript
function installFB() {
```
```
if (!document.getElementById('FirebugLite')) {
    E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
    E = E ? document['createElement' + 'NS'](E, 'script') : document['createElement']('script');
    E['setAttribute']('id', 'FirebugLite');
    E['setAttribute']('src', 'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
    E['setAttribute']('FirebugLite', '4');
    (document['getElementsByTagName']('head')[0] || document['getElementsByTagName']('body')[0]).appendChild(E);
    E = new Image;
    E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
}

Note:
To force the Browser Form Control to reload after making changes to the JavaScript file, you need to use the Reload page action from the form control's contextual menu.

Related information
Custom CSS Functions (on page 1981)
URL: oxy_url() Function (on page 1997)

Button Form Control
The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.
visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

transparent - Flattens the aspect of the button form control, removing its border and background. The values of this property can be true or false (default value).

showText - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

showIcon - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

enableInReadOnlyContext - To enable button form controls (on page 2006) or groups of buttons form controls (on page 2009), this property needs to be set to true. This property can be used to specify areas as read-only (by setting the oxy-editable property to false). This is useful when you want to use an action that does not modify the context.

hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

actionContext - Specifies the context that the action associated with the form control is executed. Its possible values are element (default value) and caret. If you select the element value, the context is the element that holds the form control. If you select the caret value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the element value is selected automatically.

actionID - The ID of the action, specified in the document type association (on page 148), that is invoked when you click the button.

Note:
The element that contains the form control represents the context where the action is invoked.
• **action** - Defines an action directly, rather than using the `actionID` parameter to reference an action from the [document type association](on page 148). This property is defined using the `oxy_action` function (on page 1982).

**Tip:**

You can also create a button form control **directly from an** `oxy_action` function (on page 1983).

```html
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

**Tip:**

To execute multiple actions sequentially, you can use the `oxy_compound_action` function (on page 1986).

**Example: oxy_button Form Control**

```css
button:before {
    content: "Label:
    oxy_button{
        /* This action is declared in the document type
         * associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection";
    }
}
```

**Tip:**

To insert a sample of the `oxy_button` form control in a CSS file (or LESS file), invoke the [Content Completion Assistant](on page 2815) by pressing Ctrl + Space and select the `oxy_button` code template. Also, an `oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an `action` parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR]/samples/form-controls.

Custom CSS Functions (on page 1981)
Actions: oxy_action() Function (on page 1982)

Button Group Form Control

The oxy_buttonGroup built-in form control is used for a graphical user interface group of buttons that invokes one of several custom Author mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_buttonGroup form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the \$\{i18n()} editor variable (on page 320).
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be true or false.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- **enableInReadOnlyContext** - To enable button form controls (on page 2006) or groups of buttons form controls (on page 2009), this property needs to be set to true. This property can be used to specify areas as read-only (by setting the -oxy-editable property to false). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- **actionIDs** - The IDs of the actions that will be presented in the group of buttons.
• **actionID** - The ID of the action, specified in the *document type association (on page 148)*, that is invoked when you click the button.

**Note:**
The element that contains the form control represents the context where the action is invoked.

• **actions** - Defines a sequential list of actions directly, rather than using the *actionID* parameter to reference actions from the *document type association (on page 148)*. This property is defined using the *oxy_action_list* function (on page 1983).

```xml
oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'InsertFragmentOperation',
            arg-fragment, '<element></element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Delete',
            description, 'Deletes the current element',
            operation, 'DeleteElementOperation'
        )
    )
)
```

**Tip:**
To execute multiple actions sequentially, you can use the *oxy_compound_action* function (on page 1986) in the *oxy_action_list* function (on page 1983).

```xml
p:before { 
    content:
        oxy_buttonGroup(
            label, 'A group of actions',
            icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
            actions,
            oxy_action_list{
                oxy_compound_action(
```
name, oxy_getActionName('framework.id', 'Fallback'),

description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',

icon, url('http://www.oxygenxml.com/img/ico_ox20.png'),

oxy_action(
  name, 'Insert',
  description, 'Insert an element after the current one',
  operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
  icon, url('insert.png'),
  arg-fragment, '<p audience=""></p>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After'
),

oxy_action(
  name, 'Activate edit mode',
  description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
  operation, 'SetPseudoClassOperation',
  arg-name, 'edit-mode-on',
  arg-elementLocation, '.',
)

),

Oxygen XML Author 26.0 | 16 - Framework and Author Mode Customization | 2012

```
buttongroup:before {
    content: oxy_label(text, "Button Group:", width, 150px, text-align, left)
    oxy_buttonGroup(
        label, 'A group of actions',
        /* The action IDs are declared in the document type
           associated with the XML document. */
        actionIDs,
        "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
        actionStyle, "both";
    }
}
```

Tip:
To insert a sample of the oxy_buttonGroup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_buttonGroup code template. Also, an oxy_buttonGroup_in_place_action code template is available that inserts an oxy_buttonGroup function that includes an oxy_action_list function.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Checkbox Form Control

The oxy_checkbox built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The oxy_checkbox form control supports the following properties:
- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 1972) to render the text only in the form control that the `oxy_editor` function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$[comma]` variable (on page 319).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:**
  Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.
- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$[i18n()]` editor variable (on page 320). If this property is not specified, the `values` property is used as the label.
- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.
Example: Single oxy_checkbox Form Control

checkBox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)
  The values are specified in the CSS:"
  oxy_checkbox{
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
    labels, "On/Off";
  }
}

Example: Multiple oxy_checkbox Form Controls

multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value.
  Depending whether the check-box is selected,
  a different value is committed:"
  oxy_checkbox{
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started";
  }
}

Tip:
To insert a sample of the oxy_checkbox form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_checkbox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Custom CSS Functions (on page 1981)
Collapse Text: -oxy-collapse-text Property Value (on page 1972)

Combo Box Form Control

The oxy_combobox built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The oxy_combobox form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the *visibility* property to -oxy-collapse-text (on page 1972) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **editable** - This property accepts the true and false values. In addition to a drop-down menu, the true value also generates an editable text field box that allows you to insert other values than the proposed ones. The false value generates a drop-down menu that only accepts the proposed values.
- **tooltips** - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the $[comma] variable (on page 319).
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
Note:

Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to true.

- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$i18n()` editor variable (on page 320).

Note:

This property is only available for read-only combo boxes (the `editable` property is set to false).

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is inherit, the form control has the same color as the element that was used to insert it.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- **canRemoveValue** - If the value is set to true and the combo box is not editable, then a new <Empty> value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

- **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 1982) or referenced from the framework (on page 2817) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: oxy_combobox Form Control

This example uses a combo box form control to edit an attribute value. Each time the value changes, it triggers an action that inserts an element into the attribute's parent element.
comboBox:before {
  content: "A combo box that edits an attribute value.
  The possible values are provided from CSS:
  oxy_combobox{
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action{
      name, 'Insert',
      operation, 'XQueryUpdateOperation',
      arg-script, 'insert node <product>{xs:string(\@attribute)}</product>
as last into .');
  }
}

Tip:
To insert a sample of the oxy_combobox form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_combobox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Collapse Text: -oxy-collapse-text Property Value (on page 1972)

Date Picker Form Control
The oxy_datePicker built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The oxy_datePicker form control supports the following properties:
- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

**Note:**
You can set the value of the visibility property to -oxy-collapse-text (on page 1972) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- **format** - This property specifies the format of the inserted date, if a specific format is not detected from the associated document schema. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the datepicker form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to false.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example:** oxy_datePicker Form Control

```html
date {
  content: oxy_label(text, "Date time attribute with stop
```
format defined in CSS: ", width, 300px)

oxy_datePicker(
    columns, 16,
    edit, "@attribute",
    format, "yyyy-MM-dd");
}

Tip:
To insert a sample of the oxy_datePicker form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_datePicker code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

https://www.youtube.com/embed/-WY3wzkMSLM

Related information
Custom CSS Functions (on page 1981)
Label: oxy_label() Function (on page 1989)

HTML Content Form Control
The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

• href - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
• id - The unique identifier of an item. This is a <div> element that has a unique @id and is a child of the <body> element. The <div> element is the container of the HTML content to be rendered by the form control.
• content - An alternative to the @href and @id pair of elements. It provides the HTML content that will be displayed in the form control.
• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `p_description <div>` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```css
p#intro_id:before {
  content: oxy_htmlContent(
    href, "descriptions.html",
    id, "p_description",
    width, 400px);
}
```

An alternative example, using the `content` property:

```css
p#intro_id:before {
  content: oxy_htmlContent(
    content, "<div style='font-weight:bold;'>My content</div>",
    width, 400px);
}
```

**Tip:**

To insert a sample of the `oxy_htmlContent` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant (on page 2815)** by pressing **Ctrl + Space** and select the `oxy_htmlContent` code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Related information

Custom CSS Functions (on page 1981)

Pop-up Form Control

The oxy_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy_popup form control supports the following properties:

• **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

  Note:
  This property is used for rendering in the Author mode.

• **columns** - Controls the width of the form control. The unit size is the width of the w character. This property is used for the visual representation of the form control.

• **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  • @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  • #text - Specifies that the presented/edited value is the simple text value of an element.

  Note:
  You can set the value of the visibility property to oxy-collapse-text (on page 1972) to render the text only in the form control that the oxy_editor function specifies.

• **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are ascending and descending.
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

• **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are `ascending` and `descending`.

• **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.  

   **Note:**  
   The value of the `resultSeparator` property cannot exceed one character.

• **rows** - This property specifies the number of rows that the form control presents.

   **Note:**  
   If the value of the `rows` property is not specified, the default value of `12` is used.

• **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.

• **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the `editorSort` and `rendererSort` properties have a higher priority. The possible values of this property are `ascending` and `descending`.

• **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.

• **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$[comma]` variable (on page 319).

**Example:**
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris, Snowdrop, Gardenia, Liliac,
    Chrysanthemum, Salvia, Gerbera",
    selectionMode, single);
}

• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:**
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

**Example: oxy_popup Form Control**

```xml
popupWithMultipleSelection:before {
  content: "This editor edits an attribute value. The possible values are specified inside the CSS:"
  oxy_popup(
    edit, "@attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);
  font-size: 30px;
}
```
Tip:
To insert a sample of the oxy_popup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the .oxy_popup code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Collapse Text: -oxy-collapse-text Property Value (on page 1972)

Text Area Form Control
The oxy_textArea built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The oxy_textArea form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.
  - #content - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

Note:
You can set the value of the visibility property to -oxy-collapse-text (on page 1972) to render the text only in the form control that the oxy_editor function specifies.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
<apiname><text>API</text></apiname></codeblock>
```
and your CSS includes the following snippet:

```
codeblock:before{
  content: oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></text></sp
```

**Note:**
When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em, ex`), absolute (`in, cm, mm, pt, pc, px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content that the form control will format with syntax highlighting. The following values are supported: `text/batch; text/c; text/cc; text/css; text/dtd; text/html; text/java; text/javascript; text/json; text/markdown; text/nvdl; text/perl; text/plain; text/php; text/properties; text/python; text/rnc; text/rng; text/sch; text/shell; text/sql; text/wsdl; text/xml; text/xpath; text/xproc; text/xquery; text/xsd; text/xsl; text/yaml`.
- **indentOnTab** - Specifies the behavior of the `Tab` key. If the value of this property is set to `true` (default value), the `Tab` key inserts characters. If it is set to `false`, `Tab` is used for navigation, jumping to the next editable position in the document.
- **white-space** - CSS property that influences the value that you edit, as well as the form control size:
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specified, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.
Note:
The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.

- **normal** - The white spaces and new lines are normalized.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

### Example: `oxy_textArea` Form Control

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```css
textArea {
    visibility: -oxy-collapse-text;
    white-space: pre;
}
textArea[language="CSS"]:before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/css');
}
textArea[language="XML"]:before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/xml',
        rows, 10,
        columns, 30);
}
```
Tip:
To insert a sample of the oxy_textArea form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_textArea code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

**Text Field Form Control**

The oxytextfield built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The oxytextfield form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the visibility property to -oxy-collapse-text (on page 1972) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 319).

tooltip - Specifies a tooltip to be displayed when you hover over the form control.

color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

hasMultipleValues - Specifies if the text field allows multiple values separated by spaces or just a single value.

Note:
If the value is false, the Content Completion Assistant (on page 2815) considers the entire text as the prefix for its proposals. If the value is true (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: value a, value b, and other values. If the hasMultipleValues property is set to true and the user enters *value * (notice the space character after 'value') in the text field, the Content Completion Assistant will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the hasMultipleValues property was set to false, the Content Completion Assistant would only suggest value a and value b because the space is considered part of the prefix.

hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

Example: oxy_textfield Form Control

```css
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

```xml
element {
  content: "Label: "
  oxy_textfield{
    edit, "@my_attr",
  }
}
```
Tip:
To insert a sample of the `oxy_textfield` form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the `oxy_textfield` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: `{OXYGEN_INSTALL_DIR}/samples/form-controls`.

URL Chooser Form Control
The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently open editor.

The `oxy_urlChooser` editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - *@attribute_name* - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2819) and the CSS must have a namespace declaration for the prefix.
  - *#text* - Specifies that the presented/edited value is the simple text value of an element.

  Note:
  You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 1972) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

- **fileFilter** - String value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "jpg,png,gif" is mapped to a single filter that will display all jpg, png, and gif files.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example:** `oxy_urlChooser` Form Control

```css
urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a URL.
    The selected URL is made relative to the currently edited file:"
    oxy_urlChooser(
        edit, '@file*',
        columns 25);
}
```

**Tip:**

To insert a sample of the `oxy_urlChooser` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant (on page 2815)** by pressing `Ctrl + Space` and select the `oxy_urlChooser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: `{OXYGEN_INSTALL_DIR}/samples/form-controls`.

Custom CSS Functions (on page 1981)
Collapse Text: -oxy-collapse-text Property Value (on page 1972)

Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4'), width, 400px, height, 300px)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_video Form Control

```xml
object {
  content:
    oxy_video(
      href, 'resources/video.mp4',
      width, 400px,
      height, 300px),
}
```

Tip:

To insert a sample of the oxy_video form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2815) by pressing Ctrl + Space and select the oxy_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.
Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a **SWING** implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (**Swing**-based) distribution to specify the name of the class used for editing. It is a **Swing** implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.
- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a **SWT** implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

**Note:**

If the custom form control is intended to work in the Oxygen XML Author standalone distribution, the declaration of `swtEditorClassName` is not required. The **renderer** (the class that draws the value) has different properties from the **editor** (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.
- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Author will perform the commit logic by itself. You can use the **custom** value to perform the commit logic yourself.

- **saHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas). It is also helpful if you want to use JavaFX, since JavaFX-based form controls are not compatible with the classic form control architecture.
The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 2817) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 144) for your particular framework (on page 2817) or specified with the `classpath` property (on page 2032).

**Example: Java Code**

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                    context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the built-in form controls (on page 2000), as well as specified custom properties.

**Example: CSS**

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
    content: oxy_editor(
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```
How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Author SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter. You could also use ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 2817) library.
4. Copy the JAR library to the [OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR] directory.
5. In Oxygen XML Author, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.

Tip:
To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Resources

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Editing Processing Instructions Using a Form Control

Oxygen XML Author allows you to edit processing instructions, comments, and CDATA by using CSS extensions.

Note:
You can edit both the content and the attribute value from a processing instruction.

Example: Editing an Attribute from a Processing Instruction

PI content:

<?pi_target attr="val"?>

CSS:
Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the AuthorDocument model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Author they are used to hide/show the(colspec) elements from CALS tables. To take a look at the implementation, see:

1. [OXYGEN_INSTALL_DIR]/frameworks/docbook/css/cals_table.css (Search for oxy-visible-colspecs)
2. The definition of action table.toggle.colspec from the DocBook framework (on page 2817) makes use of the pre-defined TogglePseudoClassOperation Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class access-control-user, like the one below:

```css
section {
    display:none;
}
```
By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an `AuthorCaretListener` that sets the `caretvisited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
  color:red;
}
```

The API that you can use from the `CaretListener`.

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)
```

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)
```

**Predefined Pseudo-Class Author Mode Operations**

Pre-defined Author mode operations can be used directly in your framework to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. `RemovePseudoClassOperation`

**Using the :before(n) and :after(n) CSS Pseudo-Elements**

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a :before or :after pseudo-element.

This example adds static text before the title ("Chapter 1", "Chapter 2", etc.).

```css
h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```
All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple `before(n)` or `after(n)` pseudo-elements:

```css
h1:before(3) {
    content: "Chapter ";
    color: blue;
}

h1:before(2) {
    content: counter(chapter);
    color: red;
    font-size: large;
}

h1:before(1) {
    content: ".";
    color: blue;
}
```

**Notes:**

- The bigger the level, the more distant the pseudo-element is.
- Level 1 corresponds to normal `:before` or `:after` pseudo-elements.

### Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a **CSS Inspector view** (on page 622) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

**Figure 388. CSS Inspector View**

There are two ways to open the CSS Inspector view:
1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

**Related Information:**

CSS Inspector View *(on page 622)*
Extending Oxygen With the SDK

Oxygen XML Author has an SDK that can be used as a base to develop frameworks (on page 2817) and plugins (on page 2819). It can be also used to create projects that use the Oxygen XML Author Component or Oxygen XML Web Author. The SDK is a Java library available under the Oxygen XML SDK licensing terms and is delivered with a set of examples that demonstrate how to extend Oxygen XML functionality through API calls. The SDK is available at https://www.oxygenxml.com/oxygen_sdk.html.

Important:
From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Author and ONLY if such extensions are used from inside Oxygen XML Author. To use such extensions outside of Oxygen XML Author (for example, a 3rd-party application that has Oxygen XML Author built in to it), an additional license must be purchased to use the SDK according the Oxygen XML SDK Licensing Policy.

Extending Oxygen XML Author with Plugins

A plugin (on page 2819) is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Author. The Plugins Development Kit contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Author Eclipse plugin you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen XML Author APIs.

General Configuration of an Oxygen XML Author Plugin

The Oxygen XML Author functionality can be extended with plugins (on page 2819) that implement a clearly specified API. On the Oxygen XML Author website, there is an SDK with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the ro.sync.exml.plugin.Plugin class.
- A Java class that implements the ro.sync.exml.plugin.PluginExtension interface.
- A plugin descriptor file called plugin.xml.
A `ro.sync.exml.plugin.PluginDescriptor` object is passed to the constructor of the subclass of the `ro.sync.exml.plugin.Plugin` class. It contains the following data items about the **plugin**:

- **basedir** *(File object)* - The base directory of the **plugin**.
- **description** *(String object)* - The description of the **plugin**.
- **name** *(String object)* - The name of the **plugin**.
- **vendor** *(String object)* - The vendor name of the **plugin**.
- **version** *(String object)* - The **plugin** version. The allowed format is: `MAJOR.MINOR.PATCH` (for example, `1.0.2`).
- **id** *(String object)* - A unique identifier.
- **classLoaderType** - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Author lib directory will have precedence over those referenced in the **plugin.xml** configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the **plugin.xml** configuration file will have precedence over those found in the Oxygen XML Author lib directory, if they have the same package names.

The **plugin** descriptor is an XML file that defines how the **plugin** is integrated in Oxygen XML Author and what libraries are loaded. The structure of the **plugin** descriptor file is fully described in a DTD grammar located in `{OXYGEN_INSTALL_DIR}/plugins/plugin.dtd`. Here is a sample **plugin** descriptor used by the **Capitalize Lines** sample **plugin**:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="Capitalize Lines"
    description="Capitalize the first character on each line"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
  <runtime>
    <library name="lib/caplines.jar"/>
  </runtime>
  <extension type="selectionProcessor"
    class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension"
    keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your **plugin** is of the **Selection**, **Document** or **General** types, and thus contributes an action either to the contextual menu or to the main menu of the **Text** editing mode, then you can assign a keyboard shortcut for it. You can use the `@keyboardShortcut` attribute for each `<extension>` element to specify the desired shortcut.
Tip:
To compose string representations of the desired shortcut keys you can go to Options > Menu Shortcut Keys, select an action, and click Edit. Then choose the desired key sequence and use the representation that appears in the resulting dialog box.

Referencing Libraries
To reference libraries, use either of the following elements:

- `<library name="path/libraryName">` - To point to specific libraries. Notice that the value of `library name` includes the path (relative or absolute) to the library.

  Note:
  You can use the `${oxygenInstallDir}` editor variable (on page 320) as part of the value of the `@name` attribute. You can also use a system variable (`${system(var.name)}`) or environment variable (`${env(VAR_NAME)}`).

- `<librariesFolder name="path/libraryFolderPath">` - To point to multiple libraries located in the specified folder. Notice that the value of `libraryFolder name` includes the path (relative or absolute) to the library folder.

Both elements support the `@scope` attribute that defines the loading priority. It can have one of the following two values:

- `local` - The library is loaded in the plugin's own class loader. This is the default behavior.
- `global` - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application `lib` directory).

Dependency Injection for Plugins
If you want to share a single instance of a certain class between plugin extensions and custom operations (to prevent instances from being repeated), you can declare a `<context>` element in your `plugin.xml` file:

```
<context class="my.package.ContextClass"/>
```

Important:
The `my.package.ContextClass` class should have a no-arguments constructor that will be called when the class is instantiated.

This will result in an instance being automatically generated. You can access this instance in an extension class by defining a field of that type and annotated with the `ro.sync.exml.plugin.PluginContext` annotation:

```
@PluginContext
ContextClass contextInstance;
```
The defined field is automatically populated with the single instance.

Tip:
By default, an instance of the PluginDescriptor class is also injectable.

Installing an Oxygen XML Author Plugin

Choose one of the following methods to install a plugin (on page 2819) in Oxygen XML Author:

**Manual Method**

To manually install a plugin in Oxygen XML Author, follow these steps:

1. Go to the Oxygen XML Author installation directory and locate the plugins directory.
   
   **Note:**
   The plugins directory contains all the plugins available to Oxygen XML Author.

2. In the plugins directory, create a subfolder to store the plugin files (for example, 
   \{OXYGEN_INSTALL_DIR\}/plugins/myPlugin).

3. In the new folder, place the plugin descriptor file (plugin.xml), the Java classes of the plugin, and the other files that are referenced in the descriptor file.

**Automatic Method**

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to Help > Install new add-ons.

2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the Show add-ons from field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml. If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose ALL AVAILABLE SITES from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Author version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

   **Note:**
   To see all the versions of the add-ons, deselect Show only compatible add-ons and Show only the latest version of the add-ons. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, click the Next button, then follow the on-screen instructions.
Note:
Accepting the license agreement of the add-on is a mandatory step in the installation process.

Note:
All add-ons are installed in the **extensions** directory inside the Oxygen XML Author preferences directory *(on page 125).*

Tip:
As an alternate approach, you can add an **Install** button to a web page that links to a URL that has the syntax `https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue` and drop the button into the application's main editing area.

Types of Plugin Extensions Available with the SDK

A plugin *(on page 2819)* can have one or more defined plugin extensions that provide functionality to the application. This section presents the plugin extensions that are available.

**Workspace Access Plugin Extension**

This type of plugin *(on page 2819)* allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an open editor.

The plugin must implement the `ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension` interface. The callback method `applicationStarted` of this interface allows access to a parameter of the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` type (allows for API access to the application workspace).

The `StandalonePluginWorkspace` interface has three methods that can be called to customize toolbars, menus, and views:

**addToolbarComponentsCustomizer**

Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated plugin.xml descriptor file using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ..............>
<runtime>
```
The `<toolbar>` element adds a toolbar in the Oxygen XML Author interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- **id** - Unique identifier for the toolbar.
- **initialSide** - Specifies the place where the toolbar is initially displayed. The allowed values are **NORTH** and **SOUTH**.
- **initialRow** - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of 0 and the next toolbar has an initial row of 1.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

**addViewComponentCustomizer**

Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated plugin.xml descriptor using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ..............>
  <runtime>
    ........
  </runtime>

  <extension type="WorkspaceAccess" ............../>
  ..............

  <view id="SampleID" initialSide="WEST" initialRow="0"/>
</plugin>
```

The `<view>` element adds a view in the Oxygen XML Author interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:
• **id** - Unique identifier of the view component.
• **initialSide** - Specifies the place where the view is initially displayed. The allowed values are: NORTH, SOUTH, EAST, and WEST.
• **initialRow** - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Author, the **Project view (on page 385)** has an initial row of 0 and the **Outline view (on page 521)** has an initial row of 1. Both views are in the WEST part of the workbench.
• **initialState** - Specifies the initial state of the view. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The `<view>` element also supports an optional `<perspective>` child element so that you can show or hide a certain view for a specified perspective. The `<perspective>` element supports the following attributes:

• **id** (required) - Unique identifier for the perspective. The possible values are: editor, dita, and database.
• **initState** (optional) - Specifies the initial state of the perspective. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

**addMenuBarCustomizer**

Contributes to or modifies existing menu components.

Access to the open editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)` API method. There are two available editing areas: the **DITA Maps Manager** editing area and the main editing area. Using the URL of an open resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the **Text mode** (`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`) and the **Author mode** (`ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

**Examples:**
A simple Maven-based sample of a workspace access plugin is available here: https://github.com/oxygenxml/sample-plugin-workspace-access.

A more complex sample of a workspace access plugin mimicking a CMS integration is available in the Author SDK: https://www.oxygenxml.com/oxygen_sdk.html.

Example: Adding a Custom View in Oxygen XML Author

To add a custom view in Oxygen XML Author, follow this procedure:

1. Locate the plugin.xml descriptor file for your plugin (should be located inside the plugins folder, for example, [OXYGEN_INSTALL_DIR]/plugins/myPlugin). Define the ID of the view you want to add and specify the location where it will be placed:

   ```xml
   <view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
   ```

2. In your Workspace Access Plugin Extension (on page 2043) implementation, where the applicationStarted callback is received, add a view component customizer like this:

   ```java
   pluginWorkspaceAccess.addViewComponentCustomizer(new ViewComponentCustomizer() {
       public void customizeView(ViewInfo viewInfo) {
           if ( //The view ID defined in the "plugin.xml"
               "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
               cmsMessagesArea = new JTextArea("CMS Session History:");
               viewInfo.setComponent(new JScrollPane(cmsMessagesArea));
               viewInfo.setTitle("CMS Messages");
               viewInfo.setIcon(Icons.getIcon(Icons.CMS_MESSAGES_CUSTOM_VIEW_STRING));
           }
       }
   });
   ```

3. Define the cmsMessagesArea as a static field (if you can access the messages area from anywhere in your code).

Related Information:
https://www.oxygenxml.com/oxygen_sdk/oxygen_standalone_plugins.html

Workspace Access Plugin Extension (JavaScript-Based)

This is a JavaScript-based plugin (on page 2819) extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the Workspace Access plugin extension (on page 2043), but the implementation is JavaScript-based and uses the bundled Rhino library to create and work with Java API from the JavaScript code.
First, you need to create a custom plugin folder inside the plugins folder (for example, 
\[OXYGEN_INSTALL_DIR\]/plugins/myPlugin). This folder will contain your custom plugin descriptor file (plugin.xml) and all other resources for the plugin.

The plugin descriptor file (named plugin.xml) needs to reference a JavaScript file, as in the following example:

```xml
<plugin
    id="unique.id.value"
    name="Add Action To DITA Maps Manager popup-menu"
    description="Plugin adds action to DITA Maps Manager contextual menu."
    version="1.0"
    vendor="Syncro Soft"
    class="ro.sync.exml.plugin.Plugin"
    classLoaderType="preferReferencedResources">
    <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file wsAccess.js (located in your custom plugin folder (on page 2047)) will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    ..........
}

function applicationClosing(pluginWorkspaceAccess) {
    ..........
}
```

With regard to the applicationStarted callback, besides using the ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace API with the pluginWorkspaceAccess parameter, you can also use a globally defined field called jsDirURL that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the DITA Maps Manager view (on page 2472). The action starts the notepad.exe application and passes the reference to the currently selected <topicref> to it.

```javascript
function applicationStarted(pluginWorkspaceAccess) {

    Packages.java.lang.System.err.println("Application started "+ pluginWorkspaceAccess);

    edChangedListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {

```
Packages.java.lang.System.err.println("\nrunning "+editorLocation);

/*Get the opened DITA Map*/
editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
ditaMapPage = editor.getCurrentPage();

/*Add listener called when right-click is done in the DITA Maps manager*/
customizerObj = {
customizePopUpMenu: function(popUp, ditaMapDocumentController) {
Packages.java.lang.System.err.println("RIGHT CLICK"+popUp);
tree = ditaMapPage.getDITAMapTreeComponent();

/*Selected tree path*/
.sel = tree.getSelectionPath();
if (sel != null) {
selectedElement = sel.getLastPathComponent();

/*Reference attribute*/
.href = selectedElement.getAttribute("href");
if (href != null) {
try {
/*Create absolute reference*/
absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(),
.href.getValue());
Packages.java.lang.System.err.println("Computed absolute reference 
+ absoluteRef);

.mi = new Packages.java.swing.JMenuItem("Run notepad");
.popUp.add(mi);
.actionPerfObj = {
.actionPerformed: function (e) {
try {
Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "
+ pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
}
catch (el) {
el.printStackTrace();
}
}
.mi.addActionListener(new JavaAdapter(Packages.java.awt.event.ActionListener,
.actionPerfObj));
}
catch (el) {
Packages.java.lang.System.err.println(el);
}
ditaMapPage.setPopUpMenuCustomizer(new Packages.ro.sync.exml.workspace.api.
editor.page.ditamap.DITAMapPopupMenuCustomizer(customizerObj));
}
}
edChangedListener = new JavaAdapter(Packages.ro.sync.exml.workspace.api.
listeners.WSEditorChangeListener, edChangedListener);
pluginWorkspaceAccess.addEditorChangeListener(
edChangedListener,
Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
}

function applicationClosing(pluginWorkspaceAccess) {

Packages.java.lang.System.err.println("Application closing "+pluginWorkspaceAccess);
}

### Declaring Multiple Modules

JavaScript-based plugins can include multiple modules of JavaScript files in the plugin. In those files, you can declare functions that can be used in the main `WorkspaceAccessJS` JavaScript file. Thus, you can use those external script files as a library of functions. The modules must be declared in the plugin descriptor file (`plugin.xml`).

For example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds action to DITA Maps Manager contextual menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule1.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule2.js"/>
</plugin>
```
For more information and some samples, see GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples.

**Trusted Hosts Plugin Extension**

This type of plugin (on page 2819) can be used by developers to automatically allow or reject remote connections that Oxygen XML Author would normally ask the user for confirmation.

The name of the plugin extension is `TrustedHosts`. For security reasons, Oxygen XML Author intercepts all connections to remote hosts and displays a dialog box that asks the user for confirmation. By implementing this plugin extension, the application will automatically allow or deny connections from websites you consider and configure as trusted or untrusted.

To develop an integration project, follow these steps:

- Copy the oxygen.jar file from `OXYGEN_INSTALL_DIR/lib` to the lib folder of your project.
- Implement the `ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension` extension point.
- In the plugin descriptor file, define the `<extension>` element that points to the implementation of your classes:

```xml
<extension type="TrustedHosts" class="my.trusted.hosts.provider.class.qualified.name"/>
```

Detailed information regarding the accepted or rejected connections from plugins are logged in the Information view (on page 494).

Example implementation:

```java
import ro.sync.exml.plugin.workspace.security.Response;
import ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension;

public class DummyTrustedHostsProviderImpl implements TrustedHostsProviderExtension {
    @Override
    public Response isTrusted(String hostName) {
        // Connections from this website will always be
        // considered safe and always accepted.
        if ("trusted.website:80".equals(hostName)) {
            return TRUSTED;
        } else if ("malicious.website:80".equals(hostName)) {
            // Always reject connections from malicious website
            return UNTRUSTED;
        }
        // All other connections are unknown, so a dialog will
        // appear and ask user's confirmation
        // to allow or deny the connection to this website.
    }
```
Author Stylesheet Plugin Extension

This type of plugin (on page 2819) allows you to add a stylesheet (CSS or LESS) that renders elements in Author mode.

To specify additional stylesheets, edit the plugin descriptor and add <extension> elements that point to them, as in the following example:

```xml
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```

Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in Author mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the StylesFilter plugin extension (on page 2059).

Additional Framework Plugin Extension

This type of plugin (on page 2819) allows you to add a new framework straight from the plugin.

To specify additional frameworks, edit the plugin descriptor and add <extension> elements that point to them, as in the following example:

```xml
<extension type="AdditionalFrameworks" path="framework_directory"/>
```

The path attribute should be a sub-directory of the plugin. If the plugin is installed as an add-on (on page 119), the new framework will be set as read-only and editing it will only be possible if you duplicate it (on page 138). If the plugin is installed in the [OXYGEN_INSTALL_DIR]/plugins directory, the new frameworks will be editable.

Additional XProc Engine Plugin Extension

This type of plugin (on page 2819) contributes a folder that contains an external XProc engine.

The name of the plugin extension is AdditionalXprocEngine and it makes it easier to integrate an external XProc engine (on page 1143). After the plugin is installed, when you run an XProc transformation scenario, your external XProc engine can be selected from the Processor drop-down menu in the XProc tab.

An example of the plugin.xml file looks like this:

```xml
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
/>
The @path attribute points to the XProc engine folder that contains the engine.xml and all the libraries necessary to run it.

Components Validation Plugin Extension

This type of plugin (on page 2819) allows you to customize the menus, toolbars, and other components by enabling or filtering them from the user interface.

This plugin provides the following API:

ComponentsValidatorPluginExtension interface

There is one method that must be implemented:

getComponentsValidator()

Returns a ro.sync.exml.ComponentsValidator implementation class used for validating the menus, toolbars, and their actions.

ComponentsValidator interface

Provides methods to filter various features from being added to the GUI of Oxygen XML Author:

validateMenuOrTaggedAction(String[] menuOrActionPath)

Checks if a menu or a tag action from a menu is allowed and returns a boolean value. A tag is used to uniquely identifying an action. The String[] argument is the tag of the menu / action and the tags of its parent menus if any.

validateToolbarTaggedAction(String[] toolbarOrAction)

Checks if an action from a toolbar is allowed and returns a boolean value. The String[] argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

validateComponent(String key)

Checks if the given component is allowed and returns a boolean value. The String argument is the tag identifying the component. You can remove toolbars entirely using this callback.

validateAccelAction(String category, String tag)
Checks if the given accelerator action is allowed to appear in the GUI and returns a boolean value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.

`validateContentType(String contentType)`

Checks if the given content type is allowed and returns a boolean value. The String argument represents the content type. You can instruct Oxygen XML Author to ignore content types such as `text/xsl` or `text/xquery`.

`validateOptionPane(String optionPaneKey)`

Checks if the given options page can be added in the preferences option tree and returns a boolean value. The String argument is the option pane key.

`validateOption(String optionKey)`

Checks if the given option can be added in the option page and returns a boolean value. The String argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.

`validateLibrary(String library)`

Checks if the given library is allowed to appear listed in the About dialog box and returns a boolean value. The String argument is the library. This method is mostly for internal use.

`validateNewEditorTemplate(EditorTemplate editorTemplate)`

Checks if the given template for a new editor is allowed and returns a boolean value. The EditorTemplate argument is the editor template. An EditorTemplate is used to create an editor for a given extension. You can thus filter what appears in the list of the New dialog box.

`validateSHMarker(String marker)`

Checks if the given marker is allowed and returns a boolean value. The String argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.

`validateToolbarComposite(String toolbarCompositeTag)`

Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

Tip:
The best way to decide what to filter is to observe the values that Oxygen XML Author passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.
Contribute Additional Languages Plugin Extension

This type of plugin (on page 2819) allows you to contribute new translation languages to the Oxygen XML Author UI.

The AdditionalUITranslation plugin extension provides the ability to contribute new translation languages to the interface in Oxygen XML Author.

A sample plugin.xml file looks like this:

```xml
<plugin
  id="romanian.i18n.provider"
  name="Add Romanian as an user interface language"
  description="Add Romanian as an user interface language"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```

where the translation.xml has a structure like this:

```xml
<translation>
  <languageList>
    <language description="Romanian" lang="ro_RO" localeDescription="Romana"/>
  </languageList>
  <key value="Error">
    <val lang="ro_RO">Eroare</val>
  </key>
  ......................
</translation>
```

If all error keys are not translated in the custom translation.xml contributed by the plugin, the fallback is the default English translation. Once this plugin is installed, the Languages drop-down menu in the Options > Preferences > Global (on page 126) will be updated to include the newly added languages. The end-user will still need to select that language in the drop-down menu to use it.

Contribute External DITA-OT Distribution Plugin Extension

This type of plugin (on page 2819) allows you to contribute an external DITA-OT distribution to Oxygen XML Author.

Oxygen XML Author comes bundled with DITA-OT version 4.1.1. If you want to use a different DITA-OT version, the AdditionalDITAOT plugin extension provides the ability to contribute an external distribution of the DITA Open Toolkit to Oxygen XML Author.

Example
For instance, if you wanted to use a DITA-OT version 1.8, your plugin.xml file might look like this:

```xml
<plugin id="dita-ot-18" name="Contribute DITA-OT 1.8" description="Contributes DITA-OT 1.8" version="1.0" vendor="Syncro Soft" class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalDITAOT" path="DITA-OT1.8.5" description="DITA-OT 1.8"/>
</plugin>
```

The `@path` attribute points to a folder located relative to the plugin.xml file and this folder is where the additional distribution of DITA-OT would be located.

When Oxygen XML Author is started with this plugin enabled, that addition DITA-OT version can now be selected in the DITA Open Toolkit option in the DITA preferences page (on page 259).

**Custom Protocol Plugin Extension**

This type of plugin (on page 2819) allows you to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

**URLStreamHandlerPluginExtension interface**

There is one method that must be implemented:

```java
getURLStreamHandler(String protocol)
```

It takes as an argument the name of the protocol and returns a URLStreamHandler object, or null if there is no URL handler for the specified protocol.

This type of plugin extension can be usually combined with a Workspace Access plugin extension (on page 2043) that can add a custom toolbar with custom actions for opening documents from a certain source.

As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

**URLChooserPluginExtension2 interface**

Makes it possible to create your own dialog box that works with the custom protocol. This interface provides two methods:

```java
chooseURLs(StandalonePluginWorkspace workspaceAccess)
```

Returns a URL[] object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then
return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Author.

**getMenuName()**

Returns a String object that is the name of the entry added in the File menu.

**URLChooserToolbarExtension interface**

Makes it possible to provide a toolbar entry that is used for launching the custom URLs chooser from the URLChooserPluginExtension implementation. This interface provides two methods:

**getToolbarIcon()**

Returns the javax.swing.Icon image used on the toolbar.

**getToolbarTooltip()**

Returns a String that is the tooltip used on the toolbar.

**Lock Handler Plugin Extension**

This type of plugin extension (on page 2819) is used for locking resources from a specific protocol.

It provides the following API:

**LockHandlerFactoryPluginExtension interface**

You need to implement the following two methods:

**LockHandler getLockHandler()**

Gets the lock handler for the current handled protocol. Might be null if not supported.

**boolean isLockingSupported(String protocol)**

Checks if a lock handler can be provided for a specific protocol.

To use this type of extension in your plugin, create an extension of LockHandlerFactory type in your plugin.xml file and specify the class implementing LockHandlerFactoryPluginExtension:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler" .............>
 <runtime>
 ........
 </runtime>

<extension type="LockHandlerFactory"
            class="LockHandlerFactoryPluginExtensionImpl"/>
 .............
```
Open Redirect Plugin Extension

This type of plugin is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the Archive Browser view a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface OpenRedirectExtension. It only has one callback: redirect(URL) that receives the URL of the file opened by the Oxygen XML Author user. If the plugin decides to open also other files it must return an array of information objects (OpenRedirectInformation[]) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, text/xml). The content type is used for determining the type of editor panel. A null content type allows auto-detection of the file type.

Option Page Plugin Extension

This type of plugin allows you to add custom Preferences pages.

The extension must implement the ro.sync.exml.plugin.option.OptionPagePluginExtension class. The provided callbacks allows you to create a custom Swing component that will be added to the page and to react to various calls to persistently save the page settings using the OptionsStorage API.

All preferences pages that are contributed by a plugin are listed in the Preferences dialog box in the Plugins category. As long as the added preferences page has the same name as its plugin, it will be promoted to the first level of the hierarchy within the Plugins category.

The plugin.xml configuration file can specify one or more such extensions using constructs like this:

```xml
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension"/>
```

Sharing Options Through Project Files

To share options that are configured in certain plugin preferences pages, you can store them in a project file (.xpr file extension) that can easily be shared with others. To do this, perform these steps:

1. Override ro.sync.exml.plugin.option.OptionPagePluginExtension.getProjectLevelOptionKeys() and return a set of options that need to be saved inside the project.
2. Install the plugin in an Oxygen XML Author instance (on page 2042).
3. In the Project view (on page 385), create a project or open an existing one.
4. Open the Preferences dialog box (Options > Preferences) (on page 124).
5. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to Project Options (on page 2819) in each page.
Note:
Some pages do not have the Project Options button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

6. Click **OK** and close the Preferences dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

Note:
The project file extension (`.xpr`) must be preserved when the file is distributed to others.

Notice:
When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

**Option Page Group Plugin Extension**

This type of plugin extension (on page 2819) allows you to add a group of custom Preferences pages from a plugin.

The extension must implement the `ro.sync.exml.plugin.OptionsPageGroupPluginExtension` class. The base method `OptionsPageGroupPluginExtension.addOptionPagePluginExtension(...)` allows adding multiple implementations of the `OptionPagePluginExtension` (on page 2057) base class.

All preferences pages that are contributed by this extension are listed as descendents of the plugin specific preferences page in the Preferences dialog box in the Plugins category.

The `plugin.xml` configuration file can specify one or more such extensions using constructs like this:

```xml
<extension type="OptionPageGroup" class="my.pack.CustomOptionPageGroupPluginExtension"/>
```

**Resource Locking Custom Protocol Plugin Extension**

This type of plugin (on page 2819) allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource when opening it in Oxygen XML Author.

This type of plugin extends the custom protocol plugin type with resource locking support and provides the following API:

**URLStreamHandlerWithLockPluginExtension interface**

The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Author.
There are two additional methods that must be implemented:

- **getLockHandler()**
  
  Returns a `LockHandler` implementation class with the implementation of the lock specific methods from the `plugin`.

- **isLockingSupported(String protocol)**
  
  Returns a `boolean` that is `true` if the `plugin` accepts to manage locking for a certain URL protocol scheme (such as `ftp`, `http`, `https`, or `customName`).

### Styles Filter Plugin Extension

This type of *plugin* (**on page 2819**) allows you to dynamically modify the CSS styles used to render elements in the **Author** mode.

The *plugin* must extend the `ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension` class. This class has a callback on which you can alter the styles for an **Author** mode element.

This extension point is similar with the Styles Filter that you set at the **framework** (**on page 2817**) level. The only difference is that the *plugin* filters styles are used for any open XML document, regardless of the document type. The changes made by this *plugin* are prioritized over the changes made by the **framework**-level filter.

**Note:** Alternatively, you can use the *AuthorStylesheet plugin extension* (**on page 2051**), which does not require any additional Java development and is compatible with Oxygen XML Web Author.

**Related Information:**

- Customizing the CSS Styles Filter (**on page 1889**)

### Targeted URL Stream Handler Plugin Extension

This type of *plugin* (**on page 2819**) can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This *plugin* extension can handle the following protocols: `http`, `https`, `ftp` or `sftp`. Oxygen XML Author usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension prompts for the URL stream handler for each open connection of a URL that has that protocol.

To use this type of *plugin*, you have to implement the `ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension` interface that provides the following methods:

- **boolean canHandleProtocol(String protocol)**
This method checks if the plugin can handle a specific protocol. If this method returns `true` for a specific protocol, the `getURLStreamHandler(URL)` method will be called for each open connection of a URL having this protocol.

URLStreamHandler `getURLStreamHandler(URL url)`

This method provides the URL handler for the specified URL and it is called for each open connection of a URL with a protocol that has the `canHandleProtocol(String)` method return `true`.

If this method returns `null`, the default Oxygen XML Author `URLStreamHandler` is used.

To use this method of extension in your plugin, create an extension of `TargetedURLHandler` type in your `plugin.xml` file and specify the class that implements `TargetedURLStreamHandlerPluginExtension`:

```xml
<extension type="TargetedURLHandler" class="CustomTargetedURLStreamHandlerPluginExtension"/>
```

This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Author `HTTP URLStreamHandler` may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Author) to use the default SUN `URLStreamHandler`, since it is more compatible with sending and receiving SOAP requests.

```java
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {
        boolean handleProtocol = false;
        if ("http".equals(protocol) || "https".equals(protocol)) {
            // This extension handles both HTTP and HTTPS protocols
            handleProtocol = true;
        }
        return handleProtocol;
    }
}
```
@Override
public URLStreamHandler getURLStreamHandler(URL url) {
    // This method is called only for the URLs with a protocol where canHandleProtocol(String) method returns true (HTTP and HTTPS)
    URLStreamHandler handler = null;
    String host = url.getHost();
    String protocol = url.getProtocol();
    if ("some_host".equals(host)) {
        // When there are connections opened from some_host, the SUN HTTP(S)
        // handlers are used
        if ("http".equals(protocol)) {
            handler = (URLStreamHandler) Class.forName("sun.net.www.protocol.http.Handler")
                .getConstructor(new Class[0]).newInstance(new Object[0]);
        } else {
            handler = (URLStreamHandler) Class.forName("sun.net.www.protocol.https.Handler")
                .getConstructor(new Class[0]).newInstance(new Object[0]);
        }
    }
    return handler;
}

XML Refactoring Operations Plugin Extension

This type of plugin (on page 2819) allows you to specify one or more directories where the XML Refactoring operation resources are loaded.

The RefactoringOperationsProvider extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Author will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

Example: XML Refactoring Operations Plugin Extension

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" ".//plugin.dtd">

<plugin
    id="refactoring.operations"
    name="Refactoring operations plugin"
    description="Contains operation descriptors and related scripts"
    version="1.0">
    <extension type="RefactoringOperationsProvider">
```
XSLT Transformer Plugin Extension

This type of plugin (on page 2819) allows you to add an external XSLT transformer plugin.

The name of the plugin is Transformer and it makes it easier to contribute your own implementation of the XSLT Processor. After the plugin is installed, you can create a new XML transformation with XSLT scenario (on page 1074) and select your external XSLT engine from Transformer drop-down menu in the XSLT tab.

To create an XSLT integration project, follow these steps:

- Copy the oxygen.jar file from [OXYGEN_INSTALL_DIR]/lib to the lib folder of your project.
- Copy the jars of your transformer to the lib folder of your project.
- Implement the ro.sync.exml.plugin.transform.XSLTTransformerPluginExtension interface.
- In the plugin descriptor file, define the <extension> element that points to the implementation of your classes:

```xml
<extension type="Transformer" class="my.xslt.plugin.extension"/>
```

Validator Plugin Extension

This type of plugin (on page 2819) allows you to add an external validation engine from a plugin.

The name of the plugin extension is DocumentValidator and it makes it possible to contribute your own implementation of a validation engine. After the plugin is installed, if you create a new validation scenario or edit an existing validation scenario to add a validation stage, you will find the name of the new engine contributed by the plugin in the Validation Engine combo box.

To create a plugin that implements the validator extension:

1. Implement the ro.sync.exml.plugin.validator.ValidatorPluginExtension interface in your plugin's libraries.
2. In the plugin descriptor file, define the <extension> element that points to the implementation of your classes:

```xml
<extension type="DocumentValidator" class="my.validator.plugin.extension"/>
```

Saxon XSLT Transformer Plugin Extension

This type of plugin (on page 2819) allows you to add an external Saxon XSLT transformer plugin.

The name of the plugin is Transformer and it makes it easier to contribute your own implementation of the Saxon XSLT Processor. After the plugin is installed, you can create a new XML transformation with XSLT scenario (on page 1074) and select your external Saxon engine from Transformer drop-down menu in the XSLT tab.
To create an XSLT integration project, follow these steps:

- Copy the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the Saxon jars to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.SaxonXSLTTransformerPluginExtension` interface.
- In the `plugin` descriptor file, define the `<extension>` element that points to the implementation of your classes, following example:

```
<extension type="Transformer" class="my.saxon.xslt.plugin.extension"/>
```

An add-on that implements the Saxon XSLT transformer can be found here: [Saxon XSLT and XQuery Transformer Add-on (on page 2221)](on). For more information, see the [Oxygen XML SDK Add-on Repositories web page](on).

### XQuery Transformer Plugin Extension

This type of `plugin` ([on page 2819](on)) allows you to add an external XQuery transformer `plugin`.

The name of the `plugin` is `XQueryTransformer` and it makes it easier to contribute your own implementation of the `XQuery Processor`. After the plugin is installed, you can create a new `XQuery transformation scenario (on page 1145)` and select your external XQuery engine from `Transformer` drop-down menu in the `XQuery` tab.

To create an XQuery integration project, follow these steps:

- Copy the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the jars of your transformer to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.XQueryTransformerPluginExtension` interface.
- In the `plugin` descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="XQueryTransformer" class="my.xquery.plugin.extension"/>
```

### Saxon XQuery Transformer Plugin Extension

This type of `plugin` ([on page 2819](on)) allows you to add the Saxon external XQuery transformer `plugin`.

The name of the `plugin` is `XQueryTransformer` and it makes it easier to contribute your own implementation of the `Saxon XQuery Processor`. After the plugin is installed, you can create a new `XQuery transformation scenario (on page 1145)` and select your Saxon external XQuery engine from `Transformer` drop-down menu in the `XQuery` tab.

To create an XQuery integration project, follow these steps:

- Copy the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
- Copy the Saxon jars to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.SaxonXQueryTransformerPluginExtension` interface.
In the *plugin* descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="XQueryTransformer" class="my.saxon.xquery.plugin.extension"/>
```

An add-on that implements the Saxon XQuery transformer can be found here: Saxon XSLT and XQuery Transformer Add-on *(on page 2221)*. For more information, see the Oxygen XML SDK Add-on Repositories web page.

**Plugin Extensions Designed to Work only in the Text Editing Mode**

These *plugin* *(on page 2819)* extensions operate only when editing documents in the *Text* mode. They are mounted automatically by the application on the contextual menu in the *Plugins* submenu.

The *Workspace Access Plugin Extension* *(on page 2043)* offers an API that can be used to implement similar functionality for both *Text* and *Author* mode.

**General Plugin Extension**

This type of *plugin* *(on page 2819)* allows you to invoke custom code to interact with the workspace in *Text* mode.

This *plugin* is the most general *plugin* type and provides a limited API:

**GeneralPluginExtension interface**

Intended for general-purpose *plugins*, kind of external tools but triggered from the *Plugins* menu. The implementing classes must provide the method `process(GeneralPluginContext)`, which must provide the *plugin* processing. This method takes as a parameter a *GeneralPluginContext* object.

**GeneralPluginContext class**

Represents the context in which the general *plugin* extension does its processing. The `getPluginWorkspace()` method allows you access to the workspace of Oxygen XML Author.

**Selection Plugin Extension**

This type of *plugin* *(on page 2819)* allows you to manage selections of text.

A *selection* *plugin* can be applied to both XML and non-XML documents. The *plugin* is started by making a selection in the editor, then selecting the corresponding menu item from the *Plugins* submenu in the contextual menu of *Text* mode.

This *plugin* type provides the following API:

**SelectionPluginExtension interface**

The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The `process(GeneralPluginContext)` method must return a *SelectionPluginResult* object that contains the result of the processing. The *String* value
SelectionPluginResult object can include editor variables (on page 313) such as ${caret} and ${selection}.

**SelectionPluginContext object**

Represents the context and provides four methods:

- **getSelection()** - Returns a `String` that is the current selection of text.
- **getFrame()** - Returns a `Frame` that is the editing frame.
- **getPluginWorkspace()** - Returns access to the workspace of Oxygen XML Author.
- **getDocumentURL()** - Returns the URL of the currently edited document.

**Related information**

Editor Variables (on page 313)

**Example - Uppercase Plugin**

The following plugin (on page 2819) is called **UppercasePlugin** and is an example of a Selection plugin. (on page 2064). It is used in Oxygen XML Author for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor file (plugin.xml):

- **UppercasePlugin.java**:

```java
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {

  /**
   * Plugin instance.
   */
  private static UppercasePlugin instance = null;

  /**
   * UppercasePlugin constructor.
   */
  * @param descriptor Plugin descriptor object.
  */
  public UppercasePlugin(PluginDescriptor descriptor) {
    super(descriptor);

    if (instance != null) {
      throw new IllegalStateException("Already instantiated !");
    }
  }
}
```
```java
instance = this;

/**
 * Get the plugin instance.
 * @return the shared plugin instance.
 */
public static UppercasePlugin getInstance() {
    return instance;
}

• UppercasePluginExtension.java:

```java
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {
    /**
     * Convert the text to uppercase.
     * @param context Selection context.
     * @return Uppercase plugin result.
     */
    public SelectionPluginResult process(SelectionPluginContext context) {
        return new SelectionPluginResultImpl(
            context.getSelection().toUpperCase());
    }
}

• plugin.xml:

```xml
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
```
Document Plugin Extension

This type of plugin (on page 2819) allows you to manage the current document.

The document plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode. It provides the following API:

**DocumentPluginExtension** interface

Receives the context object containing the current document. The process(GeneralPluginContext) method can return a DocumentPluginResult object containing a new document.

**DocumentPluginContext** object

Represents the context and provides three methods:

- **getDocument()** - Returns a javax.swing.text.Document object that represents the current document.
- **getFrame()** - Returns a java.awt.Frame object that represents the editing frame.
- **getPluginWorkspace()** - Returns access to the workspace of Oxygen XML Author.

How to Write a CMS Integration Plugin

To have a complete integration between Oxygen XML Author and a CMS, you usually have to write a plugin (on page 2819) that combines the following two available plugin extensions:

- **Workspace Access (on page 2043)**
- **Custom protocol (on page 2072)**

The usual set of requirements for an integration between Oxygen XML Author and the CMS are as follows:
1. Contribute to the Oxygen XML Author toolbars and main menu with your custom **Check Out** and **Check In** actions:
   - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
   - **Check In** allows you to send the modified content back to the server.

   You can use the **Workspace Access plugin extension** (and provided sample Java code) for all these operations.

2. When **Check Out** is called, use the Oxygen XML Author API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Author. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```java
/**
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */

private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess)
    throws MalformedURLException {
    //TODO Show the user a custom dialog box for browsing the CMS
    //TODO after user selected the resource create a URL with a custom protocol
    //which will uniquely map to the resource on the CMS using the URLHandler
    //something like:
    URL customURL = new URL("mycms://host/path/to/file.xml");
    //Ask Oxygen to open the URL
    pluginWorkspaceAccess.open(customURL);
    //Oxygen will then your custom protocol handler to provide the contents for
    //the resource "mycms://host/path/to/file.xml"
    //Your custom protocol handler will check out the file in a temporary
    //directory, for example, and provide the content from it.
    //Oxygen will also pass through your URLHandler if you have any relative
    //references which need to be opened/obtained.
}
```
Figure 389. Check Out Process Diagram

The phases are:

- 1 - Browse CMS repository
- 2 - User chooses a resource
- 3 - Use API to open custom URL: `mycms://path/to/file.xml`
- 4 - Get content of URL: `mycms://path/to/file.xml`
- 5 - Get content of resource
- 6 - Store on disk for faster access
- 7 - Retrieve content from disk if already checked out
- 8 - Retrieved content

3. Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Author where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action). Sample code:

```java
//Add an additional browse action to all dialog boxes/places
//where Oxygen allows selecting a URL.
pluginWorkspaceAccess.addInputURLChooserCustomizer(
    new InputURLChooserCustomizer() {

        public void customizeBrowseActions(
            List<Action> existingBrowseActions, final InputURLChooser chooser) {

            //IMPORTANT, you also need to set a custom icon on the action
            //for situations when its text is not used for display.
```
When inserting references to other resources using the actions already implemented in Oxygen XML Author, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way that the reference is made relative for a specific protocol like this:

```java
//Add a custom relative reference resolver for your custom protocol.
//Usually when inserting references from one URL to another Oxygen
//makes the inserted path relative.
//If your custom protocol needs special relativization techniques then
//it should set up a custom relative references resolver to be notified when resolving needs to be done.
pluginWorkspaceAccess.addRelativeReferencesResolver(
    //Your custom URL protocol that you already have a
custom URLStreamHandlerPluginExtension set up.
"mycms",
    //The relative references resolver
new RelativeReferenceResolver() {
    public String makeRelative(URL baseURL, URL childURL) {
        //Return the referenced path as absolute for example.
        //return childURL.toString();
        //Or return null for the default behavior.
        return null;
    }
});
```
4. Write the `plugin.xml` descriptor file. Your plugin combines the two extensions using a single set of libraries. The descriptor would look like this:

```xml
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
  name="CustomCMSAccess"
  description="Test"
  version="1.0.0"
  vendor="ACME"
  class="custom.cms.CMSAccessPlugin">
  <runtime>
    <library name="lib/cmsaccess.jar"/>
  </runtime>
  <!--Access to add actions to the main menu and toolbars or to add custom views.-->
  <!--See the "CustomWorkspaceAccessPluginExtension" Java sample for more details-->
  <extension type="WorkspaceAccess"
    class="custom.cms.CustomWorkspaceAccessPluginExtension"/>
  <!--The custom URL handler that will communicate with the CMS implementation-->
  <!--See the "CustomProtocolURLHandlerExtension" Java sample for more details-->
  <extension type="URLHandler"
    class="custom.cms.CustomProtocolURLHandlerExtension"/>
</plugin>
```

5. Create a `cmsaccess.jar` JAR (on page 2817) archive containing your implementation classes.
6. Copy your new plugin directory in the `plugins` subfolder of the Oxygen XML Author install folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`) and start Oxygen XML Author.

**Related Information:**
https://github.com/oxygenxml/oxygen-cmis-plugin
https://github.com/axxepta/project-argon

**Class Loading Issues**

It is possible that the Java libraries you have specified in the `plugin` libraries list conflict with the ones already loaded by Oxygen XML Author. To instruct the `plugin` to prefer its libraries over the ones used by Oxygen XML Author, you can add the following attribute on the `<plugin>` root element:

```
classLoaderType="preferReferencedResources" from the plugin.xml descriptor file.
```

A Late Delegation Class Loader (the main class loader in Oxygen XML Author) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Author Class Loader uses as libraries all JARS specified in the `\lib` directory. Its parent class loader is the default JVM Class loader. For each `plugin` instance, a separate class loader is created having as parent the Oxygen XML Author Class Loader.
The **plugin** class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Author `LateDelegationClassLoader`.

If you experience additional problems, such as:

```java
java.lang.LinkageError: ClassCastException:
  attempting to cast
  jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/javax/xml/ws/spi/Provider.class
to jar:file:/D:/Program Files/Oxygen XML Editor 12/plugins/wspcaccess/../../../xdocs/lib/jaxws/jaxws-api.jar!/javax/xml/ws/spi/Provider.class
  at javax.xml.ws.spi.Provider.provider(Provider.java:94)
  at javax.xml.ws.Service.<init>(Service.java:56)
  ............................................
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a `try/finally` statement:

```java
ClassLoader oldClassLoader =
    Thread.currentThread().getContextClassLoader();
try {
    //This is the implementation of the
    //WorkspaceAccessPluginExtension plugin interface.
    Thread.currentThread().setContextClassLoader(
        CustomWorkspaceAccessPluginExtension.
            this.getClass().getClassLoader());
    //WRITE YOUR CODE HERE
} finally {
    Thread.currentThread().
        setContextClassLoader(oldClassLoader);
}
```

**How to Write A Custom Protocol Plugin**

To create a custom protocol **plugin** *(on page 2819)*, follow these steps:

1. Write the handler class for your protocol that implements the `java.net.URLStreamHandler` interface. Be careful to provide ways to encode and decode the URLs of your files.
2. Write the **plugin** class by extending `ro.sync.exml.plugin.Plugin`.
3. Write the **plugin** extension class that implements the `ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface.
It is necessary that the plugin extension for the custom protocol implements the URLStreamHandlerPluginExtension interface. Without it, you cannot use your plugin, because Oxygen XML Author is not able to find the protocol handler.

You can choose also to implement the URLChooserPluginExtension interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension URLHandlerReadOnlyCheckerExtension allows you to:

◦ Mark a resource as read-only when it is opened.
◦ Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the plugin.xml descriptor file.
   Remember to set the name of the plugin class to the one from the second step and the plugin extension class name with the one you have chosen at step 3.

5. Create a JAR (on page 2817) archive with all these files.

6. Create a custom plugin folder inside the plugins folder (for example, \{OXYGEN_INSTALL_DIR\}/plugins/myPlugin) that contains your new plugin.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Author both through a framework (on page 2817) and through a plugin (on page 2819). Normally, a framework and a plugin both run in their own private classloader. If the framework and the plugin use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

To do this, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select the document type, go to the Classpath tab, and in the Use parent classloader from plugin with ID fields introduce the ID of the plugin. This ID is declared in the configuration file of the plugin (on page 2040).

If you have created the framework using a Framework Extension Script, then edit the script and specify the plugin ID on the classpath (on page 1762).

⚠️ Important:

The shared classes must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.
Packing and Deploying Plugins as Add-ons

In Oxygen XML Author, a plugin can be packed and deployed as an add-on to provide additional functionality to the application.

Packing a Plugin as an Add-on

This procedure is suitable for developers who want a better control over the add-on (on page 2819) package or those who want to automate some of the steps:

1. Pack the plugin (on page 2819) as a ZIP file or a Java Archive (on page 2817). Note that you should pack the entire root directory not just its contents.
2. [Optional] If you created a Java Archive at the previous step, digitally sign the package. You will need a certificate signed by a trusted authority. To sign the JAR, you can either use the jarsigner command-line tool inside Oracle's Java Development Kit (JDK_DIR)/bin/jarsigner.exe or if you are working with Apache Ant (on page 2814), you can use the signjar task (a front for the jarsigner command-line tool). The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate, you can generate one yourself using the keytool command-line utility.

Note:
This approach is recommended for tests since anyone can create a self-signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Author provides by going to File > New and selecting the Oxygen add-ons update site template. The products the add-on is compatible with can be specified in the template. Once deployed, this descriptor file is referenced as update site.

Deploying an Add-on

To deploy an add-on, copy the ZIP or Java Archive (on page 2817) file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.

Related Information:
Packing and Deploying Frameworks as Add-ons (on page 1916)
Oxygen XML Add-on Repositories

Testing Plugins and Java Extensions

In the various procedures for creating a plugin (on page 2819), you are usually instructed to copy your plugin folder to the (OXYGEN_INSTALL_DIR)/plugins/ directory. If you want to test the code in your plugin without copying it to that folder, follow this procedure:
1. Create a file called `plugin.redirect` that contains the full file path references to your project (for example, `C:\Users\john_doe\Documents\sample-plugin-folder`).

2. Save that file in any folder (for example, called `sample_test_folder`) inside the `\{OXYGEN_INSTALL_DIR\}/plugins/` directory.

**Step Result:** Oxygen XML Author will automatically load the plugin from your project location.

3. Now you can modify the Java code, the IDE will automatically compile it, and if the `plugin.xml` file has a classpath reference to the compiled classes folder, you can restart Oxygen XML Author and test your changes.

### Creating and Running Automated Tests

If you have developed complex custom plugins (on page 2819) or frameworks (on page 2817) (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Author standalone installation includes a main `oxygen.jar` library located in the `\{OXYGEN_INSTALL_DIR\}`. That JAR (on page 2817) library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop JUnit tests for your customizations using the Eclipse workbench, follow these steps:

1. Create a new Eclipse Java project and copy the entire contents of the `\{OXYGEN_INSTALL_DIR\}` folder to the new project under the `oxygen` sub-directory.
2. Add all JAR libraries present in the `./oxygen/lib` directory to the Java Build Path->Libraries tab.
   Make sure that the main JAR library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the Order and Export tab.
3. Click Add Library and add the JUnit and JFCUnit libraries.
4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.
5. Pass the following parameters to the constructor of the super class:
   - **File installationFolder** - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started. According to step 1, it should be `oxygen`.
   - **File frameworksFolder** - The file path to the frameworks directory. It can point to a custom framework directory where it resides. According to step 1, it should be `oxygen/frameworks`.
   - **File pluginsFolder** - The file path to the plugins directory. It can point to a custom plugin directory where it resides. According to step 1, it should be `oxygen/plugins`.
   - **File optionsFolder** - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
String licenseKey - The license key used to license the test class.

int productID - The ID of the product and should be one of the following:

PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT, PluginWorkspaceTCBase.XML_EDITOR_PRODUCT, or
PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them.

Debugging a Plugin Using IntelliJ IDEA

To use IntelliJ IDEA to debug problems in the code of a plugin (on page 2819) without having to re-bundle the plugin's Java classes in a JAR (on page 2817) library, follow these steps:

1. Download and install Oxygen XML Author.
2. Set up the Oxygen SDK following this set of instructions.
3. Create a Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where IntelliJ IDEA copies the compiled output. To find out where this directory is located, go to File > Project Structure. Then select the Modules category and inspect the value of the Output path text box from the Path tab.

Example: If the output path is C:/Users/myUser/Documents/MyPluginProject/target/classes, then in the plugin.xml, you need to add the following library reference in the runtime element:

```xml
<library name="../target/classes"/>
```

5. Copy the plugin.dtd from the [OXYGEN_INSTALL_DIR]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject dependencies (File > Project Structure > Modules > Dependencies), add external JAR references to all the JAR libraries in the [OXYGEN_INSTALL_DIR]/lib folder. Now your MyPluginProject should compile successfully.
7. In IntelliJ IDEA, create a new Java Application configuration for debugging (Run > Edit Configurations... > + > Application). Set the Main class box to ro.sync.exml.Oxygen and add the following code snippet in the VM options input box, making sure that the path to the plugins directory is the correct one:

```bash
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
-Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

Note:
If you need to configure the plugin for Oxygen XML Author, set the com.oxygenxml.app.descriptor to ro.sync.exml.AuthorFrameDescriptor.
Debugging a Plugin Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of a plugin (on page 2819) without having to re-bundle the plugin's Java classes in a JAR (on page 2817) library, follow these steps:

1. Download and install Oxygen XML Author.
2. Set up the Oxygen SDK following this set of instructions.
3. Create an Eclipse Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the Project view (on page 385)), and go to Build Path > Configure Build Path. Then inspect the value of the Default output folder text box.

Example: If the compiled output folder is classes, then in the plugin.xml, you need to add the following library reference:

```xml
<library name="../classes"/>
```

5. Copy the plugin.dtd from the {OXYGEN_INSTALL_DIR}/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject build path, add external JAR references to all the JAR libraries in the {OXYGEN_INSTALL_DIR}/lib folder. Now your MyPluginProject should compile successfully.
7. In the Eclipse IDE, create a new Java Application configuration for debugging. Set the Main class box to ro.sync.exml.Oxygen. Click the Arguments tab and add the following code snippet in the VM arguments input box, making sure that the path to the plugins directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
-Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

Note:

If you need to configure the plugin for Oxygen XML Author, set the com.oxygenxml.app.descriptor to ro.sync.exml.AuthorFrameDescriptor.

In the Dependencies tab, you should only add dependencies to two JAR libraries:

{OXYGEN_INSTALL_DIR}/lib/oxygen.jar and {OXYGEN_INSTALL_DIR}/lib/oxygen-basic-utilities.jar.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of an extension (on page 2819) without having to bundle its Java classes in a JAR (on page 2817) library, perform the following steps:
1. **Download** and install Oxygen XML Author.
2. Create an Eclipse Java Project (for example, `MySDKProject`) with the corresponding Java sources (for example, a custom implementation of the `ro.sync.ecss.extensions.api.LengthFilter` interface).
3. In the Project build path, add external JAR references to all the JAR libraries in the 
   `{OXYGEN_INSTALL_DIR}/lib` folder. In the build path Order and Export panel, make sure that the 
   `oxygen.jar` entry is before all other libraries. Now your Project should compile successfully.
4. Start the standalone version of Oxygen XML Author from the 
   `{OXYGEN_INSTALL_DIR}` and in the Document Type Association preferences page (on page 138), edit the document type (for example, DITA) to open the Document Type configuration dialog box (on page 140). In the Classpath tab, add a reference to your Project's classes directory and in the Extensions tab, select your custom StylesFilter extension as a value for the CSS styles filter property. Close the application to save your changes.
5. Create a new Java Application configuration for debugging. The Main Class should be 
   `ro.sync.exml.Oxygen`. The given VM Arguments should be:

   ```
   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
   ```

### Disabling a Plugin

To disable a plugin (on page 2819), use one of the following two methods:

- Open the Preferences dialog box (Options > Preferences) (on page 124), go to Plugins, and deselect the plugin that you want to disable.
- Create an empty file called `plugin.disable` next to the plugin configuration file (`plugin.xml`). The plugin will be disabled and will no longer be loaded by the application on startup.

**Note:**

This is useful if you want to temporarily stop work on a plugin and use the application without it.

### Oxygen XML Author Component

The Oxygen XML Author Component was designed as a subset of Oxygen XML Author that can be integrated into another application under the terms of the Oxygen XML Author SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application to provide WYSIWYG-like XML editing directly in your application.

More information about the setup for the Oxygen XML Author Component can be found on the Oxygen SDK page.

### Licensing

The licensing terms and conditions for the Oxygen XML Author Component are defined in the Oxygen SDK License Agreement. To obtain the licensing terms and conditions and other licensing information as well, you can also contact the support team at `support@oxygenxml.com`. You may also obtain a free of charge
evaluation license key for development purposes, subject to registration. Any deployment of an application
developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.

There are two main categories of Oxygen XML Author Component integrations:

- **Integration for internal use:**

  You develop an application that embeds the Author Component to be used internally (in your company
  or by you). You can buy and use previously purchased Oxygen XML Author floating licenses to enable
  the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

- **Integration for external use:**

  Using the Oxygen XML Author Component, you create an application that you distribute to other users
  outside your company (with a CMS for example). In this case, you should apply for a Value Added
  Reseller (VAR) partnership by contacting the Oxygen Sales Team (https://www.oxygenxml.com/
  sales_support.html).

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- **Inject floating license server details in the Java code:**

  The following link provides details about how to configure an HTTP floating license server: https://
  www.oxygenxml.com/license_server.html#floating_license_servlet.

```java
AuthorComponentFactory.getInstance().init(frameworkZips,
   optionsZipURL, codeBase, appID,
   //The servlet URL
   "http://www.host.com/servlet",
   //The HTTP credentials user name
   "userName",
   //The HTTP credentials password
   "password");
...
```

**Related Information:**

https://www.oxygenxml.com/sdk_agreement.html

**Installation Requirements**

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

- Oracle Java version 11 or 17.
- At least 100 MB disk space and 100MB free memory.
Customization

For a special type of XML, you can create a custom *framework (on page 2817)* (which also works in a standalone version of Oxygen XML Author). Oxygen XML Author already has *frameworks* for editing DocBook, DITA, TEI, and so on. Their sources are available in the *Oxygen SDK*. This custom *framework* is then packed in a zip archive and used to deploy the component.

**Figure 390. Components of a Custom Framework**

Multiple *frameworks* can coexist in the same component and can be used at the same time for editing XML documents.
You can add on your custom toolbar all actions available in the standalone Oxygen XML Author application for editing in the Author mode. You can also add custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component can also provide the Outline (on page 521), Model (on page 527), Elements (on page 615), and Attributes (on page 609) views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the AuthorComponentFactory class.

**Related Information:**
- Creating and Configuring Custom Frameworks (on page 1757)
- Oxygen XML Author Component (on page 2078)
- AuthorComponentFactory API

**Example - Customizing the DITA Framework**

If you look inside the bundle-frameworks\oxygen-frameworks folder distributed with the Oxygen XML Author Component sample project, it contains a frameworks folder. Customizations that affect the
framework configuration for the component should first be done in a standalone installation of Oxygen XML Author.

The Oxygen XML Author installation also includes a frameworks folder that contains the dita framework located in \[OXYGEN_INSTALL_DIR]\frameworks\dita. The dita framework contains a bundled DITA-OT distribution that contains the DTDs used for DITA editing. If your DTD specialization is a DITA-OT plugin, it should be installed (on page 2042) in the DITA-OT-DIR\plugins folder.

To make changes to the DITA framework configuration, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, and edit or extend the framework. These changes will affect the \[OXYGEN_INSTALL_DIR]\frameworks\dita\dita.framework configuration file.

After you do this, you can re-pack the Oxygen XML Author Component following the instructions from the README.html file located in the Oxygen XML Author Component sample project. The Author Component sample project and the Oxygen XML Author standalone installation should be of the same version.

**Related Information:**
Framework and Author Mode Customization (on page 1757)

### Packing a Fixed Set of Options

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have Preferences dialog boxes. However, the Author Component can be configured to use a fixed set of user options on startup.

The sample project contains a module called bundle-options. The module contains a file called options.xml in the oxygen-options folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Author.

To create an options file in the Oxygen XML Author:

- Make sure the options that you want to set are not stored at project level (on page 301).
- Set the values you want to impose as defaults in the Preferences pages (on page 124).
- Select Options > Export Global Options.

### Adding MathML support in the Oxygen XML Author Component

By default, the Oxygen XML Author Component does not come with the libraries necessary for viewing and editing MathML equations in the Author mode. You can view and edit MathML equations either by adding support for JEuclid (on page 2082) or by adding support for MathFlow (on page 2083).

### Adding MathML Support Using JEuclid

By default, the JEuclid library is excluded from the Oxygen SDK artifact dependencies. To enable it, comment the following lines in the pom.xml file:
To edit specialized DITA Composite documents with MathML content, include the entire MathML2 framework directory (for example, the default location is: \[OXYGEN_INSTALL_DIR\]/frameworks/mathml2) in the frameworks (on page 2817) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

### Adding MathML Support Using MathFlow (Deprecated)

**Note:**
The MathFlow editor integration has been marked as deprecated and in future versions, it will be replaced with a new MathType integration developed by Wiris.

In the pom.xml file, add dependencies to the following additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

**Note:**
For MathFlow 2.1, all of these JAR (on page 2817) files are packaged into one file called MathFlow.jar.

You can reference these additional libraries from the MathFlow SDK as in the example below:

```xml
<dependency>
  <groupId>com.dessci</groupId>
  <artifactId>MFComposer</artifactId>
  <version>1.0.0</version>
  <scope>system</scope>
  <systemPath>${MathFlowSDKDir}/lib/MFComposer.jar</systemPath>
</dependency>
```

In addition, you must obtain fixed MathFlow license keys for editing and composing MathML equations and register them using these API methods: `AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and `AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.
To edit specialized DITA Composite with MathML content, include the entire 
[OXYGEN_INSTALL_DIR]/frameworks/mathml2 Mathml2 framework directory in the frameworks (on page 2817) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

More documentation is available on the Wiris MathFlow website.

**Adding Support to Insert References from a WebDAV Connection**

Predefined actions that insert references, such as the Insert Image action, includes a URL chooser field with a drop-down menu that allows you to select a Browse Data Source Explorer action. This action opens the Data Source Explorer (on page 1685) that allows you to view a WebDAV connection.

To use a WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Author 26.0 and configure a WebDAV connection (on page 1727).
2. Pack the fixed set of options (on page 2082) from the standalone application to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the httpclient dependency of the Oxygen SDK artifact is excluded. You can enable it by commenting the following lines:

```xml
<exclusion>
  <artifactId>httpclient</artifactId>
  <groupId>org.apache.httpcomponents</groupId>
</exclusion>
```

If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:

```java
//DBConnectionInfo(String id, String driverName, String url, String user, String passwd, String host, String port)
DBConnectionInfo info = new DBConnectionInfo("WEBDAV", "WebDAV FTP", 
"http://host/webdav-user-root", "userName", "password", null, null);
AuthorComponentFactory.getInstance().setObjectProperty 
{"database.stored.sessions1", new DBConnectionInfo[]{ info}};
```

**Using Plugins with the Oxygen XML Author Component**

To bundle Workspace Access plugins (on page 2819) that are developed for the standalone application with the Oxygen XML Author Component, follow these steps:
• The bundle-plugins module must contain the additional plugin directories in the dropins subdirectory. The content must also contain a plugin.dtd file. Copy the plugin.dtd file from an {OXYGEN_INSTALL_DIR}\plugins folder.

• In the class that instantiates the AuthorComponentFactory (for example the ro.sync.ecss.samples.AuthorComponentSample class), call the methods AuthorComponentFactory.getPluginToolbarCustomizers(), AuthorComponentFactory.getPluginViewCustomizers(), and AuthorComponentFactory.getMenubarCustomizers(), obtain the customizers that have been added by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the AuthorComponentSample.reconfigureActionsToolbar() method for adding the toolbar from the Acrolinx plugin.

**Important:**
As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin will work.

---

**Frequently Asked Questions**

**Installation and Licensing**

1. Are there any client requirements beyond the Java VM?

   Oracle Java version 11 or 17. At least 200 MB disk space and 200 MB free memory is necessary for the Oxygen XML Author Component.

2. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?

   A single AuthorComponentFactory instance can create multiple EditorComponentProvider editors that can then be added and managed by the developer who customizes the component in a Swing JTabbedPane. A single license (floating or user-based) is enough for this.

   If you need to run multiple distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.

**Functionality**

1. What graphic formats can be directly rendered in the Oxygen XML Author Component?

   GIF, JPEG, PNG, BMP and SVG.

2. Can links be embedded to retrieve (from the server) and "play" other types of digital assets, such as audio or video files?
You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the Oxygen SDK. The Oxygen XML Author Component can only render static images (no GIF animations).

3. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

No.

4. Does the Oxygen XML Author Component provide any type of autosave functionality?

By default no, but you could customize it to save its content periodically to a file on disk.

5. Assuming multiple documents can be edited simultaneously, can content be copied, cut, and pasted from one Oxygen XML Author Component "instance" to another?

Yes.

6. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?

If no customizations are available, the content is pasted as simple text. Customizations are provided for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

7. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, Serif for the Oxygen XML Author Component), the JVM will know how to map all characters to glyphs. There is no character map available but you could implement one.

Customization

1. Describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the-box.

You can mount all actions available in the standalone Oxygen XML Author application on your custom toolbar. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the Outline (on page 521), Model (on page 527), Elements (on page 615), and Attributes (on page 609) views that can be added to your own panels.

2. Describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The Author mode internal engine uses CSS to render XML.
For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Author standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions, it could take a long time. Oxygen XML Author has built-in frameworks for editing (DocBook, DITA, TEI, etc.) and sources for them are available in the Oxygen SDK.

Multiple frameworks can co-exist in the same Oxygen XML Author instance and can be used at the same time for editing XML documents.

3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

- **Showing/hiding menus, toolbars, helpers, etc.**

  You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two implementations: one for advanced users and one for content authors.

- **Forcing behaviors (for example, ensuring change tracking (on page 2821) is on and preventing it from being shut down).**

  You could avoid placing the change tracking toolbar actions in the UI. You could also use the API to turn change tracking ON when the content has been loaded.

- **Preventing access to "privileged" editor processes (for example, accept/reject changes).**

  You can remove the change tracking actions completely in a custom implementation, including the ones from the contextual menu.

- **Presenting and/or describing XML constructs (for example, tags) in "plain-English".**

  Using our API, you can customize what the Outline view or Breadcrumb displays for each XML tag. You can also customize the in-place content completion list.

- **Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para, and inline emphasis).**

  The API allows for a content completion filter that also affects the Elements view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?

   Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a “form” (with scripting behind to tag the collection information and embed it in the XML document)?
6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

A framework developed for the standalone version of the Oxygen XML Author application can then be bundled with the Oxygen XML Author Component. For example, you could use the same framework that you use in the Oxygen XML Author standalone distribution.

A custom editing solution can deploy one or more frameworks that can be used at the same time.

**Print Document Within the Oxygen XML Author Component**

**Question**

Can a document be printed within the Oxygen XML Author Component?

**Answer**

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the preview parameter value:

```java
AuthorComponentProvider.print(boolean preview)
```

Here is the online Javadoc for this method: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean))

**Oxygen XML Web Author Component**

The Oxygen SDK provides the ability to integrate the Oxygen XML Web Author into your existing content ecosystem and it allows anyone in your organization to access your content from anywhere they have an internet connection. Oxygen XML Web Author is highly versatile and can be customized to work with any XML vocabulary, most file repository systems, and virtually any type of workflow.

**Web Author Component Integration**

For information about integrating Oxygen XML Web Author into your environment, see [Web Author Integration](#).

**Web Author Customization**

For detailed information about customizing Web Author, see the [Oxygen XML Web Author Customization Guide](#).

**Using Web Author**

For information about using the Web Author product, see the [Oxygen XML Web Author User Manual](#).
Web Author vs. Web Author Component

The purpose of this topic is to help you choose which distribution of Oxygen XML Web Author is appropriate for your particular use-case.

Oxygen XML Web Author has two distributions:

1. **Oxygen XML Web Author** (product) - This version can be downloaded from the Oxygen website and is licensed according to the [Web Author License Agreement](#).
2. **Web Author Component** - Provided as a Maven artifact (according to the [SDK Agreement](#)) that is used in the [Web Author Component integration project](#). This project can be used as a starting point for your integration.

**Note:**
The formal definition for Web Author Component inside the SDK agreement is:

“Web Author Component” is a subset of Software composed of a server component operating as a service application and a client component deployed to a web browser, such as an HTML5 based application, where the client component is not installed on the client machine but is in use by the client machine while the browser is connected to the server component.

For End-Users

For end-users, the recommended distribution is **Oxygen XML Web Author** (product).

For Plugin and Framework Developers

If you develop frameworks or plugins that provides enhanced functionality for Oxygen XML Web Author, it is recommended to distribute the plugin or framework separately from Web Author. They will work with both types of distributions and the end-users can choose:

- To install your plugin or framework in Web Author.
- To use a solution based on Web Author that has the plugin or framework installed by default.
- To use a solution based on Web Author and install the plugin or framework themselves.

Example of such plugins/frameworks:

- Integration with a terminology database.
- Adding support to edit embedded SVG snippets.
- Providing support for a specific XML language.

For Integration Developers

If you want to integrate Oxygen XML Web Author into another application (for example, a CMS), that you distribute to your end-users, there are several aspects to consider when choosing between the two distributions:
Functionality

There are some features that are available in the installable Oxygen XML Web Author product requires an additional plugin to be available in the Web Author Component. For example, the File Comparison Tool is available by default in the Oxygen XML Web Author product, but requires an additional plugin to be installed for it to be available in the Web Author Component version.

Legal

If you want to use the Web Author Component, you must have your own application that is not called Oxygen XML Web Author, but will contain Web Author as a software component provided by Syncro Soft. Hence, Syncro Soft does not have a direct legal link with your users, you will handle the licensing of your application to your end-users.

For the official details, you can consult the license agreements for both distributions:

2. Web Author Component: https://www.oxygenxml.com/sdk_agreement.html

Financial

If you choose to use the Web Author product to distribute as a plugin or framework, then you act as a channel reseller, basically reselling Oxygen XML Web Author to your end-users and you must pay Syncro Soft the corresponding cost of the license.

The Web Author Component has more flexible pricing alternatives for resellers that are negotiated for each contract and include:

- Subscription packages similar to the ones used for the Web Author product, but you may get a discount depending on the partnership level (Gold, Silver, Bronze).
- Solution OEM license.

If you choose to integrate the Web Author Component into your application, the cost is based on royalties, rather than a cost for the license. That means you do not need to pay for the ability to include the component in your application, but when you distribute your application you must pay a royalty to Syncro Soft.

Customization

It is strongly recommended to implement any customization as a combination of plugins, frameworks, and options. If you are using Web Author Component, you can also alter the Web Author files, but this is discouraged since those files are not considered API and may change in a future version.
Deployment

If you want to use Oxygen XML Web Author (product), you can install it using the installation kits, then configure the plugins, frameworks, and options using a browser-based UI. Alternatively, you can configure Oxygen XML Web Author to load the configuration from a custom directory (Oxygen Data Directory) along with desired plugins, frameworks, and options.

If you want to use Web Author Component, you can use the Web Author Component integration project to build a custom WAR file with plugins, frameworks, and options bundled. This WAR file can be deployed in any Servlet container (for example, Tomcat).

Distribution

If you want to use Oxygen XML Web Author (product), your users must download Oxygen XML Web Author from the Oxygen website, while you will distribute your plugins/frameworks to your users. You should provide instructions on how to deploy and use Oxygen XML Web Author. Alternatively, you can install and configure it for them.

If you want to use Web Author Component, you will distribute the customized WAR file.

Developer Quick Start Guide

Oxygen XML Author allows you to develop add-ons to customize the editing experience. Such customizations can be achieved through a plugin or a framework configuration. This section is meant to provide guidance to developers who are getting started with these types of customizations and to offer links to various resources to help with customizations.

- A plugin can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Once created, a plugin can be deployed and installed as an add-on (on page 2074). For more information, see the The Oxygen SDK (Part 1: Plugins) blog post.

- A framework configuration provides validation, content completion, and editing support for a specific XML vocabulary. See: https://blog.oxygenxml.com/topics/oxygenFrameworks.html. Once created, a framework can be deployed and installed as an add-on. See: https://www.oxygenxml.com/doc/ug-editor/topics/packing-and-deploying-addons.html.

From a legal point of view, you can freely develop and share such extensions as long as they are only used from inside Oxygen XML Author. For details, see: https://www.oxygenxml.com/sdk_agreement.html.

Plugins

A plugin can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Since Oxygen XML Author is a Java-based application, most of the allowed plugin types are Java-based but some JavaScript-based plugin types are also supported.

There are lots of plugin types (on page 2043) but the Workspace Access plugin type (on page 2043) is the most versatile of them. This type of plugin allows you to contribute actions to the main menu and toolbars,
create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. A Workspace Access plugin can also contribute frameworks (on page 2051).

The Maven-based Oxygen XML SDK comes with sample plugins and it provides the ability to compile Java extensions for your plugins and frameworks. Also, as a quick start for a Workspace Access plugin, you can use this project: https://github.com/oxygenxml/sample-plugin-workspace-access.

The Workspace Access plugin API can also be used with a JavaScript-based plugin (on page 2046). Small plugin samples can be found here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins.

You can create automated tests (on page ) for your plugins and debug them using the Eclipse IDE (on page 2077).

A plugin can either be installed manually or packed as an add-on and installed using Help->Install new add-ons (on page 2042).

Sample Plugins

A sample Maven-based Workspace Access plugin can be found here: https://github.com/oxygenxml/sample-plugin-workspace-access.

There is also a sample project which contains various JavaScript-based plugins: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins.

The Oxygen GitHub site contains lots of open-source plugins (https://github.com/topics/oxygen-standalone-plugin). Most of these plugins are of the Workspace Access type.

You can also find a variety of other publicly-hosted Oxygen plugins in the Public Hosted Oxygen Plugin and Framework Projects blog post.

Workspace Access Plugin Extension

This type of plugin extension allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. It is the most useful and most commonly used plugin extension.

A Workspace Access plugin extension (on page 2043) can also provide frameworks, allowing you to have a single add-on that provides both workspace-level extensions (independent of any given framework) and document type-specific frameworks. If the frameworks involve Java extensions (for example, custom dialog boxes or link text resolvers), they use the Java code for the Workspace Access plugin.

You can include frameworks with a Workspace Access plugin by declaring an "additional frameworks" extension in the plugin.xml file (on page 2051).
Java or JavaScript?

Oxygen XML Author is a Java-based application and all of its APIs are Java-based. The entire user interface (buttons, views, dialog boxes) is built on top of the Java Swing architecture. The entire Javadoc API documentation is available here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/.

A Workspace Access plugin can be implemented either in Java or in JavaScript. Sample Java-based Workspace Access plugins can be found on the Oxygen XML GitHub page.

Sample JavaScript-based implementations can be found in this sample project: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins. The Rhino library is used to convert the JavaScript method calls to Java API calls: https://github.com/mozilla/rhino.

Related Information:

- Workspace Access Plugin Extension (on page 2043)
- Workspace Access Plugin Extension (JavaScript-Based) (on page 2046)

API Overview

The Workspace Access plugin extension is called when the application starts and when it closes.

The StandalonePluginWorkspace API can be used in numerous ways:

- Customize the toolbars, contextual menu, and main menus. See: Adding Toolbar and Menu Actions (on page 2094).

- Access the API for the Project view. See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/StandalonePluginWorkspace.html#getProjectManager--.

- Access utility methods to interact with the end-user (for example, show warning and error dialog boxes, update the results view, or change the status bar). See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/WorkspaceUtilities.html.

- Add a listener to be notified when a new XML document is opened, selected, or closed either in the main editing area or in the DITA Maps Manager view. See: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/PluginWorkspace.html#addEditorChangeListener--.

- Provide access to opened XML documents via the WSEditor interface. Each opened XML document can be manipulated using the WSEditor interface. You can obtain its content, set new content to it, or save its content. You can also validate the editor contents or disable editing inside it. Depending on the
current editing mode (Text or Author), you can gain access to the current editing page and send it either to the Author editing page or Text editing page. Both APIs allow you to make changes to the current document content.

Adding Toolbar and Menu Actions

A Workspace Access plugin extension (on page 2043) can contribute custom actions to the contextual menu, main menus, or to the general toolbars.

• Contributing a new toolbar action:

This sample Workspace Access plugin contributes a new toolbar called SampleWorkspaceAccessToolbarID. The java code of the sample plugin will use the toolbar components customizer API.

• Contributing an action on the main menu:

As exemplified in the sample plugin, the addMenuBarCustomizer API can be used either to add a new menu or to customize the existing main menu.

• Contributing a contextual menu action:

The same sample plugin uses the addMenusAndToolbarsContributorCustomizer API to contribute a contextual menu customizer. Such a customizer can be contributed either for the Text or Author editing modes.

Once an action is added, you can define a new shortcut key for it using the ActionProvider API. The action can use the WSEditor API to make changes to an open XML document.

The same customizer API can be used to remove actions from the main menu, toolbars, framework-specific menus, and contextual menus.

Adding a New Side-View

A Workspace Access plugin (on page 2043) type can contribute a new side view to Oxygen XML Author. For example, the following plugin.xml descriptor file defines a new view ID called SampleWorkspaceAccessToolbarID: https://github.com/oxygenxml/sample-plugin-workspace-access/blob/master/plugin.xml.

Once the new view ID is declared, the Java code of the plugin can add content to the view using the pluginWorkspaceAccess.addViewComponentCustomizer API.

Customizing the Project View

The API method StandalonePluginWorkspace.getProjectManager() allows access to various project-related functionalities:
• Add a new contextual menu action in the **Project** view.

• Access the set of resources currently selected in the **Project** view.

• Customize the icons that appear in the **Project** view.

A sample JavaScript-based plugin that uses this API to add a new contextual menu to the **Project** view can be found here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/OpenInTerminalProjectContextualAction.

**Customizing the DITA Maps Manager View**

You can *add a listener* to be notified when a new DITA map is opened, selected, or closed in the **DITA Maps Manager** view. Once the `editorOpened()` callback is received, you can *obtain the opened WSEditor API*, then *send its current page* to the `WSDitaMapEditorPage`.

The API method `WSDitaMapEditorPage` allows you to interact with the DITA map that is open in the **DITA maps Manager** view:

• Add a customizer for the icons and text presented in the tree.

• Enable or disable editing on the tree.

• Set a popup menu customizer.

• Get the selected nodes.

• Get access to the `AuthorDocumentController` API to make changes to the content.

Sample plugins:

• JavaScript-based plugin that customizes the icons and text presented for a DITA map that is open in the **DITA Maps Manager** view: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/dmmCustomizeTopicTitlesAndIcons.

• JavaScript-based plugin that adds a new contextual menu action for a DITA map that is open in the **DITA Maps Manager** view: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/contributePopupActionDMM.

**Persistent Storage**

Your plugin may need to save plugin-specific information persistently between two sessions. The `PluginWorkspace.getOptionsStorage()` method allows you to save and retrieve *(key, value)* pairs persistently between sessions (between closing and restarting Oxygen XML Author). You can also add listeners to be notified when the values for a certain key are changed.
Contributing a Custom Preferences Page

There is a specific plugin extension type that can be used to contribute a custom preferences page (on page 2057) to the Preferences dialog box in Oxygen XML Author. An example of how such a page is implemented can be found in this sample plugin: https://github.com/oxygenxml/oxygen-dita-prolog-updater-addon/blob/master/src/main/java/com/oxygenxml/prolog/updater/plugin/PrologOptionPageExtension.java.

Imposing a Fixed Set of Global Preferences

You may want to impose a fixed set of global options to be used by all end-users who install the plugin. The GlobalOptionsStorage API provides the ability to set the following:

- **Set a certain global option to a certain value:** (https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#setGlobalObjectProperty-java.lang.String-java.lang.Object-) The APIAccessibleOptionTags interface contains a list with all keys that can be set to a custom value.

- **Set global options by importing an options XML file:** (https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#importGlobalOptions-java.io.File-) Such an options XML file can be generated by using the Options->Export Global Options action in Oxygen XML Author. A sample JavaScript-based WorkspaceAccess plugin implementation that imports such an options XML document into the application can be found here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/impose-options.

Other ways to share a common set of options with others are listed here: https://blog.oxygenxml.com/topics/sharingSettings.html.

Interaction with the End-User

If you need your plugin to frequently interact with the end user, some possibilities include:

- Your plugin can create Java Swing-based components (dialog boxes, frames) that are displayed when custom toolbar or menu actions (on page 2094) added by the plugin are called. You can also extend the Oxygen-specific API base class OKCancelDialog to create a dialog box that already includes OK and Cancel buttons. This specific base also automatically resizes its internal components depending on the currently used fonts or DPI settings and also properly positions the OK and Cancel buttons depending on the operating system (on macOS, the OK button is on the right part of the dialog box, while on Windows and Linux, it is placed on the left part of the dialog box). There is an entire API package that contains base implementations of Swing components and such implementations are recommended to be used for the plugin-contributed components to look like the ones contributed by Oxygen XML Author.

- Your plugin can add a specific side view (on page 2094).

- The WorkspaceUtilities API allows you to:
◦ Show file and folder choosers.

◦ Show confirmation dialog boxes.

◦ Show information, warning, or error dialog boxes.

◦ Show a custom status message in the application.

• The ResultsManager API allows you to add results in the Results view. These results can point to a specific document at a specific line/column location.

• The title of the main application frame can be modified using this API: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/Workspace.html#setParentFrameTitle-java.lang.String-.

Contributing Translations for New Labels and UI Text

You may want your plugin’s interaction with the end-user (dialog boxes, pop-up messages, etc.) to be properly translated in all user interface languages (on page 327) supported by Oxygen XML Author. The API method StandalonePluginWorkspace.getResourceBundle() will allow you to pass message keys that will be resolved by the application to specific language-dependent values by looking at a file called translation.xml, which needs to be placed in a folder called i18n in the plugin installation folder. The structure of the translation.xml file needs to look like this: https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html.

Comparing Documents

Using a Workspace Access plugin extension, you have access to various APIs that allow the comparison of XML documents:

• Display the Compare Files tool with a given set of URLs for two-way or three-way comparisons: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/DiffAndMergeTools.html.

Customizing the Application Layout

There are two main ways to customize the layout of the application:

• Remove some of the toolbars, actions, menus, or views that Oxygen XML Author shows by default when the application starts. A sample plugin that filters the user interface based on an XML configuration file is available here: https://github.com/oxygenxml/oxygen-components-filter-plugin.

• Export the layout of the current views and toolbars in the application using the Window→Export Layout action, then use the WorkspaceAccess plugin API to impose a fixed value for a global option key:
File layoutFile = new File(baseDir, "application.layout");
if (layoutFile.exists()) {
    PerspectivesLayoutInfo info = new PerspectivesLayoutInfo(true, false, "",
    layoutFile.getAbsolutePath());
    pluginWorkspaceAccess.setGlobalObjectProperty("perspectives.layout.info", info);
    ...
}

Adding new User Interface Translations

There is a particular plugin extension to contribute a new language to Oxygen XML Author: https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html.

Frameworks

A framework configuration provides validation, content completion, and visual editing functionality for a certain XML vocabulary. Usually, a framework customization provides a schema used to validate and edit certain type of XML documents, a CSS used to edit the XML documents in the Author visual editing mode and various custom actions or behaviors used to enhance the editing experience. For more information about framework customization, see: https://blog.oxygenxml.com/topics/oxygenFrameworks.html.

Oxygen XML Author comes with a lot of framework configuration folders ([OXYGEN_INSTALL_DIR]/frameworks) to support editing XML documents of various types (such as DocBook, DITA, XHTML, or TEI). All of these existing framework configurations can be further customized in the Preferences->Document Type Associations page. These framework configurations can be used as examples for building your own customization for a certain XML vocabulary or they can be extended if you want to share a modified version of a framework with others.

The Document Type Association configuration dialog box allows you to configure all the framework-specific settings.
You can also find various open-source frameworks for Oxygen XML Author online: https://blog.oxygenxml.com/topics/Oxygen%20plugins%20and%20frameworks.html.

Once you have set up a framework configuration folder, it can be packaged as an add-on and shared with others or it can be packaged in workspace access plugins using the "additional framework" extension point in the plugin.xml file (on page 2051).

**Customizing an Existing Framework**

An existing framework that has full built-in support (for example the DITA framework) can be extended and customized. Afterward, this customization can be shared with others. You can use such a framework customization extension to:

- Provide custom new file templates.
- Provide a custom CSS layer to render the framework in the Author visual editing mode.
- Provide custom Schematron-based validation for the XML documents.
- Provide custom Author mode actions on the toolbar, in the contextual menu, and in the main framework-specific menu.

**Customizing the Content Completion Proposals**

When editing an XML document either in the Text or Author editing modes, you can invoke the Content Completion Assistant (Ctrl+Space in Text mode or ENTER in Author mode) to see the allowed XML elements or attributes that can be inserted at the current location. The Elements view also presents the elements that
can be inserted in the document at a certain location, while the **Attributes** view presents a list of allowed attributes and their values.

The content completion proposals can be customized in various ways:

- Each framework can contain a *special content completion configuration file*. Such a file can:
  - Filter out element proposals for a parent element.
  - Configure a set of required attributes to be inserted along with a certain element.
  - Add new attribute value proposals and for each proposal, add an annotation that will appear in the **Attributes** view for each value.
  - Call an external XSLT script to compute value proposals for a certain attribute.
  - Customize how the element names are presented in the **Outline** view, **Elements** view, and **Content Completion Assistant**.

- You can alter the schema that is associated with the XML document. For example, in the case of the **DITA** vocabulary, you can create a DTD specialization plugin and integrate it into Oxygen XML Author.

- You can use the **SchemaManagerFilter** API to filter the set of proposed elements and attribute values using Java code.

### Adding Custom New File Templates

The **New Document Wizard** *(on page 351)* (**File->New** or the **New** button on the toolbar) presents custom file templates gathered from all frameworks installed in Oxygen XML Author. A custom framework can have one or more special folders that contain custom new file templates.

### Adding Custom Validation Stages

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation. See: **Configuring Validation Scenarios for a Framework**.

### Adding Custom Transformation Scenarios

When distributing a framework to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs. See: **Configuring Transformation Scenarios for a Framework**.
Customizing the Author Visual Editing Mode

The **Author visual editing mode is based on CSS**. Besides supporting most of the CSS 3 specification, Oxygen XML Author adds some custom CSS selectors, properties, and functions. Customization possibilities include:

- Use **CSS selectors** to match XML comments, processing instructions, entities, and CDATA sections.
- Change the tags display mode and tag color for certain elements, mark certain XML elements as not editable, and other customizations using additional CSS properties.
- Use **custom CSS functions**. For example, the `oxy_xpath` function allows you to run an XPath search over the document and use that value as static text.
- In **custom pseudo-classes**, you can match values that can be changed via a custom action.
- There are specific **@media types** that can be used to mark certain CSS sections for a certain distribution.
- **Fonts can be dynamically loaded** and used for rendering.

Adding Toolbar and Menu Actions

The **framework customization (on page 2098)** can define actions that appear on a framework-specific toolbar when editing content in the **Author** visual editing mode.

You can use the **Author Action dialog box (on page 148)** to configure the name, description, icons, menu shortcuts, and various XPath-enabled activation operations (on page 152).

You can use a variety of **pre-defined operations** in each activation mode to achieve various things:

- Insert an XML fragment in the document either at the current position or at a specified offset.
- Set an attribute with a certain value on a certain element.
- Invoke an XSLT script using the **XSLTOperation** to produce an XML fragment to be inserted in the document.
- Invoke a JavaScript function that can use the **Author** mode APIs to modify the document. Some samples of such operations can be found here: [https://github.com/oxygenxml/javascript-sample-operations](https://github.com/oxygenxml/javascript-sample-operations).
- Set a CSS pseudo-class on a certain element. The pseudo-class can be matched from the CSS to style various elements differently.

You can also create custom **Author** mode operations by extending the **AuthorOperation** Java API.

Once a custom action has been created, it can be added to the main menu, toolbar, or contextual menu.
Embedding Form Controls

By using custom CSS functions, you can embed form controls (checkboxes, combo boxes, text fields, pop-up boxes, buttons, etc.) in the Author visual editing mode to edit attribute values or text content for certain elements.

All the supported form controls can be found in the Form Controls section.

Sample XML and CSS documents that use form controls can be found in the [OXYGEN_INSTALL_DIR]/samples/form-controls folder.

Adding Inline Actions

Using the oxy_button and oxy_buttonGroup form controls, you can add inline actions in the Author visual editing mode. To see an example, you can open a Lightweight DITA topic from the folder [OXYGEN_INSTALL_DIR]/samples/dita/lw-dita/.

Debugging CSS-related Problems

The CSS Inspector view can be used to find out how various CSS styles are applied. For more information, see Debugging CSS Stylesheets.

Customizing Links

If you need to have working links between your XML document instances in the Author visual editing mode, consider the following possibilities:

- You can use the -oxy-link CSS property to specify a link target on a static icon placed before the element.

- You can use the oxy_link-text() CSS function to take control over the text presented inside a link using a specific Java extension.

- You can use a custom ExtensionsBundle implementation to be notified on a specific callback if the reference needs further processing.

- You can implement a custom link target element finder if the links are not referenced directly to elements that have an ID attribute. The link target element finder will be used to locate the target when the end-user clicks the link.

Related information

Sample DITA (framework) extension that sets a custom ExtensionsBundle implementation for customizing links
Customizing the Smart Paste Mapping

The Smart Paste feature in Oxygen XML Author preserves certain style and structure information when copying content and pasting it into XML documents. It is also possible to customize the mapping for the Smart Paste mechanism.

If you want full control over this behavior, there are also Java extensions that can be customized.

Difference Between a Framework (Document Type) and a Plugin Extension

Question

What is the difference between a Framework (on page 2817) and a Plugin (on page 2819) Extension?

Answer

There are two possible ways to customize the application:

1. Implement a plugin.

   A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Author.

   For the Oxygen XML Author Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type (on page 1757) that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end-users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA framework. If you look in the Document Type Association preferences page (on page 138) there is a DITA document type. If you edit that document type you will see that it has an Author tab in the Document Type Configuration dialog box (on page 140). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

   For information about developing your own document types (frameworks), see the Creating and Configuring Custom Frameworks (on page 1757) section.

   If you look on disk in the \[OXYGEN_INSTALL_DIR]\frameworks\dita folder, there is a file called dita.framework. That file gets updated when you edit a document type from the Document Type Association preferences page (on page 138). Then you can share that updated file with all users.

   The same folder contains some JAR (on page 2817) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.
The **Oxygen SDK** contains the Java sources from all the DITA Java customizations:

https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

---

**Important:**

It is possible for a **plugin** to share the same classes with a **framework**. For further details, go to [How to Share the Classloader Between a Framework and a Plugin (on page 2073)](#).

---

**Related Information:**

[Adding a Custom Operation to an Existing Framework (on page 1804)](#)

---

**SDK Common Use Cases**

This section contains details for specific use cases regarding customizations using the **Oxygen SDK**, **Author Component** (on page 2078), or **plugins** (on page 2039).

For additional questions, contact the **Oxygen support team**. The preferred approach is via email because these types of questions must be analyzed thoroughly. The **Oxygen support team** also provides code snippets, if applicable.

To stay up-to-date with the latest changes, discuss issues, and ask for solutions from other developers working with the **Oxygen SDK**, register on the **Oxygen-SDK mailing list**.

---

**Add Custom Actions to the Contextual Menu**

**Use Case**

You want to add your own custom actions to the contextual menu using an API.

**Solution**

The `WSAuthorEditorPageBase.addPopUpMenuCustomizer` and `WSTextEditorPage.addPopUpMenuCustomizer` API methods allow you to customize the contextual menu shown either in the **Author** or **Text** modes. The API is available both in the standalone application and in the Eclipse plugin.

To add actions to the **Author** page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```java
import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;
```
/**
 * This class is used to create the possibility to attach certain
 * menuContributions to the {link ContributionManager}, which is used for the
 * popup menu in the Author Page of the Oxygen Editor.<br />
 * You just need to use the org.eclipse.ui.menus extension and add a
 * menuContribution with the locationURI: <b>menu:oxygen.authorpage</b>
 */

public class OxygenAuthorPagePopupMenuCustomizer implements AuthorPopupMenuCustomizer {

  @Override
  public void customizePopUpMenu(Object menuManagerObj, AuthorAccess authorAccess) {
    if (menuManagerObj instanceof ContributionManager) {
      ContributionManager contributionManager = (ContributionManager) menuManagerObj;
      IMenuService menuService = (IMenuService) PlatformUI.getWorkbench().
        .getActiveWorkbenchWindow().getService(IMenuService.class);

      menuService.populateContributionManager(contributionManager, "menu:oxygen.authorpage");
      contributionManager.update(true);
    }
  }
}

2. Add a workbench listener and add the pop-up customizer when an editor is open in the Author page:

```java
Workbench.getInstance().getActiveWorkbenchWindow().getPartService().
  .addPartListener(new IPartListener() {
    @Override
    public void partOpened(IWorkbenchPart part) {
      if (part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {
        WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
        if (currentPage instanceof WSAuthorEditorPage) {
          ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer(;
        }
      }
    }
    ........
  });
```

3. Implement the extension point in your plugin.xml file:
Add Custom Callouts

Use Case

You want to highlight validation errors, instead of underlining them (for example, changing the text background color to red or yellow) and display a message directly at the error position that describes the problem.

Solution

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the Author mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

![Figure 392. Custom Callouts with Persistent Highlights](image-url)
Here is a working example:

```java
/**
 * Plugin extension - workspace access extension.
 */

public class CustomWorkspaceAccessPluginExtension
        implements WorkspaceAccessPluginExtension {

    /**
     * @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension
     *     applicationStarted(
     *     ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
     */

    public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
        pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
            @Override
            public void editorOpened(URL editorLocation) {
                final WSAuthorEditorPage currentAuthorPage = (WSAuthorEditorPage)currentPage;
                currentAuthorPage.getPersistentHighlighter().setHighlightRenderer(new PersistentHighlightRenderer() {
                    @Override
                    public String getTooltip(AuthorPersistentHighlight highlight) {
                        return highlight.getClonedProperties().get("message");
                    }
                    @Override
                    public HighlightPainter getHighlightPainter(AuthorPersistentHighlight highlight) {
                        //Depending on severity could have different color.
                        ColorHighlightPainter painter = new ColorHighlightPainter(Color.COLOR_RED, -1, -1);
                        painter.setBgColor(Color.COLOR_RED);
                        return painter;
                    }
                });
            }
        });
    }
```

Oxygen XML Author 26.0 | 17 - Extending Oxygen With the SDK | 2107
```java
public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
    // All custom highlights are ours
    return true;
}

@Override
public AuthorCalloutRenderingInformation getCalloutRenderingInformation(
    final AuthorPersistentHighlight highlight) {
    return new AuthorCalloutRenderingInformation() {
        @Override
        public long getTimestamp() {
            // Not interesting
            return -1;
        }

        @Override
        public String getContentFromTarget(int limit) {
            return "";
        }

        @Override
        public String getComment(int limit) {
            return highlight.getClonedProperties().get("message");
        }

        @Override
        public Color getColor() {
            return Color.COLOR_RED;
        }

        @Override
        public String getCalloutType() {
            return "Problem";
        }

        @Override
        public String getAuthor() {
            return "";
        }

        @Override
        public Map<String, String> getAdditionalData() {
            return null;
        }
    }
```
currentEditor.addValidationProblemsFilter(new ValidationProblemsFilter() {

    List<int[]> lastStartEndOffsets = new ArrayList<int[]>();

    /**
     * @see ro.sync.exml.workspace.api.editor.validation.ValidationProblemsFilter
     #filterValidationProblems
     (ro.sync.exml.workspace.api.editor.validation.ValidationProblems)
     */

    @Override
    public void filterValidationProblems(ValidationProblems validationProblems) {

        List<int[]> startEndOffsets = new ArrayList<int[]>();
        List<DocumentPositionedInfo> problemsList = validationProblems.getProblemsList();

        if (problemsList != null) {
            for (int i = 0; i < problemsList.size(); i++) {
                try {
                    startEndOffsets.add(currentAuthorPage.getStartEndOffsets(problemsList.get(i)));
                } catch (BadLocationException e) {
                    e.printStackTrace();
                }
            }
        }

        if (lastStartEndOffsets.size() != startEndOffsets.size()) {
        } else {
            boolean equal = true;
            for (int i = 0; i < startEndOffsets.size(); i++) {
                int[] o1 = startEndOffsets.get(i);
                int[] o2 = lastStartEndOffsets.get(i);
                if (o1 == null && o2 == null) {
                    //Continue
                } else if (o1 != null && o2 != null && o1[0] == o2[0] && o1[1] == o2[1]) {
                    //Continue
                } else {
                    equal = false;
                    break;
                }
            }
        }
    }
});
    //Same list of problems already displayed.
    return;
    }
    }
    //Keep last used offsets.
    lastStartEndOffsets = startEndOffsets;
    try {
        if(! SwingUtilities.isEventDispatchThread()) {
            SwingUtilities.invokeLater(new Runnable() {
                @Override
                public void run() {
                    //First remove all custom highlights.
                    currentAuthorPage.getPersistentHighlighter().removeAllHighlights();
                }
            });
        }
    }
    catch (InterruptedException e1) {
        e1.printStackTrace();
    }
    catch (InvocationTargetException e1) {
        e1.printStackTrace();
    }
    if(problemsList != null) {
        for (int i = 0; i < problemsList.size(); i++) {
            //A reported problem (could be warning, could be error).
            DocumentPositionedInfo dpi = problemsList.get(i);
            try {
                final int[] currentOffsets = startEndOffsets.get(i);
                if(currentOffsets != null) {
                    //These are offsets in the Author content.
                    final LinkedHashMap<String, String> highlightProps =
                        new LinkedHashMap<String, String>();
                    highlightProps.put("message", dpi.getMessage());
                    highlightProps.put("severity", dpi.getSeverityAsString());
                    if(! SwingUtilities.isEventDispatchThread()) {
                        SwingUtilities.invokeLater(new Runnable() {
                            @Override
                            public void run() {
                                currentAuthorPage.getPersistentHighlighter().addHighlight(
                                    currentOffsets[0], currentOffsets[1] - 1, highlightProps);
                            }
                        });
                    }
                }
            }
        }
    }
currentEditor.addEditorListener(new WSEditorListener() {
    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
        try {
            if (!SwingUtilities.isEventDispatchThread()) {
                SwingUtilities.invokeLater(new Runnable() {
                    @Override
                    public void run() {
                        // Remove all persistent highlights before saving
                        currentAuthorPage.getPersistentHighlighter().removeAllHighlights();
                    }
                });
            }
        } catch (InterruptedException e) {
            e.printStackTrace();
        } catch (InvocationTargetException e) {
            e.printStackTrace();
        }
        return true;
    }
});

/**
 * @see WorkspaceAccessPluginExtension#applicationClosing()
 */
Add Custom Highlights to Content

Use Case

You want to add custom highlights to the document content in Author mode.

Solution

There are two types of highlights you can add:

1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
   ```

   to obtain an `AuthorHighlighter` that allows you to add a highlight between certain offsets with a specified painter.

   For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlighter()
   ```

   to obtain an `AuthorPersistentHighlighter` class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

   For example, you can use this support to implement your own way of adding review comments.

**Related Information:**

Adding Custom Persistent Highlights *(on page 1865)*
Auto-Generate an ID When a Document is Opened or Created

Use Case

You want to configure how the application generates IDs (you need IDs that have a certain format for each created topic).

Solution

This could be done implementing a plugin (on page 2819) for Oxygen XML Author using the Plugins SDK:

There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the open editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }
    /**
     * @see WSEditorChangeListener#editorPageChanged(java.net.URL)
     */
    @Override
    public void editorPageChanged(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }
    private void generateID(WSEditor ed) {
        if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
            AuthorDocumentController ctrl = authorEditPage.getDocumentController();
            AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
            if(root.getAttribute("id") == null ||
                !root.getAttribute("id").getValue().startsWith("generated_"))) {
```
Change the Default Track Changes (Review) Author Name

Use Case

You want to change the default author name used for *Tracked Changes (on page 2821)* in the *Author Component*.

Solution

The *Track Changes* (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:
   
   ```java
   ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
   ```

2. **Options** - If the author name was not imposed from the API, it is determined from the *Author* option set in the *Review* preferences page (*on page 183*).

3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

   ```java
   System.getProperty("user.name")
   ```

So, to impose the *Track Changes* author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method:
   
   [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName(java.lang.String)]

2. Customize the default options and set a specific value for the *Author* name option set in the *Review* preferences page (*on page 183*).

3. Set the value of *user.name* system property when the *Author Component* is initializing and before any document is loaded.

Change the DOCTYPE of an Open XML Document

Use Case

You want to change the DOCTYPE of a document that is open in the *Author* mode.

Solution

The following API:
ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype() allows you to get the DOCTYPE of the current XML file open in the Author mode.

There is also an API method available that would allow you to set the DOCTYPE back to the XML:

ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)

Here is an example of how this solution would work:

```java
AuthorDocumentType dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
    "<!DOCTYPE article PUBLIC "testPublicID" "testSystemID">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing DOCTYPE,

ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()

modify it to your needs, and create another AuthorDocumentType object with the new content and with the same public, system IDs.

For example, you could use this API if you want to add unparsed entities in the XML DOCTYPE.

**Control XML Serialization in the Oxygen XML Author Component**

**Use Case**

You want to force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside block elements (on page 2814).

**Solution**

Usually, in a standalone version of Oxygen XML Author, the Editor > Format and Editor > Format > XML preferences pages allow you to control the way the XML is saved on the disk after you edit it in the Author mode.

Also, the APIAccessibleOptionTags interface contains a list of all accessible keys that can be read or set from the options.

In the Oxygen XML Author application, you can either bundle a default set of options (on page 299) or use the PluginWorkspace.setGlobalObjectProperty(String, Object) API:

```java
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty
```
In the Oxygen XML Author Component, you can either bundle a fixed set of options (on page 2128), or use the Java API to set properties that overwrite the default options.

```xml
(APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);
//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty

(APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);
//Zero indent size
pluginWorkspace.setObjectProperty

(APIAccessibleOptionTags.EDITOR_INDENT_SIZE, 0);
```

API Interface Documentation: APIAccessibleOptionTags

Customize the Outline View in Text Mode

Use Case

You want to customize the Outline view (on page 521) in Text mode.

Solution

Suppose that you have the following XML document:

```xml
<doc startnumber="15">
  <sec counter="no">
    <info/>
    <title>Introduction</title>
  </sec>
</doc>
```
and you want to display the XML content in a simplified Outline view like this:

```
doc "15"
sec Introduction
sec 15 Section title
sec 15.1 Section title
sec 16 Section title
```

Usually, an Outline view should have the following characteristics:

1. Double-clicking a node in the Outline view would select the corresponding XML content in the editor.
2. When the cursor moves in the open XML document, the Outline view would select the proper entry.
3. When modifications occur in the document, the Outline view would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```java
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */
public class CustomWorkspaceAccessPluginExtension implements WorkspaceAccessPluginExtension {
    /**
     * The custom outline list.
     */
    private JList customOutlineList;

    /**
     * Maps outline nodes to ranges in document
     */
    private WSXMLTextNodeRange[] currentOutlineRanges;
```
/**
 * The current text page
 */

private WSXMLTextEditorPage currentTextPage;

/**
 * Disable CaretListener when we select from the CaretListener.
 */

private boolean enableCaretListener = true;

/**
 * @see WorkspaceAccessPluginExtension#applicationStarted
 * (ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
 */

@Override
public void applicationStarted(
final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addViewComponentCustomizer
(new ViewComponentCustomizer() {
    /**
     * @see ViewComponentCustomizer#customizeView
     * (ro.sync.exml.workspace.api.standalone.ViewInfo)
     */
    @Override
    public void customizeView(ViewInfo viewInfo) {
        if( //The view ID defined in the "plugin.xml"
            "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
            customOutlineList = new JList();
            //Render the content in the Outline.
            customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
                /**
                 * @see javax.swing.DefaultListCellRenderer#getListCellRendererComponent
                 * (javax.swing.JList, java.lang.Object, int, boolean, boolean)
                 */
                @Override
                public Component getListCellRendererComponent(JList<?> list, Object value,
int index, boolean isSelected, boolean cellHasFocus) {
                    JLabel label = (JLabel) super.getListCellRendererComponent(list,
value, index, isSelected, cellHasFocus);
                    String val = null;
if(value instanceof Element) {
    Element element = ((Element)value);
    val = element.getNodeName();
    if("".equals(element.getAttribute("startnumber"))) {
        val += " + " + element.getAttribute("startnumber") + "\";
    }
    NodeList titles = element.getElementsByTagName("title");
    if(titles.getLength() > 0) {
        val += "\" + titles.item(0).getTextContent() + "\";
    }
}
label.setText(val);
return label;
});

//When we click a node, select it in the text page.
customOutlineList.addMouseListener(new MouseAdapter() {

### Disable Context-Sensitive Menu Items for Custom Author Actions

#### Use Case

You want to disable menu items for custom Author mode actions depending on the cursor context.

#### Solution

By default, Oxygen XML Author does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain Author mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own ro.sync.ecss.extensions.api.ExtensionsBundle implementation you can overwrite the method:

```java
ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()
```

and when the extension state listener gets activated, you can use the API like this:
public void activated(final AuthorAccess authorAccess) {
    // Add a caret listener to enable/disable extension actions:
    authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener() {
        @Override
        public void caretMoved(AuthorCaretEvent caretEvent) {
            try {
                Map<String, Object> authorExtensionActions = 
                        authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();
                // Get the action used to insert a paragraph. It’s ID is "paragraph"
                AbstractAction insertParagraph = (AbstractAction) authorExtensionActions.get("paragraph");
                // Evaluate an XPath expression in context of the current node
                Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath (*.ancestor-or-self::p], false, false, false, false);
                if (evaluateXPath != null && evaluateXPath.length > 0 && evaluateXPath[0] != null) {
                    // We are inside a paragraph, disable the action.
                    insertParagraph.setEnabled(false);
                } else {
                    // Enable the action
                    insertParagraph.setEnabled(true);
                }
            } catch (AuthorOperationException e) {
                e.printStackTrace();
            }
        }
    });
}

When the extension is deactivated, you should remove the CaretListener to avoid adding multiple listeners that perform the same functionality.

**Dynamically Add Form Controls Using a Styles Filter**

**Use Case**

You want to add form controls using an API.
Solution

Usually, a form control is added from the CSS using one of the built-in form controls (on page 2000). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically ro.sync.ecss.extensions.api.StylesFilter.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```java
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
            && "before".equals(authorNode.getName())) {
            authorNode = authorNode.getParent();
            if ("country".equals(authorNode.getName())) {
                // This is the BEFORE pseudo element of the "country" element.
                // Read the supported countries from the configuration file.
                Map<String, Object> formControlArgs = new HashMap<String, Object>();
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE, InplaceEditorArgumentKeys.TYPE_COMBOBOX);
                String countries = readCountriesFromFile();
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");
                Map<String, Object> labelProps = new HashMap<String, Object>();
                labelProps.put("text", "Country: ");
                labelProps.put("styles", "* {width: 100px; color: gray;}");
                StaticContent[] mixedContent = new StaticContent[] {
                    new LabelContent(labelProps), new EditorContent(formControlArgs)
                };
                styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
            }
        }
        // The added form control is the only way the element can be edited.
        if ("country".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
        }

        return styles;
    }
}
```
If the execution of the `formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);` line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called *lazy evaluation* and can be implemented as follows:

```java
formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES,
    new LazyValue<List<CIValue>>() {
        public java.util.List<CIValue> get() {
            // We avoid reading the possible values until they are actually requested.
            // This will be a List with CIValues created over countries:
            France, Spain, Great Britain
            return readCountriesFromFile();
        }
    });
```

The lazy evaluation approach can be used for the following form controls properties:

- InplaceEditorArgumentKeys.PROPERTY_VALUES
- InplaceEditorArgumentKeys.PROPERTY_LABELS
- InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS

The full source code for this example is available inside the Oxygen SDK.

### Dynamically Modify the Content Inserted by the Author

**Use Case**

You want to insert typographic quotation marks instead of double quotes.

**Solution**

By using the API you can set a document filter to change the text that is inserted in the document in **Author** mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```java
authorAccess.getDocumentController().setDocumentFilter(new AuthorDocumentFilter() {
    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
     * (ro.sync.ecss.extensions.api.AuthorDocumentFilterBypass, int, java.lang.String)
     */
    @Override
    public void insertText(AuthorDocumentFilterBypass filterBypass,
```
```java
int offset, String toInsert) {
    if(toInsert.length() == 1 && "\"".equals(toInsert)) {
        // User typed a quote but he actually needs a smart quote.
        // So we either have to add \u201C (start smart quote)
        // Or we add \u201E (end smart quote)
        // Depending on whether there’s already a start smart quote inserted
        try {
            AuthorNode currentNode =
                authorAccess.getDocumentController().getNodeAtOffset(offset);
            int startofTextInCurrentNode = currentNode.getStartOffset();
            if(offset > startofTextInCurrentNode) {
                Segment seg = new Segment();
                authorAccess.getDocumentController().getChars(startofTextInCurrentNode,
                offset - startofTextInCurrentNode, seg);
                String previosTextInNode = seg.toString();
                boolean insertStartQuote = true;
                for (int i = previosTextInNode.length() - 1; i >= 0; i--) {
                    char ch = previosTextInNode.charAt(i);
                    if ('“' == ch) {
                        // Found end of smart quote, so yes, we should insert a start one
                        break;
                    } else if ('\u201E' == ch) {
                        // Found start quote, so we should insert an end one.
                        insertStartQuote = false;      
                        break;
                    }
                }
                if(insertStartQuote) {
                    toInsert = '\u201E';
                } else {
                    toInsert = '\u201C';
                }
            }
            }
        } catch (BadLocationException e) {
            e.printStackTrace();
        }
    }
    System.err.println("INSERT TEXT |" + toInsert + "|");
    super.insertText(filterBypass, offset, toInsert);
```
You can find the online Javadoc for `AuthorDocumentFilter` API here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorDocumentFilter.html

An alternative to using a document filtering is the use of a `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

Extend the Java Functionality of an Existing Framework (Document Type)

Use Case

You want to change the way a DocBook 4 `<xref>` displays in Author mode based on what element is at the `@linkend`.

Solution

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Author classes:

   ```xml
   <dependency>
     <groupId>com.oxygenxml</groupId>
     <artifactId>oxygen-sdk</artifactId>
     <version>${oxygen.version}</version>
   </dependency>
   ```

   where `${oxygen.version}` is the version of Oxygen XML Author.

   Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `{OXYGEN_INSTALL_DIR}\frameworks\docbook\docbook.jar` to the class path of the project.

4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).

5. Pack your extension classes in a `JAR (on page 2817)` file. Copy the JAR to: `{OXYGEN_INSTALL_DIR}\frameworks\docbook\custom.jar`.

7. Open the **Preferences** dialog box (Options > Preferences) *(on page 124)* and go to **Document Type Association**. Edit the DocBook 4 document type. In the **Classpath** list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.

8. You can rename the document type and the docbook framework folder to something else (such as custom_docbook) and share it with others. A document type can also be installed using the add-on support *(on page 1916)*.

### Impose Custom Options for Authors

**Use Case**

You want to force *Track Changes* *(on page 2821)* to be enabled at startup.

**Solution**

There are two ways to enable *Track Changes* for every document that you open:

1. You could **customize the default options** *(on page 299)* that are used by your authors and set the *Track Changes - Initial State* option *(on page 182)* to *Always On*.

2. Use an API to toggle the *Track Changes* state after a document is opened in **Author** mode:

   ```java
   // Check the current state of Track Changes
   boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
   if (!trackChangesOn) {
     // Set Track Changes state to On
     authorAccess.getReviewController().toggleTrackChanges();
   }
   ```

---

### Insert an Element with all the Required Content

**Use Case**

You want to insert a DITA *image* element that points to a certain resource and has required content and you want the required content be automatically inserted.

**Solution**

The API `ro.sync.ecss.extensions.api.AuthorSchemaManager` can propose valid elements that can be inserted at the specific offset. Using the method `AuthorSchemaManager.createAuthorDocumentFragment(CIElement)`, you can convert the proposed elements to *document fragments* *(on page 2815)* (which have all the required content filled in) that can then be inserted in the document.
AuthorSchemaManager schemaManager =
this.authorAccess.getDocumentController().getAuthorSchemaManager();

WhatElementsCanGoHereContext context =
schemaManager.createWhatElementsCanGoHereContext
(this.authorAccess.getEditorAccess().getCaretOffset());

List<CIElement> possibleElementsAtCaretPosition =
schemaManager.whatElementsCanGoHere(context);

loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
    CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
    List<CIAttribute> attrs = possibleElement.getAttributes();
    if(attrs != null) {
        for (int j = 0; j < attrs.size(); j++) {
            CIAttribute ciAttribute = attrs.get(j);
            if (ciAttribute.getName().equals("class")) {
                if (ciAttribute.getDefaultValue() != null &&
                    ciAttribute.getDefaultValue().contains(" topic/image ")) {
                    //Found a CIElement for image
                    //Create a fragment that contains all required child elements already built.
                    AuthorDocumentFragment frag =
schemaManager.createAuthorDocumentFragment(possibleElement);

                    //Now set the @href to it.
                    //Ask the user and obtain a value for the @href
                    //Then:

                    String href = "test.png";
                    List<AuthorNode> nodes = frag.getContentNodes();
                    if(!nodes.isEmpty()) {
                        AuthorElement imageEl = (AuthorElement) nodes.get(0);
                        imageEl.setAttribute("href", new AttrValue(href));
                    }
                    //And insert the fragment.
                    this.authorAccess.getDocumentController().insertFragment
                    (this.authorAccess.getEditorAccess().getCaretOffset(), frag);
                    break loop;
                }
            }
        }
    }
}
}
Modify the XML Content on Open

Use Case

You want to convert fixed paths in an attribute value to relative paths.

Solution

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
            (StandalonePluginWorkspace.MAIN_EDITING_AREA);
        if (openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authPage = (WSAuthorEditorPage)
                openedEditor.getCurrentPage();
            AuthorDocumentController docController =
                authPage.getDocumentController();
            try {
                //All changes will be undone by pressing Undo once.
                docController.beginCompoundEdit();
                fixupImageRefs(docController,
                    docController.getAuthorDocumentNode());
            } finally {
                docController.endCompoundEdit();
            }
        }
    }

    private void fixupImageRefs
        (AuthorDocumentController docController, AuthorNode autorNode) {
        if (autorNode instanceof AuthorParentNode) {
            ...
        }
    }
```
//Recurse
List<AuthorNode> contentNodes =
((AuthorParentNode)authorNode).getContentNodes();
if(contentNodes != null) {
    for (int i = 0; i < contentNodes.size(); i++) {
        fixupImageRefs(docController, contentNodes.get(i));
    }
}

if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement elem = (AuthorElement) authorNode;
    if("image".equals(elem.getLocalName())) {
        if(elem.getAttribute("href") != null) {
            String originalHref = elem.getAttribute("href").getValue();
            URL currentLocation = docController.getAuthorDocumentNode().getXMLBaseURL();
            //TODO here you compute the new href.
            String newHref = null;
            docController.setAttribute("href", newValue(newHref), elem);
        }
    }
}
}

StandalonePluginWorkspace.MAIN_EDITING_AREA);

2. An API to open XML documents in the application:
ro.sync.exml.workspace.api.Workspace.open(URL)

So you can create a plugin that automatically opens XML documents one at a time from a certain folder in the application, makes modifications to them, and saves the content by calling:
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
then closes the editor by calling:
ro.sync.exml.workspace.api.Workspace.close(URL)

Modify the XML Content on Save

Use Case
You the revised date on a DITA document to be updated when it is saved.

Solution
The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts.
You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use the **Author API** to change attributes before the save takes place:

```java
@Override
public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener

    @new WSEditorChangeListener() {
        //An editor was opened
    }

    @Override
    public void editorOpened(URL editorLocation) {
        final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess

        if (editorAccess != null) {
            editorAccess.addEditorListener

            @new ro.sync.exml.workspace.api.listeners.WSEditorListener() {
                //Editor is about to be saved
            }

            @Override
            public boolean editorAboutToBeSavedVeto(int operationType) {
                if (EditorPageConstants.PAGE_AUTHOR.equals(editorAccess.getCurrentPageID())){
                    WSAuthorEditorPage authorPage = (WSAuthorEditorPage) editorAccess.getCurrentPage();
                    AuthorDocumentController controller = authorPage.getDocumentController();

                    try {
                        //Find the revised element
                        AuthorNode[] nodes = controller.findNodesByXPath("//revised", true, true, true);
                    }
                    catch (AuthorOperationException e) {
                        e.printStackTrace();
                    }

                    new AttrValue(new Date().toString()), revised);
                }
                return true;
            }
        }
    }

    //And let the save continue..
    return true;
}
```
Multiple Rendering Modes for the Same Document in Author Mode

Use Case

You want to add multiple buttons, each showing a different visualization mode of the same document, in Author mode.

Solution

In the toolbar in Author mode, there is a Styles drop-down menu that contains alternate CSS styles (on page 2814) for the same document. To add an alternate CSS stylesheet, open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Type Association, select the document type associated with your documents and click Edit. In the Document Type configuration dialog box (on page 140) that appears, go to the Author tab, and in the CSS subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets offered for the DITA document type is located here (by default):

```text
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css
```

If you open it, you will see that it imports the main CSS (on page 2818) and then adds selectors of its own.

Obtain the Currently Selected Element Using the Author API

Use Case

In Author mode, if an element is fully selected, you want to perform an action on it. If not, you want to perform an action on the node that is located at the cursor position.

Solution

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using AuthorDocumentController.getNodeAtOffset will actually return the parent of the selected node. A special API is available that makes it easier for you to determine this situation: WSAuthorEditorPageBase.getFullySelectedNode().

```java
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
AuthorElement nodeAtCaret =
(AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();
```
if (nodeAtCaret == null) {
    //We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement)
    authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    //Or we could look at the selection start and end, see which node is
    the parent of each offset and get the closest common ancestor.
}

Open a Document from Another Application

Restriction:
This feature is currently only available for macOS users.

Use Case

You want to open a document from another application in Oxygen XML Author.

Solution

The Oxygen XML Author installation kit for macOS comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is edit-in-oxygen and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:

```
```

Oxygen XML Author will start and open the HTML content from the URL http://www.oxygenxml.com/index.html.

Tip:
You can also use anchors on the URL to point to specific lines or elements inside the open document:

Opening a Document at a Specific Location Using a Command-Line Interface (on page 366).

Run XSLT or XQuery Transformations

Use Case

You want to run XSL 2.0 / 3.0 transformations with Saxon EE using the Oxygen SDK.
Solution

The API class `ro.sync.exml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an `AuthorAccess` API available:

```java
InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl"))).toString();
xmlSrc = new SAXSource(is);
javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xmlSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the plugin side, you can use this method instead:

Save a New Document with a Predefined File Name Pattern

Use Case

You want Oxygen XML Author to automatically generate a file name comprising a UUID plus file extension using the SDK.

Solution

This could be done implementing a plugin (on page 2819) for Oxygen XML Author using the Plugins SDK.

There is a type of plugin called `Workspace Access` that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```java
private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace
    pluginWorkspaceAccess;
    private boolean saving = false;
    public CustomEdListener
    (StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }
    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
```
if(! saving &&
    editor.getEditorLocation().toString().contains("Untitled")) {
    File chosenDir = pluginWorkspaceAccess.chooseDirectory();
    if(chosenDir != null) {
        final File chosenFile =
            new File(chosenDir, UUID.randomUUID().toString() + ".dita");
        SwingUtilities.invokeLater(new Runnable() {
            @Override
            public void run() {
                try {
                    saving = true;
                    editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
                } catch (MalformedURLException e) {
                    e.printStackTrace();
                } finally {
                    saving = false;
                }
            }
        });
    }
    return false;
} return true;
}

@Override
public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
        @Override
        public void editorOpened(URL editorLocation) {
            final WSEditor editor = pluginWorkspaceAccess.getEditorAccess
                (editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
            if(editor != null && editor.getEditorLocation().toString().contains("Untitled")) {

                //Untitled editor
                editor.addEditorListener(new CustomEdListener(pluginWorkspaceAccess, editor));
            }
        }
    });
}
Split Paragraph on Enter (Instead of Showing Content Completion List)

**Use Case**

You want to split the paragraph on Enter instead of showing the content completion list.

**Solution**

Yes, it is possible by creating your own custom operation.

To obtain this behavior, follow this procedure:

1. Create a custom Author mode operation (on page 1804) that handles the split. You can use the AuthorDocumentController.split API to achieve this.
2. Create a JAR library that contains its compiled version.
3. Open the Preferences dialog box (Options > Preferences) (on page 124), go to Document Types Association, and select your framework.
4. Click Edit and in the Document Type configuration dialog box (on page 140), go to the Classpath tab (on page 144) and add a reference to the JAR library for your custom operation.
5. Go to the Author tab, then go to the Actions subtab.
6. Click the + New button and use the Action dialog box (on page 148) to create your own paragraph split action.
7. Make sure you assign Enter as the Shortcut Key and specify your custom operation in the Operations section.

**Result:** Now, when you press Enter, your Java operation will be invoked to split the paragraph instead of opening the Content Completion Assistant.

**Tip:**

The Content Completion Assistant can still be invoked by using the Ctrl+Space keyboard shortcut.

Use Custom Rendering Styles for Entity References, Comments, or PIs

**Use Case**

You want to display entity references in the Author mode without the distinct gray background and tag markers.
Solution

There is a built-in CSS stylesheet in the Oxygen XML Author libraries that is used when styling content in the Author mode, no matter what CSS you use. This CSS has the following content:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
    display:morph !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|processing-instruction {
    display:block !important;
    color: rgb(139, 38, 201) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|comment {
    display:morph !important;
    color: rgb(0, 100, 0) !important;
    background-color:rgb(255, 255, 210) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
    link: attr(href) !important;
    text-decoration: underline !important;
    color: navy !important;

    margin: 2px !important;
    padding: 0px !important;
}

oxy|reference:before {
    display: morph !important;
    content: url(../images/editContent.gif) !important;
}

oxy|entity[href]:before{
    display: morph !important;
    content: url(../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
    editable:false !important;
    background-color: rgb(240, 240, 240) !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference {
    display:morph !important;
}

oxy|entity {
    display:morph !important;
}

oxy|entity[href] {
    border: 1px solid rgb(175, 175, 175) !important;
    padding: 0.2em !important;
}

xi|include {
    display:block !important;
In the CSS used for rendering the XML in **Author** mode, do the following:

1. Import the special **Author** mode namespace.
2. Use a special selector to customize the `entity` node.

**Example:**

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');

oxy|entity {
  background-color: inherit !important;
  margin: 0px !important;
  padding: 0px !important;
}
You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and CData sections. You can also customize the way `<xsi:include>` elements are rendered.
Add-ons

Oxygen XML Author offers various default add-ons that can be installed to provide additional functionality to Oxygen XML Author. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For a full list of add-ons that are officially supported for Oxygen XML Author, see Oxygen XML Add-on Repositories.

This chapter contains information about the default add-ons that are available to install directly from Oxygen XML Author.

To install one of the default add-ons, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the add-on you want to install and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Resources

For more information about extending Oxygen XML Author through add-ons, see the following webinars/presentations:

- Webinar: Extending the Functionality of Oxygen Using Add-ons
- Webinar: Add-ons You Can Use for Technical Writing
- XML Prague Conference Presentation: All About Oxygen Add-ons

Collaboration

Git Client Add-on

An add-on is available that contributes a built-in Git client directly in Oxygen XML Author. Once the add-on is installed, a Git Staging view is available that includes various actions that perform common Git commands, such as push, pull, change branch, commit, and more. It also includes a built-in tool for comparing and merging changes.
Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

Note: If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

2. Select the Git Client add-on and click Next.
3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
4. Restart the application.

Result: The Git Staging view is now available. To open the view, select Git Staging from the Window > Show View menu (or select Git Client from the Tools menu). This view acts as a Git client integrated directly in Oxygen XML Author, and it provides support for committing changes to a Git repository, comparing and merging changes, resolving conflicts, and other Git commands. A Git menu is also contributed in the main menu bar that includes various Git actions.

Git Staging View Interface

Once the Git Client add-on is installed, the Git Staging view is available by selecting it from the Window > Show View menu (or select Git Client from the Tools menu). The Git Staging view is the main interface where most of the actions that trigger Git commands and other features can be accessed.
The **Git Staging** view includes the following actions/features (most are also available in the **Git** menu):

**Push**

Pushes your local repository changes to the remote repository. The arrow icon has a small plus sign in the bottom-right corner when there are changes that have not yet been pushed to the repository.

**Pull**

Pulls the changes from the remote repository into your local repository.

**Stash drop-down menu**

Includes the following submenu items:

- **Stash changes**
  
  Creates a new stash from the working copy changed file.

- **List stashes**
  
  Opens a dialog box that lists the existing stashes and you can choose to apply or remove a stash.

**Show current repository history**
Opens the **Git History view** (on page 2150) at the bottom of the application.

**Show Git Branch Manager view**

Opens the **Git Branch Manager view** (on page 2154) on the right side of the application.

**Ellipsis (three vertical dots) menu**

Includes the following submenu items:

- **Clone new repository**
  
  Clones a repository into a new directory.

- **Push**
  
  Pushes your local repository changes to the remote repository.

- **Pull (merge)**
  
  Pulls the latest changes from the remote repository and combines them with your local unpublished changes by creating one new merge commit.

- **Pull (rebase)**
  
  Pulls the latest changes from the remote repository, rewrites their commits, and reapplies them on top of your local unpublished changes.

- **Show branches**
  
  Opens the **Git Branch Manager view** (on page 2154) on the right side of the application.

- **Show tags**
  
  Opens a dialog box that lists all the tags. You can delete tags, checkout a certain tag, or push a tag that is only present in the local branch to the remote.

- **Show history**
  
  Opens the **Git History view** (on page 2150) at the bottom of the application.

- **Submodule**
  
  Opens a combo box where you can select the desired submodule to open and work with.

- **Stash changes**
  
  Creates a new stash from the working copy changed file.

- **List changes**
  
  Opens a dialog box that lists the existing stashes and you can choose to apply or remove a stash.

- **Manage remote repositories**
  
  Opens a dialog box where you can add, edit, or delete existing remote repositories.
Track remote branch

Opens a dialog box where you can select a remote branch that the local branch will track for executing fetch, push, or pull commands.

Edit repository "config" file

Opens the configuration file for the repository in the main editor so that it can be edited.

Preferences

Opens the Git Client preferences page where you can configure some options that relate to the add-on.

Reset all credentials

Resets all credentials to the default values.

Unstaged files area

Any changed, unstaged files are listed in this box. The following actions are available at the top-right corner of the box:

- Stage selected
  Moves the selected unstaged, changed files to the Staged files area.

- Stage all
  Moves all unstaged, changed files to the Staged files area.

- Switch to tree view
  Switches to a tree-like view.

Staged files area

All staged files are listed in this box. The following actions are available at the top-right corner of the box:

- Unstage selected
  Moves the selected staged files to the Unstaged files area.

- Unstage all
  Moves all staged files to the Unstaged files area.

- Switch to tree view
  Switches to a tree-like view.

Commit message area

This box in this area is used to write a commit message. The following actions are available at the top-right corner of the box:
Choose a previously used comment

Allows you to re-use a commit message that you used in the past.

Automatically push changes to remote branch

When a commit is performed, the committed changes are also pushed to the remote repository.

Amend last commit

Allows you to edit the selected commit. You can combine staged changes with the previous commit instead of creating an entirely new commit. It can also be used to simply edit the previous commit message without changing its snapshot. This action should not be performed on public commits (commits that were pushed to the remote repository).

Cloning a Repository

Click the Clone new repository button (it has a '+' sign as the icon) and provide the following:

- Repository URL - The URL of the remote repository to be cloned.
- Checkout branch - A specific branch of the repository that is being cloned. The default branch will be cloned if another one is not specified.
- Destination path - The local path where the repository will be cloned. When you enter a URL of a repository, it will be proposed to automatically save it in a folder with the same name.

After cloning a repository, it will automatically be set as the current working copy.

Making an Oxygen Project a Git Repository

When showing the Git Staging side-view after opening an Oxygen XML Author project that is not already a Git repository, Oxygen XML Author offers the possibility to make that project also a local Git repository. This is very useful, for example, for newly created projects. After creating the local repository, bind it to a remote repository. You will be asked to specify the URL of the corresponding remote repository on your first attempt to push or pull changes.

Authentication

The Git Client supports HTTPS and SSH connections to GitHub, GitLab, Bitbucket, and more. It also includes support for ssh-agent forwarding.

Note:

For SSH connections, you can use the SSH agent to use the SSH keys already stored on it. To enable support for SSH agent access, go to Git(Menu) > Settings > Preferences > SSH Connections (or Git Staging View > Ellipsis menu > Preferences > SSH Connections) and select the Use SSH Agent option.
To access the remote repository, you need to provide your authentication details (if not using unprotected SSH keys). If no such information is found in the add-on's settings, you will be prompted for them.

The Git Client allows you to authenticate over HTTPS by using either a basic authentication method (username + password) or a personal access token.

---

**Notes:**

- The authentication using personal access tokens has been tested with GitHub and GitLab.
- Bitbucket uses a concept similar to personal access tokens, named *app passwords*. An app password must be provided as the password for *Basic authentication*, along with the correct username.
- As of August 13, 2021, GitHub will no longer accept password-based authentication.

---

If you have the **two-factor authentication (2FA)** enabled for GitHub or GitLab, to authenticate over HTTPS, you must generate a personal access token for your profile, and back in the Git Staging view in Oxygen XML Author, use the generated token value as the authentication password when asked for your credentials.

If, for example, you have been using a GitHub account but you decide to switch to another GitHub account, you would need to reset your credentials so that you will be prompted for new ones. This is because only one set of credentials for each Git platform/server is stored. To reset your credentials, go to the toolbar at the top of the Git Staging side-view, click the settings icon (a cogwheel), and select *Reset all credentials*.

**Selecting a Working Copy**

Click the **Browse** button to the right of the **Working copy** combo box to select a working copy from your file system. The selected folder must be a Git repository.

**Switching Between Local Branches**

To switch between local branches from the Git Staging view, use the **Branch** combo box. Local branches can also be changed using the Git Branch Manager *(on page 2154)*.

New branches can be created from the Git Branch Manager *(on page 2154)* or from the History table using the Create branch action in the contextual menu.

**Stashing Files**

A Git stash is a way of temporarily saving the changes you have made to your working copy so that you can continue to use other Git operations in the meantime, and you can then re-apply the stashed changes later.

On the toolbar, there is a **Stash** drop down menu with a **Stash changes** action for creating a new stash out of the working copy changed file and a **List stashes** action that presents a dialog box with the existing stashes. From, the List stashes dialog box, you can also choose to apply or remove a stash.
Creating Tags

Tagging is used to capture a specific point in history, for example to mark a release. A tag is like a branch that doesn't change. You can create tags from the History view (on page 2150) contextual menu. In the Ellipsis (three vertical dots) menu on the right side of the Git Staging view's toolbar, there is a Show tags action that lists all the tags. Both local and already pushed tags can be deleted from this dialog box. For tags present only in the local branch, you can choose to push them to the remote repository. The Show tags action is also available in the Git menu from the main menu bar.

Working with Submodules

When cloning a repository that contains submodules, all submodules are initialized and cloned as well. When pulling changes from the remote repository, the submodules are also updated. The update of the submodules when performing a pull operation depends on the Update all submodules after pulling changes from the remote repository option from Options > Preferences > Plugins > Git Client (the option is enabled by default).

When checking out a branch for a parent repository with submodules, the submodules are also checked out at the index in the parent repository to reflect the actual state of the repository at that particular time.

To open and work with a Git submodule, use the Submodules action from the Ellipsis (three vertical dots) menu (on the right side of the Git Staging view's toolbar) and select the desired submodule from the presented combo box. As an alternative, if the submodule is modified and is presented in the Unstaged files area (on page 2152), the Open contextual menu action can be used to open it.

The tooltip of a modified submodule shown in the Unstaged files area (on page 2152) presents information about the currently and previously tracked commits.

Showing the Repository History

To show the history, invoke the Show current repository history action from the toolbar of the Git Staging panel (look for the clock icon) or go to Window > Show view > Git History. This opens the Git History view at the bottom of the application.

In the toolbar, you can choose which branches will have the history shown. You have the following options:

- **Current branch** - Shows the commits for the current branch, including unpushed local and unpulled remote commits.
- **Current local branch** - Shows the commits only for the current local branch, including unpushed local commits.
- **All branches** - Shows the commits for all branches (both local and remote), including unpushed local and unpulled remote commits.
- **All local branches** - Shows the commits only for local branches, including unpushed local commits.

For each commit in the history table, the following actions are available:
• **Create branch** - Used to create a new branch starting from the selected commit. The new branch is automatically checked out by default. To disable this behavior, deselect the **Checkout branch** option in the **Create branch** dialog box.

**Tip:**
To publish a new branch to the remote repository and start tracking that branch, you need to simply push the local branch using the dedicated action from the **Git Staging** side-view.

• **Create tag** - Used to create a new tag on the selected commit. You have the option to push the tag to the remote repository.
• **Checkout** - Used to checkout a branch at a specific commit (either in detached head form or by creating a new branch at that commit).
• **Revert commit** - Used to create a new commit that reverts all the changes from the selected commit.
• **Reset "[branch_name]" to this commit** - Used to undo changes by moving the HEAD of the current branch to the selected commit.

The **Git History** view presents all the affected resources for each commit in a list, in the bottom-right area. It includes a text filter field at the top that you can use to conduct searches (e.g. by Date, Author, or Commit ID). An included revision graph helps you to understand how commits connect with one another. For each resource, the following actions are available in the contextual menu:

• **Open** (available for added and modified resources) - This action opens the selected resource.
• **Open previous version** (available for deleted resources) - This action opens the version of the selected resource from before its deletion.
• **Open working copy version** (available for added and modified resources) - This action opens the working copy version of the selected resource. It also works if the resource has been renamed in between versions.
• **Reset file to this commit** (available for added and modified resources) - This action checks out the selected version of the resource, overwriting its current version. It does not work if the resource has been renamed or deleted in between versions.
• **Compare with previous version** (available for modified resources) - This action compares the selected version of the selected resource with the previous one using the **Compare Files tool** (on page 456).
• **Compare with working copy version** (available for modified resources) - This action compares the selected version of the selected resource with the current one using the **Compare Files tool** (on page 456).
• **Compare with each other** (available when selecting 2 versions of a single file) - This action compares the selected versions with each other using the **Compare Files tool** (on page 456).

**Blame**

The contextual menu of each unstaged resource contains a **Show blame** action that opens the selected resource in the main editing area and colors the editor lines with different colors based on the revision
information. Selecting a line in the opened editor will highlight the corresponding entry from the history table in the Git History side-view.

This action is also available in the contextual menu of the current editor and of the Git resources from the Project side-view (on page 385).

Unstaged Files Area

In the Unstaged files area, you will see all the modifications that have occurred in your working copy (files that have been modified, new files, and deleted files) and are not part of the next commit.

- Various actions are available in the contextual menu (Open, Open in compare editor, Stage, Discard, Show history, Show blame, and more).
- You can stage files (i.e. move them to the Staged files area (on page 2152)) using the actions from the toolbar found above the top-right corner of this area. You can choose between staging all the files, by clicking the Stage all button (double arrow icon), and staging specific files, by selecting them and clicking the Stage selected button (single arrow icon).
- You can switch between the list view and the tree view by clicking on the Switch to tree/list view button positioned to the right of the staging buttons.

Staged Files Area

In the Staged files area, you will see all the resources that are ready to be committed. The files from this area can be unstaged and sent back to the Unstaged files area (on page 2152). This area has actions similar to those from the Unstaged files area (on page 2152), with the exception of the Show history and Show blame actions that are not available here.

Comparing Changes and Conflict Resolution

At any time, if you want to see the differences between the last commit and your current modifications, you can double-click a file from either the Unstaged files area (on page 2152) or Staged files area (on page 2152), and the Compare Files (on page 456) window will appear and highlight the changes.

If the file has a conflict (has been modified both by you and another), Oxygen's 3-Way file comparison feature (on page 459) will show a comparison between the local change, the remote change, and the original base revision.

Committing

After staging the files, on the bottom of the view you can provide a commit message and commit them to your local repository. For convenience, you can also select a previously provided message.

In the toolbar above the Commit message text area, there are a few toggle buttons that affect your commit if they are enabled:
• **Amend last commit** - Enabling this option is a convenient way to modify the most recent commit. It lets you combine staged changes with the previous commit instead of creating an entirely new commit. It can also be used to simply edit the previous commit message without changing its snapshot. This action should not be performed on public commits (commits that were pushed to the remote repository).

• **Automatically push changes to remote when committing** - If this option is enabled, when a commit is performed, the committed changes are also pushed to the remote repository.

**Push/Pull (with Merge or Rebase)**

To push your local repository changes to the remote repository, use the ↑ Push button from the view's toolbar (up arrow).

To bring the changes from the remote repository into your local repository, use one of the actions from the **Pull** drop-down menu located on the toolbar (⬇️). You can choose between **Pull (merge)** and **Pull (rebase)**. The invoked action is promoted as the current action of the toolbar button.

**Note:**

When pushing a local branch that does not have a corresponding remote branch, a remote branch will automatically be created with the same name as the local branch.

**File Conflict Solving Workflow**

After editing a file, committing it to the local repository, and trying to push it to the remote repository, if a warning appears about not being up to date with the repository, follow these steps:

1. Pull the data from the repository using one of the Pull actions.
2. In the **Unstaged files area (on page 2152)**, select each conflicted file and resolve the conflicts. You can do this, for example, by opening the conflicted files in the compare editor, either by double-clicking on them or by using the contextual menu action, and then choose what changes you want to keep and discard, and save the document. You can also use the Resolve using Mine, Resolve using Theirs, or **Mark as resolved** actions from the contextual menu of a resource.
3. If you choose to use the compare editor, after you close it, the file will be staged automatically and moved to the **Staged files area (on page 2152)**.

At this point, the next actions depend on which **Pull** action was chosen:

• **Pull (merge):**
  1. When all the conflicts are resolved and no more files are left in the **Unstaged files area (on page 2152)**, the changes can be committed.
  2. Enter a message and commit. You will now have new changes to push.
  3. Push the changes to the remote repository.
Note:
You can abort the merge by clicking the Abort merge button. This will revert the repository to its previous state prior to the pull attempt.

Pull (rebase):
1. When all the conflicts are resolved, click the Continue rebase button.
2. Push any outgoing changes.

Note:
You can abort the rebase by clicking the Abort rebase button. This will revert the repository to its previous state prior to the pull request.

Working with Large Files in Git

Git repositories are designed to track changes to text-based files, such as source code, and are optimized for small file sizes. Large binary files (such as image or video files) can slow down the Git repository and make version control difficult. Git's Large File Storage (LFS) provides a solution to this problem by efficiently storing and managing large files outside of the repository.

To start using LFS, follow the instructions at https://git-lfs.com/. Once you have installed LFS and defined the tracked large files in your repository, large files will be automatically detected and handled properly.

Warning:
If you are using a proxy, you need to set the HTTPS_PROXY environment variable for git operations that involve LFS for it to work correctly.

Setting the HTTPS_PROXY environment variable on Windows from the command line

```
set HTTPS_PROXY=http://my.proxy.com:5000
```

The Project View and the Current Editor

For resources from Git repositories, this add-on also contributes a variety of actions in the contextual menus of the Project side-view (on page 385) and the current editor (Text and Author modes). These actions include: Show history, Show blame, Git Diff (only in the Project view), and Commit (only in the Project view).

Git Branch Manager

To show all the local and remote branches, click the Show Git Branch Manager button on the toolbar of the Git Staging panel (look for the branches icon) or select Git Branch Manager from Window > Show view. By default, the Git Branch Manager is presented to the right of the editing area.

The Git Branch Manager side-view displays all the branches as a tree. The tree can be filtered using the text field at the top of the panel and you can reload the information by using the Refresh action. When hovering the
cursor over a branch name, a tooltip is displayed that provides information about the last commit performed on that branch (such as the author and the date of the commit).

The following actions are available in the contextual menu for each local branch:

- **Checkout** - Checks out the selected branch and switches the local repository to the selected branch.
- **Create branch** - Creates a new branch using the selected branch as the starting point. The new branch is automatically checked out by default. To disable this behavior, deselect the **Checkout branch** option in the Create branch dialog box.

**Tip:**
To publish a new branch to the remote repository and start tracking that branch, you need to simply push the local branch using the dedicated action from the **Git Staging** side-view.

- **Merge "SELECTED_BRANCH" into "CURRENT_BRANCH"** - Merges all the changes from SELECTED_BRANCH into CURRENT_BRANCH.
- **Squash merge "SELECTED_BRANCH" into "CURRENT_BRANCH"** - Merges all the changes made on the SELECTED_BRANCH since it diverged from the CURRENT_BRANCH, on top of the CURRENT_BRANCH, and it records the results in a new commit.
- **Delete** - Deletes the selected branch.

For the remote branches, the **Checkout branch** action checks out the selected branch and creates a local branch from the selected remote branch.

**Preferences**

The **Git Client** add-on contributes a preferences page to Oxygen XML Author. To access it, go to **Options > Preferences > Plugins > Git Client** or **Git(Menu) > Settings > Preferences** or click the **Ellipsis menu** button from the toolbar of the **Git Staging** view and select **Preferences**. This preferences page includes the following options:

- **When detecting a Git repository inside a newly opened project** - This determines what happens to the current working copy when a project that contains a Git repository is opened in the **Project side-view (on page 385)**. You can choose between:
  - Always switch to the new working copy
  - Never switch to the new working copy
  - Always ask (default value)

- **Notify me about new commits in the remote repository** - When this option is selected, Oxygen XML Author will show notification messages when it detects that new commits have been pushed to the remote repository. By default, this option is not selected.
• **Update all submodules after pulling changes from the remote repository** - If this option is selected, when a repository is updated using the *Pull* operation, all sub-modules are updated as well. This option is selected by default.

• **Detect and open Oxygen projects (.xpr) from opened working copies** - If this option is selected (by default, it is not selected) and a working copy that contains one or more project files (.xpr) is opened:
  ◦ If one .xpr file is found, it will be opened automatically.
  ◦ If more than one .xpr files are found and none of them are opened, a dialog box will appear where the .xpr can be selected.

• **Validate each file before committing** - When this option is selected, each file to be committed will be validated individually. If validation problems are detected, the commit operation will be stopped and a dialog box will appear informing you that the problems can be viewed in the "Results" area (in the "Git pre-commit validation" tab). If the *Reject commit when validation problems occur* option is selected (the default state), the dialog box will include a *Commit anyway* button that allows the commit operation to be completed even if validation issues have been found.

• **Validate all files from the project's "Main Files" folder before pushing** - When this option is selected, the files in the "Main Files" folder will be validated.

The following are required for this option to function properly:
  ◦ **Main Files** support must be enabled (*on page 401*) and the files must be properly inserted in the "Main Files" folder.
  ◦ It is mandatory that a validation scenario be configured because the validation will be based on it.
  ◦ The current repository must be the same as the project loaded in the **Project View** and there must be no uncommitted changes (if detected, a dialog box will appear offering the option to make a stash be applied after the project validation).

If validation problems are detected, the push operation will be stopped and a dialog box will appear informing you that the problems can be viewed in the "Results" area (in the "Git pre-push validation" tab). If the *Reject push when validation problems occur* option is selected (the default state), the dialog box will include a *Push anyway* button that allows the push operation to be completed even if validation issues are detected.

• **Global Options/Project Options** - If you select **Project Options**, the settings are stored in the project file (.xpr) that can easily be *shared with other users* (*on page 302*).

Under the preferences page, there is the "SSH Connections" page, which includes the following options:

• **Use SSH agent** - when this option is selected, the selected SSH agent support is used to benefit from the SSH keys already stored in it. On **Linux**, **OS X**, and **BSD**, the only agent communication mechanism supported is the usual communication via a Unix domain socket. On Windows you can choose between:
  ◦ **Pageant**
  ◦ **Win 32 Open SSH** (default value)
Editor Variables

The Git Client contributes the following editor variables:

- \${git(working_copy_name)} - The name of the working copy directory.
- \${git(working_copy_path)} - The absolute file path of the working copy directory.
- \${git(working_copy_url)} - The location of the working copy directory as a URL.
- \${git(short_branch_name)} - The short name of the current branch (e.g. dev).
- \${git(full_branch_name)} - The full name of the current branch (e.g. refs/heads/dev).

Project Validation

Validating Each File Before a Commit

To enable automatic validation of each file before a commit, select the Validate each file before committing option (on page 2156) in the Git Client preferences page (Git > Settings > Preferences, or Options > Preferences > Plugins > Git Client, or click the Settings button from the toolbar of the Git Staging view and select Preferences).

If validation problems are detected, the commit operation will be stopped and a dialog box will appear informing you that the problems can be viewed in the "Results" area (in the "Git pre-commit validation" tab). If the Reject commit when validation problems occur option is selected, the dialog box will include a Commit anyway button that allows the commit operation to be completed even if validation issues have been found.

Validating Before a Push Operation

To enable automatic validation of the files from the "Main Files" folder, select the Validate all files from the project's "Main Files" folder before pushing option (on page 2156) in the Git Client preferences page (Git > Settings > Preferences, or Options > Preferences > Plugins > Git Client, or click the Settings button from the toolbar of the Git Staging view and select Preferences).

For this option to function properly, Main Files support must be enabled (on page 401) and the files must be properly inserted in the "Main Files" folder. It is also mandatory that a validation scenario be configured because the validation will be based on it. The current repository must be the same as the project loaded in
the Project View and there must be no uncommitted changes (if detected, a dialog box will appear offering the option to make a stash be applied after the project validation).

If validation problems are detected, the push operation will be stopped and a dialog box will appear informing you that the problems can be viewed in the "Results" area (in the "Git pre-push validation" tab). If the Reject push when validation problems occur option is selected, the dialog box will include a Push anyway button that allows the push operation to be completed even if validation issues are detected.

Content Fusion Connector Add-on

An Oxygen Content Fusion Connector add-on is available that can be installed to integrate Oxygen Content Fusion with Oxygen XML Author. Content Fusion is a flexible, intuitive collaboration platform designed to adapt to virtually any type of workflow that a collaborative team may use for their documentation review process.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the Oxygen Content Fusion Connector add-on in Oxygen XML Editor or Oxygen XML Author, follow these steps:

1. Go to Window > Show View and select Content Fusion Task Manager.
2. If it has not already been installed, a message will appear asking you if you want to install the add-on.
3. To continue, click Install and follow the on-screen instructions.

Note:

If you don't see the add-on because Oxygen XML Author is unable to connect to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

Result: Content Fusion Task Manager is now available in the Window > Show View menu. Selecting this button/action opens the Content Fusion Task Manager view.

To fully take advantage of all of the benefits and features, your organization will need an Oxygen Content Fusion Enterprise Server. This solution allows you to host, setup, and configure your own server and control your data. With this model, you are also able to upload custom frameworks and plugins, and to configure various settings. It is possible to evaluate Content Fusion free of charge, for a limited time. For more information, see the Oxygen Content Fusion website.

For more information about using Content Fusion in Oxygen XML Author, see the Oxygen Content Fusion User Guide.

Integrating Oxygen Feedback with Oxygen XML Editor/Author

It is possible to integrate Oxygen Feedback with Oxygen XML Editor/Author so that your documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application. This is made possible by an add-on that when installed in Oxygen XML Editor/Author, a Feedback Comments Manager view becomes available.

Attention:
The Feedback Comments Manager view only functions in Oxygen XML Editor or Oxygen XML Author. It does not work in the Oxygen XML Developer edition.

To see a demonstration of Oxygen Feedback being integrated with Oxygen XML Editor/Author, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

![Install Button](image)

Manual Installation

To manually install this add-on in Oxygen XML Editor/Author, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select **Oxygen Feedback Connector** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** The **Feedback Comments Manager** view is now available. By default, it is displayed to the right of the main editing panel. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. You can also use the **Show Feedback Comments Manager** from the contextual menu in the **DITA Maps Manager**.

### Connecting the Feedback Comments Manager View

If this is your first time using it, you need to configure a mapping between **Oxygen XML Editor/Author** and your Feedback site configuration(s). If you have already configured a mapping, you just need to connect the **Feedback Comments Manager** to your Feedback account.

To connect, follow this procedure:

1. Select **Connect** from the user drop-down menu at the top-right corner of the **Feedback Comments Manager**.

   **Step Result:** You are directed to the *administration login page* in your default browser.

2. Log in with your credentials, click **Authorize** in the resulting page, and go back to **Oxygen XML Editor/Author**.

3. If this is your first time using the **Feedback Comments Manager**, you need to configure a mapping:
   a. Select **Preferences** from the user drop-down menu at the top-right corner of the **Feedback Comments Manager**.

      **Step Result:** You are directed to the **Oxygen Feedback Connector** preferences page (you can also reach this page by going to **Options > Preferences > Plugins > Oxygen Feedback Connector**).

   b. Click the **New** button at the bottom of the mappings table.

      **Step Result:** This opens the **New Oxygen Feedback Mapping** dialog box where you can configure the mapping.

   c. In the **Context DITA map location** field, click the **browsing button and specify the URL of your context DITA map. This is the path to the root DITA map used to publish your output.**
d. For the **Published site base URL** field, *Oxygen XML Editor/Author* automatically detects all the base URLs for the site configurations that you have the role of **Moderator**, **Admin**, or **Owner**. You can type the base URL or select it from the drop-down menu.

e. Click **OK** in both dialog boxes.

**Result:** The comments that exist in the published WebHelp output for the site configurations attached to the current user's organization (based on the configured mapping) will be loaded in the **Feedback Comments Manager** view.

### Using the Feedback Comments Manager View

If the view is not already open in *Oxygen XML Editor/Author*, go to **Window > Show View > Feedback Comments Manager**. You can also use the **Show Feedback Comments Manager** from the contextual menu in the **DITA Maps Manager**.

#### Figure 394. Feedback Comments Manager View

![Feedback Comments Manager View](image)

The **Feedback Comments Manager** view contains the following actions and components:

- **Home button**
  
  Use this button to open the **Oxygen Feedback** administration interface in your default browser.

- **User Name drop-down menu**
Once connected and authorized, your user name will appear in the upper right corner of the view. The drop-down menu offers the following actions:

**Refresh**

Forces a refresh to synchronize the information in the view and reloads the first 20 items.

**Preferences**

Opens the Oxygen Feedback Connector preferences page where you can configure a mapping between Oxygen XML Editor/Author and your Feedback site configuration(s).

**Help**

Opens the Oxygen Feedback user guide in your default browser.

**Connect/Disconnect**

Signs you in or out of your Oxygen Feedback account.

**Feedback for**

You can choose which display mode to use for retrieving comments. The options are:

- **Context DITA map** - If there are base URLs mapped to the current context map, comments from all versions defined by the given base URLs will be loaded.
- **Current editor** - Only comments added in the output for the current topic will be loaded. This mode will retrieve comments from web pages generated from any DITA source file (.dita file extension) as well as any source file with a file extension of xml, html, or md.

**Filters**

You can apply filters for **Site**, **Version**, and **Status**:  

**Site**

You can choose to show All site configurations that you are assigned as Moderator, Admin, or Owner or you can choose a specific site configuration.

**Version**

You can choose show All versions for the site configurations that you are assigned as Moderator, Admin, or Owner or you can choose a specific version for the specified site configuration. If the Site filter is set to All, this drop-down includes the name for all the versions available for the currently detected sites. If there are multiple versions with the same name, the name will be shown only once, but the filtering will detect all the versions with the selected name.

**Status**

You can choose between:
• **Not resolved (Pending, Open, Reopened)** - Displays comments that are in a state of **Pending**, **Open**, or **Reopened**.
• **Pending** - Only displays comments that are in a **Pending** state.
• **Open** - Only displays comments that are in an **Open** state.
• **Reopened** - Only displays comments that are in an **Reopened** state.
• **Resolved** - Only displays comments that are in a **Resolved** state.
• **All** - Displays all comments.

**Note:**
The filters are persistent between sessions. If the comments are retrieved for the **Context DITA map**, they are saved in options associated with the context map. Otherwise, they are associated to a ditamap that is determined from the one that is set in the mapping preferences.

**Comments Area**

**Note:**
Comments are only retrieved for site configurations that you have the role of **Moderator**, **Admin**, or **Owner**.

In the comments area, each comment is displayed as its own box and they are grouped by the topic title or path of the web page where the comments were added and then sorted by date (most recent first). If a DITA topic from context map (or the current topic) can be computed from the web page where a comment is added, you can double-click anywhere in the comment box to open the topic in the main editor. You can also click the group name (the topic title or path) to open the particular topic in the WebHelp output, in your default browser.

At the bottom-right corner of the comment box for each first-level comment (a comment that is not a reply), there is a link to **Resolve** or **Reopen** the comment. The **Resolve** action is only available for first-level comments (not replies) and it marks the comment as **Resolved**. The **Reopen** action is only available for resolved comments and it marks the comment as **Reopened**.

**Note:**
If a new reply is added to a thread that is marked as **Resolved**, the thread is automatically marked as **Reopened**.

Each comment box also includes the commenter's name and avatar, the time the comment was added, the state of the comment (e.g. **Open**, **Rejected**, **Deleted**, **Resolved**, **Reopened**), the initials of the site configuration, the version number, a link to open the WebHelp topic in your browser (the most specific URL for a version is used), and the content of the comment (up to 4 lines). If you hover over a status badge for comments whose status is **Rejected**, **Deleted**, or **Resolved**, you can see the user name who changed the status and the time it was changed.
If there are more than 20 top-level comments, the comments are retrieved in chunks of 20 (replies are not limited) and there is a **Load more comments** button at the bottom that will retrieve the next chunk of top-level comments.

**Contextual Menu**

If you right-click anywhere in a comment box, the contextual menu offers the following actions:

- **Open topic**
  
  If the **Feedback for** option is set to **Context DITA Map** and a parent file (from the current DITA map hierarchy) could be determined, selecting this option opens the parent document in the main editor. If the **Open topic** action is executed on a **block-level comment**, the parent document is opened and the element that the block-level comment is attached to is highlighted in **Author** mode (or the cursor is placed at the beginning of the element in **Text** mode).

- **Copy content (Ctrl + C)**
  
  Copies the content of the comment to the system clipboard.

- **Show comment**
  
  Opens a dialog box with the entire comment displayed. You can copy selected content from the comment to the system clipboard by clicking the **Copy** button at the bottom of the dialog box. If not content is selected, it copies the entire content of the comment.

**Migration/Conversions**

**Batch Documents Converter Add-on**

Oxygen XML Author offers an add-on that contributes actions in the following submenus:

- **Batch Documents Converter** submenu located in the **Tools** menu and the contextual menu of resources in the **Project** view.
- **Additional conversions** submenu located in **File > Import/Convert**.
- **Import** submenu located in the **Append child**, **Insert Before**, and **Insert After** submenus from the contextual menu of the **DITA Maps Manager** view when the opened DITA map is a local file.

The first time you invoke any of these actions, Oxygen XML Author will ask you if you want to install it and offer a wizard to help with the installation process.

Once installed, you need to restart Oxygen XML Author and those same actions will then contain the list of available conversions. Selecting an action from the submenu will open a dialog box where you can configure the options for the corresponding conversion. You can batch convert between the following formats:

- HTML to XHTML
- HTML to DITA
• HTML to DocBook4
• HTML to DocBook5
• Markdown to XHTML
• Markdown to DITA
• Markdown to DocBook4
• Markdown to DocBook5
• Word (.doc or .docx) to XHTML
• Word (.doc or .docx) to DITA
• Word (.doc or .docx) to DocBook4
• Word (.doc or .docx) to DocBook5
• Excel to DITA
• Confluence to DITA
• DocBook to DITA
• OpenAPI to DITA
• JSON to XML
• XML to JSON
• JSON to YAML
• YAML to JSON
• YAML to XML
• XML to YAML

When actions are invoked from the contextual menu of the DITA Maps Manager view, the resulting documents from the conversion are automatically inserted in the map as follows:

• Actions from Append child inserts map nodes as children of the currently selected node.
• Actions from Insert Before inserts map nodes as siblings of the currently selected node, above the current node in the map.
• Actions from Insert After inserts map nodes as siblings of the currently selected node, below the current node in the map.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the Batch Documents Converter add-on:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Batch Documents Converter add-on and click Next.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** A **Batch Documents Converter** submenu will now be available in the **Tools** menu and in the contextual menu. This submenu will contain a list of the various types of available conversions. Selecting one of the types of conversions will open a dialog box where you can configure options for the conversion.

**Configuration**

Options for configuring the conversions can be found in the preferences page of the add-on (Options > Preferences > Plugins > Batch Documents Converter) or in the conversion dialog box.

**Conversions from Word (Word Styles Mapping)**

The conversions from MS Word work best if you only use the MS Word styles to semantically mark up your document. It is important that sections from the Word document are well defined using the heading styles.

Use the **Word styles mapping** option from the **Batch Documents Converter** preferences page to configure any of the types of Word conversions (Word to HTML, Word to DITA, Word to DocBook4, and Word to DocBook5) by setting a mapping between Word elements and styles to the corresponding HTML element.

If the Word document contains paragraphs formatted with custom styles that are not based on default styles, they have to be set in the Word styles mapping configuration. Those that are not set will be converted into simple paragraphs.

The styles mapping configuration is inherited between styles. If you use a custom style that is based on a default style, the default style mapping configuration will be inherited and also used for the custom style. The mapping from the base style is not inherited if the custom style has a mapping defined in the Word styles mapping configuration.

To define a mapping in the **Word Styles Mapping** table, you can use the already defined default configuration. For example, if you use a custom Word style named **Document Title** that is not based on a default style, you can map this to the HTML "h1" element:

<table>
<thead>
<tr>
<th>Word element</th>
<th>Word style</th>
<th>HTML elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Document Title</td>
<td>h1:fresh</td>
</tr>
</tbody>
</table>

The resulting 'h1' element will be transformed into the corresponding element when converting to DITA, DocBook 4, and DocBook 5.

The **Word styles mapping** table contains the following columns:

- **Word element**
This column allows one of the following Word elements:

- **p** - Word paragraph
- **r** - Word run
- **b** - bold text
- **i** - italicized text
- **u** - underlined text
- **strike** - strikethrough text
- **table** - table
- **p:unorderd-list(x)** - unordered list (where ‘x’ is the nesting level of the list)
- **p:orderd-list(x)** - ordered list (where ‘x’ is the nesting level of the list)

**Word style**

This column can be used to map a paragraph, run, or table with a specific style (referenced by name).

Styles can also be referenced by style ID. This is the ID used internally in the `.docx` file. To map a paragraph or run with a specific style ID, append a dot followed by the style ID in the Word element column (for example: `p.Heading1`).

**HTML elements**

This column can be used to map the resulting HTML elements. It allows a single element or multiple nested elements.

The nested elements can be declared by using the ‘>’ character (for example: `ul > li`).

The **class** attribute can be specified on the resulting HTML elements by appending a dot followed by the class value, after the element (for example: `p.myClass`).

When converting Word to DITA, these **class** attributes are automatically converted to **outputclass** attributes. This may be useful if you want to apply extra processing on the resulting DITA document using a custom XLS stylesheet.

The **:fresh** syntax can be used to create new elements. If it is not used, the converter will try to reuse the element and close it only when it is necessary.

For example, if the following configuration is set:

<table>
<thead>
<tr>
<th>p</th>
<th>Heading 1</th>
<th>h1</th>
</tr>
</thead>
</table>

When the converter finds consecutive Word paragraphs with the style named `Heading 1`, these will be converted into a single `h1` element that contains the text appended from all of the Word paragraphs.

If `h1:fresh` is set in the last column, the converter will create separate `h1` elements.
The `:separator('separator_string')` syntax can be used to specify a separator between paragraphs that are merged when `:fresh` syntax is not specified.

For example, if the following configuration is set:

| p | Code Block | pre:separator('
') |

when the converter finds multiple consecutive paragraphs styled with the `Code Block` style, it will merge them into a single `<pre>` HTML element and the "\n" (new line) separator will be used between merged text.

To ignore elements, the '!' character can be added in the `HTML elements` column.

The **Export** button can be used to export the word styles configuration to an XML file. This exported file can be used to configure the MS Word Dynamic Conversion (on page 2707) from Oxygen XML Author by copying the file in the DITA-OT plugin directory: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.oxygenxml.dynamic.resources.converter`.

The **Import** button allows you to import the word styles configuration from an exported XML file.

**Note:**

The **Word styles mapping** configuration is applied only for the newer version of MS Word files formatted in the Microsoft Office Open XML (DOCX) format.

### Maximum Heading Level for Creating Topics

The **Maximum heading level for creating topics** option from the Batch Documents Converter preferences page allows you to set a maximum heading level that the converter will process as DITA topics. The headings with a higher level will be converted to `section` elements.

When the output is a DITA topic, this option sets the maximum heading level that will be converted as a nested topic in the document.

When the output is a DITA map, this option sets the maximum heading level that will be extracted as a DITA topic file and referenced in the DITA map hierarchy.

**Note:**

This option only applies to the HTML to DITA and Word to DITA conversions.

### Word to DITA

The **Create DITA maps from Word documents containing multiple headings** option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the sections from your Word document marked by titles or headings will be separated into individual DITA topics and referenced in a DITA map. If the word document does not contain multiple sections, the output will be a single topic. When this
option is not selected, the output will be a topic with nested topics and sections according to the number of titles and headings from the Word document.

Note:
Mathematical equations in Word documents should be automatically converted to MathML equations if they are in Office Math Markup Language (OMML) format. If the mathematical equations are in Microsoft Equation Editor format, they first need to be converted to the newer OMML format. See: https://support.microsoft.com/en-us/office/editing-equations-created-using-microsoft-equation-editor-08a44b8c-ae15-41a7-bc15-7239890c0cec.

Markdown to DITA

The Create DITA maps from Markdown documents containing multiple headings option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, all headings from your Markdown document will be separated into individual DITA topics and referenced in a DITA map. If the Markdown document does not contain multiple headings, the output will be a single topic. When this option is not selected, the output will be a topic with nested topics or sections according to the number of headings from the document.

The Create short description elements option from the conversion dialog box allows you to decide whether or not the shortdesc elements are created in the output DITA document. When this option is selected, the first paragraph before the headings from the Markdown document will be converted into DITA short description elements. When this option is not selected, the output will not contain the short description element.

HTML to DITA

The Create DITA maps from HTML documents containing multiple headings option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the headings from your HTML document will be separated into individual DITA topics and referenced in a DITA map. If the HTML document does not contain multiple sections, the output will be a single topic. When this option is not selected, the output will be a topic with nested topics or sections according to the number of headings from the document.

The Ignore HTML 'div' elements option from the conversion dialog box allows you to decide whether or not the div elements will be ignored. When this option is selected, all div elements will be ignored. When this option is not selected, only div elements that include the @class or @id attribute will be handled by the converter.

Confluence to DITA

The Confluence to DITA conversion processes the HTML content generated by the Atlassian® Confluence (see https://www.atlassian.com/software/confluence) export process. To export
Confluence content to HTML, log in to your Atlassian® Confluence account and navigate to the specific space that you want to export. Then go to Space Settings > Export space and choose to export it as HTML. The resulting index.html file must be provided in the Input files list from the conversion dialog box.

**DocBook to DITA**

The Create DITA maps from DocBook documents containing multiple sections option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the sections from your DocBook document will be converted into individual DITA topics and referenced in a DITA map. When this option is not selected, the output will be a single topic with nested topics.

**OpenAPI to DITA**

The OpenAPI to DITA conversion can be used to convert JSON or YAML files that use and conform to the OpenAPI specification (versions 2.0, 3.0, or 3.1) into DITA documents. The Create DITA maps from OpenAPI documents option from the conversion dialog box allows you to decide whether the output will be a DITA map or a DITA topic. When this option is selected, the converter will create separate DITA topics for the introduction (including OAS 'Info', 'Server', 'Security Requirement' and 'External Documentation' objects), 'Tag', 'Operation', 'Callback', and 'Components' objects. These topics will be referenced in a DITA map. When this option is not selected, the output will be a single topic with nested topics.

**Word to DITA Conversion Notes**

The following are some notes about the Word to DITA conversion:

- Paragraphs styled with default Word heading styles (or with custom styles based on default Word heading styles) are handled as topics or sections in the converted DITA output.
- You can choose whether the converted output is a DITA map with referenced topics or a single DITA topic. See the Create DITA maps from Word documents containing multiple headings (on page 2168) option.
- You can choose the level of headings that are converted as topics or sections. See the Maximum Heading Level for Creating Topics (on page 2168) option.
- You can customize the conversion by adding mappings from your own Word styles to HTML elements. The configured HTML element is converted to the proper DITA element. The @class attribute is transformed to the DITA @outputclass attribute. See the Conversions from Word (Word Styles Mapping) (on page 2166) section.
- Ordered and unordered lists are converted to DITA and the list level is preserved.
- Bold, italic, underline, strikethrough, superscript, and subscript styles are converted to the corresponding DITA elements.
- The formatting of table properties (such as borders) is currently ignored, but the formatting of the text inside the table is treated the same as in the rest of the document. Only the header row formatting is taken into account when converting tables to DITA.
- Footnotes and endnotes are converted.
• Images embedded in Word documents are saved to separate files and referenced in the generated DITA topics.
• Links (cross-references and external links) are converted.
• Line breaks and taken into account.
• Mathematical equations in Word documents are automatically converted to MathML equations if they are in Office Math Markup Language (OMML) format. If the mathematical equations are in Microsoft Equation Editor format, they first need to be converted to the newer OMML format.
• Symbols are converted.
• Index entries are converted.
• The Table of Contents is ignored in the DITA result.

DITA Editing

DITA Prolog Updater Add-on

Oxygen XML Author offers an add-on that contributes a preferences page (Options > Preferences > Plugins > DITA Prolog Updater) that includes various options for updating the prolog section of a DITA topic or map.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA Prolog Updater add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The DITA Prolog Updater preferences page will now be available in Options > Preferences > Plugins.

DITA Prolog Updater Preferences Page

The contributed preferences page (Options > Preferences > Plugins) includes the following general options:

**Author**

Specifies the name of the author. By default, it is the system user name.

**Date format**

Specifies the format of the date that will be added in the prolog section. If the date format entered is invalid, the yyy/MM/dd format is used by default.

**Limit the number of revised dates to**

Specifies the number of revisions that will be kept. Anytime a `<revised>` element is added in the prolog section and the specified limit has been reached, the oldest `<revised>` element is deleted.

**Custom type attribute value for the original author**

Specifies a custom value for the type attribute of the `<author>` element that is inserted to emphasize the primary or original author of the content. When is not set, the creator value is used.

**Custom type attribute value for an additional author**

Specifies a custom value for the type attribute of the `<author>` element that is inserted to emphasize an additional author who is not the primary/original author. When is not set, the contributor value is used.

These options are followed by the following options that can be set for DITA topics or maps (or both):

**Enable automatic prolog update on save**

When this option is selected, the prolog is updated anytime the document is saved.

**Set original author**

When this option is selected, the primary or original author is set in the prolog when the document is saved. This option is only applicable for new documents.
Set created date

When this option is selected, a created date is added to the prolog when the document is saved. This option is only applicable for new documents.

Update additional authors

When this option is selected, an additional author is set in the prolog when the document is saved. This option is only applicable for already existing documents.

Update revised dates

When this option is selected, a revised date is added to the prolog when the document is saved. This option is only applicable for already existing documents.

For more information, see the details for this DITA Prolog Updater add-on in GitHub.

DITA References View Add-on

Oxygen XML Author offers an add-on that contributes a DITA References side view that shows all outgoing and incoming references for the current DITA topic. Once the add-on is installed, the view is available in both Text and Author modes.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

   Note:
   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

3. Select the DITA References View add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.
Result: Once installed, you need to restart Oxygen XML Author and the **DITA References** view becomes available. To open the view, select **DITA References** in the Window > Show View menu.

**Outgoing References**

The types of outgoing references that are presented in this view include:

- Image references (referenced with an `@href` or `@keyref` attribute)
- References to other media resources (DITA objects pointing to video, audio, or embeddable frames)
- Cross references (referenced in an `<xref>` element with an `@href` or `@keyref` attribute)
- Key references (referenced with a `@keyref` attribute)
- Content references (referenced with a `@conref` or `@conkeyref` attribute)
- Related links (referenced with an `@href` or `@keyref` attribute)
- Related links defined in relationship tables

This side-view is synchronized with the main editor to make it easy to locate a reference in the current document. It also includes contextual menu actions for opening the target of an outgoing reference or showing its definition location. You can also double-click a reference to open its target.

**Incoming References**

The **Incoming** references tab shows all references to the current opened DITA topic.

- The references are presented by taking both the **Main Files** support and the current context map configured in the **DITA Maps Manager** view into account.
- The references are grouped into three categories: **Map**, **Cross**, and **Content**.
- To open the target of a reference, you can double-click the references, or press Enter with the cursor located on the reference, or right-click the reference and choose Open reference.
- To copy the location of the target of the reference, select the reference and press Ctrl + C (Cmd + C on Mac).
- If a referenced topic is expanded, references to that topic are also displayed.
- While editing a document, if changes appear that might influence how the references were computed, the Refresh button can be used to re-compute the references graph and show an updated list of incoming references.

For more information, see the details for the **DITA Outgoing References View** add-on in GitHub.

**Resources**

For more information about the DITA References add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Author, watch the following webinars/presentations:

- Webinar: Extending the Functionality of Oxygen Using Add-ons
Terminology

Terminology Checker Add-on

Oxygen XML Author offers an add-on that provides support for checking terminology. Once the add-on is installed, you can create a terminology file with a set of rules for each term (or sequence of characters) you want flagged. After referencing the custom file, Oxygen XML Author will automatically highlight matched terms in the Author visual editing mode and offer some contextual menu actions.

Tip:
The terminology checker works for any document opened in the Author visual editing mode, including XML file types, and JSON and HTML5 document types.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

Note:
If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

3. Select the Terminology Checker add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Creating Custom Rules for the Terminology Checker

To create your own custom rules for the terminology checker, follow this procedure:
1. Create a terminology file. There is a template available to help you get started in the New Document wizard (on page 351). Click the New button on the toolbar or select File > New and search for the Terminology File template. Here is an example of the structure for this type of file:

   <incorrect-terms lang="en">
     <incorrect-term ignorecase="true">
       <match>Oxygen</match>
       <suggestion></suggestion>
       <message>Product name should be inside a tag.</message>
     </incorrect-term>
   </incorrect-terms>

2. Save the newly created terminology rules XML file either in a new subfolder named oxygen-term-checker located in the current project folder (the current project opened in the application Project view), or in a custom folder.

3. If you saved the terminology file in a custom folder path, go to the Options > Preferences > Plugins > Terminology Checker preferences page and set the Additional Terminology folder path to point to that folder.

4. Click OK several times to apply the changes and close the preferences dialog box.

**Result:** If any of the terms (or sequence of characters) that are defined in the terminology file are detected in any open file, Oxygen XML Author highlights the matches in the Author visual editing mode.

**Note:** If you have a folder named oxygen-term-checker in the current project that is open in the Project view, all the files in that folder will also be loaded by the terminology checker.

**Structure of Terminology Rules File**

The following elements can be used in the terminology rules XML file:

   <incorrect-terms>
     This is the root element of the XML rules file.

     You can specify the @lang attribute on the <incorrect-terms> root element. When set, the terms defined in this terminology file are applied when the closest @xml:lang attribute of the checked node matches the value specified. Not setting this attribute means that the incorrect terms are applied for all nodes.

     If the @xml:lang attribute is not defined in your document, the language specified in the Spell Check preferences (on page 225) is used.

**Note:** If the value of the document's @xml:lang attribute is not a superset of the value of the @lang attribute for the <incorrect-terms> element, there will not be a match.
Table 18. Language Matching Matrix

<table>
<thead>
<tr>
<th>@lang value for &lt;incorrect-terms&gt; element</th>
<th>@xml:lang value</th>
</tr>
</thead>
<tbody>
<tr>
<td>en</td>
<td>en_US</td>
</tr>
<tr>
<td>match</td>
<td>match</td>
</tr>
<tr>
<td>en_US</td>
<td>not matched</td>
</tr>
</tbody>
</table>

You can specify the @phase attribute on the <incorrect-terms> root element. The value of this attribute is inherited by <incorrect-term> children nodes. Not setting this attribute means the default phase is used.

The allowed values are:

- **always** - Incorrect terms are always presented (default value).
- **editing** - Incorrect terms are shown when the document is opened in the **Author** mode.
- **validation** - Incorrect terms are shown when the document is checked from a validation scenario.

For example, set this attribute if you want to apply the most important rules when validating with the **Validate and Check for Completeness** action, while still keeping them applied in the editing window.

```
<incorrect-term>
    <match>he</match>
    <message>Pronouns should be avoided.</message>
</incorrect-term>
```

Defines ways to match and correct an incorrect term. The <incorrect-term> element must include a <match> element.

The @ignorecase attribute specifies whether or not the match is case-sensitive.

The @severity attribute can be set to one of the following values: **info**, **warning**, or **error**. Example:

```
<incorrect-term severity="error">
    <match>he</match>
    <message>Pronouns should be avoided.</message>
</incorrect-term>
```

An experimental @part-of-speech attribute can be set on the <incorrect-term> element with the value set to a part of speech tag (for example: **adjective**, **verb**, etc.) If set, when scanning for terminology problems, the problem is presented only if the term's part of speech matches the one specified. The processor used to identify the part of speech is **Apache OpenNLP** and this feature is supported only for the English language.

**Note:**

The results may not be 100% accurate, so you should double-check them.
Specify the text fragment to match.

You can specify the `@type` attribute on the `<match>` element, with the values `character`, `whole-word`, or `regular-expression`. The default value is `whole-word`, unless the matched term contains Japanese, Chinese, or Korean characters because Asian languages often do not use spaces to separate words. Example:

```
<incorrect-term>
  <match type="character">ing</match>
  <message>Progressive tense should not be allowed</message>
</incorrect-term>
```

The `<suggestion>` element can be left blank or there can be one or more of them inside the `<incorrect-term>` element. It supports regular expressions grouping.

If you want to replace the match with an XML fragment, you can set the `@format` attribute on the `<suggestion>` element with the value `xml`. For example:

```
<incorrect-term ignorecase="true">
  <match type="whole-word">Oxygen XML Editor</match>
  <suggestion format="xml">&lt;ph keyref="oxygen"/&gt;</suggestion>
  <message>Replace all occurrences of product with key reference.</message>
</incorrect-term>
```

The `<message>` element is optional. If present, its content is displayed in a tooltip when you hover over a highlight. It supports regular expressions grouping.

The `<link>` element is optional. If present, it provides the source for this rule. Example:

```
<incorrect-term ignorecase="true">
  <match type="whole-word">Oxygen XML Editor</match>
  <suggestion format="xml">&lt;ph keyref="oxygen"/&gt;</suggestion>
  <link>https://www.oxygenxml.com/doc/ug-editor/topics/terminology-checker.html</link>
</incorrect-term>
```

The `<xpath-context>` element can be used to define simple XPath expressions that match specific elements.

You can specify `@include` and `@exclude` attributes. The elements covered by this simplified XPath will be checked for matches (or the exclusion of a match). A list of comma-separated XPath values can be used. Example:
The following are examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

**Note:**
The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.

You can use one or more of the following attribute conditions:

**Attention:**
Default attribute values are not taken into account.

- `element[@attr]` - Matches all instances of the specified element when it includes the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element when it does not include the specified attribute.
- `element[@attr = 'value']` - Matches all instances of the specified element when it includes the specified attribute with the given value.
- `element[@attr != 'value']` - Matches all instances of the specified element when it includes the specified attribute and its value is different than the one given.

### Using Vale Rules with the Terminology Checker

The **Terminology Checker** has partial support for applying custom **Vale** rules.

Supported **Vale scopes**: heading, table.header, table.cell, list, paragraph, code, strong, emphasis, sentence.

Supported **Vale extension points**: Existence, Substitution, Occurrence, Repetition, Conditional.

**Result:** If any of the terms (or sequence of characters) that are defined in the terminology file are detected in any open file, Oxygen XML Author highlights the matches in the **Author** visual editing mode.

**Note:**
If you have a folder named oxygen-term-checker in the current project that is open in the **Project** view, all the files in that folder will also be loaded by the terminology checker. As an example, the Oxygen XML Author user guide has a folder with some of the **Microsoft style guide rules**: https://github.com/oxygenxml/userguide/tree/master/DITA/oxygen-term-checker. Once the user guide
Resources: You can find already created Vale rules that implement various checks on the following websites:

- Vale rules that aim to automate the Microsoft style guide: https://github.com/errata-ai/Microsoft/tree/master/Microsoft.

Working with the Terminology Checker

The Terminology Checker side view shows all problems found in the document. You can right-click each problem to apply possible fixes or to find out more details about it. The tooltip for each problem displays a custom message and more information (e.g. for Vale rules, it also displays the name of the Vale rule file that defines the rule). You can filter problems based on their severity, match, and message and the toolbar has actions to navigate between problems or to open the Terminology Checker preferences page.

You can also right-click problems highlighted in the Author visual editing mode to access the following contextual menu actions:

- **Replace with "..."** - Replaces the currently highlighted match with the content inside the `<suggestion>` element.
- **Replace all with "..."** - Replaces all instances of the highlighted match found in the current document with the content inside the `<suggestion>` element.
- **Correct all matching highlights** - Replaces all highlighted matches (all matched terms) within the document with the content inside the first `<suggestion>` element from the terminology file.

The terminology checking can be disabled by clicking the Show/Hide Terminology Highlights toolbar button.

Other Notes:

- The checker automatically skips deleted content with tracked changes and space-preserved elements (e.g. codeblocks).
- When replacements are performed, the capitalization is preserved.
- In the Oxygen XML Author Options > Preferences > Plugins > Terminology Checker page, you can define the highlight colors to be used for each issue depending on its severity. You can also reference a folder that contains the terminology rules. This folder can contain other
folders with terminology files or just the terminology files. The option that controls automatic capitalization can also be found in this preferences page.

- If you select Project Options (in the Terminology Checker preferences page), the settings are stored in the project file (.xpr) that can be shared with other users (on page 302).

### Terminology Checker Preferences

The Options > Preferences > Plugins > Terminology Checker preferences page contains various settings for configuring the tool. The preferences page can be saved at project level to share these settings, as is common for a group of users who use the same project configuration.

**Highlight background**

You can specify various colors to influence the background colors for terminology highlights that are added in the Author visual editing mode.

**Highlight decoration**

You can specify various colors to influence the highlight decoration styles for terminology highlights that are added in the Author visual editing mode.

**Editing**

**Preserve case when performing replacements**

Controls whether or not the original letter casing is automatically preserved when replacing words. The option is selected by default.

**Report unsupported Vale rules as errors**

If selected (default), errors that are related to Vale terms (such as unsupported extension points or invalid properties) are reported. If not selected, unsupported Vale rules are ignored (although an error is still reported if the file is invalid).

**Learned terms**

**Default project terminology folder**

Displays the default location where all the terminology rule files (XML or Vale) are stored. By default, the rule files located in the oxygen-term-checker subfolder of the current project folder (the current project loaded in the Project view) are automatically loaded and used.

**Additional terminology folder**

You can use this option to specify an additional terminology folder where XML and Vale rule files are located. You can use editor variables such as ${pd}/terms to specify the path to the terminology folder.

### Checking Multiple Resources

Once installed, the terminology checker add-on can be used to batch-check multiple files:
- Right-click on the root of the DITA map opened in the DITA Maps Manager view and choose Check terminology.
- Right-click a folder in the Project view and choose Check terminology.
- Create a new validation scenario or edit an existing validation scenario, and add a new validation stage. For the File type field, choose XML Document and for the Validation engine field, choose Terminology checker. The validation scenario can be used in multiple ways:
  - In the Project view, you can right-click a folder and validate using a specific validation scenario.
  - In the DITA Maps Manager view, you can use the Validate and Check for Completeness toolbar action and choose to Batch validate referenced DITA resources. This will apply the associated validation scenario for each topic or map referenced in the context of the main DITA map.

**Terminology Files Contributed from Other Oxygen Add-ons**

Any Oxygen add-on can contribute terminology files that will be used by the Terminology Checker. The contributed terminology files will be loaded and used if the contributor add-on is enabled.

The following pre-conditions must be fulfilled:

1. The contributor add-on's plugin.xml descriptor file should reference the rules folder in the plugin.xml as a librariesFolder with a global scope:

```xml
<plugin
   id="unique.identifier.name"
   name="My Style Guide"
   description="Style Guide"
   version="1.0"
   vendor="Vendor Name"
   class="ro.sync.exml.plugin.Plugin"
   classLoaderType="preferReferencedResources">
   <runtime>
       <librariesFolder name="Rules_Folder" scope="global"/>
   </runtime>
</plugin>
```

2. The contributor add-on should have a marker file named oxy-terms-auto-detect inside the rules folder. The terminology files can be added in the rules folder or organized in subfolders (the Terminology Checker scans the subfolders to identify the terminology files). Inside the oxy-terms-auto-detect file, there should be a textual description of the terminology file contents, which is used when presenting add-on contributed terms in the Terminology Checker preferences page (Options > Preferences > Plugins > Terminology Checker).

**ASD Simplified Technical English Specification (ASD-STE100) Rules**

An extra add-on is available that contributes ASD Simplified Technical English Specification rules to the Terminology Checker. It contains technical rules based on ASD-STE100 (http://www.asd-ste100.org), but note that these rules are not endorsed by ASD-STE100.
To install these rules, use the manual add-on install procedure (on page 2175) and select **ASD Simplified Technical English Specification (ASD-STE100) Writing Style Guide Rules (experimental)** for the add-on to install.

**MS Writing Style Guide Vale Rules**

An extra add-on is available that contributes a set of rules based on the *Microsoft Writing Style Guide* to the **Terminology Checker**. It contains a Vale-compatible ([https://github.com/errata-ai/vale](https://github.com/errata-ai/vale)) implementation of the MS Writing Style Guide ([https://learn.microsoft.com/en-us/style-guide/welcome/](https://learn.microsoft.com/en-us/style-guide/welcome/)) as provided by the errata-ai open-source project ([https://github.com/errata-ai/Microsoft](https://github.com/errata-ai/Microsoft)). Note that this project is neither maintained nor endorsed by Microsoft.

To install these rules, use the manual add-on install procedure (on page 2175) and select **MS Writing Style Guide Vale Rules** for the add-on to install.

**Resources**

For more information about the Terminology Checker add-on, along with details regarding other popular add-ons that extend the functionality of Oxygen XML Author, watch the following webinar:

- [Webinar: Add-ons You Can Use for Technical Writing](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml)

**Vale Linter for Markdown and HTML Validation Add-on**

The Vale Validation add-on runs the Vale linter over the currently edited file and presents the validation errors in the results area at the bottom of the application. A **linter** is a tool that automatically verifies specific rules against your code or documentation. This is useful for enforcing a style guide or for catching commonly mistaken branding issues.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** to quickly initiate the installation process:

![Install Button]

**Manual Installation**

To manually install this add-on, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the Vale Linter for Markdown and HTML Validation add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Setup the Oxygen Vale Validation

To set up the Vale validation, follow this procedure:

1. Download and unzip the proper Vale executable for your OS. On Linux and macOS, you must give executable permission to the Vale executable. You can do this by opening a console in the Vale directory and running:

   chmod u+x vale

2. Go to Options > Preferences > Plugins > Oxygen Vale Validation and specify the path to the previously downloaded Vale executable.
3. In the same preferences page, you can also specify a path to a Vale configuration file (.vale.ini). Vale automatically detects this file by looking 6 levels up in the current file's ancestor directories, but you can also impose one.

Vale Styles

Vale uses collections of individual YAML files (or "rules") to enforce particular writing constructs. These collections are referred to as styles and are organized in a nested folder structure at a user-specified location. The .vale.ini file is where you will control most of Vale's behavior, including which files to lint and how to lint them. Vale automatically detects .vale.ini, but you can also specify the path to .vale.ini from the plugin's preferences page (Options > Preferences > Plugins > Oxygen Vale Validation).

Third-party Styles

Vale has a growing selection of pre-made styles available for download from its style library.

Validation

After setting up the Vale executable, creating or downloading Vale styles, and specifying the path to .vale.ini, the add-on will intercept the and Manual Validation and contribute errors and warning obtained by running Vale validation over the current file. The errors and warnings are highlighted in the editor.
Translation

Fluenta DITA Translation Add-on

Introduction

Fluenta is a tool designed to simplify the translation of DITA projects. It parses a DITA map, resolves the references to all topics and subtopics, and prepares a unified XLIFF file that you can send to your Language Service Provider. The Fluenta DITA Translation add-on allows you to manage the Fluenta translation workflow directly from within Oxygen XML Author.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

Note:
If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the install new add-ons dialog box to locate the downloaded addon.xml file.

2. Select the Fluenta Dita Translation add-on and click Next.
3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
4. Restart the application.

Result: A Fluenta submenu is now available in the DITA Maps Manager's (on page 2472) contextual menu.

Translation Workflow

A translation workflow based on Fluenta has the following steps:
1. Create a Fluenta project *(on page 2186)*. A project contains metadata associated with a DITA map (for example, the languages that the project is translated into). This is a one-time action.

2. At various milestones (for example, when a new version is released), you generate XLIFF files *(on page 2187)* for each language you translate to.

3. You send the XLIFF file to the translation service provider.

4. Once the XLIFF returns from translation, you import the XLIFF file *(on page 2187)*. A translated version of your map and topics will be generated at the selected location from the XLIFF file.

**Creating a Fluenta Project**

The first step in the workflow is to create a Fluenta project:

1. Open the main DITA map in the DITA Maps Manager *(on page 2472)*.

2. Right-click the map and select Fluenta > Create project.

   **Note:**
   
   This action is visible only if there is no project detected for the open DITA map.

3. In the resulting dialog box, you need to provide a name for the project and the languages that the project will be translated into.

   ![Create a new Fluenta project dialog box](image)

   **Result:** A translation memory *(on page 2189)* with the same name as the project will automatically be created. Also, only one project can be created for a DITA map file. Once created, you will be able to edit it to change certain information.
Generating XLIFF Files

When you are ready to send the project to translators, you can generate an XLIFF file like this:

1. Open the main DITA map in the DITA Maps Manager (on page 2472).
2. Right-click the map and select Fluenta > Generate XLIFF.

**Note:**
This action is visible only if there is a Fluenta project (on page 2186) associated with the current DITA map and the XLIFF files will be generated for this project.

3. In the resulting dialog box, select the output folder where the XLIFF file(s) will be generated and the languages that you want to send to translation.

4. Selecting the **Use translation memory** option will use the translation memory associated with the project to recover translations for the segments not yet translated. Selecting the **Reuse ICE matches** option will compare current content with the content translated in the past and reuse all existing translations.

**Result:** An XLIFF file will be generated in the output folder for each selected language.

**Importing XLIFF**

Once you receive a translated XLIFF from translation, you need to generate a translated version of your project:

1. Open the main DITA map in the DITA Maps Manager (on page 2472).
2. Right-click the map and select Fluenta > Import XLIFF.
3. In the resulting dialog box, browse for the XLIFF file:

![Import XLIFF dialog box](dialog-box.png)

4. Selecting the **Accept unapproved translations** option will use translations that are not marked as approved in the XLIFF file being imported. Selecting the **Update "[MemoryName]" translation memory** option will store the imported translations in the project translations memory.

**Result:** A translated version of the project content will be created in the indicated output folder.

**CAUTION:**
If your images are not in SVG format, you will have to copy them to the newly generated project.

**Editing a Fluenta Project**

Sometimes after creating a project, certain information needs to be edited. The steps are similar to those for creating a new project:

1. Open the main DITA map in the **DITA Maps Manager (on page 2472)**.
2. Right-click the map and select **Fluenta > Edit project "[ProjectName]"**.

**Note:**
This action is visible only if there is a Fluenta project (on page 2186) associated with the current DITA map and this project will be edited.
3. In the resulting dialog box, you need to replace the project information you want updated.

![Edit project dialog box]

---

**Important:**

It is not recommended to edit the name of a project or its source language because they may become inconsistent with the associated translation memory.

---

**Managing Translation Memories**

A translation memory is a database that stores sentences, paragraphs, or segments of text that have previously been translated. The original language (sometimes referred to as the "source") and its translation (also referred to as the "target") are both included in each entry or segment in the translation memory.

1. Open the main DITA map in the DITA Maps Manager (on page 2472).
2. Invoke the contextual menu and select **Fluenta > Manage translation memories**.
3. In the resulting dialog box, you will see a table with all the translation memories defined in Fluenta.
4. In this dialog box, you can perform the following operations:

- **Create** - This action will open a dialog box for creating a new translation memory.

- **Edit** - This action will open a dialog box for editing the selected translation memory from the translation memories table.
Delete - Deletes the selected translation memory. If a translation memory is associated with a project, it cannot be deleted.

Import TMX - Populates the content of the translation memory with content from a specified import file.

Note: One or more files can be imported into a translation memory.

Export TMX - Exports the selected translation memory to TMX format to view its content and use at a latter time.

Preferences

Various options can be configured in the preferences page, both at the global level and at the project level.

1. Open the main DITA map in the DITA Maps Manager (on page 2472).
2. Right-click and select Fluenta > Preferences.

Result: In the resulting dialog box, you will see the Fluenta Addon preferences page:
3. Configure options as needed. You can set the folders where projects and translation memories will be saved. Both absolute paths and paths that contain editor variables can be used. Also, you can set some target languages that will be pre-filled when a Fluenta project is created.

Resources

For more information about Fluenta translations, see the following resources:

- Fluenta website: Fluenta DITA Translation Manager
- Webinar: DITA Project Management, Validation, and Translation in a Docs as Code Environment

Translator Helper Add-on

Oxygen XML Author offers an add-on that provides support for helping translators. Once the add-on is installed, you can use Google Translate to create a preliminary translation for your XML content that can later be manually improved. The add-on is also useful for showing potential customers how a DITA project will look like after it is translated into their native language. After the add-on is installed, a Translator Helper view is available from the Window > Show View menu.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field.

Note:
If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

3. Select the Translator Helper add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart Oxygen XML Author.

Result: The Translator Helper view now be available and can be selected from the Window > Show View menu.

Features:

• You can translate content to various languages using Google Translate or DeepL Translator.
  1. In Oxygen XML Author, select the content you want to translate in Author mode. You can also select the entire contents of the document.
  2. Right-click, select Translate, and choose the target translator and language.
  3. Copy the translated content from the resulting web page (the easiest way to do this is to use the Copy translation button for Google Translate or the Copy to clipboard button for DeepL Translator).
  4. Go back to Oxygen XML Author. If your original selection included multiple inline elements (or entire block elements or the entire document), a dialog box will be displayed. Click the Replace button to replace the selection with the copied translated content. If you leave the Show original content side-by-side option selected, the original untranslated content will be displayed in the Translator Helper side view.

• You can choose to display your original content in a Translator Helper side view so that you can see the original untranslated content side-by-side with the content that you are editing/translating. To open this side view, right-click anywhere in the Author mode editor pane and select the Original Content Side By Side action (or select Window > Show View > Translator Helper).

Resources

For more information about the Translator Helper add-on, along with details regarding other popular add-ons that extend the functionality of Oxygen XML Author, watch the following webinar:

• Webinar: Add-ons You Can Use for Technical Writing
DITA Translation Package Builder Add-on

Oxygen XML Author offers an add-on that contributes contextual menu actions that help you build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

![Install button]

Manual Installation

To manually install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the Show add-ons from field or select it from the drop-down menu.

   ![Note]

   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

3. Select the DITA Translation Package Builder add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: A Translation Package Builder submenu will now be available in the contextual menu of the DITA Maps Manager. This submenu includes actions to generate a ZIP package of modified files that can be sent to translators, as well as an action to extract translated files back into your DITA project.

For more information, see the details for this Translation Package Builder add-on in GitHub.

Using the Translation Package Builder

Once the add-on is installed, a sub-menu named Translation Package Builder is available in contextual menu of the DITA Maps Manager with the following actions:

- Generate Milestone - Use this action first. It generates a unique hash for each documentation resource. This information is used by the second action (Create Modified Files Package) to detect which files have been modified. A milestone file should be generated after you install this add-on and then again after each package is sent to translators.
• **Create Modified Files Package** - This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

• **Apply Package** - When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open `dita-map-french.ditamap` if the package contains the french translation). Invoking this action will extract the changed files inside the map's directory.

**Resources**

For more information about the Translation Package Builder add-on, along with details regarding other popular add-ons that extend the functionality of Oxygen XML Author, watch the following webinars/presentation:

- Webinar: Add-ons You Can Use for Technical Writing
- Webinar: Automate XML processing with Oxygen XML Scripting

**Productivity**

**Oxygen AI Positron Assistant**

The **Oxygen AI Positron Assistant** add-on uses the advanced **Oxygen AI Positron** service to support technical documentation writers throughout their content creation process.  

https://www.youtube.com/embed/Do_KWYZfCFg?si=2Mrm7Bh1pmPvehqV

**Overview**

In a simplified form, technical documentation is often done in two stages: analysis and implementation. In the analysis stage, technical writers could use various resources such as web searches, ChatGPT, or discussions with colleagues or engineers to further understand the subject that needs to be documented. In the second stage, technical writers would use tools such as Oxygen XML Author to write the actual content.

The **Oxygen AI Positron Assistant** add-on provides various ways to use ChatGPT to help writers while editing or reviewing the technical documentation. For example, it can be used to receive hints about what to write next, improve the readability of content, or re-structure the content in various ways.

**Note:**

Content received from the [OpenAI ChatGPT](https://openai.com) model may be inaccurate or contain misleading information, so it needs to be thoroughly reviewed and revised accordingly.

**Terms:**

The terms of use for the service can be found [here](https://www.oxygenxml.com/support/terms-of-use).

AI Positron Assistant Samples Playground.
Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install this add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

   ![Note]
   
   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

2. Select the Oxygen AI Positron Assistant add-on and click Next.

   ![Important]
   
   There are two different iterations of the add-on and you can only have one or the other installed at once:
   - Oxygen AI Positron Assistant - The regular version of the add-on.
   - Oxygen AI Positron Assistant (Enterprise) - This Enterprise version is for those who want to connect to their own OpenAI or MS Azure OpenAI account.

3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
4. Restart the application.

Result: The AI Positron Assistant side view is now available.

Connecting to the Oxygen AI Positron Service

You can use the AI Positron Assistant side view to easily configure login details and connect to the Oxygen Positron Service in the web browser.

To initiate the connection process, use the Connect button in the AI Positron Assistant view (or from the user drop-down menu at the top-right corner of the view).
Note:
The Oxygen Positron Service uses the OpenAI ChatGPT server version 3.5 API to propose document generation and change suggestions.

AI Server Requests and Credits

Each user has a limit to the number of requests that are sent to the AI server each month and this is managed through the use of credits.

Important:
To use your own company-specific AI service, the specific Oxygen AI Positron Assistant Enterprise (on page 2206) add-on needs to be installed instead of the one listed above.

Generating and Refining Content

Once you log in to the server, the following actions for generating content are available in the Actions drop-down menu at the top of the AI Positron Assistant side view, in the main chat panel when a conversation has not yet started, in the AI Positron Assistant submenu within the contextual menu, and in the AI main menu. The progress and results of triggering an action are displayed in the main chat pane (on page 2198):

**Content Generation**

- **New DITA Topic** - Generates a DITA XML topic based on a text description entered in a popup dialog box.
- **Continue Writing** - Generates additional text based on the content preceding the cursor position.
- **Short Description** - Generates a short description (inside a `<shortdesc>` element) based on a summary of the selected text (or the entire document if there is no selection). You can configure the style and the approximate number of sentences to be generated.
- **Index Terms** - Generates a `<keywords>` element that contains index terms obtained from the selected text (or the entire document if there is no selection).
- **Follow Instructions** (available when editing schemas, XSLT stylesheets, and Schematron files) - Replaces the selected instructions with content generated based on them.

**Rewrite**

- **Correct Grammar** - Generates a suggestion for correcting the grammar and spelling within the selected content.
- **Improve Readability** - Modifies the selected content to improve readability and fix grammar/spelling errors. If you hover the mouse prompt over this button, a ⚙*Settings* button becomes available in the top-right corner. Clicking the ⚙*Settings* button opens a pop-up window where you can choose the writing level of the content to be generated.
You can choose between: 5th grade (Very Easy), 8th grade (Plain English), and College (Advanced).

- **Use Active Voice** - Generates a suggestion for replacing the selected content with content that has been converted from passive to active voice.
- **Itemize** - Generates a suggestion for converting the selected content into a list of items.
- **Join Items** - Generates a suggestion for converting the selected list of items into a paragraph.

**Overview**

- **Answer Questions** - Generates answers to questions that the AI finds within the selected content (or the entire document if there is no selection).
- **Generate Questions** - Generates a list of five questions that are answered within the selected content (or the entire document if there is no selection).
- **Summarize** - Generates a summary of the selected content (or the entire document if there is no selection).
- **Readability** - Generates suggestions for changing the selected content (or the entire document if there is no selection) to improve its general readability.

**Translation**

- **English, German, French, Japanese** - These actions translate the selected text to the target language, while preserving the original XML markup.
- **Other...** - This action behaves like the previous ones, but it allows you to provide the target language. You can either choose from the predefined values or type another one.

**Marketing**

- **Release Notes** - Creates release notes based on a set of features or issue ticket numbers with optional descriptions.
- **Marketing Post** - Creates a marketing post based on a list of ideas or release notes.
- **Improve SEO** - Rewrites the content to enhance search engine optimization.
- **Pain-Agitate-Solution** - Rewrites the content using a marketing style based on the Pain-Agitate-Solution framework.
- **Features-Advantages-Benefits** - Rewrites the content using a marketing style based on the Features-Advantages-Benefits framework.

**Tip:**
Custom actions can be configured in the Al Positron Assistant preferences page (on page 2200).

**AI Positron Assistant View**

The add-on provides access to the Al Positron Assistant side-view. If the view is not displayed, it can be opened by selecting it from Window > Show View.
The **Actions** drop-down menu at the top of the **AI Positron Assistant** view contains the available AI-powered actions that can be used to generate and refine content *(on page 2197)*. Simply select the action to trigger it. You can hover the mouse cursor over an action to see a description of what the action does. A set of 5 recently used actions are also available in the **Actions** drop-down menu.

The **Record** button in the top-left corner of the view allows you to create custom actions or prompts by recording changes *(on page 2203)*.

There is also a user drop-down menu at the top-right corner of the **AI Positron Assistant** view that contains the following:

- **My account** - Opens a webpage where you can see your current subscription package and credit status.
- **Disconnect** - Disconnects **Oxygen** from the **Oxygen Positron Service**.
- **Preferences** - Opens the **Oxygen AI Positron Assistant preferences page** *(on page 2200)* where you can configure the **AI Positron service address** and provide a **Context** for the user that the AI will use to create more relevant and personalized responses.

The main chat pane presents the results after processing an action and allows you to further refine the responses by sending messages to the **Positron** service platform. When an AI Positron action is triggered, the chat pane displays the progress and results.

The response is received from the server in streaming mode (the AI sends chunks of the response as it is being generated rather than waiting to send the entire response after it is generated). Once the entire response is received from the server, the following actions are available under the response:
• **Insert/Replace** - Inserts the response at the cursor location within the document (or replaces the selected content).
• **Preview** - Allows you to preview the content that would be inserted at the cursor location within the document.
• **Copy** - Copies the response to the system clipboard.

The Chat *History drop-down toolbar button makes it easy to go back to previous conversations and continue them.

You can use the bottom pane to refine the response by sending a message to the AI platform and it will generate a new response based upon your message. You can create your own favorite prompts and use supported variables to specify the content that is sent to the platform. You can use the Favorites drop-down button to store a favorite prompt. You can use the Insert Variables drop-down button to select one of the supported variables:

• **${selection}** - Expands to the currently selected content.
• **${document}** - Expands to the content of the entire document.

**Tip:**
Previously sent prompts can be modified directly in the chat thread. Once a prompt is edited, a new chat thread is started based on the new prompt’s content. For edited prompts, you can use the Next/Previous buttons to navigate between chat threads.

To clear the information in the chat pane and start a new chat, click the New Chat button in the top-right corner of the view.

**AI Refactoring**

The **AI Positron Assistant** add-on contributes an **AI Positron Refactoring** action in the contextual menu (Refactoring > AI Positron Refactoring) of both the Project and DITA Maps Manager views in Oxygen XML Author. It can be used to refactor multiple files (local or remote) at once.

You can invoke the **AI Positron Refactoring** action to apply either a predefined AI action or a custom prompt to modify the selected resources. The resulting **AI Positron Refactoring** dialog box presents an estimate of the amount of credits that will be consumed by the operation, and you have the option to preview the changes before applying them over the original content.

For example, you could use the predefined **Translate to** action to translate multiple DITA topics into a certain language or apply the **Correct Grammar** or **Improve Readability** actions on multiple resources.

**Oxygen AI Positron Assistant Preferences Page**

Various settings can be configured in Options > Preferences > Plugins > Oxygen AI Positron Assistant:

**Context**
The context provides useful information about the user to the AI and is used in each action and chat request to create more relevant and personalized responses.

**Load default actions**

Specifies if default actions are loaded.

**Additional actions folder**

You can use this option to specify a local folder where you have stored additional actions.

**Enable XPath Functions**

Enables the use of AI-specific XPath functions in Oxygen XML Author when applying Schematron validation or XSLT transformations. This feature is disabled by default.

**Cache responses and reuse them for identical prompts**

If enabled (default), responses for identical requests are stored (cached), resulting in fewer requests being sent to the AI server and faster completion times. A Clear cache button located to the right of this option can be used to clear the cache.

**Cache size**

Specifies a maximum limit for the cache size.

**Notify me when the number of requests exceeds**

You can select this option and specify a number of AI requests that when exceeded, a confirmation dialog box is displayed asking if you want to continue using the XPath AI functions. If you select “No” for the answer, the XPath functions will be disabled.

**AI Service Configuration Preferences Page**

Various service-related connection settings can be configured in Options > Preferences > Plugins > Oxygen AI Positron Assistant > AI Service Configuration:

**AI Positron Service address**

Currently, there is only one public platform that provides this service.

**Default model**

The default model is used for the chat pane and for actions that do not explicitly specify a fixed model. Each chosen model consumes a certain number of credits (on page 2197) per token.

**Validation Quick Fixes**

When validation problems are displayed in the Results pane, you can right-click on a problem and use the AI Positron Fix action to ask the AI Positron platform for help with fixing the problem. It will propose content in the chat pane (within the AI Positron Assistant view) that can be used to solve the problem.
Creating Custom Actions

In the Al Positron Assistant preferences page (on page 2200), you can define a reference to a folder that contains custom actions.

Once the add-on is installed, the New Document wizard (on page 351) can be used to create either a new Al Positron Custom Action file that contains a custom action definition in JSON format or an Al Positron Custom Actions List that contains a JSON array with multiple defined actions. Validation and content completion are automatically provided for such custom action files. If the action definition files are saved in the custom actions folder defined in the Al Positron Assistant preferences page, the Al Positron Assistant view should automatically reload its Actions drop-down list to include them.

The most simple action defines an action id, title, type, and context:

```json
{
    "id": "my.action.id",
    "title": "Improve Grammar",
    "type": "replace-selection-with-fragment",
    "input-type": "markup",
    "context": "Improve grammar in the following content preserving the XML markup:"
}
```
Defined actions can contain expandable parameters and their values can be customized before invoking the action:

```json
{
    "id": "my.action.id",
    "title": "Improve Grammar",
    "type": "replace-selection-with-fragment",
    "input-type": "markup",
    "context": "${style} Improve grammar in the following content preserving the XML markup:",
    "expand-params": [
        {
            "name": "style",
            "label": "Style",
            "value": "",
            "alternate-values": ["Use active voice.", "Use passive voice."],
            "alternate-value-labels": ["Active voice", "Passive voice"],
            "choice-type": "single-choice"
        }
    ]
}
```

### Create Custom Prompts/Actions by Recording Changes

The ![Record](record-icon.png) Record button in the top-left corner of the view allows you to create new AI actions. It opens the Record examples for instructions dialog box where you can provide a set of instructions that are intended for the AI to follow. Then, after clicking the Start recording button at the bottom of the dialog box, you can record a collection of examples in the editing area that will help the AI better follow the given instructions. The examples are recorded from the changes made in the open editors.

After providing examples, you need to click the ![Record](record-icon.png) Record button again to stop the recording. You will then have the opportunity to save the final result as either a Positron action or as a favorite chat prompt.

For example, if you want to add DITA markup to menu cascades, you can follow these steps:

1. Click the ![Record](record-icon.png) Record button.
2. In the Record examples for instructions dialog box, enter some instructions like: You are a technical writer. Add DITA markup to menu cascades.
3. Click Start recording.
4. Open a DITA topic that has a menu cascade without markup (for example: File > Export).
5. Edit the topic and add markup, transforming it to:

```xml
<menucascade>
    <uicontrol>File</uicontrol>
    <uicontrol>Export</uicontrol>
</menucascade>
```
6. Click the **Record** button again to stop the recording. The system generates the following instructions with examples:

```
You are a technical writer. Add DITA markup to a menu cascades.

###
Input:
<p>File > Export</p>

Output:
<p>&lt;menucascade&gt;&lt;uicontrol&gt;File&lt;/uicontrol&gt;
    &lt;uicontrol&gt;Export&lt;/uicontrol&gt;&lt;/menucascade&gt;&lt;/p&gt;

Input: ${selection}
Output:
```

7. In the resulting dialog box, save the final result as either a Positron action or as a favorite chat prompt.

**Custom Validation Rules**

The add-on contributes two XPath extension functions (available in the content completion proposals for Schematron, XSLT, XQuery, and XPath) that can be used to rephrase content or to perform validation checks on existing content:

```
ai:transform-content(instruction, content)
```

Use this function from namespace `http://www.oxygenxml.com/ai/function` to automatically transform content using AI.

The function has two string parameters:

- **instruction** - The OpenAI instruction to be performed on the content.
- **content** - The content to be transformed.

It returns a string that represents the transformed content.

Here is an example of a custom Schematron schema that uses the `transform-content` function to correct the number of words used in a short description:

```
&lt;sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt3"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
    xmlns:ns url="http://www.oxygenxml.com/ai/function" prefix="ai"/&gt;

&lt;sch:ns prefix="ai"/&gt;

&lt;sch:rule context="shortdesc"&gt;
    &lt;sch:report test="count(tokenize(.,',\s+')) &gt; 50" sqf:fix="rephrase"&gt;
    The phrase must contain less than 50 words.&lt;/sch:report&gt;
    &lt;sqf:fix id="rephrase"&gt;
    &lt;sqf:description&gt;
```

<sqf:title>Rephrase phrase to be less than 50 words</sqf:title>
</sqf:description>

<sqf:replace match="text()" select="ai:transform-content('Reformulate phrase to be less than 50 words', .)"/>
</sqf:replace>
</sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

ai:verify-content(instruction, content)

Use this function from namespace http://www.oxygenxml.com/ai/function to automatically validate content using AI.

The function has two string parameters:

- **instruction** - The OpenAI instruction to be performed on the content.
- **content** - The content to be validated.

It returns a boolean value that represents the result of the validation.

Here is an example of a custom Schematron schema that uses the verify-content function to check a short description for instances of a passive voice:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt3"
xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:ns uri="http://www.oxygenxml.com/ai/function" prefix="ai"/>
  <sch:pattern>
    <sch:rule context="shortdesc">
      <sch:report test="ai:verify-content('Does the following content has passive voice?', .)">
        sqf:fix="rephrase">The phrase uses passive voice.</sch:report>
      </sch:report>
      <sqf:fix id="rephrase">
        <sqf:description><sqf:title>Rephrase text to be active voice</sqf:title>
        </sqf:description>
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

**Oxygen AI Positron Assistant Enterprise**

The **Oxygen AI Positron Assistant Enterprise** add-on provides advanced support for technical documentation writers throughout their content creation process by using a company-specific AI service (by configuring your company's specific OpenAI key or Microsoft Azure OpenAI Service connection).

A detailed list of actions and functionality available in the add-on is presented in the Oxygen AI Positron Assistant (on page 2195) topic.

**Installation**

To install this add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the Show add-ons from field or select it from the drop-down menu.

   **Note:**
   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

2. Select the Oxygen AI Positron Assistant (Enterprise) add-on and click Next.

   **Important:**
   There are two different iterations of the add-on and you can only have one or the other installed at once:
   - Oxygen AI Positron Assistant - The regular version of the add-on.
   - Oxygen AI Positron Assistant (Enterprise) - This Enterprise version is for those who want to connect to their own OpenAI or MS Azure OpenAI account.

3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.

4. Restart the application.
Result: The **AI Positron Assistant (Enterprise)** side view is now available.

**Licensing and Configuration**

You can configure the company-specific AI service details in the **AI Service Configuration Preferences Page (on page 2207)**.

A special license key needs to be purchased to enable this direct access. You can use the **Register** button in the **AI Positron Assistant** side view to configure the special license key.

![Important:](image)

*If you want to use the default **Oxygen AI Positron** service instead of a company-specific AI service, the **Oxygen AI Positron Assistant (on page 2195)** add-on needs to be installed and used instead of the one listed above.*

**AI Service Configuration Preferences Page**

Various service-related connection settings can be configured in **Options > Preferences > Plugins > Oxygen AI Positron Assistant (Enterprise) > AI Service Configuration:**

- **AI Connector**
  - Specifies the connector type: **OpenAI** or **Microsoft Azure OpenAI**.

**OpenAI:**

If **OpenAI** is chosen as the connector type, the following settings are available:

- **Address**
  - The web address of the OpenAI service. By default: [https://api.openai.com](https://api.openai.com).

- **Key**
  - The **OpenAI** API key necessary to work with the connector.

  ![Note:](image)

  *This option does not get saved in the Project-level options.*

- **Organization**
  - For users who belong to multiple organizations, they can specify which organization is used for an API request. Usage from these API requests will count as usage for the specified organization.

- **Default model**
  - The default model is used for the chat view and for actions that do not explicitly specify a model.

- **Enable text moderation**
This setting applies moderation (checks whether content complies with OpenAI's usage policies) to both the input text sent to the AI service and the response received from the AI service. It is enabled by default.

**Tip:**

By default, when executing an action using the **OpenAI** connector, three requests are made:

- A moderation on input content request to `configured_web_address/v1/moderations`.
- A completion request to `configured_web_address/v1/chat/completions`.
- A moderation on content returned by AI to `configured_web_address/v1/moderations`.

If your AI service does not require moderation (for example, moderation is already made by chat/completions endpoint) you can disable it by unchecking this checkbox.

**Extra Headers**

Extra name/value parameters to set in the headers that are specific for the AI requests.

**Tip:**

If the service uses **Bearer Authentication**, you can specify the key in the **Key** text field. If another authentication method is used, the **Key** field can be left empty, and the **Extra Headers** table can be used to set the authentication info on the request header. Note that editor variables can be used in this field and you can set your key in editor variables and specify the value in this table like this: `${env(AI_SERVICE_KEY)}` to access pre-set values of environmental variables.

**Microsoft Azure OpenAI:**

If **Microsoft Azure OpenAI** is chosen as the connector type, the following settings are available:

**Endpoint**

The web address where the connector service is located. This value can be found in the **Keys & Endpoint** section when examining your resource from the **Azure** portal. For example: `https://your-company-name.openai.azure.com/`.

**Key**

The **Microsoft Azure OpenAI Service** key necessary to work with the connector.

**Deployment**
The deployment name that was chosen when the model was deployed in Microsoft Azure.

**Extra Headers**

Extra name/value parameters to set in the headers that are specific for the AI requests.

**Note:**

You can use editor variables (on page 313) such as `${env(ENV_NAME)}` in all configuration and header parameter values.

**Troubleshooting:**

In case the add-on fails to connect with the custom settings, it might be useful to enable debug logging in the application to see what requests and responses are made to/from the AI server. You can enable debug logging (on page 2440) in the application by adding a `logback.xml` file in the application installation folder. A minimal `logback.xml` configuration XML file content to enable logging only for the AI Positron add-on's connections would look like this:

```xml
<configuration>
    <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
        <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
        <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
            <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
            <minIndex>1</minIndex>
            <maxIndex>20</maxIndex>
        </rollingPolicy>
        <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
            <maxFileSize>12MB</maxFileSize>
        </triggeringPolicy>
        <encoder>
            <pattern>%r %d [%t] %c - %m%n</pattern>
        </encoder>
    </appender>

    <logger name="com.oxygenxml.positron.connector.openai" level="debug"/>
    <logger name="com.oxygenxml.positron.core" level="debug"/>
    <root level="error">
        <appender-ref ref="R2"/>
    </root>
</configuration>
```

The logging information will be copied in the `Desktop/oxygenLog` folder once the application is started. To avoid performance problems, the `logback.xml` file must be deleted once the logging has been obtained.
Oxygen Emmet Plugin

An Oxygen Emmet Plugin is available as an add-on and it provides the means for high-speed coding and editing in Text mode or Author mode via a content assistance mechanism. It can be used for HTML, XSL, CSS, LESS, and other formats. For example, with the Emmet add-on installed, you can type abbreviations (similar to CSS selectors) and expand them into full-fledged HTML code. The add-on contributes a submenu named Emmet in the contextual menu and it contains actions for expanding abbreviations or wrapping content with an expanded abbreviation. The two actions can also be invoked using the Alt + Shift + E (Ctrl + Shift + E on macOS) or Alt + Shift + W (Ctrl + Shift + W on macOS) keyboard shortcuts.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install this add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

Note:
If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

Tip:
For HTML, CSS, LESS, or XSL files, you can simply right-click anywhere in the editor pane and select Emmet from the pop-up menu.

2. Select the Oxygen Emmet Plugin add-on and click Next.
3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
4. Restart the application.

Result: The Emmet actions will now be available using the keyboard shortcuts or in the Emmet submenu (located in the contextual menu of Text mode or Author mode.

Emmet Actions

The two contributed actions are:
Expand abbreviation \([\text{Alt + Shift + E (Ctrl + Shift + E on macOS)}]\)

In **Text** mode, after entering an abbreviation, invoking this action will expand a valid abbreviation into a code snippet, depending on the document type.

In **Author mode**, invoking the action opens a dialog box where you can enter an abbreviation. After you click **OK**, a valid abbreviation is expanded into a code snippet, depending on the document type.

**Tip:**
For HTML, CSS, LESS, or XML-based document types, you can also use **Ctrl + Space** to expand Emmet abbreviations.

Wrap with abbreviation \([\text{Alt + Shift + W (Ctrl + Shift + W on macOS)}]\)

It opens a dialog box where you can enter an abbreviation and after clicking **OK**, the abbreviation is expanded with the selected content added in the last element of the generated snippet.

**Abbreviation Expansion Examples**

Here are some examples for HTML:

- **Expand abbreviation** example:

  ```html
  #page>div.logo+ul#navigation>li*5>a{Item $}
  ```

  expands into:

  ```html
  <div id="page">
    <div class="logo"></div>
    <ul id="navigation">
      <li><a href="" Item 1</a></li>
      <li><a href="" Item 2</a></li>
      <li><a href="" Item 3</a></li>
      <li><a href="" Item 4</a></li>
      <li><a href="" Item 5</a></li>
    </ul>
  </div>
  ```

- **Wrap with abbreviation** example:

  If the following content is selected to be wrapped:

  ```html
  About
  News
  Products
  Contacts
  ```
then

```
ul>li*[title=$#]>*{$#}+img*[src=https://www.ex1.com/$#][alt=item$]
```

expands into:

```
<ul>
  <li title="About">About<img src="https://www.ex1.com/About" alt="item1"></li>
  <li title="News">News<img src="https://www.ex1.com/News" alt="item2"></li>
  <li title="Products">Products<img src="https://www.ex1.com/Products" alt="item3"></li>
  <li title="Contacts">Contacts<img src="https://www.ex1.com/Contacts" alt="item4"></li>
</ul>
```

You can also use Emmet abbreviations for other XML documents. Here are some examples of expanded abbreviations for DITA:

- `prolog>author {AuthorName}`

expands into:

```
<prolog>
  <author>AuthorName</author>
</prolog>
```

- `simpletable>{strow>stentry*4}*4`

expands into a 4x4 simple table.

- `ul>li*3`

expands into an unordered list with 3 list items.

- `ol>li[id="item$"]*3`

expands into:

```
<ol id="ol_gff_bjd_mkb">
  <li id="item1"/>
  <li id="item2"/>
  <li id="item3"/>
</ol>
```

Here are a few CSS examples:

- `@f+`

expands into:
• -br expands into:

-webkit-border-right: ;
-moz-border-right: ;
-ms-border-right: ;
-o-border-right: ;
border-right: ;

Tip:

Live Tutorials Add-on

An add-on is available that contributes a view that provides the ability to create, run, and check progress for tutorials directly in Oxygen XML Author. Once the add-on is installed, a Tutorials view is available that shows the available tutorials and allows missions to be followed.

The add-on comes bundled with a set of tutorials for learning to work with the DITA XML standard and you also have the ability to create your own tutorials (on page 2217). Each tutorial contains one or more missions. A mission consists of initial file content that is opened in the application and a set of steps and hints for guidance. The mission is considered complete when the initial content is changed by the end user to match an expected result.

Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:
Manual Installation

To manually install the add-on, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.

   Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

   Note: If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

2. Select the Live Tutorials add-on and click Next.

3. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.

4. Restart the application.

Result: The Tutorials view is now available. To open the view, select Tutorials from the Window > Show View menu.

Loading Tutorials

The add-on comes bundled with a set of tutorials for learning to work with the DITA XML standard. For example, there are tutorials that contain various missions for learning some basic DITA editing tasks, learning how to work with tables, learning how to edit and insert images, reuse content, and more. Additional tutorials can be loaded from a specified location in the Options > Preferences > Plugins > Live Tutorials page.

Extra tutorials files (with the fixed name tutorial.xml) that are located within various folders in the Project view will also be loaded automatically.

You can also create your own tutorials (on page 2217) and use them with the add-on.

Tutorials View

Once the Live Tutorials add-on is installed, the Tutorials view is available by selecting it from the Window > Show View menu.

The Roadmap is the main interface of the add-on, where all the available tutorials are presented along with the actions that can be triggered regarding the tutorials.
The **Roadmap** panel includes the following actions/features:

**Tutorials list**

This is a list of all the available tutorials. Each tutorial is an entry, with its own progress icon displayed on the left side. The following actions are available in the **Tutorials** list:

**Start mission**

Double-click, press ENTER, or right-click and choose **Start mission** on any selected mission to begin a new mission. Missions can be started in any order.

**Reset mission progress**

Right-click on a mission and choose **Reset progress** to reset its current progress.

**Learn how to create your own tutorials help link**

Opens the user guide help pages of the add-on in the preferred browser.

**Learn how to create your own tutorials link**

Opens the user guide of the add-on in the preferred browser.

Once a mission is opened from the **Roadmap**, the **Tutorials** view changes to display the selected mission.
The **Mission Progress** panel shows the overall status of the current mission. The following actions/features are available:

**Back**

Navigates back to the **Roadmap** missions list.

**Hints**

Opens the collapsible/expandable **Hints** pane that gives you access to various hints to help you complete the current mission.

The **Hints** pane has the following features:

**Compare with expected result link**

Opens a visual file comparison tool with the current mission's edited file on the left side and the expected file content from the finished tutorial on the right side.

**Hint details section**

Presents details about the current hint.

**Previous/Next hint buttons**

Navigates between available hints.
Details are displayed in the mission panel about what the mission consists of and the steps needed to complete it.

**Completing a Mission**

Once a mission is started, details about how to complete the mission and hints are available. The initial mission file is opened and the add-on will automatically check it to check when it matches the expected content. Upon completing a mission, the *Mission Accomplished* dialog box is shown and the *Next Mission* button becomes available to progress to the next mission.

**Creating New Tutorials**

Once the add-on is installed, you can create new tutorials that can later be loaded from the Options > Preferences > Plugins > Live Tutorials page. Each tutorial loaded by the add-on must have an associated configuration file named `tutorial.xml`, where details about the tutorial and the corresponding missions, as well as activity files and hints, are defined.

First, you should create a folder that will contain both the `tutorial.xml` file and other resources necessary for the tutorial.

Then use the New Document Wizard (on page 351) and search for the tutorial template. Select Live Tutorials/ tutorial and save it as `tutorial.xml` in the custom tutorial folder. A small sample tutorial folder can be downloaded from here.

The `tutorial.xml` file can be edited in the Author visual mode, which contains inline actions to add new missions, hints, or to browse for referenced resources.

**Elements of a tutorial:**

```xml
<tutorial>
  <title>
  <goal>
    An overall goal description for the tutorial (can contain escaped HTML content). It is displayed when hovering over the tutorial in the Roadmap.
  </goal>
  <mission>
    A tutorial has one or more missions. A mission is one of the many objectives that may appear in a tutorial. There has to be at least one mission in a every tutorial. A mission requires the following elements and attributes:
    <id>
      An attribute of the mission element that is unique to a mission.
    </id>
  </mission>
</tutorial>
```
The title of the mission.

<activity>

The activity of the mission describes the steps to follow and contains the initial and expected files.

<description>

Describes the steps required to complete the activity. May contain escaped HTML content.

<files>

An activity requires two of file paths that are used to test if the user completed the steps of the activity.

@projectFolder

An optional reference to a folder where the resources for the mission are located. It can contain an *Oxygen Project File* (.xpr) that will automatically be opened when the mission starts. The folder needs to be created and referenced relative to the tutorial.xml file.

@editPath

Represents the path of a file that will serve as a starting point for the user to complete the mission. The edited file needs to be created and referenced relative to the tutorial.xml file.

@expectedPath

A reference to a file with expected content that is compared with the changes the end user performs in the edit file. The expected file needs to be created and referenced relative to the tutorial.xml file.

@ignoreXPath

An XPath expression that can be set to ignore certain elements or attributes when comparing the original and the user-modified file. For example, you can set it to @id to ignore all automatically generated IDs.

<hint>

A hint helps the user with more information when trying to complete an activity. The hint may contain embedded escaped HTML content. An activity can have zero or more hints.
**Customizing the Default Tutorials**

To customize the default tutorials, follow this procedure:

1. Copy the default tutorials from the installation directory of the add-on to a project and edit them as desired. Oxygen XML Author automatically loads the tutorials found inside the current project.

   **Tip:**
   To find the location where the add-on is installed, go to Options > Preferences > Plugins, select Live Tutorials from the list of add-ons and look at the value of the Location property. In that location, there is a tutorials folder that contains all the default tutorials.

2. Once you have copied the tutorials to your project, you need to disable the loading of the default tutorials by going to Options > Preferences > Plugins > Live Tutorials and de-selecting the Load default tutorials option. You should also save the options from the Live Tutorials preferences page at the project level (on page 302) so that whenever someone opens your project, the custom tutorials will be loaded from it instead of the default tutorials.

3. If applicable, you can share your custom tutorials with others.

**Resources**

To see a visual demonstration of the Live Tutorials add-on, watch our webinar: Interactive Tutorials in Oxygen.

**Writer Helper Add-on (Experimental)**

Oxygen XML Author offers an add-on that provides support for helping technical writers. Once the add-on is installed, a Writer Helper view is available from the Window > Show View menu. Once opened, you can use one of its available tabs to access the functionality.

**Quick Installation**

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

![Install Button]

**Manual Installation**

To manually install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.

2. Enter or paste http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field.
Note:
If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the Browse for local files action in the Install new add-ons dialog box to locate the downloaded addon.xml file.

3. Select the Writer Helper add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart Oxygen XML Author.

Result: The Writer Helper view now be available and can be selected from the Window > Show View menu.

Review
You can select folders or files in the Project view and start a review session for them. By default, the review is done in random order and all reviewed documents are opened with change tracking enabled. During the review process, you can see a list of already reviewed documents and check the status of your progress.

This feature is useful for reviewing a set of documents.

Similar Content
You can select folders or files in the Project view, then choose a list of elements to check for similarity. Once you start the Find similar content processing, information from all XML, HTML, and Markdown files is gathered to determine elements that have similar text content. Once the similar matches are presented, you can click on each of them to show a detailed list of places where the matches are found.

If the Show similar content for the current file checkbox is enabled and the similar elements have been found, once you open a document, a results tab will show elements the current document has in common with all other documents that were analyzed.

This feature is useful for finding possible elements that can be reused instead of being copy-pasted between documents.

Read Aloud
Select content in the current document and use the Play button to listen to how it is read by an operating system-specific narrator.

This feature is useful to review content by listening to it.

Tips
You can view a list of editing tips, tuned for technical writers. Each tip might also have a Mode details link to open the Oxygen XML Author user guide.
This feature is useful for discovering productivity tips to help make your editing experience more efficient and productive.

**Resources**

For more information about the Writer Helper add-on, as well as details regarding other popular add-ons that extend the functionality of Oxygen XML Author, watch the following webinar:

- **Webinar: Add-ons You Can Use for Technical Writing**

**Development**

**Saxon XSLT and XQuery Transformer Add-on**

Oxygen XML Author offers an add-on that installs an external Saxon XSLT and XQuery processor and allows you to validate and transform XSLT and XQuery documents with that external processor. The default add-on update site includes versions for Saxon 9.6, 9.7, 9.8, 9.9, 10.7, 10.8, 11.5, and 12.0.

**Manual Installation**

To manually install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select one of the versions of the **Saxon XSLT and XQuery Transformer** add-on (9.6, 9.7, 9.8, 9.9, 10.7, 10.8, 11.5, or 12.0) and click **Next**.

   ![Note](image)

   If you have issues connecting to the default update site, you can download the package for either Saxon 9.6, Saxon 9.7, Saxon 9.8, Saxon 9.9, Saxon 10.8, Saxon 11.5, or Saxon 12.0, unzip it, then use the **Browse for local files** action in the **Install new add-ons** dialog box to locate the downloaded `addon.xml` file and install them one by one.

4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** When you configure the validation or transformation scenario, you will now have the option to choose the particular Saxon transformer.

![Restriction](image)

Debugging XSLT/XQuery transformations based on this engine is **NOT** supported.

**DocBook Checker Add-on**

Oxygen XML Author offers an add-on that allows you to validate DocBook files. It reports issues such as broken internal and external links, problems with images, or profiling conditions that conflict with profiling preferences.

**Quick Installation**

You can drag the following **Install** button and drop it into the main editor in **Oxygen** to quickly initiate the installation process:

![Install button]

**Manual Installation**

To manually install the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.

   **Note:**
   If you have issues connecting to the default update site, you can download the add-on package, unzip it, then use the **Browse for local files** action in the **Install new add-ons** dialog box to locate the downloaded **addon.xml** file.

3. Select the **DocBook Checker** add-on and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** A **Check DocBook for Completeness** action will now be available on the toolbar and in the contextual menu. This action opens a dialog box that offers various validation options for running a completeness check on the current DocBook document.

For more information, see the details for this **DocBook Checker** add-on in GitHub.

**CGM Image Support Add-on**

Oxygen XML Author offers an add-on that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, the **Oxygen CGM support** add-ons need to be installed in Oxygen XML Author.
Quick Installation

You can drag the following Install button and drop it into the main editor in Oxygen to quickly initiate the installation process:

Install

Manual Installation

To manually install the Oxygen CGM support add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen CGM support add-on and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: You should be able to see CGM images in Author mode.

For more information, see the details about this CGM Support add-on in GitHub.
19.

Tools

Oxygen XML Author includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view (on page 385).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2472).
